Eismannianum. Hybrid between P. villosum var. Boxallii and P. Harrisianum.

enfieldénse. Hybrid between P. Lawrenceanum and P. Hookeræ.

exûl. Lvs. to 12 in. long and 1 in. wide: fls. to 3 in. across, solitary on stalks to 8 in. high; dorsal sepal green edged with white and spotted with dark brown; petals yellow-green with dark spots at base; lip brownish-yellow. Feb.—July. Siam.

Fairieanum. Lvs. to 6 in. long and 1 in. broad: fls. 2-2½ in. across, solitary on stalks about 6 in. long; sepals white with violet stripes; petals green or yellowish-white streaked with violet; lip brownish-green with purple reticulations. Himalayas.

Fowleri (P. callo-Rothschildianum). Hybrid between P. callosum and P. Rothschildianum.

fulshawense: P. Schlesingerianum.

Gaudianum. Hybrid between P. Curtisii and P. Har-

Germinvanum. Hybrid between P. hirsutissimum and P. villosum.

gigas (P. Prewettii). Hybrid between P. Lawrenceanum and P. Harrisianum.

glandulferum. Lvs. strap-shaped, to 24 in. long: scape 1–2-fid., to 22 in. long, dull purple; fis. large; dorsal sepal yellowish-white with reddish-brown veins; petals to 5 in. long, yellow-green with reddish veins; lip yellowish with reddish-brown veins. June-July. New Guinea.

glaucophýlium. Lvs. to about 10 m. long and 2 in. wide: fls. many, on stalks to 18 m. or more high; dorsal sepal yellowish-green with pale yellow margin; petals twisted, thickly spotted with brown-red; lip dull violet with green margin. Blooms all year. Java.

Gódefroyæ. Lvs. to 6 in. long and 1¼ in. wide, dark green mottled with greenish-white; scapes very short, 1-2-fid.; fis. white or pale yellow, closely spotted with redpurple, sparingly pubescent; hp similarly colored, minutely spotted. Indo-China.

Godseffànum (P. Bragaianum). Hybrid between P. villosum var. Boxallii and P. hirsutissimum.

Gowerianum. Hybrid between P. Curtisii and P.

Gratrixianum. Hybrid between P. bellatulum and P. en fieldense.

Grovesianum. Hybrid between P. Lathamsanum and P. Leeanum.

Hánsenii. Hybrid between P. Haynaldianum and P. millosum.

Harrisianum (P. Dauthieri. P. hybridum). Hybrid between P. villosum and P. barbatum.

Harvevanum. Hybrid between P. Stonei and P. Leeanum.

Haynaldianum. Lvs. to 17 in. long and 2 in. wide: fls. to 7 in. across, in 2-6-fld. racemes to about 40 in. high; dorsal sepal green at base with large brown spots, whitish-cream or rosy above; petals elongate-spreading, lower half greenish with large brown spots, apical part pale purple; lip greenish tinted with brown. Philippines.

hirsutissimum. Lvs to 12 in long and 34 in. wide: fls. to about 5½ in. across, solitary on stalks to 12 in. high; dorsal sepal green heavily marked with blackish-violet; petals green at base spotted with dark purple, violet at tip; lip green stained with brown-violet. Mar.-May. Himalayas.

Hitchinsiæ. Hybrid between P. Charlesworthii and P. insigne.

Holkerse. Lvs. to 6 in. long and 2 in. wide: fls. 3-4 in. across, solutary (rarely 2) on stalks to 1 ft. high; dorsal sepal green with yellowish-white border; petals green at base spotted with purple, purple at tip; lip brown-purple tinged with green. Jan.-Aug. Borneo.

Hornianum. Hybrid between P. Spicerianum and P. superbiens.

hvbridum: P Harrisianum.

ingens. Hybrid between P. insigne and P. Rothschildianum.

insigne. Lvs to 12 in. long and 1½ in. wide: fis. 4-4½ in. across, solitary on stalks to about 8 in. high; dorsal sepal yellow-green spotted with brownish-purple at base, white at tip; petals and lip yellow-green veined with brown. Oct.—Mar. Himalayas.—Runs into many named forms, a few of which are: Amesianum with unspotted fis. and sepal with broad white margin; abreum with clear yellow-brown petals and lip; Ballies; Bahnhofflanum; Berryanum; brugénse; Chantinii with deeper coloring and larger white area on dorsal sepal; Cobbianum; corrugatum with corrugated lip; Coulsonianum with larger fis.; Dominaianum; Edenianum; Ernestii with yellow fis. the sepal brownspotted; Fostermannii, sepal with broad white border; gigantèum; Gravesianum, sepal with broad white border and brown spots arranged in regular lines; heatonénse; Hurrellianum, sepal greenish-yellow, reddish-brown at base and tipped with white; immaculatum nigrum; Légeres, sepal dark brown in center margined with white; leopardinum; Letwycheanum; Líndeniæ; Lucianii with bright border; lateo-album has sepal two-thirds white, yellowishgreen at base; Macfárlanei, with clear yellow fis. and sepal with broad white border; máximum with large deep green

sepal; McNabianum; montanum, dorsal sepal bright yellow sepai; McNaoianum; montanum, dorsai sepai oright yellow on basal half, brownish above, petals yellow, striated with brown-red; punctatissimum has the sepal covered with brown spots; rutherfordénse; Sádleri; Sánderæ with bright yellow fils. white at tips; Sanderiànum with yellowish-green fils. veined with dark green, sepal with broad white border; sylheténse, sepal with large dark spots; Wátsonii; westgaténse; xánthinum; Youngiànum; zebrinum.

javánicum. Lvs. to about 12 in. long and 2½ in. wide: fis. about 3-4 in. across, solitary (rarely 2) on stalks nearly twice as long as lvs. green, dorsal sepal veined with dark green. Feb.-Mar., July-Sept., Nov. Java, Borneo.

Josephianum. Hybrid between P. Drurui and P.

Kámilii. Hybrid between P. villosum var. Boxallii and P. Chamberlainianum

lævigatum: P. philippinense.

Lairéssei. Hybrid between P. Curtisii and P. Rothschildranum

Lathamianum (P. Thom Spicerianum and P. villosum. Thompsonii). Hybrid between P.

Lawrenceanum. Lvs. to about 10 in. long and 21/4 in. Lawrenceanum. Lvs. to about 10 in, long and 2½ in. wide: fls. to 5½ in. across, solitary (sometimes 2) on stalks to 18 in. high; dorsal sepal white veined with deep violet; petals bright green tipped with purple-brown; lip brownpurple Apr.-Aug., Nov. Borneo. Var. Hyeanum has white sepals and petals marked with green and ohve-green lip Var.roseum is listed.

Lebaudvanum. Hybrid of P. Haynaldianum and P. philippinense.

Leeanum. Hybrid between P. insigne and P. Spicer-ianum. There are many named forms of this hybrid.

Ledniæ. Hybrid between P. insigne and P. callosum.

leyburnénse magníficum. Hybrid.

longwoodénse. Hybrid between P. Charlesworthii and P. Leeanum.

Lowii. Lvs. to 16 in. long and 2 in. wide: scape to 40 in. high, 2-6-fld.; dorsal sepal yellowish-green to pale yellow basally veined with brown-purple; petals with basal half yellow with brown spots and apical part violet-purple; lip greenish-brown. Feb.—July. Malaya.

lùridum. Hybrid between P. Lawrenceanum and P. villosum var. superbum.

Mabeliæ. Hybrid between P. superbiens and P. Rothschildianum.

macrópterum. Hybrid between P. Lowii and P. superbiens

Mahleræ. Hybrid between P. Rothschildianum and P. Lawrenceanum.

Mángoldii. Hybrid.

marmorophýllum. Hybrid between P. barbatum and

Mastersianum. Lvs. to about 10 in. long and 2 in. wide: fls. about 3-4 in. across, solitary on stalks to 18 in. high; dorsal sepal green with yellowish-white border; petals brownish-red; lip copper-brown. Mar.-May, July-Sept. Malava.

Mátthewsii. Hybrid between P. Lawrenceanum and P. Mastersianum.

Maùdiæ. Hybrid between P. L. Hyeanum and P. callosum var. Sanderæ. P. Lawrenceanum var.

mirábile magníficum. Hybrid.

Mórganiæ. Hybrid between P. Stonei and P. superbiens. nitens (P. Salheri). Hybrid between P. villosum and P. insigne var. Maulei.

niveum. Lvs. to about 6 in. long and 1½ in. wide, green, tesselated above, purple beneath: fis. 2½-3½ in. across, solitary or 2 on stalks to 8 in. high, white dotted with red-purple. June-Aug. Malaya.

cenanthum. Hybrid between P. Harrisianum and P. ineigne var. Maulei.

oultonénse. Hybrid between P. insigne and P. Mme. Jules Hye.

Osbornei: P. Savageanum.

Parishii. Lvs. to 15 in. long and 2½ in. wide: fls. 3-4 in. across, in 3-8-fld. racemes on scapes to 2 ft. high; dorsal sepal yellowish with green veins; petals green at base, blackish-purple above; lip green, often stained with purple. Mar.-Aug. Burma.

pavoninum. Hybrid between P. villosum var. Boxallii and P. venustum.

philippinénse (P. lævigatum). Lvs. to about 15 in. long and 1¼ in. wide: fis. about 3 in. across vertically, in 3-5-fid. racemes about twice as long as lvs.; dorsal sepal yellowish-white veined with violet; petals elongate, pendent, twisted, mostly brown-violet, green at base; lip yellow veined with green. Mar.-July Philippines.

Pitcherianum. Hybrid between P. Harrisianum and P. Spiceruanum.

Pollettianum. Hybrid between P. calophyllum and P.

Prewettii: P. gigas.

purpuratum. Lvs. to about 5 in. long and 1½ in. wide: fls. solitary on stalks to 12 in. high; dorsal sepal white striped with brown-purple; petals crimson-purple veined with green or dark purple; lip brown-purple. Sept.-Jan. China.

regale. Hybrid between P. purpuratum and P. insigne var. Maulei

Rehderianum. Hybrid between P. Pitcherianum and P. purpuratum.

Ridolflanum. Hybrid between P. conspicuum and P.

Rôlfei magnificum. Hybrid between P. bellatulum and P. Rothschildranum.

Rosséttii. Hybrid between P. insigne var. Sanderi and P. Maudiæ.

Rothschildianum. Lvs. to 2 ft long and 1½-3 in, wide: fls. 3½-5 in. across vertically, in 2-5-fld racemes to 2½ ft. high; dorsal sepal yellowsh lined with dark purple; petals narrow, elongate, pale green closely spotted with redpurple, wavy; lip dull purple tipped with yellow at the opening. Jan.—Apr., Aug. Sumatra, Borneo.

Sallièri: P. nitens.

Sánderi. A cross between two hybrids, P. Calypso and P. nitens.

Sanderianum. Lvs. to about 1 ft. long and 1½ in. wide: fls in 3-5-fld racemes to 2 ft high; dorsal sepal pale yellow with broad purple stripes; petals very narrow, to 25 in. long, pale yellow tipped and edged with brown-purple; lip brown-purple Oct. Malaya.

Savageanum (P. Osbornei). Hybrid between P. Harrisanum and P. Spicerianum.

Schlesingerianum (P. fulshawense). Hybrid between P. villosum var. Boxallı and P. insigne var. Maulei.

selligerum. Hybrid between P. barbatum and P. philippinense.

Shillianum. Hybrid between P. Gowerianum and P.

Rothschildtanum.

Siebertianum. Hybrid between P. Dayanum and P.

Siemonii (P. Actæus). Hybrid between P. Leeanum and P. insigne var. Sanderæ.

Spicerianum. Lvs. to 12 in. long and 2 in. wide: fls. about 2½ in. across, solitary (rarely 2) on stalks to 12 in. high; dorsal sepal snow-white with a purple band in center; petals yellowish-green with a median crimson line, wavy-margined; lip red-brown. Nov.—Dec. India.

Stèvensii. Cross between the hybrids P. Calypso and P. Lathamianum.

Stonei. Lvs. to about 16 in. long and 2 in. wide: fls. about 4 in. across vertically, in 3-5-fld. racemes to 2 ft. high; dorsal sepal white with several longitudinal purple stripes; petals with lower two-thirds pale yellow spotted with brown and the apical third brownish-crimson; lip dull rose with darker venus. May-Aug. Borneo.

supérbiens. Lvs. to 7 in. long and 2½ in. wide: fls. about 4 in. across vertically, solitury on stalks to 12 in. high; dorsal sepal white regularly lined with green; petals whitish lined with green and spotted with purple-brown; lip brown-purple. Jan.-July. Malaya.

supercilière. Hybrid between P. barbatum and P. superbiens.

Swanianum. Hybrid between P. barbatum and P.

Swinburnei magnificum. Hybrid between P. insigne var. Maulei and P. Argus.

ténue. Hybrid.

Thómpsonii: P. Lathamianum.

tixallense. Hybrid between P. Lawrenceanum and P. Rothschildianum.

tonsum. Lvs. to about 7 in. long and 2 in. wide: fls. to about 5 in. across, solitary on stalks to 16 in. high; sepal white or greenish striped with green (and sometimes purple also); petals bright green veined with darker green, with several black spots; lpg greenish shaded with brown and crimson. Aug.—Nov. Jan. Sumatra.—The named forms Arthurianum and Charlesworthii are in the trade.

Tracyànum supérbum. Hybrid between P, aureum and P. Lecanum var. giganteum.

triumphans. Hybrid between P. nitens and P. ananthum. Trowamskianum. Hybrid.

Truffautiæ. Hybrid between P. ciliolare and P. Stonei.

venústum. Lvs. to 6 in. long and 1½ in. wide, greer-mottled above, purple-mottled beneath: fis. 3-3½ in. across, solitary (rarely 2) on stalks to 9 in. high; dorsal sepal whitish striped with green; petals green with blackish warts at base, brownish-purple above; lip yellow-green tinged with rose and veined with green. Nov.-Mar., Aug Himalayas.

vexillarium. Hybrid between P. barbatum and P. Fairieanum.

Victòriæ-Marlæ. Lvs. to 12 in. long and 2 in. wide: scape 18 in. high, many-fld; fls. to 3 in. across vertically; dorsal sepal green lined with red-brown and with a whitish border; petals green with red-purple margins; lip purple-brown with green around mouth. Mar -July. Sumatra.

villösum. Lvs. to 18 in. long and 1½ in wide: fls. large, nearly 6 in. across, solitary on stalks nearly as long as lvs; dorsal sepal purplish-brown at base and center, green above with narrow white boder; petals yellowish-brown with brown-purple mid-vein, wavy-margined; lip brownish-prown dorsal sepal, the basal and central area brownish. Var. Bóxallii has dorsal sepal spotted with blackish-brown, with broader white border.

Vipanii. Hybrid between P. ni: eum and P. philippinense. viridissimum blenheimense. Hybrid.

warnhaménse. Hybrid between P. Curtisii and P. philippinense.

Wiertzianum. Hybrid between P. Lawrenceanum and P. Rothschildnanum.

Williamsii, Hybrid.

PAPILIONACEOUS corolla: butterfly-like; pea-like flower, with a standard, wings, and keel.

PAPPUS: peculiar calyx-limb of composites, being plumose, bristle-like, scales, or otherwise.

PAPYRIUS: Broussonetia papurifera.

PAPYRUS: Cuperus Papyrus.

PARACARYUM: Adelocaryum calestinum.

PARADISEA. Liliaceæ. One per. herb with fleshy rhizomes and linear basal lvs. P. Liliästrum (Anthericum Liliastrum). St.-Bruno-Lily. To 2 ft.: fls. white, funnel-shaped, to 2 in. long, in loose racemes on slender bracted scapes. Eu. Var. mājor is taller and has larger fls.: a form, gigantēa is listed and may be this var.—Of easy cult. in the hardy border. Propagated by division and seeds.

PARADISE NUT: see Lecythidaceæ.

PARAMÍGNYA. Rutacex. Evergreen spiny climbing Indian shrubs: lvs. of 1 lft.: fls. solitary or in axillary clusters, large and white; stamens 8–10, not united: fr. elliptic or globose, gummy inside. P. monophýlla has alternate lvs. and recurved spines that aid in climbing, and more or less hairy young parts: fr. berry-like, about 1 in. diam., yellow.—Grown experimentally as a Citrus relative.

PARA-NUT: Bertholletia.

PARASOL-TREE, CHINESE: Firmiana simplex.

PARDANTHUS: Belamcanda.

PARIETARIA. Pellitory. Urticacex. Widely distributed herbs, with alternate entire lvs. and polygamous fls. in axillary clusters; one species formerly grown for medicinal purposes. Propagated by seeds and cuttings.

arbòrea: Gesnouinia arborea.

officinalis. Erect per. blooming first year, to 1 ft. or sts. prostrate: lvs. ovate to oblong, to 4 in. long: fis. very small, in sessile clusters. Eu., Asia.

PÀRIS. Liliaceæ. Rhizomatous herbs native in mts. of north temp. zone, differing from Trillium in the parts of the fl. in 4's; sometimes planted in hardy border.

polyphfila. To 3 ft.: lvs. in a whorl of 4-9, petiole to ½ in. long: fls. with yellow filiform petals and green ovate-lanceolate sepals, to 4 in. or more across: berry green, to 2½ in. diam. W. China.—Very variable as to size of parts.

quadrifòlia. HERB-PARIS. To 1 ft.: lvs. in a whorl of 4 about 2 in. below the solitary yellowish-green fl. about 1½ in. diam.: berry bluish-black. Eu.

PARITI. PARITIUM: Hibiscus.

PARKINSÒNIA. Leguminosæ. Trop. and warm-temp. trees or shrubs with bipinnate lvs., yellow or whitish fls. in racemes, and flattened leathery pods.

aculeata. Jerusalem-Thorn. Ratama. Tree to 30 ft. with spines about 1 in. long: Ifts. having flattened twiglike stalks, the numerous small segms. deciduous: fls. yellow, fragrant, in loose axillary racemes: pods to 5 in. long, constricted between the seeds. Probably trop. Amer.—A good hedge plant.

Torreyana. Tree to 25 ft.: Ifts. 2-3 pairs, ¼ in. long, glaucous: fls. bright yellow, in terminal racemes: pods to 3 in. long, constricted between seeds. Ariz., Tex.

PARMENTIÈRA. Bignoniacex. Trees, often bearing spines at the nodes, lvs. of 3 lfts., large funnelform fls. solitary or clustered, the ealyx split and spathe-like, and long cylindrical frs.; planted in S. Fla.

alàta. Tree, without spines: Ifts. oblanceolate to spatulate, entire, the terminal one often 3 in. long, petiole very broadly winged and long. Mex.

cereffera. CANDLE-TREE. Lifts. obovate, to 2 in. long, entire or toothed: fis. white, to 3 in. long, with large brownish calyx: frs hanging, to 4 ft. long, yellowish and resembling candles. Panama.

edulis. GUAJHOTE. Tree to 30 ft., with broad head; lfts. ovate, entire, petiole very narrowly winged, spines subtending lvs.: fis. greenish-yellow, about 2½ in. long; fr. 4-6 in. long and about 1 in. diam., yellowish-green, edible. Mex., Guatamala.

PARNÁSSIA. Grass-of-Parnassus. Saxifragaceæ (or Parnassiaceæ). Small per. herbs native in north temp. zone in low or moist places, with entire basal lvs. and 1 sessile lf. on the scape, and white fls. solitary at top of scape with greenish or yellowish veins. Useful for planting in damp situations, blooming in summer. Propagated by seeds or division.

asarifòlia. To 20 in.: lvs. kidney-shaped, to 3 in. across, the st.-lf orbicular and clasping, about middle of scape: fls. 1 in. across, the petals clawed. Va. to S. C.

californica (P. palustris var. californica). To 16 in: If, not clasping, tapering to base, to 134 in. long. Mts, Calif.

caroliniàna. To 2 ft: lvs. ovate to orbicular, to 2 in. long, often cordate at base, the st.-lf. ovate and clasping, below middle of scape: fls. 1½ in. across, staminodes stout and shorter than stamens. N. B. to Va. and Ia. Var. montàna, a dwarf mountain form.

fimbriata. To 1 ft.: If. reniform or broad-cordate, to 1½ in. long: petals fringed on sides. Colo. and Calif. to Alaska.

foliòsa. St. acutely 4-angled, winged: st.-lvs. rotund-cordate, sessile, lobed, about 1 in. across, 5-7-nerved: fis. white, to 1 in. across, petals much incised. India.

grandifòlia. To 2 ft.: lvs. ovate to orbicular, st.-lf. ovate and clasping at or below middle of scape: fls. to 2 in. across; staminodes slender and longer than stamens. Va. to Fla., La. and Mo.

intermèdia. To 16 in.: lvs. ovate to kidney-shaped, to 1½ in long, the st.-lf. ovate and sessile: fls. ¾ in. across, petals fringed. Nev., Ore.

montanénsis. To 8 in.: lvs. ovate, to ¾ in. long: fis. to ¾ in. across, petals entire. B. C. to Mont.

palústris. To 1 ft.: lvs. ovate, to 1½ in. long, cordate at base, the st.-lf. ovate and clasping, below middle of scape: fls. to 1 in. across. N. Amer., Eu., Asia.

parviflora. To 1 ft.: lvs. oval, to 1 in. long, narrowed at base, the st.-lf. oval and clasping, about middle of scape: fls. about ½ in. across. N. Amer.

PARÓCHETUS. Leguminosæ. Per. trailer from trop. Asia and E. Afr. P. commūnis. Shamrock-Pea. Blue Oxalis. Lfts. 3, marked with brown crescent at base: fis. papilionaceous, cobalt-blue with pink wings, solitary or 2-3 in the axils: pods 1 in. long.—Useful for rock-gardens or hanging-baskets. Propagated by seeds.

PARÒDIA. Cactaceæ. By some authors this includes the monotypic genus Hickenia as well as other species: plants small, spines hooked or straight: fis. yellow to red, the tube hairy and bristly: native in S. Amer.

aureicentra. Usually cespitose, depressed-globose, to 6 in. tall; ribs about 15, slightly tubercled; radial spines about 40, bristly, somewhat adpressed; centrals stouter, swellen at base, rose to yellow-brown; fis. bright blood-red, about 1½ in. long. Argentina.

aureispina. Globose, bluish-green; ribs spiral and tubercled; radial spines 40 and white, centrals 6 and golden, one hooked: fls. golden, 1 in. across, tube white-hairy. N. Argentina. Var. 6legans is listed.

catamarcénsis (Malacocarpus catamarcensis). Globose, becoming cylindrical; ribs divided into round flat-topped tubercles; radial spines about 9, spreading, slender, white; centrals 4, dark purple, curved: fls. pale yellow. Argentina.

chrysacanthion (Echinocactus and Malacocarpus chrysacanthion). St. simple or branched, globose to subcylindric, to 3 in. tall and 2 in. diam.; ribs 24-30, spiral, tubercled throughout; spines mostly alike, 30-40, the outer more slender than inner, golden-yellow, to ¾ in. long, unequal: fis golden-yellow, to ¾ in. long. Argentina.

erythranta. Spherical, to 2 in. high, spirally tubercled; radial spines about 20, to 1/4 in. long, matted; centrals 4, reddish with white base, one hooked: fis. red, to 1 in. across, stuma white. N. Argentina.

islayénsis (Echinocactus and Malacocarpus islayensis). To 3 in. across, very spiny, woolly at top; ribs 19-25; radial spines 8-22 and spreading; central spines 4-7 and ½ in. long; fls. yellow, ½ in. long. Peru.

Massii (Echnocactus and Malacocarpus Massii). Globular or short-cylindric, 6 in. across, yellowish-green; ribs 13 and undulate or tubercled; radial spines 8-10, weak and long; central spine to 3 in long, curved or hooked; fis. orange-red, 6 in. across. Boliva, Argentina.

microspérma (Echinocactus and Malacocarpus microspermus. Hickenia and Microspermus microspermus). Globose or short-cylindric, very spiny, simple or in clusters, to 8 in. high and 4 in. thick; tubercles in indefinite ribs; radial spines 11-25, to ½ in long, white; centrals 3-4, the lowest strongly hooked, red or brown: fis yellow or red, to 2 in. aeross. Argentina. Var. rigidispina has stouter spines.

minor (Islaya minor). Globose, to 4 in. diam., and 5 in. high, dark green; ribs 16-18, to ½ in wide and half as high, arcoles about ½ in apart; spines black becoming grayish, radials 18-22, to ¼ in. long, centrals 4, to ¾ in. long and stouter; fis. golden-yellow, to nearly 1 in. across; fr. red, pubescent. Peru.

mutábilis. Globose, to about 3½ in. diam., white-woolly on top; tubercles in indefinite ribs; radial spines about 50, bristly, white; centrals usually 4, one hooked, white to orange: fis golden-yellow, to 2 in. across, throat often red. Argentina.

nivôsa (Microsperma nivosa. Echinocactus nivosus). Differs from P. microsperma in its larger habit, no central spines hooked, and fis. brilliant scarlet, to $1\frac{1}{2}$ in. across. Argentina.

sanguiniflora (Microspermia sanguiniflora). Solitary, depressed-globose, woolly on top; tubercles in spiral indistinct ribs, areoles woolly when young; radials about 15, to ½ in long, spreading, bristly, white; centrals 4, brownish, the lowest one hooked, to ¾ in. long: fis. dark red, to 1¾ in. across. Argentina.

Schwebsiana (Echinocactus Schwebsianus). Depressed-globose, 2 in. high and broad, white-woolly at top; rbs 13-20; radial spines 10 and ½ in. long; central spine 1, to ¾ in. long and curved: fls. red, 1 in. long. Bolivia.

setifera. Solitary, depressed-globose, to 3 in. diam.; ribs 18, to ½ in. high; radual spines about 20, to ½ in. long, white; centrals 3-4, pink, one hooked, to ½ in. long and often deciduous: fls. pale yellow, to 1½ in. across. Argentine

Sthemeri (Echinocactus Stuemeri). Globose, very spiny, to 4 in. high and broad; ribs about 20; radial spines about 25 and ½ in. long, white; central spines 4 and 1 in. long, brown: fis. orange-yellow, 1¾ in. long. Argentina.

tabularis: Notocactus tabularis.

tilcarénsis. Differs from P. Stuemeri in having fewer spines and slightly smaller orange-red fls. Argentina.

PARONÝCHIA. WHITLOW-WORT. NAIL-WORT. Illecebraceæ. Small herbaceous tufted annuals and perennials with minute clustered fis. without petals, often hidden among silvery stipules or bracts: ivs. opposite, broad or narrow: mostly in the Medit. region but several native

in U. S. Useful in the rock-garden. Of simple cult.; propagated by seed and the perennials also by division.

argéntea. Prostrate per.: lvs. ovate to lanceolate, ciliate: fis. in dense clusters among the lvs., concealed by silvery bracts. Medit, region.

argyrécoma (Anychia argyrocoma). Erect or ascending per. to 8 m., making broad tufts or mats, covered with silvery scale-like hairs: lvs. linear, stipules silvery-white: fls. in forking cymes, concealed by the large and silvery bracts. Rocky places, Me. to Ga. and Tenn. Var. albimontàna is listed as a dwarf form to 3 in. high.

bonariénsis. Prostrate tufted per.: lvs. ovate-oblong, usually acute, densely appressed-pubescent: fis. in axillary clusters. Probably Uruguay.

capitàta: see P. serpyllifolia.

dichôtoma. Tufted per. to 14 in., woody at base: lvs. awl-shaped, stipules silvery: fis. yellow, in loose cymes with ascending branches. Dry soil, Md. to Tex.

Kapéla. Per. to 4 in.: lvs. oblong, bluish-green, ciliate: fls. in heads to ¾ in. across, concealed by silvery bracts. S. Eu.

Lindheimeri. Ann. or bien. to 8 in.: lvs. thread-like: fis. in loose cymes. Tex., New Mex.

nívea. Per. to 5 in., woody at base, sts. ascending, pubescent: Ivs. linear-lanceolate to lanceolate, acute, densely culate. fls. with large silvery-white bracts in dense heads. Medit. region.

pulvinata. Mat-forming per.: lvs. oblong, obtuse, densely covering the short sts.: fls. terminal, sessile, few, nearly covered by the lvs. Colo., Wyo. and Utah.

serpyllifòlia. Creeping rooting per.: lvs. obovate: fls. in dense heads borne in cymes. S. Eu.—Probably a var. of the species *P. capitata*, which is a per. to 6 in., sod-forming, with fls. in dense terminal silvery-white heads.

sessilifòlia. Differs from P. pulvinata in its linear-subulate acute to mucronate lvs. Colo. to Sask.

PAROSELA: Dalea.

PARROT-BEAK: Clianthus puniceus.

PARRÒTIA. Hamamelidaceæ. Deciduous tree native in Persia, hardy N. and the foliage assuming brilliant autumnal colors. P. pérsica. To 15 ft.: lvs. oval to 4 in. long, coarsely toothed above middle: fls. before lvs., in dense heads to 1/2 in. across surrounded by brown-tomentose bracts, without petals, the stamens drooping.—Propagated by seeds, layers and cuttings.

PARROTIÓPSIS. Hamamelidaceæ. Himalayan deciduous tree to 20 ft. P. Jacquemontiàna (Parrotia Jacquemontiana). Lvs. nearly orbicular, to 3 in. long, toothed, turning pale yellow in autumn: fls. with the lvs., in dense heads to 2 in. across surrounded by large white bracts, without petals, the stamens erect.— Rather tender in the N. Propagated by seeds, layers, and cuttings of green wood under glass.

PARROTS-BILL: Clianthus puniceus. -Feather: Myriophyllum proserpnacoides.

PÁRRYA. Cruciferæ. W. American per. herbs allied to Radicula, differing in having yellow or white fls. and pods flattened, not terete. One species, P. Ménziesii, may be grown in the rockery; propagated by seeds. To 6 in., cespitose: lvs. spatulate to oblanceolate, to 4 in. long, entire, usually densely stellate-hairy: fls. rose to purple, many in racemes: pods spreading horizontally. W. Nev. to Calif. and Ore.

PARSLEY: Petroselinum crispum.

PARSNIP: Pastinaca. Cow-: Heracleum. Water: Sium suave.

PARSONSIA: Cuphea.

PARTED: cleft or cut not quite to the base, as a leaf or petal.

PARTHÈNIUM. Compositæ. Herbs and shrubs, per. or sometimes ann., with alternate

lvs. and small heads of white or yellow ray-anddisk-fls. borne in corymbs and panicles; pappus of awns or none; native N. Amer. to N. S. Amer.

The guayule is grown in southwestern United States for the rubber obtained from the stems and is now of commercial importance. The plants are set out late in March in rows 2-3 feet apart. Propagated by seeds.

argentatum. Guayule. Shrub to 3 ft., much branched. lvs. lanceolate to ovate-lanceolate, to 2 in. long, silvery-pubescent: heads ¼ in. across. Mex., Tex.

integrifòlium. Per. to 4 ft., corymbosely branched above: lower lvs. oblong to lanceolate, toothed, to 6 in. long, upper ones ovate: heads whitish and small. Md. to Ga. west to Minn. and Tex.

PARTHENOCÍSSUS (Psedera). Vitaceæ. Many species of shrubs climbing by tendrils often with disk-like tips, having alternate lobed or digitately compound lvs., small greenish fls. in cymes, parts of the fl. in 5's and falling separately (see Vitis), and fr. a black berry.

These vines are grown as covering for walls, fences and arbors and allowed to grow on trees. They thrive in any good soil. Propagated by seeds, cuttings of hard and green wood, and by layers.

Henryana (Ampelopsis Henryana). Young branchlets 4-angled: lvs. of 5 ovate to obovate lfts. to 2½ in. long, toothed above middle, marked with white above, purplish beneath. China.

heptaphýlla (Ampelopsis heptaphylla). Lvs. of mostly 7 oblong-lanceolate lfts. to 2½ in. long, coarsely toothed.

himalayana. Allied to P. tricuspidata Ifts. 3, obovate to ovate, glaucous underneath. Himalayas; adaptable only

hirsuta: P. quinquefolia var.

insérta: P. quinquefolia var. vitacea.

lætévirens. Lvs. of 5 obovate lfts. to 4 in. long, coarsely toothed, yellow-green, glabrous except perhaps on veins underneath. China.

underneath. China.

quinquefòlia (Ampelopsis quinquefòlia and hederacea).

Virginna Creefer. American Ivy. I.vs. of 5 ellipticovate coarsely toothed stalked lits. to 6 in. long, paler beneath. New England to Fla. and Tex. Var. Engelmannii (Ampelopsis Engelmannii). Lits. smaller. Var. hirsūta (P. and Ampelopsis hirsūta). I.vs. pubescent beneath. Var. muròrum. Tendriis short and numerous. Var. Saint-Paulii (Ampelopsis Saint-Paulii). Branchlets often with aerial rootiets; lits. pubescent beneath. Var. vitàcea (P. and Ampelopsis vitacea, P. inserta). Tendrils mainly without disks and not clinging well; lits. deeply cut in one form.—In its many forms, the Virginia creeper is one of the hardiest and most adaptable of climbers; sometimes called Fiveleaved Ivy and Woodbine.

Thémsonii (Ampelopsis Thomsonii). Lvs. of 5 elliptic toothed lfts. to 3 in. long, purplish when young. China, Himalayas.

tricuspidata (Ampelopsis tricuspidata). Japanese or Boston Ivy. Lvs. variable, ovate to orbicular, to 8 in. across, 3-lobed or 3-parted, shining above. Japan, China. Var. Lòwii (Ampelopsis Lowi). Lvs. to 1½ in. long, purplish when young. Var. purpurea. Lvs. dark purple. Var. robusta does not differ from the type. Var. Veitchii (Ampelopsis Vetchii). Young Ivs. purple, smaller. A small-lvd. form is offered as minutifòlia.

vitàcea: P. quinquefolia var.

PARTRIDGE-BERRY: Mitchella repens.

PASANIA: Lithocarpus.

PASITHÈA. Liliacex. One bulbous herb native in Chile, belonging to the Anthericum group. P. cærůlea. Lvs. narrow-linear, grasslike: fls. blue, 1 in. across, borne in loosely branched panieles on graceful scapes; perianth-tube very short, the lobes spreading.

PÁSPALUM. Graminex. Ann. and per. grasses of temp. and warm regions of the world, sometimes grown for ornament: spikelets in one-sided racemes which are solitary, paired or in panicles. See Grasses.

dilattum. Per. to 6 ft.: lvs. to 1 ft. long and ½ in. wide: racemes to 5 in. long, in panicles of 3-8. Argentina; nat. in S. U. S.

élegans: see P. racemosum.

racemosum. Ann. with decumbent sts. to 3 ft. long: lvs. to 5 in. long and 1 in. wide: racemes to 1 in. long, numerous, in panicles to 6 in. long. Colombia to Peru.—Sometimes cult. as P. elegans and P. stoloniferum.

stoloniferum: P. racemosum.

PASOUE-FLOWER: Anemone Pulsatilla.

PASSIFLÒRA. Passion-Flower. Passifloraceæ. Many vines climbing by tendrils, with alternate entire or lobed lvs., solitary or racemose odd and often very showy fls. with stamens united in tube and fr. a many-seeded berry; some of them have edible frs. and others are grown as ornamentals.

Passifloras are hardy only in the southernmost United States but are sometimes grown under glass for the striking bloom. Propagated by seeds and cuttings. P. edulis and P. quadrangularis are the species mostly grown for the edible fruit.

alata. Sts. slightly winged: lvs. entire: fls. fragrant, to 5 in. across, white, red inside, the crown red, purple and white: fr. yellow, to 5 in. long, edible. Trop. Amer.

alato-cærûlea (P. Pfordin). Hybrid between P. alata and P cærulea: ivs. 3-lobed: fis. fragrant, 4 in. across, white, pink inside, the crown purple, blue and white.

álba: P subpeltata.

antioquiensis (P. and Tacsonia Van-Volxemin). Lvs with 3 lanceolate toothed lobes: fls. to 5 in. across, bright red; calyx-tube to 1½ in long: fr. edible. Colombia.

atropurpurea. Hybrid between P. racemosa and P. Raddiana. fls. 3 in. across, dark red, the crown violet spotted with white.

Bánksii. Lvs. with 3 broad lobes: fis. pale at first but becoming scarlet. Australia.

biflòra. Sts. 5-angled: lvs. transversely linear to oblong, to 4 in. wide and 1 in long: fis. white. Mex. to Venezuela and Bahama Isls.

cerulea. Lvs. with 5 lanceolate lobes; fls. to 4 in. across, pale pink, the crown white and purple; fr. yellow, 1½ in. long. Brazil, and grown under glass. Var. grandiflora has larger fls. and "Constance Elliott" white fls.

coccinea. Lvs. ovate, not lobed, coarsely toothed: fls. scarlet with orange crown. S. Amer.

Cólvillei. Hybrid between P. incarnata and P. cærulea: lvs. with 3-5 deep toothed lobes: fis. 3½ in. across, white spotted with red-brown, the crown purple, white and blue.

edùlis. Purple Granadilla. Lvs. with 3 deep toothed lobes; fls. 2 in. across, white with white and purple crown; fr. deep purple, to 3 in. long, edible. Brazil.

Eichwaldtii: listed name of unknown botanical standing. exoniénsis. Hybrid between P. antioquiensis and P. mollisama: lvs. deeply 3-lobed, pubescent beneath: fls to 5 in. across, brick-red, rose-pink inside, with tube 2½ in. long.

grácilis. Lvs. with 3 shallow lobes: fls. pale green or white, apetalous, about 1 in. across. Brazil.

grandiflòra: P. cærulea var.

ignea: P. manicata.

incarnata. WILD P. MAYPOP. Lvs. with 3 deep toothed lobes: fls. to 2 in. across, white with purple or pink crown: fr. yellow, to 2 in. long, edible. Va. to Fla. and Tex.

Jamesonii (Tacsonia Jamesonii). Lvs. 3-lobed: fls. bright rose or coral-red, the calyx-tube about 4 in. long. Peru.—Some of the material cult. under this name is P. tomentosa.

kermesina (P. Raddiana). Lvs. 3-lobed, slightly toothed, purplish beneath: fis. crimson, the crown dark purple with white filaments inside. Brazil.

lanata ($Tacsonia\ lanata$). Lvs. entire, tomentose beneath: fls. white, with tube $2\frac{1}{2}$ in. long. Andes.

latifòlia: confused name, perhaps referable to P. alata.

laurifòlia. Yellow Granadilla. Water-Lemon. Jamaica-Honsysuckle. Lvs. entire: fis. to 4 in. across, white spotted with red. the crown violet and white: fr. yellow, to 3 in. long, edible. Trop. Amer.

ligularis. Sweet Granadilla. Lvs. entire: fis. to 3 in. across, greenish with white and purple crown: fr. brown or purplish, 3 in. long, edible. Trop. Amer.

lûtea. Lvs. broader than long, shallowly 3-lobed: fis. greenish-yellow, ¾ in. across: fr. purple, ⅓ in. across. Pa. to Fia. and Tex.

macrocárpa: P. quadrangularis.

malifórmis. Lvs. entire: fls. fragrant, to 5 in. across, white with red, violet and white crown: fr. yellowish-green, 2 in. across, edible. Trop. Amer.

manicata (P. ignea. Tacsonia manicata). Lvs. with 3

ovate toothed lobes: fls. to 4 in. across, bright scarlet with blue crown, the calyx-tube 1½ in. long: fr. yellowish-green. Colombia, Ecuador. Peru.

militaris. Lvs. with 3 deep toothed lobes: fls. to 5 in. across, deep crimson with purple crown. Hybrid.

mixta (Tacsonia mixta). Lvs. with 3 deep toothed lobes: fis. rose-pink, to 4 in. across, the green calyx-tube to 5 in. long. Andes.

mollissima (Tacsonia mollissima). I.vs. with 3 deep toothed lobes, very pubescent beneath: fis. to 3 m. across, rose, the calyx-tube to 5 m. long: fr. yellow. Andes.

Pfórdtii: P. alato-cærulea.

princeps: P. racemosa.

quadrangulàris (P. macrocarpa). Giant Granadilla. Sts. winged: lys. entire: fls. fragrant, 3 in. across, white with purple and white crown: fr. greenish-yellow, to 10 in. long, edible. Trop. Amer. Var. variegàta has foliage blotched yellow.

racemosa (P. princeps). Lvs. deeply 3-lobed, margins entire: fls. to 4 in. across, deep red with purple and white crown: fr. greenish-yellow, 2 in. long. Brazil.

Raddiana: P. kermesina.

rosacea: probably of hort. origin; the name has no botanical standing.

subpeltata (P. alba). Lvs. broad-ovate, shallowly 3-lobed, glaucous beneath: fis. pure white, 2 in. across: fr. green becoming yellowish, size of an egg. Mex. to S. Amer.

tetrandra: Tetrapathæa tetrandra.

tomentòsa ($Tacsonia\ tomentosa$). Lvs. 3-lobed, tomentose beneath: fis, with pubescent tube to $3\frac{1}{2}$ in, long. Peru.

trifasciàta. Lvs. 3-lobed, banded with purple along midribs: fis small, yellowish, fragrant. Brazil.

Van-Volxemii: P. antroquiensis.

violacea. Lvs. 3-lobed: fls. to 4 in. across, violet with violet and white crown. Brazil.

PASSIFLORACEÆ. Passion-Flower Family. About 18 genera of woody vines or sometimes erect herbs, most abundant in S. Amer., characterized by alternate simple or lobed lys., simple tendrils, regular mostly bisexual fls. with 3-5 sepals and separate petals or without petals, usually with a conspicuous often showily fringed crown in the center, and fr. a berry or caps. Passiflora is grown for ornament and for the edible fruits, also Tetrapathea.

PASSION-FLOWER: Passiflora.

PASTINACA. PARSNIP. Umbelliferæ. Thick-rooted herbs, mostly bien., with pinnately compound lvs., yellow or red fls. in compound umbels, and flattened frs.; grown for the edible root.

Parsnips should be grown in deep mellow soil so that the roots may develop straight and unbranched. Seeds may be sown in spring in rows 16-18 inches apart and the seedlings thinned to 5-6 inches in the row. If the ground becomes crusted or baked before the seeds germinate, it should be broken with a rake. Parsnips may be dug in autumn and stored in a cellar, or left in the ground till spring. They require the entire season in which to grow.

sativa. Cultivated P. To 5 ft., with grooved hollow st. and roots to 20 in. long: lvs. with 7-9 ovate toothed or lobed lfts.: fls. greenish-yellow. Eu.—The wild form, var. sylvéstris, is nat. in N. Amer.

PATA-VACA: Bauhinia mexicana.

PATERSONIA. Iridacex. Australian rhizome-bearing perennials with rosettes of stiff linear lvs. longer than the slender erect fl.-sts.; fls. usually blue, short-lived, in terminal clusters, the outer segms. spreading and inner ones minute and erect: fr. a linear caps. Summer blooming and somewhat difficult to establish.

glauca. Lvs. narrowly linear, to 18 in. long, acute, pale green: fls. blue, 2-4 in solitary terminal spikes, outer segms. ovate, about ½ in. long.

umbròsa. Lvs. linear, to 24 in. long, more rigid than above: fis. with outer segms. obovate, to $1\frac{1}{2}$ in. long.

PATRÍNIA. Valerianaceæ. Hardy perennials from N. Eu. and Asia, having pinnatifid or pinnatisect lvs., except for entire basal ones, and

fls. yellow or white in corymbose-panieled cymes, and differing from those of other cult. genera of this family in having 4 stamens. Blossoming in early summer and adapted to rockery or border.

intermèdia. To 1½ ft.: lvs. pinnatifid with large terminal lobe, other segms. lanceolate: fls. yellow. Siberia.

palmàta: P. triloba.

rupéstris: confused name, the plants in cult. may be P. intermedia or P. scabiosæfolia.

scabiosæfòlia. Plant glabrous: basal lvs. ovate-oblong, lyrate, meised, st.-lvs. pinnatifid, segms. linear-lanceolate, acute, distal one longest: fis. yellow. Dahuria.

sibírica. To 1 ft.: basal lvs. long-spatulate, toothed or entire, st.-lvs. few, pinnate, segms. entire: fls. yellow, fragrant. Siberia.

triloba (P. palmata). To 15 in., hairy at nodes and on peduncles, branched above: lvs. heart-shaped, palmately 3-5-lobed to entire, lower ones coarsely dentate to scrate: fls. golden-yellow, in clusters to 4 in. across Japan.

villosa. Coarse per. to 3 ft: basal lvs. auricled, petioled, villous, st.-lvs. sessile, toothed: fls. white, in panicled corymbs. Japan.

PAULLÍNIA. Sapindaceæ. Climbing shrubs of the tropics with alternate compound lvs., small irregular fls. in axillary racemes, and somewhat fleshy capsular frs.; one species is grown in the greenhouse as a foliage plant. The tops should be pinched off to induce stocky growth. Propagated by cuttings in early spring.

thalictrifòlia. Tendril-bearing: lvs. fern-like, three times pinnate into 3 small lfts, of bronze tint when young: fls. pinkish: fr. 1 in. long, 3-winged. Brazil.

PAULÒWNIA. Scrophulariaceæ. Deciduous trees of E. Asia grown for their large attractive opposite catalpa-like lvs. and showy panicles of violet, or sometimes nearly white, tubular fls. with 5 spreading lobes: fr. a large caps. with winged seeds.

Paulownias are tender in far North but are root hardy north of their proper region and in the spring send up strong new shoots and make very large leaves. They thrive best in a light deep loam and northward in a sheltered position. Propagated by seeds sown in the spring or by root-cuttings, and in greenhouses from greenwood cuttings, also from the leaves, taken when unfolding and about 1 in. long.

Fórtunei. Tree to 20 ft.: lvs. ovate or ovate-oblong, to 10 in. long, densely tomentose beneath: fls. before lvs., white spotted inside with purple, to 4 in. long. China.—Grown in Calif.

imperiàlis: P. tomentosa.

tomentosa (P. imperialis). Pubescent tree to 40 ft., much like catalpa in habit: lvs. broad-ovate, to 1 ft. and more long, entire or 3-lobed, tomentose beneath: ffs. 2 in. or more long, pale violet, durker spotted inside, fragrant, n many-fid. panicles to 1 ft. long. China: escaped in the U.S; hardy in the East to about the latitude of N. Y. City or somewhat farther, and along the Ohio River. Var. lanata is yellow-tomentose beneath. Var. pallida has pale fis.

PAURÒTIS (Acælorraphe). SAW PALMETTO. Palmaceæ. Attractive hermaphrodite fan-palms of southern everglade Fla. and parts of W. Indies and probably Cent. Amer., producing several slender trunks in one clump, unarmed except for the short-spiny or sharp-toothed petioles: spadix long and branched, among the lvs. and surpassing them; fls. small, solitary or in 2's or 3's; stamens 6, nearly or quite equal in length, the filaments broad at base: fr. a globular glabrous drupe about 3% in. thick, black.

androsàna: P. Wrightii. arboréscens: P. Wrightii.

Wrightii (P. androsana and P. arborescens. Serenoa arborescens. Acadorraphe arborescens and Wrightii. Acanthosabal cæspitosa) Evergalade Falm of Florida. Shurer-Saw P. Saw-Cambagge P. Trunks slender, several or very many, strict, to 10 ft: lvs. nearly or quite orbicular, 2-3 ft and more across, divided below the middle into narrow segms., green above and silvery underneath.

PAVIA: Æsculus.

PAVÒNIA (Malache). Malvaceæ. Herbs and shrubs in warm parts of Old and New Worlds, with alternate often angled or lobed lvs., yellow, pink or purple fls. solitary or clustered and 5 carpels separating from axis at maturity; sometimes grown under glass N., or in the open in warm climates. Propagated by cuttings in spring or early summer, or by seeds.

flava: P. sepium.

hastata. To 6 ft., shrubby: lvs. toothed, halberd-shaped; fls. solitary, pale red with dark spot at base, to 1 in. long. S. Amer.; nat. in S. U. S.

multiflora. Lvs. narrowly oblong, toothed: fls. in terminal clusters, purple, to 1½ in. long, the staminal column exserted. Brazil.

præmôrsa. Shrub: lvs. broad-ovate, toothed: fls. yellow with dark center, solitary. S. Afr.

sèpium (P. flava). To 6 ft., shrubby: lvs oblong-ovate, coarsely toothed: fls. about ½ in. long, in few-fld. racemes. S. Amer.

spinifex. Shrub to 20 ft.: lvs. ovate, toothed: fls. solitary, yellow, 1 in. across. Trop. Amer.; nat. in S. U. S.

PAWPAW: Carica Papaya; also Asimina triloba, mostly spelled papaw.

PEA. The garden and field pea is a coolseason hardy annual tendril-climbing plant. It occupies the land only part of the season. Peas are grown for the edible green seeds, and one race for the edible pod with the seeds intact after the way of string beans but this sort is little known in North America. See Pisum. Garden peas are "smooth" and "wrinkled." The smooth kinds are inferior to the wrinkled in quality.

Since the pea plant is hardy and does not produce well in hot weather, plantings in most sections of the North should be made as early as the land can be prepared. The best method of obtaining a succession of peas is to plant early, medium, and late varieties about the same time in spring. In the South and in parts of the Southwest and in southern California, the crop is grown in winter and early spring, plantings being made at intervals during fall and winter. In home gardens and in commercial plantings, in some regions, tall-growing varieties are supported on strings attached to stakes or on trellises of chicken wire 2½ to 3 feet wide stapled to stout stakes; as soon as the crop is harvested the wire is rolled up and the stakes are pulled and allowed to dry, and the material is then stored, being used over and over for years. A large part of commercial plantings of both tall and dwarf varieties are not supported. In the home garden peas may be planted in rows 18 inches apart for hand cultivation and 30 to 36 inches apart for horse cultivation, using about 1 quart of seed for 100 feet of row. Most pea seed is planted too deeply, resulting in slow come-up and thin stand. A depth of I inch is sufficient in moist heavy soil and 1½ to 2 inches in dry soil. A covering greater than 2 inches is seldom justified in humid regions.

As a field crop, peas may be sown in rows far enough apart to admit of horse-hoeing, but usually they are broadcast or planted with a grain drill. For sale as green peas, the pods are picked by hand, but for canning the crop is harvested with a mowing-machine and hayrake. The canning crop is hauled to the factory as gathered and is there threshed; the straw has value as manure and as feed for livestock.

Pea louse is often a serious pest, particularly

in broadcast fields where the insect spreads readily from plant to plant. In rows the louse or aphis can be controlled by spraying or dusting with nicotine preparations. The lice may be brushed from canning fields by a machine devised for the purpose. The pea weevil infests ripe peas in storage, where they may be killed by fumigation with bisulfide of carbon; but peas that have been injured by weevil should not be planted for they produce weak plants.

PEA: see Lathyrus. Asparagus-: Psophocarpus tetragonolobus. Butterfly-: Centrosema, Clitoria. Chaparral-: Pickeringna. Chick-: Cicer aretinum. Glory-: Clianthus Dampieri. Partitige-: Cassia fasciculata. Pigeon: Cajanus Cajan. Rosary-: Abrus precatorius. Scurfy-: Psoralea. Shamrock-: Parochetus communis. -Shrub: Caragana. -Tree: Caragana. Winged-: Lotus tetragonolobus.

PEACH (Prunus Persica). In some of its forms the peach can be grown in nearly all parts of the United States and southern Ontario where winter temperatures do not fall beyond 12° to 15° below zero F. and where late spring frosts are not common. Although under the most favorable conditions dormant peach blossom-buds may withstand a temperature of 20° below zero, ordinarily 10° below is critical and lower temperatures may cause damage. Temperatures of 15° to 25° below zero may seriously injure the sapwood or kill the tree outright. Varieties do not differ enough in hardiness to make possible the extens on of the peach industry by the choice of hardy varieties as can be done with the apple. Commercial peach growing is, therefore, confined to the southern and middle states, and those parts of the northern states that have the protection of bodies of water, as for example the fruit districts along the Great Lakes and some of the larger inland lakes. Outside these regions, peach growing is too un-certain to be commercially profitable, but may be undertaken in home plantings where occasional crop failure is of no great importance. In the warmer parts of the United States peaches often fail because of insufficient cold weather to break the rest period. The Honey and Peen-to races are adapted to southern conditions. Large quantities of clingstone varietes are raised in California for canning.

Peach trees bear young, often a partial crop the third year. In the northern states where severe winters take their toll, the average life of a peach orchard is only about a dozen years. Farther south and particularly in California the productive life of the trees is longer. Commercial growers have successive orchards coming on, but in the home garden young trees may be set every four or five years to replace older ones, thus having trees at a bearing age at all times on a small place. Peach trees are set when one year old, that is, one season's growth from the bud. Trees should be set 18 to 20 feet apart each way in spring or autumn, the former being the better time in the North. In regions where the trees attain large size, planting should be as much as 24 feet apart either way.

Although peaches may be grown with fair success on practically any good agricultural soil that is well drained and reasonably warm, the fruit attains its best development in color and quality on good sands, sandy loams or the lighter clay loams. In some regions, with abundant fertilizer, good commercial crops are grown in almost pure sand. Heavy or very fertile lands which prolong the growing season should be

avoided in the North as late growth does not become sufficiently hardened to withstand the winter.

Peach varieties are budded on seedling stocks. The pits are planted in the nursery row in late summer, or they may be stratified and sown in spring; in either case germination does not take place until the spring following the ripening of the seed. The first-year seedlings are budded to the desired variety, in June in the southern states and in late August or September in the North. The buds inserted in late summer or autumn remain dormant until the following spring, when the stock (or young tree) is cut off just above the bud; this bud is forced into growth, and all other sprouts from the stock are pulled off. The age of the tree is reckoned from the bud, but of course the root is one year older. In June-budded trees in the South, the bud grows the same year in which it is inserted and the resulting tree is ready for planting that autumn. For heavy lands, peaches are some-times budded on stocks of St. Julien or Damson plum.

Tillage and fertilizer are important. Although it is sometimes possible to grow peaches for home use without cultivation, by mulching with manure, fertilizing heavily, or planting the trees in the poultry yard, the universal practice in commercial orchards is to till thoroughly and turn under cover-crops. The land is plowed or disked in early spring and then tilled frequently enough to kill all weeds until July or August or until the peach crop is well along. A cover-crop of weeds or sowed crop, such as buckwheat, rape, clover or cowpeas, is allowed to grow. On light sandy soils a complete fertilizer is frequently added, although usually nitrate of soda is the most effective element. The nitrate may be applied at the rate of 2 to 4 pounds a mature tree, when the buds start growth. Nitrate should be applied with caution as an overdose will lower the color of the fruit and prolong growth too late in the season. Manure may be used to advantage in many cases.

Severe pruning at the time of setting is the common practice. The trees are headed to the desired height, usually 20-30 inches, and all but the three or four branches wanted for the head are removed and these are cut back to stubs 2 to 3 inches long. As the young shoots appear in the spring the trees should be disbudded by removing all young shoots except those desired for permanent scaffold branches. From this time until the first crops are borne, the tree, as grown in the northern states, should be pruned little except to keep it in shape and the head somewhat open. In the South and West where the trees grow more rapidly, the scaffold branches must be headed back to prevent them from be-coming "leggy." Mature trees must be heavily pruned to maintain vigor of growth of the fruiting wood, to keep the tree low so that the fruit can be harvested from the ground or a six-foot step-ladder, and to open up the center of the tree. All this is accomplished by heading back the most vigorous growth to side branches and thinning out where necessary. The best time for pruning peach trees is in the late winter or early spring before the buds start.

Peaches are harvested when full sized and well colored, but still firm. The time of picking is very important and requires experience to deter-

mine it with nicety. Care must be taken not to tear the flesh about the stem. In its fourth or fifth year a well-grown tree may yield 1/2 to 1 bushel of fruit and when in full bearing 3 to 4 bushels are not exceptional. On the average, however, 150 to 250 bushels to the acre are all that can be expected. The yield of peach trees is not dependent on cross-pollination, except in the varieties J. H. Hale and the Mikado. Yields are larger in California.

Marketing and storage have changed in recent years. Roadside and local markets now absorb much of the peach crop. The commercial crop is shipped in various types of containers, among the most common being the Georgia carrier of the south Atlantic states, hampers of various sizes and the standard bushel basket. Because of the perishable nature of the fruit it is usually pre-cooled and shipped in iced cars if the distance is great. Firm fruit in prime condition can be held in cold storage for a week to ten days at 32° F., after which loss of quality is rapid.

Varieties of peaches are many, with regional adaptations. Many new varieties are being introduced yearly. The commercial grower should choose varieties suited to the particular market. The following varieties, listed in order of ripening, give a succession for either home or

commercial use.

Varieties with hardy fruit-buds adapted to growing at the northern limits of peach culture: Greensboro, Carman, Oriole, Golden Jubilee,

Rochester, Crosby, Hills Chili.

Varieties for fruit sections of New England, New York, and Michigan: Mikado (June Elberta), Oriole, Golden Jubilce, Rochester, Valiant, Halehaven, Veteran, Champion, Early Elberta, Early Crawford, J. H. Hale, Elberta.

Varieties for the Atlantic coast not including Florida: Mayflower, Golden Jubilee, Carman, Hıley, Halehaven, Belle, J. H. Hale, Elberta,

Late Crawford.

Varietics for the Middle West: Golden Jubilee, Carman, Cumberland, Rochester, Halehaven, Champion, Early Elberta, Belle, Elberta, Wilma, Salberta.

Varieties grown on the Pacific coast, not including canners and driers: Mayflower, Alexander, Triumph, St. John, Hale's Early, Early Crawford, Early Elberta, Elberta, J. H. Hale,

Salwey, Decker.

Varieties for southern Florida and other sub-

tropical regions: Jewell, Suber, Waldo, Angel, Florida Gem, Honey, Imperial, Luttichau.

The spraying of the commercial orchard should be carefully planned to meet local conditions. In most cases a satisfactory program for home planting consists of two sprays. The first spray should be applied in autumn after the leaves are off or early in the spring before the buds start, using lime-sulfur 1-15 or an oil spray for the control of scale, leaf-curl and brown-rot; the second spray is applied when the "shucks" or calyx-rings are falling from the fruit, using wettable sulfur at manufacturers' directions, lead arsenate 2 pounds, hydrated lime 16 pounds, water 100 gallons. This is to control curculio, scab and brown-rot. The oriental peach moth, now widely distributed, cannot be controlled by spraying but is kept in check by liberating larval parasites.

The peach borer, one of the worst pests in many regions, can be controlled with ethylene dichloride emulsion or by digging them out with a knife. Ethylene dichloride emulsion has the advantage of application as a liquid in October after the rush of orchard work is past. Borers may also be dug out in the way described for the apple-tree borer. In using paradichlorobenzenc, all gum is removed from the base of the tree and the ground made level for a space of about 1 foot. The dry white powder is then spread on the ground in a narrow ring about 2 inches from the base of the tree. The base of the tree is then mounded up with finely pulverized earth to a height of about 2 inches above the highest visible borer injury and the surface of the mound packed with a shovel. This mound should be left undisturbed for three weeks and then torn down. One ounce of powder for a tree six years old, ½ ounce for a three- to five-year tree, ¼-¾ ounce for a one- to two-year tree is sufficient. An excess may cause serious injury. Applications should be made in the fall, about September 1 in a region like New Jersey, when the soil temperatures are about 55-70° F.

PEACOCK-FLOWER: Delonix regia. Flower-Fence: Adenanthera pavonina.

PEANUT: Arachis hypogæa, Hog-: Amphicarpa.

PEAR. In North America pomological pears are of three botanical groups: (1) The European pear, Pyrus communis, comprising all the old standard varieties. (2) The Asian or oriental pear, P. pyrifolia (P. serotina), native in China, characterized by the absence of calyx on the fruit, a very gritty hard flesh and long-keeping quality, mostly an apple-shaped fruit, and sharply serrate long-pointed leaves; the Sand pear belongs here, but the species is not much grown in America. (3) The Eurasian race, P. Lecontei. hybrid between the two, represented principally by Kieffer and Leconte. The Snow pear, Pyrus nivalis, is grown in Europe for the making of eider or perry but is known in America only in botanical collections.

No home fruit plantation is complete without trees of various kinds of pears, ripening from early August till winter. The late varieties are generally good keepers, and extend the season into February, thus supplying fruit for six or seven months. The pear is also a good commercial fruit although perhaps not maintaining its former importance in many of the fruit regions. Compared with the apple the pear is much more restricted in its geography. It cannot endure the low temperatures of many parts of the northern states nor the humid heat of the South, thriving only in those favored regions that have a fairly equable climate. Commercially, therefore, plantings of the European type of pear are largely confined to the fruit districts of New England, about the Great Lakes and on the Pacific coast. In home plantings, by the selection of cold-resistant varieties, the range can be extended somewhat farther north and by blight-resistant varieties, particularly those derived from the oriental or Asian pear, into the southern states.

Soils for the pear should be of the strong or heavy types. It thrives on the heavier sandy loams or clay loams, which have good humus content and moisture-holding capacity. Good drainage and a porous subsoil are essential for its best development. On the average the European pear is adapted to heavier soils than the apple.

The Kieffer and other oriental pears, however, thrive better on rather light soil.

Propagation of the pear is by seeds, which are imported from France, or from Japan if the oriental stock is desired. Commonly, however, nurserymen have imported seedling stocks from France. The desired varieties are budded or grafted on one-year seedling stocks as with the apple, shield-budding being the usual method. Dwarf pears are propagated by budding on French-grown Angers quince cuttings. Some varieties do not grow well on quince, but must be double-worked by budding a compatible variety, like Angouleme, directly on the quince stock and after the cion has grown a year or two grafting the desired variety on the Angouleme as an intermediate stock. As some varieties of pear grow to perfection on quince, the dwarf tree is peculiarly adapted to planting on small home grounds, and is often used as a boundary plant, or to serve the purpose of a screen. These dwarf trees should be set deep-4 to 6 inches below the union—to prevent the stock from growing. Dwarf trees may be set as near together as 10 to 16 feet, while the standard or tall-growing pears should be set farther apart. Trees are planted when two years old from the bud. Dwarfs are kept within bounds by thorough and systematic pruning and heading-in.

In orchards, one- or two-year-old nursery trees are planted very early in the spring in the northern states. In milder climates, fall planting may be successful. Planting distances are 20×25 or 25×25 for standards (not dwarfs). To provide satisfactory pollination it is advisable to plant at least two varieties in contiguous rows or alternating in the rows. Not more than three to four rows of one variety should be planted together. The two important varieties Bartlett and Seckel are intersterile.

Either tillage and cover-crops, or sod culture, are practiced as with the apple. Mulching trees with grass or straw in the home orchard is often advisable. Trees in sod require fertilization with manure or nitrate. Great care must be exercised not to force the tree into very soft growth and thus render it susceptible to fireblight infection.

Pruning is similar to that described for the apple except that more scaffold limbs can be left on the young pear tree. As the trees mature they should be thinned out by removing crossing or crowded limbs and, in case the head becomes spurry, by cutting out many of the smaller branches. Severe pruning is to be avoided as the resulting succulent growth is susceptible to fire-blight. Kieffer and other oriental pears are cut back much more severely than varieties of the European pear. Pruning may be undertaken at any time when the trees are dormant, ordinarily in late winter or early spring.

The fruit is always hand-picked when mature but still firm. The fruit is raised and the stem separates from the twig; it should not be pulled off. Pears should not be tree-ripened even for home use. The yields vary with the variety, but under good conditions 200-400 bushels to the acre may be expected. In California the yields may be much larger. In the East, pears go on the general market in bushels and hampers. On the Pacific coast the box is the standard package. Local markets and canneries absorb much of the crop in some regions.

The cold storage of pears is not as well understood as that of the apple. Many varieties are perishable and should not be stored, or for a short time only. Bartlett, if picked while still very firm. can be held for three months at 30° F., although under most conditions a month or six weeks is the commercial limit of storage. Ripening Bartletts in high humidity at 65° F. after removal from storage improves the quality. Most varieties should be put into storage as soon as possible after picking. The Bose, however, is an exception and should be ripened at 50° F. for ten days before going into the cold. Varieties like Anjou, Winter Nelis, and Lawrence, may be held until February in cold storage. In home storage, the fruit should be kept as cool as possible without freezing.

The question of varieties is very important inasmuch as there is great variation in regional adaptation and resistance to disease. In the following lists the varieties are given in order of ripening. Commercial varieties are starred:

Varieties of more than average hardiness adapted to growing in the colder parts of the pear regions: Tyson, *Clapp, *Seckel, Flemish Beauty, *Anjou, Lawrence.

Varieties adapted to milder fruit sections, such as the fruit districts of New England, New York, Ohio and Michigan: Tyson, *Clapp, *Bartlett, Gorham, *Seckel, Sheldon, Angouleme, *Bose, *Clairgeau, *Anjou, Dana Hovey, *Kieffer, Lawrence, Winter Nelis.

Varieties for the states south of New York:

Kieffer, LeConte, Garber, Pineapple.
Varieties for the Pacific coast: *Bartlett, *Comice, Easter Buerre, Hardy, *Bosc, *Anjou, *Winter Nelis.

Varieties resistant to fire-blight: Tyson, Seckel, Fred Clapp, Angouleme, Kieffer, Anjou. Insects and diseases play an important part in pear culture. Of those common to both apple and pear the codlin-moth and borers are important and may be controlled as described under the former. Fire-blight is the most serious disease, becoming the limiting factor to pear growing in the southern part of the pear regions. It is caused by bacteria which gain entrance through flowers and insect punctures and cause the young growth and fruit to blacken and die. Frequently trees of susceptible varieties are killed outright. It can sometimes be kept in check by cutting out the diseased branches as soon as they are observed, making the cuts a foot or more below the point where the tissue is killed. The cut stub should be disinfected with a mixture of cyanide of mercury 1 part, bichloride of mercury 1 part, and water 500 parts. Dormant cankers on the trunk and limbs should have the bark removed from the diseased area and at least 1/2 inch beyond and the wound disinfected. After disinfection the wounds should be protected with some good wound dressing. Blossom blight can be controlled in part by spraying the trees in early full bloom with bordeaux mixture 2-6-100. In some regions pear psylla is a very troublesome pest as are also the pear midge and the pear thrip. The control of these insects is a complicated and difficult matter which, in the commercial orchard, requires expert advice. For the home orchard about the only spray that is practicable is the calyx application for codlinmoth control as for apple.

PEAR, ALLIGATOR -: Persea americana. Balsam -:

Momordica Charantia, Prickly-: Opuntia, Vegetablesee Chanote

PEARL-BUSH; Exochorda. -Fruit; Marguricarpus setosus. PEARLWORT: Samna.

PECAN. One of the hickory-nuts, Carya Pecan, of special value and attractiveness. In the United States, the species is indigenous throughout most of the valley of the Mississippi and its principal tributaries as far north as Iowa. especially on the lowlands along the rivers and creek bottoms. Farther west, it is found along most of the important streams in Texas and Oklahoma. In Mexico, the pecan is native over areas in the northern and central parts. The cultural range of the pecan, as is usual with most fruits and nuts, is much larger than its native habitat. Pecans have been planted successfully from the Atlantic coast to the western part of Iowa, Oklahoma, and west Texas, from the forty-third parallel on the north to the Gulf on the south. In addition fairly successful trial plantings have been made in Arizona and in the Pacific states, especially California.

In Texas, Oklahoma, Arkansas, and Louisiana the native pecan has become of considerable commercial importance as a nut-producing tree. It is estimated that in this area are well over a hundred million native seedling trees which produce an average of about 50,000,000 pounds of nuts annually. The largest seedling crop reported up until 1940 is 78,000,000 pounds in 1935. Although much of the production comes from seedling groves that are in no way improved, there is a considerable area in improved seedling pecan groves which receive more or less cultural management. Grove improvement consists of cleaning the ground of underbrush and the trees of vines and other competing vegetation. Trees other than pecans are removed and the remaining trees carefully observed as to the amount and quality of the crop borne. The grove is then further thinned to about a dozen well spaced trees to the acre, taking care to retain the best trees in both type of nut and quantity produced. Where the timber is not considered valuable, the cost of thinning out the trees is greatly reduced by the use of poison consisting of sodium arsenite and caustic potash which is applied in a girdling ring of axe cuts. Trees thus treated die within a few weeks and are then allowed to rot in place. Under some conditions seedling groves are further improved by top-working the trees to thin-shelled named varieties. The method of topworking is to cut back all the limbs of the seedling trees to stubs a few inches in diameter. These cuts are made when the tree is dormant and during the following season many sprouts grow from the branches. In late summer buds are inserted in a sufficient number in these sprouts to make a good distribution of wood of the new variety. After the buds have caught hold, the remaining sprouts are thinned out and the budded sprouts cut back to within 2 inches of the bud. The following season the buds grow to form the new top of the tree.

In recent years extensive plantings have been made of named varieties of pecans in orchard form. These occur not only in the regions where the pecan is native but also in the southeastern states, particularly northern Florida, Georgia and South Carolina. Production of improved varieties furnishes about 15,000,000 pounds annually with a maximum of 21,000,000 in 1931.

Trees are planted at distances ranging from 50-70 feet, depending upon the richness of the soil and the vigor of the variety. Pecans are best adapted to deep, well-drained alluvial soils, but may grow in other locations provided the soil is well drained, of a good depth, and care is given to supply the needed fertilizers and soil management. It has been a mistake to attempt to grow pecans on run-down cotton lands without suitable soil-building practice. On level lands the pecan orchards are cultivated for at least part of the year. Leguminous cover-crops have been shown to be a decided advantage in providing nitrogen and humus for the soil. Under some conditions commercial fertilizers can be used to advantage. In some of the areas where pecans have been planted, growth has been unsatisfactory because of various mineral deficiencies in the soil. In some cases an application of zinc compounds has been of value.

Many varieties of pecans have been named and propagated. These show great variation in their type of growth and particularly in the length of time required to mature their crop satisfactorily. Varieties adapted to the Gulf Coast require a growing season of 270 to 290 days. On the other hand, varieties adapted to the northern part of the natural range, particularly southern Indiana and parts of Iowa, mature crops in 170 to 190 days. In the northern United States, particularly parts of New York, Ohio and Michigan, the northern strains of pecan are hardy to winter cold but do not mature crops satisfactorily. Among the Gulf Coast varieties are the Schley, Stewart, and Frotscher. Some of the northern varieties are the Indiana, Busseron, Niblack and Posey. Many other sorts show intermediate requirements as to length of growing season and climatic adaptation. Varieties best adapted to different regions should be carefully chosen in establishing a plantation.

Pecans are usually propagated by budding named varieties on seedling stocks. The stratified nuts are planted in the nursery row. Seedlings are budded using the annular or ring type of bud. Whip-grafting may also be used. Nursery trees are somewhat harder to handle than others because of the long tap-root which must be dug carefully to assure successful transplanting.

Pecans are wind pollinated. Many varieties show self-sterility so that in any plantation several varieties should be included. The grower should make sure that the varieties shed pollen at the time that the pistils are receptive. Pecan yields are extremely variable. Specimen trees on rich soil with plenty of room have been known to yield upwards of a thousand pounds in a single year with an average of 400 or 500. In the orchards, however, the yields are much less and in fact are inclined to be disappointingly light and variable. The whole matter of yield is affected by variety, soil, and particularly the drop of the nuts due to the work of various pests and diseases. Nuts are allowed to fall on the ground at maturity or they may be shaken from the trees. They should be harvested promptly, cleaned and dried to prevent deterioration.

Much of the crop reaches the market as pecan meats or kernels. Effective mechanical crackers have been devised for handling the product. Deterioration of the meats is prevented either by packing in a vacuum or by holding in cold storage.

Pest and disease control in the pecan orchard is an important problem. The most serious disease, pecan scab, is particularly harmful in the Gulf states. Its control requires a number of spring and early summer sprays with 3-3-50 bordeaux mixture. The pecan nut and leaf case-bearers are among the most serious pests. These and some other chewing insects can be held in check by spraying with arsenicals. Commercial plantings require attention to the special pest and disease problems in the locality.

PECTIANTIA: Matella.

PECTINATE: narrow segments or spines set close together along an axis like teeth of a comb.

PEDALIACEÆ. PEDALIUM FAMILY. About 14 genera of the oriental tropics, mostly herbs but sometimes shrubs, with opposite lvs. or the upper alternate, covered with slime-secreting hairs or glands, irregular gamopetalous fls. having 5-lobed limb, 4 stamens, usually superior 2-4-celled ovary, and capsular frs; allied to Bignoniaceæ and Martyniaceæ. Sesamum is cult. for the oily seeds and medicinal purposes and Ceratotheca for ornament.

PEDATE: said of a palmately lobed or divided leaf of which the two sides are again 2-cleft; bird-footed.

PEDICEL: stem of one flower in a cluster.

PEDICELLARIA: Gynandropsis.

PEDICULARIS. Wood-Betony. Lousewort. Scrophulariacew. Herbs sometimes planted in the border or the rock-garden for the showy terminal bracted spikes of purplish, red, rose-colored or white 2-lipped tubular fls., and the finely cut foliage. Propagated by seed and division. Some of them are probably partially parasitic on roots and may not find the proper connections.

bracteosa. Per. to 3 ft., glabrous: lvs. to 1 ft. long, divided to midrib into lanceolate laciniately toothed divisions: fls. yellowish, ¾ in. long. June-Aug. B. C. to Calif. and Colo.

canadénsis. Pubescent per. to 1½ ft.: lvs. to 5 in. long, pinnately parted: fls. yellow or reddish, rarely white, 5 % m. long, Apr.-June: caps. 3 times as long as calyx. N. S. to Fla. and Mex.

densiflora. Per. to 1 ft., pubescent or nearly glabrous: lvs. pinnate into oblong toothed or cut divisions: fis. crimson, 1 in. long. Calif.

grænlándica. Per. to 1½ ft., glabrous: lvs. pinnate, to 6 in long: fls. red or purple, upper lip of corolla compressed into a decurved beak to ¾ in. long Greenland to B. C., south to New Mex. and Calif

lanceolàta. Per. to 3 ft, nearly glabrous: lvs. to 5 in. long, pinnately lobed: fls. yellow, to ¾ in. long, Aug.-Oct.: caps. about length of calyx Conn. to Neb.

palústris. Ann. or bien. to 2 ft., glabrous: lvs. to 2 in. long, pinnately parted: fls. purple seldom white, ¾ in. long: caps. twice as long as calyx. N. N. Amer., Eu.

racemòsa. Per. to 20 in., cespitose: lvs. lanceolate to linear, to 3½ in. long, undivided, crenate: fis. white, to ½ in. long, June-Aug.: fr. with long strongly curved beak. Alta. to New Mex., west to B. C. and Calif.

verticillàta. To 7 in.: lvs. 1-2-pin ately parted: fls. red, ½ in. long. Arctic regions.

PEDILÁNTHUS. Euphorbiaceæ. Odd succulent shrubs of trop. Amer. with milky juice, alternate simple lvs., fls. in showy cyathia (see Euphorbiaceæ), and capsular fr.; grown for ornament in warm climates. For cult. see Succulents.

aphýllus. Differs from P. macrocarpus in the peduncle being attached to the back rather than center of involucre. Mex.

euphorbioldes: listed name. grandiflòrus: listed name.

macrocárpus. To 3 ft., with whitish sts. and minute lvs.: infl. green, lobe of the involucre above the spur 2-parted: caps. 34 in. across. Mex., Lower Calif.

planifòlius: listed name.

retusus. Much like the following but the lvs. obtuse and usually notched at end and midrib not keeled underneath. Brazil.—A state with white-bordered lvs. is grown in the tropies and is to be expected in Fla.

tithymaloides. Redbird-Cactus. Slipper-Flower. Jew-Bush. To 6 ft.: lvs. ovate, to 4 in. long, pointed, with midrib winged below: fls. (cyathia) red or purple, to 34 in. long, pointed, in dense terminal cymes. W. Indies, Cent. Amer., N. S. Amer. Vars. cucullatus and variegatus have lys. bordered with white.

PEDIOCÁCTUS. Cactaceæ. One (possibly 2) small simple or cespitose strongly tubercled very spiny cactus with dry dehiscent fr., arcoles at first very woolly but nearly naked with age: fls. massed in woolly center of plant. See Cacti. P. Símpsonii (Echinocactus and Mammillaria Simpsonii (M. Purpusii). SNOWBALL CACTUS Depressed-globular, to 6 in. broad; radial spines 15-20, white and needle-like; centrals 5-7 and stouter: fls. somewhat funnelform, pinkish, less than 1 in. long, partially closing at night, massed in center in whitish or brown wool. Kans. to Wash, and New Mex.

PEDIOMELUM: Psoralea esculenta.

PEDUNCLE: stem of a flower-cluster or of a solitary flower.

PEEPUL: Ficus religiosa.

PEERSIA: Rhinephyllum.

PEIRANISIA: Cassia multijuga.

PEIRESKIA: Pereskia.

PEJIBAYE: Gurlielma Gasipaës.

PELARGÒNIUM. STORKSBILL. GERANIUM of florists (see Geranium). Geraniaccæ. Herbs or shrubs with entire, lobed or dissected lvs., irregular fls. in axillary 2-many-fld. umbels, the calyx with a nectar-spur adnate to the pedicel, stamens 10, and fr. of 5 valves which coil as they open. Species here entered are S. African or else hort. derivatives. They are perennials.

Geraniums are commonly grown as house and bedding plants. Propagated by cuttings. Bloom can be secured in four or five months. Plants over a year old are not satisfactory for the common house or conservatory subjects and should be discarded after cuttings are taken, although the Domesticum group may be retained longer. Plants of the common or fish geranium grown out-of-doros may be lifted in autumn and kept until cuttings can be taken from them for next year's plants. If wanted for winter bloom in the window, cuttings should be taken in summer. The show geraniums may be kept several years; cuttings taken late in spring will produce blooming plants the following winter or summer.

acerifòlium (Geranium citriodorum). Maple-leaved G. Shrubby, to 3 ft.; lvs. 3-5-angled or -lobed, about 3 in. across: fls. deep rose or purplish, in many-fld. umbels.

alchemilloides ($P.\ malvæfoli\ m$). To $1\frac{1}{2}$ ft., hairy: lvs. 5-7-loted, to 3 in. across: fis. white veined with rose, in 3-6-fid. umbels.

capitatum. To 1 ft. or less, sts. woody at base, weak and trailing: lvs. cordate, 3-5-lobed, long-petioled: fls. rose-purple, on peduncles longer than lvs., in dense heads.—Plant is rose-scented.

 ${\tt citriod\delta rum:}\ hort.\ hybrid\ of\ unknown\ parentage\ said\ to\ have\ lemon-scented\ foliage.$

coccineum: P. hybridum

crispum. Woody, to 3 ft.: lvs. numerous and small, 1 in. or less long, crisped on the margin, lemon-scented: fls. pink or rose, in 1-3-fld. umbels. Var. latifolium is listed.

denticulatum. To 1 ft.: lvs. with long linear deeply toothed lobes: fis. lilac or rose-purple, in 1-3-fid. umbels. Var. majus is a larger form.

domésticum. Show, Fancy, or Lady Washington Geraniums or Pelargoniums. To 1½ ft., soft-hairy: lvs. 2-4 in. across, obscurely lobed, toothed: fls. large, white, pink and red, the two upper petals with dark blotches, in few- to many-fld. umbels. Cultigen of many forms.

echinatum. Sts. short and fleshy with persistent spine-like stipules: lvs. cordate-ovate, with 3-7 shallow wavy-toothed lobes, white-tomentose: fls. white with purple center or all purple.

ferulaceum (P. parmforum). To 2 ft., sts. fleshy, swollen at nodes: lvs. oblong, punnatifid to punnatisect, hairy on both sides, segms. incised, flat: fls. white, upper petals spotted rose, in umbels of 4-6, petals narrow, subequal with upper 2 eared at base.

filicifòlium: a name sometimes applied to P. denticulatum

filtrum: listed name of unknown botanical standing.

fragrans. To 1 ft.: lvs. 1 in. across, the margins crenate or crisped: fls. whitish with pink veins, in 4-8-fld. umbels.

fálgidum. Shrubby: lvs. pinnately 3-parted into lobed or cut toothed segms.: fis. bright scarlet with darker lines. in many-fld, umbels.

grandiflorum. Shrubby: lvs. deeply 5-7-lobed, lobes acute, dentate, glabrous: fis. white, upper 2 petals with red lines and broader than others, usually 2-3 fis. on each peduncle.

graveolens. Rose G. Woody, to 3 ft.: lvs. deeply 5-7-lobed, the divisions again lobed and toothed, fragrant: fis. rose or pink veined with purple, in 5-10-fid. umbels. Var. ròseum is listed.

grossularioides. Ann. to 18 in., sts. ascending or erect, glabrescent: lvs. remform-cordate, palmately lobed, margins crenate-dentate, petioles of basal lvs. to 4 in. and of st-lvs. to ½ in. long: fls. red, small, petals rarely twice as long as calyx, spur to ½ in. long: beak of fr. about ½ in.

hederæfdlium: P. lateripes.

hirsûtum. To 8 in.: lvs to 3 in. long, entire to pinnatifid, densely white-hairy, margins toothed: fis. in umbels of 10-15 on pedicels 1-4 in. long, flesh-colored to dark purple.

hortorum. Fish G. Succulent, 1-2 ft. or more when grown in the open: lvs. 3-5 in across, scalloped and crenate-toothed, with fishy odor: fls red, pink, salinon, white, in many-fld umbels. Cultigen of many races.

hfbridum (P. coccineum). Hybrid between P. zonale and P inquinans: fls. deep scarlet.

latéripes (P. hederæfolium). Similar to P. peltatum and differing chiefly in having lvs. cordate with acute lobes rather than peltate with obtuse lobes.

Limoneum. Lemon G. A garden hybrid, lemon-scented, and with purple and lilac fls.

malvæfðlium: P. alchemilloides.

melissinum. Hybrid of P. crispum and P. graveolens: lvs. size and shape of P. graveolens and crisp margin of P. crispum: fls. white, upper 2 petals obovate, emarginate, with red spots, lower petals narrowly lanceolate without

odoratissimum. Apple or Nutmeg G. Lopping plants with branches to 1½ ft. long: lvs. 1 in. across, crenate, sweet-scented: fls. white or whitish, in 5-10-fld. umbels.

parviflorum: P. ferulaceum.

peltatum. 1. Jeruaceum.

peltatum. Ivr G. Trailing or somewhat climbing plants with branches to 3 ft.: lvs. 2-3 in. across, shallowly 5-angled or -lobed, broadly ovate and somewhat obtuse: fis. rose-carmine varying to white, the upper petals with dark markings, in 5-7-fid. umbels.

pinguifòlium. Hybrid of P. pellatum and P. lateripes characterized by non-peltate lvs. whose lobes are more obtuse than acute, sts. and petioles remotely pilose and occasionally 4-angled.

quercifolium. Oak-leaved G. Shrubby, to 4 ft.: lvs. pinnately lobed with 2 to 3 toothed or angled lobes on each side: fls. pink to rose with dark markings, in 3-7-fld. umbels.

Rádula. To 1 ft.: lvs. deeply lobed into narrow toothed divisions: fis. rose with dark markings, in 5-fid. umbels.

ròseum: a garden name applied to plants of the P. graveolens type.

sæpeflorens. Garden hybrid between P. reniforme and probably P. echinatum, flowering from late summer to late spring under gluss: fls. bright rose with light spot in center and 2-dark marks.

scabrum. Shrubby, sts. stiffly glandular-hairy: lvs. deeply 3-lobed, base wedge-shaped, terminal lobe usually trifid, laterals bifid, all toothed, bristly beneath on nerves: fis. small, many, in panicles, pedicels and calyx scabrous-bristly. S. Afr.

terebinthinaceum. A garden hybrid between P. quercifolium and P. graveolens.

tomentòsum. Shrubby, to several ft., white-hairy: lvs. cordate-ovate, 3-7-lobed, velvety, minutely toothed: fis. white, red spot near center.—Peppermint-scented.

vitifolium. Grape-Leaved G. Shrubby, to 3 ft.: lvs. 2-3 in. across, with 3 shallow angled crenate lobes: fis. rose or pink with darker veins, in 7-16-fld. umbels.

zonale. One of the species from which the *P. hortorum* group is probably derived; apparently not in cult. in its original form.

PELECÝPHORA. HATCHET CACTUS. tacex. Small cespitose tubercled cacti with watery juice, the tubercles strongly flattened sidewise and not on ribs and topped with elliptic areole bearing 1 scale-like pectinate spine and with woolly axils: fls. central on the plant. See Cacti.

asellifórmis. Body cylindric, to 4 in. high and half as much in diam.; tubercles in spirals: fls. bell-shaped, purplish with outer segms. sometimes white, more than 1 in. broad. Mex.

pectinàta: Solisia pectinata.

pseudopectinata. Solitary, to 2½ in. high and 1¾ in. diam., somewhat depressed on top, most of the st. under the ground; tubercles square at base, compressed; spines small, pectinate, yellowish: fls. rose-violet, to ¾ in. long. Mex.

Valdeziana: Thelocactus Valdezianus.

PELICAN-FLOWER: Aristolochia grandiflora.

PELLÆA. CLIFF-BRAKE. Polypodiacex. Small rock-loving ferns with nearly uniform fronds 1or more pinnate, and sori in a marginal band, protected by the reflexed margin of the segms.: of wide distribution mostly in temp. and warmtemp. regions. Some of them are grown in rockgardens and a few in cool greenhouses. They prefer limerock situations. See Ferns.

adiantoides: P. viridis.

andromedæfòlia. Fronds to 2½ ft. long, 2-4-pinnate, segms. oval or elliptic, ½ in. long, on flesh-colored stipes 1½ ft. long. Calif, Ore.

atropurpurea. Hardy: fronds tufted, leathery, to 1 ft. long and 6 in. wide, 1-2 pinnate, segms. to 2 in. long, on dark purple stipes to 8 in. long. N. Amer.

brachfptera. Fronds to 1½ ft. long, 2-pinnate, segms. narrow-linear, to ¾ in. long, on purplish-brown stipes 1½ ft. long. Ore., Calif.

Brèweri. Fronds to 10 in. long, 1-pinnate, pinnæ mostly 2-parted, on brown slender stipes to 4 m. long. Wash. to Calif. and Utah.

Brídgesii. Fronds tufted, leathery, to 1 ft long, 1-pinnate, segms. oval or oblong, on shining brownish stipes to 8 in. long. Calif., Ida.

dénsa (Cheilanthes densa and siliquosa, Cryptogramma densa). Fronds to 3 in. long, 3-pinnate, glabrous, margins of segms. revolute, on shining brown stipes to 9 in. long. Que., Ont., W. N. Amer.

falcata (Platyloma falcatum). Fronds leathery, to 1½ ft. long and 3 in. wide, 1-pinnate, the lanceolate or oblong pinnæ to 2 in. long India to New Zeal.

glabràta: listed name.

grácilis: Cruptogramma Stelleri.

hastata: P. viridis.

mucronata (P. ornuthopus). Fronds to 1½ ft. long, 2-3-pinnate, segms. elliptic or linear-oblong, to ½ in. long, on purplish stipes to 10 in. long. Calif. to Tex. and Colo.

occidentalis (P. pumila). Fronds to 3 in long, 1-pinnate, segms. few, oblong, shining and somewhat leathery, on shining dark brown stipes to 2 in. long. B. C. to Colo.—Possibly only a var of P. glabella.

orníthopus: P. mucronata.

pùmila: P. occidentalis.

rotundifòlia (Allosurus rotundifolius). Fronds to 1 ft. long and 1½ in. wide, 1-pinnate, pinnæ oblong to orbicular, to ¾ in. long. New Zeal.—Sometimes seen in greenhouses. viridis (P. and Pteris adiantoides. P. hastata). Fronds to 2 ft. long, 2-3-pinnate, segms. oblong to ovate. Afr.

PELLIÒNIA. Urticaceæ. Prostrate or depressed herbs with alternate lvs. and unisexual fls. borne commonly in dense cymes; native in Asia and Pacific Isls.; grown in greenhouses and baskets for the attractively colored sts. and lvs.; require warmth and moisture. Propagated by cuttings and division.

Daveauana. Sts. prostrate, to 2 ft. long: lvs. oblong or orbicular, to 2½ in. long, bronzy olive-green, paler along midnerve. India to Cochin-China.—Some of the material cult. under this name is Ruellia Devosiana.

púlchra. Sts. creeping, purplish: lvs. oblong, light green with black nerves, pale purple beneath. Cochin-China.

PELLITORY: Parietaria.

PELTÁNDRA. ARROW-ARUM. Araceæ. Herbs native in the bogs of E. N. Amer., having arrow-shaped entire lvs. with long sheathing petioles, and unisexual fls. borne on spadices which are shorter than the spathes; sometimes transferred from the wild and easy to colonize.

virginica. Lvs. about 1 ft. long and 6 in. wide, the petioles about 3 times longer: spathes green, to 8 in. long. Me. to Fla. and Mo.

PELTÀRIA. SHIELDWORT. Cruciferæ. Per. glabrous herbs of the Medit. region: lvs. entire, clasping on st.: fs. small, white or rose, in terminal clusters: fr. or silicle orbicular or nearly so. P. alliàcea is a low per. with an onion-like odor, useful in borders for its numerous white fs. in summer; it grows 1-1½ ft. high, branched.—Grown readily from seeds, blooming the following year. also by division.

PELTATE: attached to its stalk inside the margin; peltate leaves are usually shield-shaped.

PELTIPHÝLLUM. Saxifragaceæ. Per. herb similar to Saxifraga, native on banks of streams in Ore. and Calif. P. peltātum (Saxifraga peltata). UMBRELLA-PLANT. To 4 ft.: lvs. basal, to 2 ft. across, 9-15-lobed and toothed, petioles often to 3 ft. long: fls. numerous, white or pinkish, ½ in. across, in terminal corymbs, appearing before the lvs., Apr.—Sometimes planted in wet places, and hardy in parts of the E.

PELTÓPHORUM (Baryxylum). Leguminosæ. Trop. trees with 2-pinnate lvs., showy yellow fis. in terminal panicles, and flattened winged pods; commonly cult. for ornament in the tropics.

dùbium. Large tree, rusty-tomentose: lfts. 20-30-pinnate, to ½ in. long: pods to 3 in. long. Brazil.

ferrugineum: P. inerme.

inérme (P. ferrugineum). To 50 ft., brown-tomentose: lfts. 10-20-pinnate, to ¾ in long: pods to 3½ in. long. Ceylon, Malaya, N. Australia.

PENICILLARIA SPICATA: Pennisetum glaucum.

PENIOCÈREUS. Cactaceæ. Slender plants with an enormous turnip-shaped root which is sometimes 2 ft. diam., and angled sts.; spines similar on all the areoles. See Cacti.

Gréggii (Cereus Greggii). DEERHORN CACTUS. Sts. somewhat erect to 10 ft. but not rising high, to 1 in. thick, pubescent on young plants; spines small and blackish, radials 6-9 and central 1 or 2: fls. white tinged red outside, nocturnal, to 8 in. long, the segms. acute. W. Tex. to Ariz., Mex.

J6hnstonii. Sts. somewhat erect to 12 ft. tall; ribs 3-5; spines 9-12, brown to black, about 1/4 in. long; fis. white, to 6 in. long. Lower Calif.

PENNÁNTIA. Icacinaceæ. Small genus native in New Zeal., Norfolk Isl. and Australia: shrubs or trees: lvs. alternate: fis. diœcious or polygamous, in terminal panicles or corymbs: fr. a small fleshy drupe.

corymbòsa. To 35 ft.: lvs. obovate or oblong, to 4 in. long, usually toothed or lobed: fls. white, fragrant, diœcious: fr. black, 1/4 in. long. New Zeal.

PENNISÈTUM (Gymnothrix). Graminex. Tall ann. and per. grasses of trop. and subtrop. regions, spikelets subtended by bristles and borne in spike-like contracted panicles; several grown for ornament and P. glaucum for grain and forage. See Grasses.

alopecuroides (P. japonicum). Per. to 4 ft.: lvs. long and narrow, to 2 ft. and 1/4 in. or less broad; spikes solitary and

terminal, to 6 in. long, silvery with purplish anthers and long bristles. China.

americanum: P. alaucum.

atrosanguineum: a form of P. Ruppelii.

cùpreum: a form of P. Ruppelii.

gladum (P. and Panicum americanum of authors. Penicullaria spicata). PEARL, INDIAN or AFRICAN MILLET. Ann. to 10 ft.: lvs. to 3 ft. long and 2 in. wide, rough: spike solitary and terminal, very dense and cat-tail-like, to 1½ ft. long and 1 in. thick: fr. bluish or whitish and used for food. Cultigen.

iapónicum: P. alopecuroides.

latifolium. Per. to 4 ft.: lvs. to 1 ft. long and 1 in. wide: spikes several on the st., to 4 in. long, green, nodding, with long bristles. Peru to Brazil and Uruguay.

longistylum: P. villosum.

macrophyllum: P. macrostachyum.

macrostachyum (P. macrophyllum). Per. to 5 ft.: lvs. to 1 ft., and to 1 in. broad: spikes solitary and terminal, to 1 ft. long, E. Indies. Var. atropurpareum has purplish lvs.

macrourum. Per. to 3 ft. or more: lvs. to 2 ft. long and 1/2 in. wide, usually convolute: spikes in cylindrical panicles to 1 ft. long. S. Afr.

purpureum. Napier-Grass. Per. to 12 ft.: lvs. to 1 in. wide: spikes in dense panicles, purplish or yellow, to 8 in. long. Afr.—Grown for fodder in the S.

Ruppelianum: P. Ruppelii.

Rappelii (P. Ruppelianum). FOUNTAIN-GRASS. Per. to 4 ft., curving: lvs. to 2 ft., 1/8 in. or less broad, often involute: spikes solitary and terminal, to 1 ft. or more long, nodding or curved, rose, purple or copper-colored in cult. forms, with long bristles. Abyssinia. See Grasses.

villosum (P. longistylum). Per. to 2 ft.: lvs. 4 in. and more long and 1/4 in. across, spikes solitary and terminal, to 4 in. long, with long feathery bristles. Abyssinia.

PENNYROYAL: Mentha Pulegium, Hedeoma pulegioides. PENNYWORT: Umbilicus pendulinus.

PENSTÈMON (Pentstemon, Pentastemon). BEARD-TONGUE. Scrophulariaceæ. Many attractive herbaceous perennials or shrubs with opposite or whorled lvs., bright colored 2-lipped tubular fls. in terminal racemes or panicles in summer, with 4 fertile and 1 sterile stamen, and capsular frs.; mostly native in N. Amer.

Nearly all penstemons succeed in full sun but in a hot dry place they may not last long. Many species are not hardy North, but many others are, especially if given winter protection. Some forms of *P. gloxinioides* are treated successfully as annuals. Propagated by seed, somewhat by division, rarely by cuttings in summer.

acaulis. Almost stemless tufted per. 2 in. tall or less: lvs linear-acute, to ¾ in. long, in bunches or whorls: fls. blue, to ¾ in. long and ¼ in. across, throat yellow-harry. Wyo.

acuminatus. To 2 ft., glaucous and glabrous: st.-lvs. ovate, to 3 in. long, entire: fls. blue, ¾ in. long; sterile stamen bearded. Wash., Ore.—Name has been used for P. secundiflorus and P. Fendleri.

Adamsiànus. To 10 in., glabrous except infl.: lvs. oblong or obovate, to 1½ in. long, shning: fls. dark purple, to 1 in. long; sterile stamen bearded. Mt. Adams, Wash.

albertinus. To 8 in., glabrous: lvs. rhombic-ovate to elliptic-lanceolate, to 1 in. long, entire or st.-lvs. slightly toothed: fis. light blue, ½ in. long; sterile stamen bearded. Mts., Alta., B. C.

álbidus. To 1 ft., the st. glandular-pubescent: st.-lvs. lanceolate or oblong, toothed, to 2½ in. long: fis. white, ¾ in. long; sterile stamen slightly bearded. Minn. to Tex.

alpinus (P. glaber var. alpinus). To 1 ft., glabrous: st.-lvs. lanceolate, to 4 in. long, entire: fls. bluish-purple, 1 in. long; sterile stamen glabrous. Rocky Mts.

amábilis. To 8 in., tufted, glabrous except infl.: lvs. lanceolate or basal ovate, to 1 in. long, toothed: fls. blue, ½ in. long; sterile stamen densely bearded. Wash.

ambiguus. To 2 ft., sts. usually much branched and woody at base: lvs. lipear-filiform: fls. white within with deep rose throat, usually purplish outside, corolla salverform. Colo. to Mex. and Ariz.

angustifòlius (P. cæruleus). To 1 ft., glabrous and glaucous: lvs. linear or linear-lanceolate, to 2½ in. long, entire: fis. blue, ¾ in. long; sterile stamen bearded S. D. to Mont. and N. Mex.

antirrhinoides (P. Lobbii). Shrub to 6 ft.: lvs. linear or oblong, ½ in. long: fls. yellow, to ½ in. long, very broad; sterile stamen bearded. S. Calif.

áridus. To 8 in., slightly pubescent: lvs. oblanceolate

to linear, to $1\frac{1}{2}$ in long, entire: fis. purplish, $\frac{1}{2}$ in. long, sterile stamen slightly bearded. Mont.

arizonicus. To 8 in., glabrous: lvs. oval, crenate or entire, leathery: fls. purplish, 1 in. long; sterile stamen glabrous. Anz.

atronurpureus: hort, name for P. campanulatus.

attenuatus (P. veronuzjohus). To 2 ft., glabrous except infi: lvs spatulate to lanceolate, to 1½ in. long. fls. sulfuryellow, 34 in. long; sterile stamen bearded. Wash., Ore, Ida.

australis. To 2½ ft. or more, pubescent. lvs usually narrowly lanceolate, to 3 m. long, finely serrulate, acute or obtuse: fls. reddish-purple outside and paler within, vens darker, to 1 in. long. S. Va. to Cent. Fla. and Miss.

azūreus (P. heterophyllus var. azureus). To 3 ft., glaucous and slightly pubescent: lvs. narrow-ovate to lanceolate, entire: fls. blue or violet, 1½ in. long; sterile stamen glabrous. Calif

barbatus (Chelone barbata). To 6 ft., glabrous: lvs. lanceolate or linear, entire: fts. red, 1 in. long, strongly 2-lipped, the lower lip bearded; sterile stamen glabrous Utah to Mex. Var. coccineus, fts. scarlet. Var. præcox is listed as early flowering. Var. rôseus, fts. rose-pink. Var. Tórreyi is P. Torreyi.

Bárrettiæ. To 1 ft., glabrous and glaucous: lvs. ovate to lanceolate, to 3 m. long, thick and leathery: fis. hlac-purple, 1½ in long; sterile stanien glabrous. Ore.

Brádburyi: P grandiflorus.

Brándegei. To 2 ft, usually glabrous: st.-lvs. ovate, to 2¾ m. long; basal lvs. glaucous. sterile stamen nearly glabrous Mts, Colo.

Bridgesii. To 2 ft, nearly glabrous: lvs. linear to oblong, to 3 m. long, entire: fis. red or scarlet, 1 m. long; sterile stamen glabrous. Calif., Ariz, Colo.

cærùleo-purpùreus: P. confertus var.

cæruleus: P. angustrfolius.

cæspitòsus. Sts. decumbent, to 8 in. long, pubescent: lvs. spatulate, to ½ in. long, fls. lilac-purple, to ¾ in. long, the sterile stamen bearded. Wyo. to Colo.

calycòsus. To 4 ft., nearly glabrous: lvs. spatulate to lanceolate, to 6 in. long, entire or toothed: fis. 1 in. long, purple; sterile stamen bearded Ind. to Ala.

campanulatus (Gerardia hybrida). To 2 ft., nearly glabrous, lvs. lanceolate, toothed; fls. 1 in long, rose-purple or violet, sometimes white; sterile stamen bearded. Mex., Guatemala.

canéscens. To 2 ft., pubescent: lvs. elliptic-lanceolate, irregularly toothed. fls. pale purple, white inside lined with purple, 1 in. long; sterile stamen bearded. Pa. to N. C.

Cárdwellii. Evergreen, to 10 in., from woody base, mostly glabrous: lvs. thick, lanceolate or ovate, to 1 in. long, sharp-serrate: fls. purple, to 1½ in. long; sterile stamen slender and short. Ore. Var. rôseus has rose-colored fls.

centranthifòlius. To 3 ft, glaucous: lvs. ovate-lanceolate, thick, to 2 ½ in. long, entire: fls. scarlet, 1 in. long, the lobes very short; sterile stamen glabrous. Calif. to Ariz.

cinèreus. Tufted, gray-pubescent: lvs. somewhat leathery, lanceolate, to $\frac{3}{4}$ in. long, entire. fls. dark blue, to $\frac{1}{2}$ in. long; sterile stamen bearded at top. Ore.

Clèvelandii. To 23½ ft, glabrous: lvs. ovate, to 2 in. long, entire to denticulate, lower ones petioled: fls. purplishred, tubular-funnelform, to ¾4 in. long, in narrow racemose panicles to 1 ft. long. Calif. to Lower Calif.

Cobæa. To 2 ft., pubescent: lvs. oblong or ovate, to 5 in. long, toothed: fis. 2 in. long, purple, scarcely 2-lipped; sterile stamen bearded. Mo. to Tex.

comarrhènus. To 16 in., nearly glabrous: lvs. oval or spatulate, to 4 in. long: fls. deep blue, 1 in. long; sterile stamen bearded. Utah, Colo.

confértus. To 2 ft.; lvs. oblong to linear, to 2 in. long, entire, glabrous: fls. yellow, densely hairy patch on lower hp, to ½ in. long; sterile stamen bearded. Alta. to Wash. Var. atropurphreus is not distinct from var. cærlleo-purphreus (P. cæruleo-purpureus) which is a low matfornfing variant. with fls. white tipped blue. Var. procèrus is P. procerus.

cordifòlius. Pubescent half-climbing shrub: lvs. ovate, to 2 in. long, toothed: fis to $1\frac{1}{2}$ in long, scarlet, the limb short; sterile stamen bearded. S. Calif

corymbòsus. Tufted subshrub to 16 in., nearly glabrous: lvs. oblong or obovate, to 1½ in. long, toothed or entire: fls. scarlet, to 1½ in. long; sterile stamen bearded. Calif.

Crándallii. To 8 in., sts. prostrate or ascending, slightly pubescent: lvs. linear-oblanceolate, to ¾ in. long: fls. blue, I in. long; strile stamen bearded. Mts., Colo. Var álbus, fls. white. Var. procúmbens is a prostrate habit form. Var. rôseus, fls. rose-pink.

crassifòlius. Shrub to 2 ft., glabrous: lvs. oblanceolate, to 2 in. long: fls. hlac-purple, 1 in. long; sterile stamen glabrous. Mts., Wash. to Wyo.

craténsis: P. crateria

cràteris: provisional name for an Ore. dwarf plant with small lys, and blue fis.

cristatus: P. eranthera

cyanánthus (P. glaber var. cyananthus). To 3 ft., glabrous and glaucous: lvs. ovate, entire: fis. 1 in. long, blue; sternle stamen bearded. Utah, Ida., Wyo.

cyathophorus. To 16 in.: lvs. spatulate to orbicular, 2½ in. long: fls. pinkish-purple, ½ in. long; sterile stamen bearded. Colo., Wyo.

Davidsonii (P. Menziesii var. Davidsonii) Matted prostrate alpine with sts. to 2 in.: lvs. ovate, ½ in. long, entire: fls. hlac-purple, to 1½ in. long; sterile stamen bearded. Calif. to Wash. Var. roseus is listed.

defistus. To 1 ft, nearly glathrous, alpine: lvs ovate to oblong-lanceolate, to 1½ in. long, toothed; fis. blue, ½ in. long; sterile stamen glabrous. Wyo. to Wash. and Calif. Var. áibus is listed.

diffusus. To 2 ft, rather bushy and pubescent: lvs. ovate or lanceolate, 2 in. or more long, deeply toothed: fls. 34 m. long, blue or purple; sterile stamen bearded. B. C. to Ore. Var. álbus is listed.

Digitalis (P. lævugatus var. Dugıtalıs). To 5 ft, nearly glabrous: lvs. ovate to lanceolute, to 7 m. long, toothed: fls. 1 m. long, white or pinkish, tube dilated at middle; sterile stamen bearded. Me to S. D. and Tex.

Douglasii. Similar to P. fruticosus but dwarf and with broad short lys. Mts., Ore, Wash.

Dracophyllum: listed name of unknown botanical stand-

ing.

Eatonii. To 2 ft., glabrous: lvs. ovate to linear-lanceolate, to 4 in. long: fts. bright red, 1 in. long; sterile stamen bearded. Utah, Colo., Ariz.

Èdithiæ: hort, name.

ellipticus. Per. to 6 ft.: lvs. broadly elliptic to roundish: fls. vrolet-purple, to $1\frac{1}{2}$ in. long, swollen, calyx densely sticky-pubescent. Alta. to Ida and Mont

erianthèra (P. cristatus) To 16 m, pubescent: st-lvs. oblong or linear, entire: fis. purplish, 1 m. long, sterile stamen with long yellow hairs. N. D. to Wash.

euglaucus. To 1½ ft., glabrous and glaucous: lvs. oblong-lanceolate, to 2½ in. long, entire: fls. blue, ½ in. long; sterile stamen bearded. Ore.

flagellifórmis: listed name of unknown botanical standing

fruticosus. Shrub to 3 ft.; lvs. spatulate, about 1 in. long, toothed, fls purple, 1 m. long; sterile stamen glabrous. Alta. to Wash and Ida. Var. Adamsianus 1s P. Adamsianus. Var azūreus 1s listed and may be P. azureus.

Gàirdneri. To 10 in., tufted, gray-pubescent: lvs. lneur or spatulate, to 1 in long: fls. dark blue or purple, 34 in. long: sterile stamen bearded. Wash., Ore. Var. hians has larger fls.

Garrettii. To 1½ ft., nearly glabrous, somewhat glaucous. Ivs lanceolate, to 4 m. long: fis. blue, ¾ in. long; sterile stamen bearded. Utah.

gentianoides: P. Hartwegni.

glaber (P. Gordoni). To 2 tt., glabrous: lys. oblance olate, to 6 in. long, entire: fls blue or purple, to 1½ in. long; sterile stamen slightly hairy. N. D. to Wyo. Var. alpinus is P. alpinus. Var. cyananthus is P. cyananthus. Var. rôseus is listed. Var. speciosus is P. speciosus.

glandulòsus. To 3 ft., sticky-pubescent: lvs. ovate to lanceolate, to 6 in. long, toothed: fls. hlac, to $1\frac{1}{2}$ in. long; sterile stamen glabrous. Wash., Ore., Ida.

glaucus: may be applied to either P. gracilis or P. Whippleanus.

gloxinioides. A race of variants from P. Hartwegii or hybrids between P. Hartwegii and P. Cobæa, in many colors.

Gordonii: P. glaber.

Górmanii. Per. to 10 in: basal lvs. spatulate-oblong, to 2 in. long; st.-lvs. oblong-linear, to 2 in. long, upper ones glandular-villous: fls. purple, to ¾ in. long, very hairy within. Alaska.

graciléntus. To 15 in., sts. woody at base: lvs linear to oblong-lanceolate, mostly basal, glabrous: fls. violet-blue, to ⅓ in. long, on viscid 2-5-fld. peduncles. N. Calif. to Nev. and Ore.

grácilis. To 16 in.: lvs. oblanceolate to linear-lanceolate, to 3 in. long: fis. lilac or whitish, ¾ in. long; sterile stamen bearded. Man. to Sask. and N. Mex.

grandiflorus (P. Bradburyı). To 6 ft., glabrous: lvs. obovate to ovate, to 2½ in. long, entire: fls. 2 in. long, lavender-blue; sterile stamen bearded. Ill. to N. D. and

Grinnéllii (P. hians). Similar to P. Palmer: but with bright green foliage and cream fls. tinted pink, having a shorter tube and 2 wide-spreading lips. S. Calif.

Hallii. Tufted alpine to 8 in., glabrous: lvs. linear-lanceolate to linear, entire: fls. violet, to 34 in. long, with very short tube; sterile stamen bearded. Colo.

Hártwegii (P. gentianoides). To 4 ft., nearly glabrous: lvs. ovate-lanceolate to lanceolate, entire: fls. to 2 in. long, scarlet, slightly curved. Mex. Vars. álbus and grandiflörus are listed.

Héctori: hort, name.

heterophyllus. Shrub to 5 ft., glabrous: lvs. lanceolate to linear, to 2½ in. long, entire: fls. purple, to 1½ in. long; sterile stamen glabrous. Calif. Var. azūreus is P. azureus. Var. eréctus, a very dwarf form to 1½ ft. with blue fls. Var. Pūrdyi, a decumbent mat-forming plant to 10 in. tall; fls. blue to light purple; sometimes listed as California Blue Badder

hìans: P. Grinnellii.

hirsûtus (P. pubescens). To 3 ft., sticky-pubescent: lvs. oblong or lanceolate, to 4½ in. long, toothed: fis. 1 m. long, purplish or violet, densely bearded in the throat; sterile stamen bearded. Me. to Va. and Wis. Var. pygmæus is listed as only 6 in. high.

hūmilis. To 1 ft., pubescent: lvs. ovate to lanceolate, to 1½ in. long, entire: fls. deep blue, less than ½ in long; sterile stamen bearded. Wyo., Ida., Utah. Var. álbus is listed.—Name has been used for *P. orrens* of Colo.

h¢bridus: listed name.

imbérbis. Per to 20 in.: lvs narrowly linear, to 3 in. long, entire, subobtuse, glabrous: fls. pinkish-red, to ¾ in. long, beardless within, in terminal panicles to 9 in long. Mex.—Some of the material in cult. with yellow-bearded throat is a variant of *P. barbatus*.

isophýllus. To 2 ft., nearly glabrous: lvs. lanceolate, entire: fls. nodding, $1\frac{1}{2}$ in. long, scarlet, the throat white-pubescent. Mex.

Jaffrayanus. To 14 in., glabrous and glaucous: lvs. obovate to elliptic, to 1½ in. long, fls. lilac or purplish-blue, to 1½ in. long, steple standard property Calif.

to 1½ in long; sterile stamen glabrous. Calif.

Jamesii. To 1 ft.: lvs narrowly linear-lanceolate, to 4 in. long; fls. purplish, to 1 in. long, glandular-villous. Colo.

labrosus. To 2½ ft., glabrous and glaucous: lvs linear or oblanceolate, to 4½ in. long, entire: fis. scarlet, to 1½ in. long; sterile filament glabrous. Calif. and Lower Calif.

lætus. To 14 in, pubescent: lvs. lanceolate or linear, to 3 in. long, entire: fls. blue or bluish-purple marked with white, 1 in. long; sterile stamen glabrous. Ore., Nev., Calif.

lævigàtus (Chelons Pentstemon). To 3 ft., nearly glabrous, lvs oblong or lanceolate, to 6 in. long, toothed: fls. purplish, to 1 in long; sterile stamen bearded. Pa. to Fla. Var. Digitàlis is P. Digitalis

lavéndulus: P. secundiflorus var.

Làveri: listed as a bushy plant to 1 ft., with lavenderblue fls white at base.

linarioides. To 1½ ft, pubescent: lvs. linear to threadlike, to 1 in long: fis lilac or purple, ½ in. long; sterile stamen bearded. New Mex., Ariz.

linearifòlius. Per. to 1 ft., sts. woody at base: lvs. linear to linear-lanecolate, long-acuminate, to 3 in. long, leathery: fts. light purple, to 1½ in. long. Mont. and Ida.

lineolatus. To 1 ft., tufted, slightly pubescent: lvs. oblanceolate to oblong-linear, to 1 m. long, entire: fis. purple, 3/4 m. long; sterile stamen bearded. Nev.

Lóbbii: P. antirrhinoides.

Lyallii. To 1 ft, woody at base, nearly glabrous: lvs. lanceolate or linear-lanceolate, to 4 in. long, toothed: fls. purple, 1½ in. long; sterile stamen glabrous. B. C. to Mont.

Ménziesii. Woody at base, about 6 in. high: lvs. oblong to ovate, to 3/4 in. long: fls. 1 in. long, violet-blue to purple; sterile stamen bearded B. C. to Ore. Var. álbus is listed. Var. Dàvidsonii is P. Davidsonii.

mexicanus: Allophyton mexicanum.

montanus. To 1 ft., somewhat cespitose and gray-hary: lvs. ovate to elliptic, to 1 ½ in. long, dentate: fis. pinkish-purple, to 1½ in. long, calyx glandular with lanceolate lobes. Wyo. to Ida. and Mont.

Murrayanus. To 3 ft., glabrous and glaucous: lvs. ovate to oblong, to 4 in. long, upper connate: fis. deep scarlet, 1 in. long; sterile stamen glabrous. Ark., Tex.

Nélsoniæ. To 3 ft., glabrous: lvs. lanceolate to ovate-lanceolate, to 5 in. long, acuminate, entire or toothed: fls. yellow, to ¾ in. long, calyx-lobes linear-lanceolate; sterile stamen yellow-hairy. Wash.

nemoralis: P. nemorosus.

nemordsus (Chelone nemorosa). To 2 ft.: lvs. ovate to

lanceolate, to 2 in. long, short-petioled: fls. violet-purple, 1 in. long, in loose clusters. Wash, to Calif.

Newberryi. To 20 in., woody at base: lvs. orbicular or ovate, to 1½ in. long, toothed, leathery: fis. red, about 1 in. long; sterile stamen bearded at apex. Calif.

nítidus. To 1 ft., glaucous: lvs. oblanceolate to lanceolate, to 2 in. long, usually acute to acuminate: fls. blue, to ¾ in. long, somewhat funnelform, in loose infl. Wyo to Alta, and Wash.

ochroleùcus: hort, name.

oligánthus. Slender per. to 1 ft.: basal lvs. oblong-ovate, to 34 in. long; st.-lvs. linear-lanceolate: fls. white, pale blue or pink, to 1 in. long, densely villous in throat. Mts., Colo. to New Mex.

oreganus. To 1½ ft., woody at base, pubescent: lvs. linear-oblance olate, to 1½ m. long, entire: fls. purple, ¾ in. long; sterile stamen bearded. Ia., Ore.

ostrinus: provisional name for a pink-fld. penstemon

ovatus. To 4 ft., pubescent: lvs. broad-ovate, to 3 in. long, toothed: fis. blue changing to purple, 34 in long; sterile stamen bearded. Ore. to B. C. Var. Douglasii is listed

Pálmeri. To 3 ft., glabious: lvs ovate to lanceolate, to 4 in. long, toothed, upper connate: fls. cream-white inited with pink, 1 in. long, short-tubed; sterile stamen bearded. Utah and Ariz. to Calif. Var. Grinnéllii is P. Grunnellii.

palústris: listed name for a plant with violet fls. shading to pink.

Părishii. To 3 ft., woody at base, glabrous: lvs. ovate to lanceolate, to 2½ in. long, entire or toothed: fls. red, 1 in. long; sterile stamen glabrous. Calif.

pinetòrum: P. Wilcoxii.

procedum. To 1 ft.: lvs. oblanceolate, to 3 in. long, glabrous: fls. purplish-blue, to ½ in. long; sterile stamen bearded. Sask to B. C. and Calif. Var. minor is listed as a dwarf form. Var. Tólmei is P. Tolmei.

pseudohūmilis. To 1 ft, glabrous: lvs. elliptic to spatulate, basal ones petroled: fls. bluish-purple, to % in. long, funnelform; sterile stamen yellow-bearded. Ida. to Alta.

pubéscens: P. hirsutus.

pulchéllus. Similar to P. campanulatus, with violet or lilac fls. with white veins, throat spotted. Mex.

puniceus. To 6 ft, very glaucous: lvs. ovate: fls. 1 in. long, scarlet; sterile stamen bearded. Arız., Mex.

purpureus. probably P. confertus var. cæruleo-purpureus.

pygmæus: hort. name for a dwarf alpine form, or for P. hirsutus var. pygmæus.

Ráttanii. To 1½ ft : st.-lvs. oblong- or triangular-ovate, to 2½ in long, toothed: fis. lavender, ¾ in or more long; sternie stamen slightly hairy. Calif. Var Kleèi, has clasping lvs. and fis. to 1½ in. long. Var. minor has smaller fis-

Rîchardsonii. To 3 ft, glabrous: lvs. ovate to lanceolate, to 3 in. long, deeply toothed or pinnatifid: fis red, 2 in. long; sterile stamen slightly bearded. B C. to Ida. Var. dentătus is listed and may not be distinct from type.

Roézlii. To 1 ft.: lvs. lanceolate or linear: fls. pale blue or violet, ½ in long; sterile stamen glabrous. Mts., Calif.

rupicola. Decumbent shrub to 4 in., pubescent: lvs. ovate or orbicular, to ½ in. long, glaucous: fis. rose-crimson, 1½ in. long; sterile stamen glabrous. Wash. Vars. mājus and roseus are listed.

Rýdbergii. To $1\frac{1}{2}$ ft., glabrous: lvs. oblong, to 2 m. long, entire: fls. pale blue to purple, $\frac{1}{2}$ in. long; sterile stamen bearded. Wyo., Colo. to Nev.

saliens. Probably per., to 1 ft., sts. viscid-puberulent: lvs. obovate to oblanceolate, to 2 in. long, sharply dentate to subentire: fls. purplish, to 1 in. long, swollen, calyx glandular-hairy; sterile stamen bearded. Mont.

saxosòrum. To 2½ ft., glabrous: lvs. lanceolate, to 3 in. long: fis. deep blue, ¾ in. long; sterile stamen bearded. Wyo., Colo.

Scoileri. Shrub to 1½ ft., slightly pubescent: lvs. lanceolate, to 2 in. long, toothed: fis. lilac, to 2 in. long; sterile stamen glabrous. B. C. to Calif. A var. álbus with white fis. is offered.—Probably only a var. of P. frutcosus.

secundiflorus. To 2 ft., glabrous and glaucous: lvs. oblanceolate, to 3 in. long, entire fls. blac, 34 in. long; sterile stamen bearded. Wyo. to New Mex. Var. lavéndulus, fls. lavender-pink or lavender-blue, smaller than type.—Name has been used for P. unilateralis.

serpyllifdlius: listed name.

Smállii. To 4 ft.: lvs. lanceolate or ovate-lanceolate, to 6 in. long, toothed: fis. pink-purple striped with white within,

1 in. long, with yellow hairs in throat; sterile stamen bearded. N. C., Tenn.

speciòsus (P. glaber var. speciosus). To 2 ft., glabrous: lys. oblance olate to linear-lance olate, to 4 in. long, entire: fls. bluish-purple, 1 in. long; sterile stamen glabrous. Wash. to Calif.

spectabilis. To 6 ft., glabrous and glaucous: lvs. ovate or ovate-lanceolate, to 3½ in. long, toothed: fis. 1 in. or more long, rose-purple or lilac; sterile stamen glabrous. Ariz., Calit. Var. coronarius is listed.

stenosépalus: P. Whippleanus.

strictus. To 1½ ft., glabrous: lvs. spatulate to linear, to 4 in. long: fis. deep b ue, 1 in. long; sterile stamen glabrous. Wyo. to New Mex.

subglaber. To 1½ ft., glabrous: lvs. oblanceolate to linear-lanceolate, to 4 in. long; fls. blue or violet, 1 in. long; sterile stamen bearded. Mts., Ida. to Colo.

Per. to 3 ft. or more: basal lvs. obovate, connate-perfoliate; st.-lvs. ovate-acute, connate, fleshy: fls. brilliant scarlet, to 1 in. long, in narrow panicles. Calif.

ternatus. Straggling shrub to 6 ft., glabrous and glaucous: lvs. linear-lanceolate, to 2 in. long, toothed, in 3's: fis. pale scarlet, 1 in. long; sterile stamen bearded. Mts., S. Calif.

teucrioides. Sts. ascending to 6 in., grayish: lvs. linear-spatulate, to ½ in. long, entire, gray-green: fls. deep purple, to ½ in. long, corolla not much swollen. Colo. to Utah.

Tôlmiei. Tufted per. to 9 in., with woody roots: lvs. lanceolate, entire: fls. ½ in. long, in dense racemes. Wash.

Torreyi (P. barbalus var. Torreyi). Similar to P. barbalus but with larger scarlet fls., lower lip not bearded. Colo. to Mex. Var. ròseus is listed.

trichânder. To 2½ ft., slightly pubescent, glaucous: lvs. spatulate to linear, to 3 in. long: fis. scarlet, 1 in. long; sterile stamen glabrous. Mts., Colo., Utah.

tubifdrus. To 3 ft., nearly glabrous: lvs. ovate to lanceolate, to 4 in. long, entire: fls. scarcely 2-lipped, white or tanged purple, ¼ in. long; sterile stamen bearded. Mo. to Ark. and Okla.

unilateralis. To 2 ft., glabrous: lvs. oblanceolate to linear-lanceolate, to 4 m. long: fls. blue, 34 m. long, in one-sided infl.; sterile stamen glabrous. Wyo. to Utah.

one-suced inn.; sterile stamen glabrous. Wyo. to Utah.
utahénsis. To 2 ft. glabrous: lvs. oblanceolate, to 3 in.
long: fls. carmine, 3/4 in. long; sterile stamen glabrous.
Utah, Ariz.
variábilis. To 2 ft., much branched, glabrous except
infl.: lvs. lanceolate, to 2 in. long, usually toothed: fls.
yellowish-white striped with red, 3/2 in. long; sterile stamen
bearded. Wash.

venústus. To 2 ft., nearly glabrous: lvs. lanceolate, to 2 in. long, toothed: fis light purple, 1 in. long; sterile stamen hairy. Wash., Ore., Ida.

veronicæfdlius: P. attenuatus.

versicolor. To 15 in.: lvs ovate to obovate, to 2 in. long, base cordate, very glaucous, acute: fls. pink changing to blue, to ¾ in. long, in fascicles forming narrowly elongate thyrsus, sepals ovate-acuminate. Colo.

virens. Per. to 1 ft. or more: Ivs lanceolate-oblong, to 2 in. long, lower ones petioled, upper usually toothed: fis. deep blue, to 3/2 in. long, funnelform, lower lip bearded. Alta., Colo. and Nev.

Wátsonii. To 1½ ft., glabrous: lvs. lanceolate, 2 in. long: fls. violet-purple, ½ in. long; sterile stamen yellow-bearded. Ida. to Ariz.

Whippleanus (P. stenosepalus). To 1½ ft.: lvs. spatulate to linear-lanceolate, to 3 in. long: fis. purple or lavender, to ¾ in. long; sterile stamen bearded. Wyo. to New Mex.

Whitedii. Per. to 1 ft.: basal lvs. narrowly spatulate, to 3½ in. long; st.-lvs. ovate-lanceolate, to 2 in. long, acute, entire or remotely dentate: fls. light blue, to ¾ in. long, glandular-pubescent without. Wash.

Wilcoxii (P. pinetorum). To 4 ft., glabrous: lvs. ovate, to 3 in. long, entire: fls. bright blue or pink, to 3/4 in. long; sterile stamen bearded. Wash. to Mont.

Wrightii. To 2 ft., glabrous, slightly glaucous: lvs. obovate or oblong, entire: fls. bright red, ¾ in. long; sterile stamen bearded. W. Tex. to Ariz.

PENTAGLÓTTIS (Caryolopha).Boraginaceæ. European per. herb differing from Anchusa in technical characters of the nutlet: fls. in long-peduncled lf.-subtended glomerules. P. sempérvirens (Anchusa sempervirens). To 2 ft.: lvs. broadly ovate: fls. rich blue, in spring and summer: grown for ornament.

PENTAPTER ÝGIUM. Ericacex.Asian epiphytic shrubs with alternate leathery lvs., tubular fls. solitary or clustered, and fr. a berrv. Grown in Calif.

sérpens. Sts. drooping: lvs. oblong, to ¾ in. long, margins recurved: fis. bright red with darker V-shaped markings, ¾ in. long. Himalayas.

PÉNTAS. Rubiacex. Herbs and subshrubs of Afr., with opposite lvs., long-tubular fls. in corymbs, and capsular frs.; grown in warm greenhouses or bedded out in S. U. S. Propagated by cuttings of half-ripe wood over heat.

cárnea: P. lanceolata.

cárnea: P. lanceotata. lanceolata (P. carnea). To 2 ft., somewhat woody at bottom: lvs. ovate to lanceolate-oblong, to 6 in. long: fls. pale purple, 1 in long, hairy in throat. Trop. Afr., Arabia. Vars. alba and coccinea are listed.

mussaendoides. Erect shrub or tree to 15 ft., twigs brown-pubescent becoming glabrous: lvs. oblong-lanceolate, to 5 in. long, tapering at ends, petioled, stipules fringed: fls. with pilose tube to 1 in. long, in large terminal panicles. Madagascar

PENTASTEMON. PENTSTEMON: Penstemon.

PEONY: Paonia.

PEPERÒMIA. Piperaceæ. Usually succulent and often prostrate or somewhat scandent herbs. widely distributed in trop. regions, having minute bisexual fls. borne in dense slender spikes; grown as foliage plants in the greenhouse.

Peperomias require warm temperature and careful watering. Propagated by cuttings of stems or leaves in sand over bottom heat, and by rooting joints when produced. The cultivated kinds are small plants, suitable for not culture.

argyroneùra. Sts. erect, fleshy, to 4 in.: lvs. alternate, elliptic or oblong, to 1 in. long and ½ in. wide, the nerves above silvery: spikes ¾ in. long. Bismarck Archipelago.

arifòlia: P. Sandersii.

blanda. Sts. weak: lvs. opposite or in 3's, obovate, to 1½ in. long; spikes to 4 in. long. Venezuela to Bolivia.

crassifòlia. Sts. decumbent, to 1 ft.: lvs. alternate, orbicular, ½ in. long: spikes to 3 in. long. Trop. Afr.—Plants grown under this name may belong to a different species.

maculosa. Sts. erect, green spotted with brownish: lvs. alternate, ovate, to 7 in. long: spikes to 1 ft. long. Trop. Amer.—Plants cult. under this name may be P. Sandersii var. argyreia.

magnoliæfòlia: P. tithymaloides.

nummularifòlia: P. rotundifolia.

obtusifòlia. Sts. erect or decumbent, rooting at nodes: lvs. alternate, fleshy, oblanceolate or obovate, to 4 in. long and $2\frac{1}{2}$ in. wide. Trop. Amer.

ochetina: listed name.

pellùcida. To 8 in.: lvs. ovate or triangular, ¾ in. long: spikes ½ in. long. S. Amer.; nat. in tropics.

pericáttii: listed name.

rotundifòlia (P. nummularifolia). Sts. rooting at nodes: lvs. oblong to orbicular, about ½ in. long; spikes to ¾ in. long. Trop. Amer.

Sándersii (P. arifolia). Stemless: lvs. ovate, to 5 in. long, peltate or splitting at base, the stalks dark red: spikes to 4 in. long. Brazil. In var. argyrèia the lvs. are lighter colored between the veins.

tithymaloides (P. magnoliæfolia). Ann. or bien.: lvs. alternate, ovate to ovate-elliptic, to 3 in. long, acute, base cuneate, nerves 10 or more, petiole about 1 in. long and keeled beneath. Santo Domingo.

velitina. Plant erect, sts. villous and reddish: Ivs. ovate, acute, fleshy, short-petioled, dark green above with ivory-colored veins and reddish-brown beneath; fls. not known. Ecuador.

PEPINO: Solanum muricatum.

PEPPER. The pepper of world commerce and spice markets is the small fruit or berries of Piper nigrum, known as black pepper when the outer shell is intact, white pepper when the shell is removed. The plant is native in the Old World tropics, but is now widely spread in warm countries.

The peppers of vegetable-gardens and green-

grocery markets are the fruits of a very different plant, Capsicum frutescens and its derivatives. The plants are tender while young, although they endure some frost in autumn. Their culture is that recommended for eggplant, being grown as annuals. A small seedsman's packet of seed is sufficient for a large number of plants, seay 200. The large Bell peppers are the mildest, and are used for making "stuffed peppers" and other dishes. Paprika is made from the long pointed type of fruit. The small hot peppers are used for seasoning and sauces. Seeds would better be started indoors for the northern states, although early varieties bear well from seed sown in the open ground as soon as it is thoroughly warm. From the original pan or flat the little seedlings may be transplanted to other flats or to pots before putting them in the garden. Rows should be as far apart as will admit of good tillage, usually 2-3 feet, and the plants may stand 10 to 18 inches apart in he row depending on the variety. The commercial culture is not essentially different from that indicated above. See Capsicum.

PEPPER: Piper. -Tree: Schinus. -Tree, Monks: Vitex Agnus-castus. -Vine: Ampelopsis arborea.

PEPPERBUSH, SWEET: Clethra alnifolia.

PEPPERIDGE: Nussa sylvatica. PEPPERMINT: Mentha piperuta. PEPPERWORT: Marsilea. PERAMIUM: Goodyera. PERDICIUM: Gerberia.

PEREGRINA: Jatropha hastata.

PERENNIAL, Latin perennis, enduring, perpetual, is a noun and adjective denoting in horticulture a plant that persists more than two years, a one-year plant being an annual and a two-year plant a biennial. All shrubs and trees are perennial, but the word ordinarily connotes an enduring herbaceous plant, one that remains year after year; the "perennial border" is com-prised of such plants, among which may be larkspurs, peonies, columbines, sedums. A perennial may not endure indefinitely, however; many of them are at their best in about the third year and then gradually fail; but tansy and bouncingbet may remain after the house falls down. It is enjoyable work to grow perennials from seed. Sown one spring, or sometimes in midsummer, the seeds should give fresh blooming plants the following season.

PERÉSKIA. Cactacex. Perhaps a score of leafy shrubby or arboreous or vine-like cacti native in Mex. and W. Indies to S. Amer., a few of them long known in cult. in warm countries: spines single, paired or clustered in axils of the broad alternate lvs., no glochids: fls. solitary, corymbose or paniculate, rotate. See Cacti. Sometimes spelled Peireskia or Peirescia, but the original spelling used by Linnæus is adopted here.

Although the pereskias are leaf-bearing plants, their culture does not differ particularly from that of other cacti. They are used as stocks on which to graft other kinds but otherwise they are not much known as glasshouse subjects. They propagate from cuttings.

aculeate (P. Pereskia). Barbados-Gooseberry. Lemon-Vine. Erect at first but becoming a vine to 30 ft. long; axillary spines 2 or 3 and recurved: Ivs. thick, lanceolate to ovate, acute, to nearly 3 in. long: fis. paniculate or corymbose, white, yellow or pinkish, 1-1 ½ in. across. Trop. Amer. Var. rubescens (P. rubescens) has redvariegated lvs.

Bièo. Tree to 20 ft., trunk to 4 in. diam. and becoming naked; spines in fascicles of 5 and 6 but on young shoots fewer: lvs. thin, oblong to oblanceolate, to 8 in. long: fis. rose-color, style red: fr. truncate and naked. Panama, Colombia.—The plant cult. under this name is usually P.

Conzáttii. Tree to 40 ft., bark smooth: lvs. orbicular to obovate, about 1 in. long, acute; spines 2-6, on small sts. and 10-20 on large branches, to 1 in. long, yellowish to dark brown: fr. pyriform, to 2 in. long, smooth. Mex.

Godseffiana. Sport of *P. aculeata*, with Ivs. mottled or blotched above with crimson, yellow and green, purplish underneath

granditolia. Shrub or tree to 15 ft., with very spiny trunk; spines 1 or 2: lvs. oblong, to 6 in. long: fls. in mostly few-fid. terminal clusters, rose-color or white and sepals green, style and stigma-lobes white: fr. pear-shaped, leaf-bearing. Brazil.—Usually cult. under the name P. Bleo.

lychnidiflora. Tree or shrub, sts. terete: Ivs. ovate-oblong, to 3 in. long, fapex acute, base obtuse, sessile; single stout spine to 2 in. long in lf.-axils: fls. solitary, to 2½ in. diam., terminal on short lateral shoots, petals fringed terminally. Mex.

Moèrei. Shrub to nearly 4 ft. tall, much branched: lvs. orbicular to obovate, to 3½ in. long, apex obtuse or acute: spines 2-4, to 3 in. long, unequal, gray or blackish: fis. purplish-red, to nearly 2 in. across. Brazil.

Nicoyàna. Tree to 25 ft.; spines 1 and 1½ in. long or wanting; lvs. lanceolate or oblanceolate and nearly sessile, lateral veins nearly parallel; fls. yellow, petals fimbriate. Costa Rica.

Peréskia: P. aculeata.

549

rubéscens: P. aculeata var.

sachardsa. Shrub or small tree to 25 ft., sts. green, becoming yellowish-brown with age: lvs. lanceolate to oblanceolate, to 5 in. long, acute: spines 1-3 on young and 3-6 on old branches, to 2 in. long, unequal: fls. white to rose-pink, to 31/2 in. across, in terminal clusters. Argentina, Paraguay.

spathulata: Pereskiopsis spathulata.

subulata: Opuntia subulata.

tampicana. Shrub, sts. spiny or spineless: Ivs. ovate, to 2 in. long, petioled: spines about 3-5, to 1½ in. long, sharp, black: fls. rose-pink. Mex.

PERESKIÓPSIS. Cactacex. Group that differs from Pereskia in bearing glochids on the areoles and in having opuntia-like fls.; from Opuntia in carrying true lvs. and in tree-like or shrub-like habit: species 10 or more in hedges and thickets of Mex. and Guatemala. See Cacti.

aquòsa. Shrub, sts. green, spineless: lvs. elliptic, acute, about 1 in. long, glabrous; spines solitary, white, glochids yellow: fis. yellow, outer segms. red-blotched. Mex.

Chapistle. Branching shrub to 16 ft.: spines 1 and 21/2 in. long and white: lvs. obovate, to 1½ in. long: fls. yellow.

Diguètii (Opuntia Diguetii). Shrub to 10 ft. or more, sts. becoming reddish with age: lvs. elliptic-obovate, to 2 in. long, almost cuspidate: spines 1-4, to 3 in. long, unequal, black to gray, glochids brown: fls. yellow. Cent. Mex.

echinata: listed name.

Gâtesii. Differs from P. Portern in thicker, smaller and more rounded lvs. and in deep rose-colored fr. ¾ in. long. Lower Calif.

Porteri. To 4 ft. high and 1 in. diam., branching: spines 1-8 or more on trunk, areoles with many brown glochids: lvs. obovate, 1 in. long: fls. yellow, 1½ in. across: fr. orange, 2 in. long. Mex.

rotundifòlia (Opuntia rotundifòlia). Sts. thick and woody: lvs. nearly orbicular: spines 1: fls. reddish-yellow, 1½ in. across. Mex.

spathulata (Opuntia and Pereskia spathulata). Branching bush to 6 ft., somewhat glaucous, branches deflexed: spines 1 or 2 and about 1 in. long: fls. red. Mex.

subulata: Opuntia subulata.

velutina. Low, spreading, compact shrub to 4 ft. high, sts. green becoming reddish-brown with age: lvs. broadly elliptic, to 2½ in. long, acute, puberulent: fls. bright yellow, borne on second-year sts. Cent. Mex.

Per. herbs native **PERÈZIA.** Compositæ. Per. herbs native from Tex. to Patagonia, with alternate leathery lvs. and heads of rose, purple, white of blue diskfls., solitary or in panicles; pappus of bristles. Sometimes planted for ornament.

microcéphala. To 3½ ft.: lvs. oblong-ovate, to 7½ in. long, toothed, clasping: heads whitish or purplish, ½ in. or less long, in panieles. Cahf.

multiflora. To 1 ft or more: lvs. pinnately cut into triangular segms, to 6 in. long, spiny-margined; heads blue, in dense corymbs. Peru to Argentina.

PERFUME-PLANT: Mathiola bicornis.

PERIANTH: the floral envelope considered together; commonly employed for flowers in which there is usually no clear distinction between cally and corolla, as the liles.

PERICARP: the ripened ovary, or fruit.

PERÍCOME. Compositæ. Tall herbs from N. Mex. and S. W. U. S., having opposite petioled lvs. and small yellow fls. in rayless heads arranged in large discoid cymes. P. caudata is adapted to the border and is propagated by seeds. To 4½ ft.: lvs. hastate or deltoid, to 4 in. long, acuminate, minutely puberulent and punctate: heads to ½ in. across, on pedicels to ¾ in. long, disk-fls. tubular, to ¼ in. long. W. Tex. to S. Calif. and Mex.

PERÍLLA. Labiutæ. Asian herbaceous annuals, one of which is grown for the attractive colored foliage something like a Coleus: fls. small, in axillary or terminal simple or panicled racemes, the corolla-tube not exceeding the calvx.

Perillas require a sunny or half-sunny position, and the same treatment as other half-hardy annuals. Propagated by seed.

frutescens. The form known in cult. is var. crispa (var. nankinensis) with dark purple-brown or bronzy foliage: lvs. broad-ovate, to 4½ in. long, toothed: fis. white or reddish, ½ in. long, in autumn. India to Japan. Other vars. have lvs. wrinkled or crisped, fringed or cut, sometimes variegated, in the trade under the names alropurpurea, lacenada, frutescens lacenada.

nankinénsis: P. frutescens var. crispa.

PERÍPLOCA. SILK-VINE. Asclepiadacez. Woody vines, ours deciduous, with opposite lvs., wheel-shaped fls. in terminal or axillary clusters, and milkweed-like frs.; native in S. Eu., Asia and trop. Afr., more or less hardy in N. U. S.

Silk-vines grow in well-drained soil in sunny situations. They may need winter protection in the North. Propagated by seeds, layers or cuttings under glass in summer.

græca. To 40 ft.: lvs. ovate-lanceolate, to 5 in. long: fls. greenish, brownish-purple inside, 1 in. across, in summer. S. Eu., W. Asia.

 $\boldsymbol{s\`epium.}$ Lvs. narrower and fls. smaller than in the above. N. China.

PERISSOLOBUS: Machairophyllum.

PERISTÈRIA. Orchidaccæ. American terrestrial or epiphytic orchids with pseudobulbs, large plaited lvs. and fls. in laterally produced racemes, the sepals and petals similar and cupshaped, the base of lip united with the column by broad wings. For cult. see Orchids.

cerina. Pseudobulbs ovoid, to 3 in. tall: lvs. 2-4, to about 18 in. long and 3 in. wide: fis. pale citron-yellow, in dense raceme on short pendulous scape. Apr.-June. Cent. Amer., Trindad.

elàta. Holy-Ghost-Flower. Dove-Flower. Plant tall: pseudobubs ovoid, with 3-5 lvs. to 40 in. long and 6 in. wide: infl. tall. erect, to 5 ft. high with very loose many-fid raceme; fis. fieshy, waxy-white with lip spotted with purple, fragrant. Aug-Oct. Costa Rica, Panama, Colombia.—Requires liberal supply of moisture and treatment given Calanthe.

péndula. Pseudobulbs subconic to ovoid, to 6 in. tall: lvs 3-4, elliptic-lanceolate, to 20 in. long: scape pendulous, to 7 in. long, densely fld.; fls. globose, 2 in. across, greenish-white spotted with purple. Sept.—Jan. British Guiana, Brazil.—Said rarely to flower in cult.

PERÍSTROPHE. Acanthacex. Herbs or shrubs of the Old World tropics with opposite entire lvs. and rose or purple tubular 2-lipped

fls. in bracted clusters or solitary; grown in the greenhouse where they need abundant air and rich loamy soil. Propagated by cuttings.

angustifòlia. Grown as ann.: lvs. lanceolate, to 3 in. long: fls. rose, in terminal clusters. Java. Var. aùreovariegàta has lvs. variegated with yellow.

speciòsa. Woody per. to 3 ft: lvs. ovate, to 5 in. long: fis, violet-purple, 2 in. across, 2-3 together. India.

PERIWINKLE: Vinca.

PERNÉTTYA (originally spelled Pernettia by Gaudichaud who a year later corrected it to Pernettya). *Ericaceæ*. Low evergreen shrubs adapted to rock-gardens, having small toothed lvs., urn-shaped nodding usually solitary fls., and fr. a bright colored berry persistent throughout the winter.

Pernettyas thrive in sunny positions in rather moist peaty soil Fairly hardy North. Propagated by seeds, cuttings of half-ripe wood, layers and suckers.

mucronata. To 2 ft., much branched: lvs. ovate to ovate-lanceolate, to $\frac{3}{4}$ in. long: fls. white or pinkish, $\frac{1}{4}$ in. long, May-June: fr. white to red or purple, as indicated in the names álba, coccinea, lilácina, nigra, purpùrea, ròsea, rùbra. Magellan region to Chile.

nana. Low creeping mat-forming shrub to 3 in high: lvs. oblong-lanceolate, acutish, to ½ in long, thick and leathery, entire or remotely toothed, mostly glabrous: fis. urceolate, to ½ in. long, usually solitary, axillary; calyx-lobes acute; filaments as long or longer than styles, anthers minutely bristle-tipped. New Zeal.

speciòsa: a form of P. mucronata.

tasmánica. Creeping glabrous per., sts. to 3 in long: lvs. oblong, to $\frac{1}{2}$ in long, subacute, leathery, obscurely crenate: fls. campanulate, to $\frac{1}{2}$ in long, solitary in axils on pedicels to $\frac{1}{2}$ in long; calyx-lobes obtuse; filaments shorter than styles, anthers not bristle-tipped. Tasmania.—Material so listed in cult. may be P. nana.

PERÓVSKIA. Labiatæ. Asian herbs or subshrubs with opposite lvs. and rather small 2-lipped fls. in whorls in terminal spikes; one species grown for ornament.

Perovskia succeeds in sunny places in good loam, and is fairly hardy North. Propagated by cuttings of young wood under glass.

atriplicifolia. To 5 ft., hoary-tomentose: lvs. ovate-lanceolate to lanceolate, to 2½ in. long, toothed: fis. blue, ½ in. long, the spikes forming panicles to 1½ ft. long. Aug.—Sept. W. Asia.

PÉRSEA. Lauracex. Broad-lvd. evergreen trees with alternate entire lvs., small bisexual greenish not showy fls. in panicles, and fr. a berry or drupe, edible in the case of the avocado, which see for cult.

The perseas are small trees of warm and tropical regions, the avocado now much grown for fruit, the others more or less planted for ornament because of the laurel-like habit and foliage. Most of them bear greenish, reddish or glaucous young shoots. The ornamental kinds require no special treatment. Propagation by seeds and cuttings.

americana (P. gratissima. P. Persea). Avocado. Much branched tree to 60 ft. or more: lvs. elliptic or oval, 4-8 in. long, acute or short-pointed: fis. small, greenish, in close terminal panicles, the parts prominently gray-pubescent: fr. large, fleshy, pyriform to oblong or globular, with rich buttery flesh, thick skin, and one large seed. Trop. Amer., cult. in the warmest parts of U. S., as West Indian and Guatemalan avocado; somewhat nat. in S. Fla.; the fr. was formerly known somewhat as "allgator-pear," a name that should be discontinued. Var. drymifolia (P. drymifolia), is the Mexican avocado of cult.: lvs. mostly elliptic and acute at either end, anise-scented when crushed: perianth more or less persistent: skin of fr. thin and soft.

Borbonia (P. gratinenis Tamula Racharia Nata-

Borbonia (P. carolinensis. Tamala Borbonia. Nota-phæbe borbonica). Red Bay. Bull Bay. Tree 30-40 ft.: lvs. oblong to long-oblong, tapering to base, glabrous and somewhat glaucous, to 6 in: fls. few or several, in short-peduncled clusters: fr. blue or blue-black, about ½ in. dram. Del. to Fla. in swamps.—Sometimes planted for ornament.

carolinénsis: P. Borbonia.

drymifòlia: P. americana var.

glauca: advertised as a tree to 30 ft. with lvs. to 5 in.

long and 2 in, wide, whitish beneath; fr. black, pear-shaped, 1/2 in. long.

gratissima: P. americana.

graussima: P. americana.
indica. Attractive small tree with finely pubescent or nearly glabrous young shoots: lvs. oblong to lance-oblong, to 6 in, coriaceous, pubescent underneath, mostly acute: fis. small and few in upper axillary peduncled clusters: fr. oblong, scarcely fleshy, ¾ in. long, Canary, Madeira, Azores Isls.—Planted for ornament in S. Cahit. and Fla., named Laurus indica by Linnæus, but habitat given by him as Virginia.

leiógyna. Trapp Avocado. Differs from P. americana in the perianth glabrous within and only sparsely pilose outside, pistil and stammodes glabrous. Probably trop.

macrodenia: listed name of unknown botanical standing. Meyeniana. Tree, with elliptic obtuse or acutish lvs. glaucous beneath: fls. with silky-tonentose perianth, the outer parts ovate, inner twice as long and elliptic-oblong; staminodes usually harry at tip. Chile.—Intro. in Calif.

Nánmu: Phabe Nanmu.

palústris (P. pubescens. Tamala pubescens). SWAMP RED BAY. Shrub or small tree: lvs. elliptic, to 8 in. long, obtuse, tomentose beneath: fr. dark blue and bloomy, ½ in. long. N. C. to Fla. and Tex.

Pérsea: P. americana. pubéscens; P. palustris. ròsea: probably hort. name.

PERSICA VULGARIS: Prunus Persica.

PERSICARIA: Polygonum.

Species of Diospyros. PERSIMMON. though noteworthy varieties of the American persimmon, Diospyros vrginiana, native from Connecticut and southern Iowa to Florida and Texas, have been introduced, no important orchard industry is based on it. The small size of the fruit and its pulpy character when mature have been real drawbacks not offset by its high quality and delicious flavor. Hence, persimmon culture has been undertaken with varieties of Diospyros Kaki introduced from Japan and China, commonly known as oriental or Japanese persimmons and as kaki.

Roughly, the oriental persimmons are adapted climatically to the cotton-belt. They are grown as garden fruits over wide areas but a commercial industry has been developed for the most part only in California, Texas, Florida, southern Georgia and the southern parts of those states bordering on the Gulf of Mexico. Outside of California, individual orchard holdings usually

are not large.

The persimmon is not particular in its soil requirements. It may be grown on any good farming land, provided water is available for irrigation in dry sections and drainage is satisfactory where rainfall is heavy. Lands of good quality produce more abundant crops of finer

fruits than do lighter soils.

Native persimmon stocks are employed for propagation in the southern and eastern districts entirely, while in California seedling D. Kaki and D. Lotus stocks are also used; the Lotus has been freely utilized in recent years. Native persimmon roots are adapted to moist soils, D. Lotus to dry soils, while D. Kaki is intermediate in its moisture requirements. D. Lotus has a fine fibrous root system while D. Kaki and D. virginiana have well-developed taproots, naturally very deficient in lateral and fibrous roots. Their root systems can be greatly improved by transplanting and by root pruning. Propagation is by whip-grafting in winter just below the surface of the ground on one-or twoyear seedling stocks or by shield-budding with long heavy buds just before the stocks become dormant in summer.

In the eastern districts persimmons are planted 15 by 20 feet apart each way. In California they are spaced the same distances on lighter soils and 25 to 30 feet on heavy soils. Orchards are clean-cultivated in spring and early summer, followed by cover-crops of cowpeas, beggarweed or crotalaria for summer, and oats, rye or vetch for winter. It is important that the organic matter content be well maintained. Commercial fertilizers are applied in spring and again in June as for other tree crops.

While many varieties of oriental persimmons may be found in gardens and a fruiting season from August to January maintained, commercial plantings are usually made with Tane-Nashi and Fuyu in the East and with Hachiya and Fuyu in California. Hyakume is present in the earlier California plantings in large numbers. Fuyu has the distinct advantage of being hard lightfleshed and non-astringent at all stages, while both Tane-Nashi and Hachiya are astringent until they are soft-ripe. Pollination is required for Fuyu in the eastern districts and a good pollinator such as Gailey should be interplanted one tree in ten.

Persimmons are attacked by such insects as white-fly, mealy-bug, white peach scale and black scale. These are controlled by spraying with miscible oil. The most serious pest in the southern and eastern districts is the flat-headed borer which attacks the trunk and branches. It is controlled by going carefully over the trees in spring, locating the places attacked, digging or cutting them out and painting with a good tree paint.

PERSISTENT: remaining attached; not falling off annually or frequently, as leaves of pines; evergreen.

PERSONATE: said of a 2-hpped corolla the throat of which is closed by a palate, as in snapdragon and linarias; like a masked face.

PERSOÒNIA. Proteaceæ. Small trees or shrubs of Australia and New Zeal., with mostly alternate entire lvs., small yellowish or white fls., and fr. a drupe; one species intro. in Calif.

Toru. Tree to 40 ft.: Ivs linear-lanceolate, to 8 in long, thick and leathery fts. yellowish-brown, to 1/3 in long, in rusty-pubescent axillary racemes: fr. reddish, to 2/3 in. long. New Zeal.

PERULARIA: Habenaria flava.

PERUVIAN BARK TREE: Cinchona.

PESCATOREA. Orchidacex. Epiphytes with fragrant showy fls. solitary in the axils of distichously tufted lys., the lateral sepals forming a chin with the column-foot, the lip clawed and with a thick crest at base; native in trop. Amer. For cult. see Orchids.

cerina. Lvs. to about 20 in. long and 1½ in. wide: fls. white or citron-yellow with orange-yellow semicircular grooved callus on lip, on peduncles to 6 in. long. June Dec. Costa Rica, Panama.

Dayàna. Lvs. to 15 in. long and 2 in. wide: peduncles to 4 in. long; sepals and petals cream-white with pale green tips; lip white stained with crimson. June-Sept. Colombia.

Klabochorum. Lvs. to 20 in. long and about 2 in. wide: peduncles short, pendulous; fls. to 4 in. across; sepals and petals white with brown-purple apex; lip white densely covered with purple papillae and purple orest. May-Aug. Ecuador, Colombia.

PETAL: one of the separate leaves of a corolla.

PETALOID: petal-like; of color and shape resembling a petal; it may be a bract, sepal, or expanded stamen.

PETALOSTÈMUM. Prairie-Clover. Leguminosæ. Herbs, mostly per., or subshrubs with pinnate lvs., papilionaceous fls. in spikes, and short pods included in the calvx; native in N. Amer, and any of the species may be planted in the rock-garden, border or wild-garden.

cándidum. To 2 ft.: lfts. oblong or oblanceolate: fls. white, in cylindric spikes to 4 in. long. Ind. to La. and Tex.

corymbosus (Kuhnistera pinnata). To 4 ft.: lifts. 3-7, linear-spatulate to filiform, usually only to ¼ in. long or less, minutely glandular-dotted: fis. white, in several to many subglobose condensed head-like spikes to ½ in. diam.: pods less than ½ in. long. N. C. to Fla. and Miss.

decúmbens. Sts. decumbent or ascending: Ifts. linear or linear-oblong: fts. pink or rose-purple, in ovoid or short-oblong spikes to ¾ in. long. Ark., Tex.

multiflorus. To 2 ft.: lits. linear to oblanceolate: ffs. white, in spikes ½ in. long. Kans. to Tex.

obovatum. To 20 in., silky-hairy: Ifts. obovate or oval: fis. yellowish-white, in cylindric spikes to 4½ in. long. Tex.

oligophflum. To 2½ ft.: Ifts. linear or linear-oblong: fis. white, in oblong spikes to 3 in. long. Minn. to Ariz.

purpureum (P. nolaceum). To 3 ft.: Ifts. linear: fis. violet or purple, in dense spikes 2 in. long. Ind. to Sask. and Tex.

Searlsize. To 1½ ft.: lfts. linear-lanceolate to ovate: fls. rose, in dense oblong spikes to 2 in. long. Utah, Ariz.

Stánfieldii. To 1 ft.: lifts. linear: fls. rose-purple, in cylindric spikes to 1 m. long. Tex.

villosum. To 2 ft., ascending or decumbent, densely hairy: lfts. oblong or oblanceolate: fls. rose-purple or rarely white, in cylindric spikes to 4 in. long. Mich. to Tex.

violaceum: P. purpureum.

PETASITES. BUTTER-BUR. Compositæ. Herbaceous perennials with thick and often creeping rootstocks, large basal felty lvs. that appear after the very early clustered purple to white heads of directions disk-fls, or sometimes with ray-fls., the scapes scaly; pappus of bristles; native in the north temp. zone. Of easy cult. Usually increased by division; also by seeds. The name is pronounced in four syllables.

fragrans. WINTER-HELIOTROPE. SWEET COLTSFOOT. To 1 ft.: lvs. orbicular, small toothed, green and silky below, evergreen: heads small, fragrant, pale hlac to purple. Medit. region.

frigidus (P. nizalis). To 10 in.: lvs. triangular or heart-shaped, 5-7-lobed, to 4 in. long, white-tomentose beneath: heads 14 in. long. Alaska to Wash.

hýbridus (P. oficinalis. P. vulgarıs). To 2 ft.: lvs. reniform or orbicular, to 1 ft. across, toothed, gray-tomentose beneath: heads ½ in. across, purplish, fragrant, in dense spike-like racemes. Eu., Asia; nat. in E. N. Amer.

japónicus. To 6 ft.: lvs to 4 ft. across: fi.-heads in a fastigiate thyrse. Isl. of Sachalin. Var. gigantèus has densely clustered fi.-heads and wavy-margined lvs.—The stalks are used as a vegetable and the fi.-buds as a con-

nivalis: P. frigidus.

niveus. To 1 ft.: lvs. broadly cordate, toothed, densely white-woolly beneath; heads pinkish-white. Eu.

officinalis: P. hybridus.

variegatus: trade name for a variegated form.

vulgāris: P. hybridus.

PETIOLE: leaf-stalk.

PETIOLULE: stalk of a leaflet.

PETIVERIA. Phytolaccacex. Herbs or subshrubs with alternate lvs. and small fls. in racemes or solitary; one species has medicinal properties and is sometimes planted under glass for interest.

alliacea. Guinea-Hen Weed. To 3 ft., with a strong garlic odor: lvs. ovate or elliptic, entire: fls. pink, white or green, in long interrupted spike-like racemes. Trop. Amer.

PETREA. PURPLE WREATH. Shrubs, erect or climbing, grown out-of-doors in the S. and under glass, having opposite leathery simple lvs. and violet, purple or bluish fls. in long racemes. Propagated by cuttings of the shoots over heat and by seeds.

arbòrea. Shrub, sometimes vine-like, to 25 ft.: lvs. sessile or with petioles less than 1/8 in. long, elliptic, to 6 in.

long, obtuse to emarginate, entire to undulate, cordate: fis. blue, in axillary racemes 2-6 in. long. Trinidad to Venezuela and British Guiana. Var. Brôadwayi has white fis.—Much of the cult. material under this name is P.

Kohautiana. Woody vine or tortuous nearly self-supporting shrub to 30 ft. or more: lvs. with petioles to ½ in. long, elliptic to elliptic-ovate, to 6 in. long, usually obtuse to emarginate at apex, cordate at base, glabrous on both sides: fls. lilac-blue to dark purple, in terminal racemes 6-20 in. long. W. Indies, particularly the French Antilles. Var. anômala has white fls. and lvs. narrowed at ends.
—Sometimes cult. as P. volubilis.

volubilis. Woody vine or subshrub to 35 ft.: lvs. with petioles to ½ in. long, elliptic, 2-8 in. long, apex mostly acute to short-acuminate, base acute or obtusely cuneate, rough-scabrous on both sides: fls. pale lilac to purple, in axillary racemes 3-12 in. long. Mex., Cent. Amer., W. Indies. Var. albiflora has white fls.

PETROCÁLLIS. Cruciferæ. Draba-like per. in the Pyrenees, Alps and east (another in Persia), grown in rock-gardens. P. pyrenaica (Draba pyrenaica). Mat-like, 2-3 in., with simple sts.: lvs. all radical in rosette, wedge-shaped, lobed: fls. white changing to pink: silicle or pod short, little longer than broad.

PETROCÓPTIS. Caryophyllacex. Perennials of small size, the lvs. mostly tufted or in a rosette, fls. with uncut petals; a few species from the Pyrenees, sometimes used in the rock-garden. Very similar to Lychnis.

Lagáscæ (Lychnis Lagascæ). Low, tufted, glaucous, to 4 in. high: lvs. linear to ovate-lanceolate, to 34 in. long, acute: fls. pale rose with white center, about 24 in. across, long-pedicelled.

pyrenàica (Lychnis pyrenaica). Low, tufted, to 6 in. high, glabrous: lvs. obovate-spatulate, to ¾ in. long, glaucous, mucronate: fls. white to rose, to nearly ½ in. across, not long-pedicelled, petals slightly notched at tip.

PETRÓPHILA. Proteacex. Shrubs with stiff lys. and white or yellow fls. borne beneath scales or bracts and forming dense spikes or cones; intro. in Calif., from Australia.

biloba. Lvs. flat, ternately divided into obliquely ovate or oblong pungent-pointed segms. to ½ in. long: fls. harry, to ¾ in. long: cones ¼ in. long.

mèdia. Lvs. cylindrical, 2-3 in. or occasionally to 10 in. long: fis. hairy, about 1/2 in. long: cones 1/2 in. across.

Shuttleworthiana. Lvs. flat, divided into pungent-pointed segms. 1 in. long: fls. glabrous, 1/4 in. long: cones to 1 in. long.

PETRÓPHYTUM. Rosacex. Prostrate evergreen shrubs native in W. N. Amer. and adapted to the rock-garden: lvs. crowded, entire: fls. small, white, in terminal racemes: fr. a leathery follicle. It succeeds in sunny positions in limestone soil. Propagated by seeds and division.

cæspitosum (Spiræa cæspitosa). Forming mats to 3 ft. across: lvs. to ½ in. long, 1-nerved: fl.-spikes to 2 in. long. S. D. to Calif; hardy N.

cineráscens (Spiræa cinerascens). Differs from P. Hendersonii chiefly in lvs. being gray-pubescent. Wash.

Héndersonii (Eriogynia and Spiræa Hendersonii). Matforming, sts. ascending to 4 in.: Ivs. spatulate, to ¾ in. long, 3-nerved: fls. in dense racemes to 3 in. long, petals obovate to oval. Olympic Mts., Wash.

PETRORHAGIA: Tunica Saxifraga.

PETROSELÌNUM. Umbelliferæ. Herbs of the Old World with pinnately compound lvs., greenish-yellow or reddish fis. in compound umbels, and ovate compressed frs.; one species is grown as a garnish and for salads.

Seeds of parsley should be sown in rows 10-12 inches apart, and the seedlings thinned to 5 or 6 inches in the row. As germination is very slow, it is well to soak the seeds in warm water. For winter use roots may be transplanted to boxes or pots and kept in a sunny window.

crispum (P. hortense. P. sativum. Apium Petroselinum)
PARSLEY. Bien. to 3 ft.: lvs. ternately decompound, those

of the typical form curled and crisped. Eu., W. Asia. Var. filicinum is a fern-lvd. form, nat. in E. N. Amer. Var. latifolium has lf-segms. flat and not crisped and roots fibrous. Var. radicosum. TURNIP-ROOTED P., has thick parsnip-like edible roots and flattened non-crisped lf.-segms.

horténse: P. crispum. sativum: P. crispum.

PE-TSAI. A leaf vegetable, Brassica pekinensis, much grown in China and now well known in this country as "Chinese cabbage" and "celery cabbage." Annual and biennial; sown in spring, it produces a close mass of foliage and a tender central core in summer and early autumn. The leaves are used as greens, and the white heart for salad. For harder heads, the seeds should be sown later so that the plant will mature in late autumn. The excellence of the crop apparently depends much on the care practiced in seed selection. The product does not have the strong flavor and odor of real cabbages, and it should not be called a cabbage.

A related product is Pak-choi, Brassica chinensis and B. parachinensis. This plant does not produce the solid head of Pe-tsai, and it is more definitely biennial, if not even sometimes short-

perennial.

All these plants are probably natives of eastern Asia. See Brassica.

PETTÈRIA. Leguminosæ. Deciduous shrub native in Dalmatia, sometimes planted for ornament. Cult. as for Laburnum. P. ramentacea (Cytisus Weldenii). To 6 ft.: lvs. of 3 lfts. to 2 in. long: fls. yellow, papilionaceous, fragrant, in dense upright racemes to 3 in. long, in May and June: pods to 1½ in. long.

PETŪNIA. Solanaceæ. Soft more or less hairy branching annuals and perennials, of weak straggling growth, with simple lvs., alternate or the upper ones opposite, and white, purple or reddish fls. funnel- or salver-shaped, fragrant, blooming all summer; native in S. S. Amer.

Petunias are treated as annuals in gardens and are very satisfactory for bedding, to fill in spaces in the border, and in window- and porch-boxes; also grown in the greenhouse. They require sunny exposure. Petunias may be propagated from seed, the large frilled and double forms sometimes from cuttings. These latter high-bred types require more care than the smaller single-flowered kinds; the seeds should be started undoors; the weak plants usually have the most double and daintily colored flowers.

argéntea: trade name for a form of P. hybrida.

Atkinsii: form of P. hybrida.

axillaris (P. nyctayınıflora). Large White P. Usually erect, sticky-pubescent, to 2 ft.: fis. dull white, to 2½ in. long, fragrant at night, tube 3-4 times as long as calyx. Argentina.

compácta: P. hybrida. élegans: P. hybrida. fimbriàta: P. hybrida. grandiflòra: P. hybrida.

grandiflora: P. hybrida.

hýbrida. Common Garden P. Reputed to be a series of hybrids between P. axillaris and P. violacea, funnel-shaped fl-tube broader than in the former species and longer with a broader limb than in the latter, to 3½ in. long: growth stocky and plant often sticky. There are many vars. and strains with fls. varying in size, color and form, sometimes to 5 in. across, from white to deep red-purple often striped, with star-like markings radiating from the throat or irregularly marked, some deeply fringed or even full double; both tall and more or less dwarf forms. Some of the Latinamed forms, often listed as binomials, are álba, compácta, élegans, fimbriàta, gigantèa, grandiflòra, kermesina, maculàta, nana, péndula, purphrea, ròsea, superbissima.

inflata. Much like P. violacea but corolla-tube much broader as if swollen or inflated: lvs. rather narrow. Paraguay, Argentina.

nana: dwarf hort. form of P. hybrida.

nyctaginiflòra: P. axillaris.

parviflora. Ann. to 18 in., pubescent: lvs. to 3/4 in. long:

fls. purple, to $\frac{3}{2}$ in. across, corolla-lobes abruptly pointed. N. C. to Fla., west to Calif., W. Indies, Mex. to S. Amer.

phonicea: apparently one of the P. hybrida group. superbissima: P. hybrida.

violacea. Violet-Flowered P. Sts. to 10 in. long, slender, prostrate or tips erect: fls. rose-red or violet, the tube lighter, funnel-shaped, to 1½ in. long, about twice as long as calyx, with unequal limb Argentina.—Perhaps some of the material so listed represents color forms of P. hybrida.

PEUCÉDANUM. Umbelliferæ. Large and complex group of herbs with lvs. that are much divided, white, yellow or rarely purple small fls. in umbels, and flattened frs.

austriacum. Per. to 3 ft.: lf.-segms. linear to linear-lanceolate, not dentate: fls. white, bracts reflexed: fr. to 3/6 in. long. Eu.

Cervària. Per. to 3½ ft.: lf.-segms. oval to ellipticlanceolate, lobed or dentate: fis. white or pink, bracts reflexed. Cent. Eu. and Medit. region

Ostráthium (Imperatoria Ostruthium). To 3½ ft.: lvs. 1-2-pinnate into broad toothed segms.: fls. polygamous, white or pinkish. Mts. of Cent. and S. Eu.

PEÙMUS. Monimiaceæ. Evergreen diaccious tree to 20 ft., native in Chile. P. Bóldus (Boldoa fragrans). Boldo. Lvs. opposite, ovate, leathery and rough: fls. white, ½ in. across, in panicles: fr. an edible drupe.—Sometimes grown in S. Calif. The tree has many economic uses, as the hard wood is valuable for charcoal and implements, the bark for tanning and dyeing, and the lvs. have medicinal properties.

PEYOTE: Lophophora Williamsii.

PFEIFFERA. Cactaceæ. A monotypic epiphytic genus from W. Argentina, growing on trees and somewhat resembling Rhipsalis. P. ianothèle (P. cereiformis. Rhipsalis cereiformis). Sts. 3-4-angled, without aërial roots, to 15 in long or more and to ¾ in. thick, areoles about ½ in. apart, reddish; spines 6-7, to nearly ¼ in. long: fls. white within, pale pinkish-purple to pink outside, campanulate, about 1 in. long, tube short or nearly absent: fr. spherical, winered, to ¾ in. diam. but usually less.

PHACA: Astragalus.

PHACÈLIA. Hydrophyllacex. More than 100 species of herbs, ann. and per., in Amer., the larger part western, with mostly alternate lvs., blue, purple or white fls. in scorpioid cymes or racemes and deciduous corolla; some of them are grown for summer bloom in the flower-garden. The individual fls. are commonly not showy but produce a bold effect in mass.

Seeds of the annual species may be sown in spring where the plants are to stand. The perennials are propagated by division as well as by seeds.

bipinnatifida. Bien. to 2 ft.: lvs. pinnatifid: fls. violet or b'ue. Ohio to Ga. and Tenn.

campanulària (P. minor var. campanularia) Ann. to 8 in.: lvs. ovate, toothed: fis. blue. S. Calif., in dry or desert regions.

ciliàta. Ann. to 1½ ft., rough-pubescent: lvs. pinnate into oblong toothed or cut segms.; fls. blue. Calif., Lower Calif.

congésta. Ann. to 21/4 ft : lvs. pinnatifid, often finely dissected: fls. blue. Tex., N. Mex.

divaricata. Ann to 1 ft., straggling: lvs. ovate or oblong, entire: fls. blue. Calif. Var. Wrangeliana has lvs. slightly lobed or toothed at base.

gloxinoldes: P. Whitlavia var.

grandiflòra: P. Whi lavia.

linearis (Eutoca multiflora). Ann. to 1 ft.: lvs. linear to lanceolate: fls. violet or white. Calif. to Wash. and Utah.

leucophýlla. Per. to 1½ ft., densely silky-pubescent: lvs. lanceolate to oblong, entire: fls. white or bluish, corollalobes entire. S. D. to B. C. south to Colo and Neb.—Sometimes confused with P. heterophylla which has some lvs. divided.

Lyallii. Per. to 8 in., tufted: lvs. oblanceolate, to 4 in. long, somewhat strigose, divided half way to midrib: fis. dark blue, to $\frac{1}{3}$ in long, in short dense infi, calyx-lobes harry Mont., Idn to B. C.

minor. Widespread hairy and viscid ann. in S Calif., to 2 ft.: lvs. broad-ovate, coarsely serrate, to $2!_2$ in long: fls. long-campanulate, the lobes not reaching middle, blue or purple—Known in cult in its forms or relatives P. campanularia and P. Whitlavia.

Párryi. Ann. to 1½ ft.: lvs. ovate, toothed or lobed: fis. deep violet. Calif.

Púrshii. To 1 ft.: lvs. pinnate-lobed, lobes 5-9, lanceolate to elliptic: fls. pale blue with white center, lobes briefly fringed. Tenn.

sericea. Per. to 1 ft., silvery-silky: lvs. pinnate into linear segms.: fts. violet-blue. Alta. to Wash and Nev.

tanacetifòlia. Ann. to 3 ft.: lvs. pinnatifid, finely cut like those of tansy: fis blue or lavender. Calif

viscida (Eutoca viscida). Ann. to 2 ft: lvs ovate, toothed: fls. deep blue, with purple or whitish center. Calif.

us. deep due, with purple or whitish center. Chilf.

Whitlavia (P. minor var. Whitlavia. Whitlavia grandifora). California Bluebell. Ann to 1)2 ft.: lvs. ovate, toothed: fis. blue or purple with swollen corollatube. S. Calif.—Probably not specifically distinct from P. minor, but long known in gardens as Whitlavia. Var. 41ba has white fis. Var. gloxinoides (Whitlavia gloxinoides) has white fis. with blue center.

Wrangeliana: P. divaricata var.

PHÆDRANÁSSA. Amaryllidaceæ. Bulbous herbs of Cent. and N. S. Amer., allied to Eucharis, but differing in the subcylindrical colored corolla whose segms. spread only at the tip. One species from Costa Rica, P. Carmiðlii, has recently been intro. to Calif. To 2 ft., bulb to 3 in. diam.: lvs. 1–3, oblanceolate, to 15 in. long and 2 in. wide, obtuse, appearing at flowering time, petiole to 8 in. long: fls. scarlet with segms. green margined yellow, to 2 in. long, usually 6–10 in umbels, pedicels 1 in. long, scape terete, naked.

PHÆDRÁNTHUS. Bignoniaceæ. Showy Mexican evergreer climber grown in subtrop. climates and in cool greenhouses. Propagated by cuttings. P. buccinatòrius (Bignonia buccinatorius and B. Cherere). Lvs. of 2 ovate or oblong lfts. to 3 in. long and a terminal 3-parted tendril: fls. blood- or purple-red with yellow base, funnelform, 4 in. long, in terminal racemes.

PHÆTHUSA: Verbesina virginica.

PHAGNALON. Compositæ. Old World genus having alternate lvs. and heads of disk-fls.; allied to Senecio and Erigeron, differing from the former in involucral bracts of several series and imbricated, and from Erigeron in being white-tomentose and not merely pubescent.

rupéstre. To 1 ft., somewhat woody at base, erect: lvs. oblong to linear, to 2 in. long, obtuse, white-tomentose beneath and somewhat so above, undulate: heads yellow, to ½ in. across, solitary on slender naked peduncles to 2½ in long. Medit. region and Asia Minor.

PHÀIUS. Orchidaccæ. Old World epiphytic or terrestrial orchids with leafy sts. or severallvd. pseudobulbs and fls. in showy racemes, the sepals and petals similar, the lip 3-lobed, free, usually spurred at base. For cult. see Orchids.

flavus (P. maculatus). Pseudobulbs produced into a leafy st.: lvs. 2-8, to about 2 ft. long, often spotted with whitish or pale yellow: seape to 3 ft. high, many-fld.; fis. to 3 in. across, yellow with apex of lip orange or reddish and wavy. Spring and summer. Malaya, China, Japan.

grandifòlius. Pseudobulbs with 4-6 lvs. to 40 in. long: scapes to 4 ft long, to 18-fid.; fls to 4 in. across, silverywhite outside and yellowish-brown inside; lip yellow or brown-yellow marked with rose-purple. Himalayas, Indo-China, China, Australia.

maculàtus: P. flavus.

Sanderianus: a hort. form, referred to as a var. of P. Blumei, with sepals and petals coppery or bronzy and lip dull rose with white margin.

PHALÆNÓPSIS. Orchidaceæ. Epiphytic orchids of eastern hemisphere with short non-pseudo-bulbous leafy sts., thick leathery lvs. and fls. in loose racemes or panicles, the sepals and petals equal or the latter larger, the lip 3-lobed and united with base of column, sometimes with appendages at apex. Raised in a greenhouse with minimum temperature not below 65°; grown in osmundine or sphagnum and must be well supplied with moisture. See Orchids.

amábilis (P. grandifora. P. amabilis var. Rimestadtiana).

Lvs. oblong-lanceolate, to 1 ft. long: infl. a drooping raceme or panicle, loosely 3- to many-fid., to about 3 ft. long; fts. white, to 4 in. across; lpn marked with yellow and red at base, terminating in a pair of divergent tendrils. Blooms at various seasons. Malaya. Var. Aphrodite (P. Aphrodite, P. Sanderuana) is a form distinguished from the species by the retuse apex of the arms of the callus of the lip, and by slightly smaller fis.; the form designated as P. Sanderuana has fis. suffused with rose.

amethystina. Lvs. cuneate-oblong, to 4 in. long: peduncles simple or branched, few-fid.; fis. small, white; sepals about as wide as petals; lip amethyst striated with white, notched at apex. Malaya.

Aphrodite: P. amabilis var.

Elizabethiæ. Hybrid between P. amabilis and P. amabilis var. Rimestadtiana.

equéstris (P. rosea). Lvs to about 8 in. long and 2¾ in. wide: infl. a raceme or panicle, many-fld, to 16 in. long; fls. about 1½ in. across; sepals and petals white tinged with rose in the center; lip rose-purple. Blooms nearly all year. Philippines.

Esmerálda: Doritis pulcherrima.

grandiflòra: P amabilis.

Lueddemanniana. Lvs. to 11 in. long and about 3 in. wide: mfl racemose or rarely panneulate, about length of lvs, few-fld.; fls to 2 in across; sepals and petals yellowishwhite banded with violet-purple; in amethyst-purple with white side lobes. Blooms nearly all year. Philippines. Var. ochacea has stripes on sepals and petals light ochre-yellow.

Rimestadtiàna: P. amabilis.

rdsea: P. equestris.

Rôsenstromii. Lvs. oblong, to about 15 in. long: panicles to nearly 3 ft. long, racemose branches 10 in. long, each 8-10-fld.; fls. white stained with yellow, similar to *P. amabilis* but smaller; petals rhombic, wider than other segms. Queensland.

Rothschildiana. Hybrid between P. amabilis and P. Schilleriana.

Sanderiàna: P. amabilis var. Aphrodite.

Schilleriana. I.v.s. to 20 m. long and 4½ m. wide, mottled above with gray and beneath with red-brown: infl. loosely paniculate, to 4 ft. high; fis to 3½ m. across; sepals and petals rose-purple tinted with white, lateral sepals dotted with purple near the base; hip white dotted with purple. Spring and early summer. Philippines. Var. grandiflora is listed.

Stuartiana. Lvs. to 1 ft. long and 4 in. wide, mottled with gray above, purplish beneath: infl. a many-fld. drooping panucle; fls. to 2½ in. across; dorsal sepal and petals white; lateral sepals white with inner half yellowish covered with purple spots; lip yellowish spotted with red-purple. Jan.—Feb., May. Philippines.

Jan.—rep., May. Finippines.

violacea. Lvs. to 9 in. long and 4 in. wide: infl. racemose, about 2-5-fid.; fis. to 3 in. across; dorsal sepal and petals greenish-white with violet near base; lateral sepals greenish-white with inner half mostly violet-purple; lip with yellow side lobes and violet-purple mid-lobe. Sumatra.

PHALANGIUM: Anthericum.

PHÁLARIS. Graminex. Ornamental ann. and per. grasses with flat lvs. and flattened spikelets in narrow panicles or spikes; native in Old World and N. Amer. See Grasses.

arundinacea. Reed Canary-Grass. Per. to 6 ft.: lvs. to 1 ft. long and 34 in. wide: panicles dense, to 8 in. long, branches erect. Eu., Asia, N. Amer. Var. picta (var. var.vgata), Ribbon-Grass, has lvs. striped with white and yellowish, common in yards as clumps or patches and sometimes infrequently blooming.

canariénsis. Canary-Grass. Ann. to 2 ft.: ivs. to 6 in. long and ¼ in. wide: spikes ovoid, to 1½ in. long. Eu.; nat. in N. Amer.—Grown for the shining straw-colored seeds which are fed to birds.

minor. Similar to P. canariensis but with cylindricoblong spikes and differing in floral characters. Eu.

stenóptera: P. tuberosa var.

tuberòsa var. stenóptera (P. stenoptera). Per. to 1½ ft. or more, with short vertical or ascending branched rhizomes: lvs. ¼ in. or less broad; panicle spike-like, dense, often lilac. Probably Medit. region.—Sometimes mistakenly written stenophylla. It has been sold as "Peruvian winter-grass."

PHARIUM: Bessera elegans.

PHASÈOLUS. BEAN. Leguminosæ. Mostly twining, native in warm regions and extensively grown for the edible seeds and pods: lvs. of 3 lfts. or sometimes reduced to 1: fls. papilionaceous, in axillary racemes or clusters: pods flattened. For cult. of the annual garden beans, see

aconitifòlius. Moth B. Ann., trailing or diffuse, to 2 ft.: lfts. divided into 3-5 narrow lobes: fls. yellow: pods to 2 in. long; seeds oblong, very small. Probably E. Indian.

acutifòlius var. latifòlius. TEPARY B. Ann., bushy or twining: lfts. ovate, pointed: fis white or violet: pods to 3 in. long; seeds roundish, ¼ in. or more long. Ariz., Mex. angulàris. Adzuki B. Ann., bushy, to 2½ ft.: lfts. ovate, abruptly short-pointed, sometimes slightly 3-lobed; fls. bright yellow: pods to 5 in. long; seeds oblong, ¼ in. or less long. Asia

aureus. Mung B. Green or Golden Gram. Ann. to 3 ft. and more: lits. ovate, acuminate: fls. yellow: pods to 4 in. long; seeds globular, small. Probably E. Indian.

calcaratus. Rice B. Ann, half-climbing: lfts. ovate, pointed: fls. bright yellow: pods to 5 in. long; seeds oblong, 14 in. or more long. Asia.

Caracálla. SNAIL-FLOWER. CORKSCREW-FLOWER. Per., twining to 20 ft.: lits. ovate, pointed: fis. light purple or yellowish, fragrant, the keel coiled like a snail-shell. Tropics.

coccineus (P. multiflorus). MULTIFLORA B. COCCINEUS (P. multisforus). MULTIFLORA B. SCARLET RUNNER. Per. but grown as ann, tall-twining: files broadly ovate: fis. bright scarlet, large: pods to 1 ft long; seeds broad, to 1 in. long. Trop. Amer. Var. álbus, White Duttch Runner, has white fis. Var. albonânus is a bushy form with white seeds and var. rubronânus is erect and has red fla

liménsis (P. lunatus var. macrocarpus). Lima B. Per. but grown as ann, high-climbing: Ifts. ovate, long-pointed: fis. white or yellowish: pods with thick margins, to 5 in. long; seeds flat, ½ in. and more long. Trop. Amer. Var. limenanus, Bush or Dwarf Lima, is a bushy form.

lunatus. Sieva B. Civet B. Ann., climbing: Ifts. broadly ovate, long-pointed: fls. white or yellowish: pods to $3\frac{1}{2}$ in. long, seeds flat and thin, $\frac{1}{2}$ in. long. Trop. Amer. Var. lunonanus, Dwarf Sieva B, is a bush form. Var. salícis, Willow-leaf B, has narrowly lanceolate lys.

Métcalfei (P. retusus). METCALFE B. Per. with fleshy roots: Ifts oblong, obtuse: fls reddish-purple: pods to 2½ in. long; seeds circular, about ½ in. long. New Mex., Ariz. Mex.

multifldrus: P. coccineus.

Müngo. Urd. Black Gram Ann., spreading, to 3 ft.: Ifts. ovate, acuminate: fts. yellow: pods to 2 in. long; seeds oblong, small. Probably E. Indian. Var. radiatus (P. radiatus), sts. and pods with silky reddish pubescence.

nanus: perhaps P. vulgaris var. humilis, but identity

radiàtus: P. Mungo var.

retùsus: P. Metcalfei.

trilobus. Ann. or per., trailing to 2 ft.: lfts. ovate, lobed: fls. minute: pods 2 in. long. Old World tropics.
trinérvius. Per., twining: lfts., ovate, often lobed: fls. yellow or reddish: pods to 2½ in. long. Malaya.—Grown as cover-crop in tropics.

violaceus (Doluchos violaceus). Ann. to 3 ft.: lfts. ovate-lanceolate, acute, usually glabrous: fls. 2-3, wings violet, standard and keel white, calyx glabrous. Ethiopia.

vulgaris. Kinner B. Haricor. Ann. tall-twining: Ifts. ovate, long-acuminate: fls. white, yellowish or violet-purple: pods to 8 in. long; seeds oblong or globular, about ½ in. long. Probably American. Var. humilis, Busn B., is a low non-climbing form; the common garden and field bean.

PHEASANTS-EYE: Adonis.

PHEBALIUM. Rutacex. Shrubs with alternate simple lvs. and small white or yellow fls. usually in corymbs; native in Australia and New Zeal. and adapted to cult. in Calif.

argénteum. Lvs. lanceolate, to 4 in. long, entire: infl. densely covered with silvery scales. W. Australia.

PHEGOPTERIS: see Dryopteris and Athyrium.

PHELLODÉNDRON. CORK-TREE. Rutacex. Trees from E. Asia with the aspect of Juglans diœcious, bearing opposite pinnate lvs., small greenish fls. in terminal panicles or corymbs and black berry-like frs.; grown for ornament.

Cork trees are hardy in the North and adapted to most soils. Propagated by seeds, cuttings over heat, and root-cuttings stored over winter in moist sand or sphagnum.

amurénse. To 50 ft., with corky bark: lfts. 5-13, glabrous and glaucous beneath. China, Japan.

chinénse. To 30 ft.: líts. 7-13, pubescent beneath. China. Var. glabriúsculum is pubescent only on veins.

japónicum. To 30 ft.: Ifts. 9-13, pubescent beneath.

sachalinénse. To 50 ft.: lfts. 7-11, glabrous beneath. Japan, Korea, China.

PHELLÓPTERUS. Umbelliferæ. Per. herbs with fleshy roots and subterranean sts., related to Levisticum, bearing at the surface of the ground a cluster of pinnate lys. and white or purplish fls. on naked peduncles; native in W. N. Amer.

macrorhizus. To 8 in., glaucous, roots to 2 in. diam.: lvs. to 3 in. long, of many ovate lfts.: fls. pinkish, in open umbels: fr. 1/4 in. long. N. E. Tex.

PHELLOSPÉRMA. Cactacex. Small cactus characterized by the large corky base of the seed. See Cacti. P. tetrancistra (Mammillaria tetrancistra. M. Phellosperma). Solitary or cespitose, globular or becoming cylindric and 1 ft. long, root long and often thick; tubercles terete and axils naked; radials numerous and needle-like; centrals 1-4: fls. purple, about 1½ in. long, S. Utah and Nev., W. Ariz., S. Calif., Lower

PHENOMENAL BERRY: Rubus loganobaccus.

PHILADÉLPHUS. Mock-Orange. Saxifragacex. Popular floriferous shrubs, mostly erect but with curving or drooping branches, with simple commonly deciduous opposite lys. and white fls., often very fragrant, solitary or in small clusters or racemes; a confused genus of wide distribution in Asia, Eu., U. S. and Mex., and many cultigens. Sometimes called Syringa but this name belongs to the lilac.

The mock-oranges commonly bloom in late spring. They are well adapted to shrubberies. If pruning is needed it should be after flowering, since the blossoms appear from wood of the previous year. They are propagated by seeds, layers, suckers and cuttings, the latter usually of mature wood. Well-marked varieties are grown from cuttings of soft wood in summer in frames.

argénteus. Low spreading shrub, older branches with exfoliating bark: lvs. elliptic to ovate, to 3% in. long, entire, white-silky beneath, strigose above, cornaceous, almost sessile: fls. white, in leafy panicles, sepals white-silky without, tomentose within, petals obtuse to retuse. Ft. Hua-

chuca, Ariz.
aureus: P. coronarius var.

Billiárdii: P. insignis.

brachýbotrys: P. pekinensis var.

californicus. To 10 ft.: lvs. ovate, to 3 in. long, mostly glabrous beneath: fls. 1 in. across, fragrant, in panicles, calyx glabrous. Calif.

columbianus: P. Gordonianus var.

cordifòlius. To 6 ft.: lvs. ovate, to 4 in. long, nearly glabrous beneath: fls. to $1\frac{1}{2}$ in. across, in panicles, calyx glabrous. Calif.

coronàrius. To 10 ft.: lvs. ovate to ovate-oblong, to 3 in. long, hairy only on veins beneath: fls to 1½ in. across, very fragrant, creamy, in 5-7-fld. racemes, calyx usually glabrous. Eu., S W. Asia. There are many hort. vars. such as: aireus (var. folus aureus), lvs. yellow; deutziæflörus, double with narrow petals; dianthifibrus, double; diplex (var. folre-pleno), double or partially so, dwarf; multifibrus plènus, fls. double; nànus is var. pumilus; primulæflorus, double with broad petals; pimilus (var. nanus), dwarf; rosæflörus, double; salicifòlius, lvs. lanceolate; speciosissimus (P. speciosissimus) is lower than the species and has smaller lvs.: variegatus, lvs. bordered with creamy-white. smaller lvs.; variegatus, lvs. bordered with creamy-white.

Coulteri. To 10 ft.: lvs. ovate to ovate-oblong, to 2 in. long, white-tomentose beneath: fls. about 1 in. across, with red spot at base of petals, solitary, calyx white-tomentose. Mex.

cymòsus. Hybrid between P. Lemoinei and probably P. grandiflorus: lvs. elliptic-oblong, to 4 in. long, pubescent beneath: fis. 2 in. or more across, often double, in 3-9-fid. cymes or racemes, calyx glabrous. Hort. names belonging here are Bannière, Conquête, Mer de Glace, Norma, Perle Blanche, Rosace.

Delavayi. To 15 ft.: lvs. ovate-oblong, to 4 in. long, grayish-tomentose beneath: fls. 1½ in. across, very fragrant, in 5-13-fld. racemes, calyx glabrous and purple. W. China.

dianthiflorus: P. coronarius var.

Fálconeri. Hybrid between P. coronarius and probably P. laxus: lvs. ovate-lanceolate, to 3 in. long, nearly glabrous beneath: fis. 1 in. across, fragrant, in 3-7-fid. racemes, petals oblong, acute.

floribundus. Hybrid between P. coronarius and probably P. Gordonianus: lvs. ovate, to 4 in. long, pubescent beneath: fls. 1½ in. across, slightly fragrant.

floridus. Resembling P. grandsflorus but with lvs. pubescent beneath and calvx and pedicels densely pubescent. N. C., Ga.

gloridsus: P. grandiflorus.

Gordonianus (P. Lewisii of cult.). To 12 ft.: lvs. ovate to elliptic-oblong, to 3 in. long, pubescent beneath: fls. about 2 in. across, fragrant, in 7-11-fld. racemes, calyx slightly pubescent. B. C. to N. Calf. Var. columbianus (P. columbianus) is smaller throughout.

grandiflorus (P. inodorus var. grandiflorus. P. gloriosus). To 10 ft. lvs. elliptic-ovate, to 5 in. long, nearly glabrous beneath: fls. 2 in. across, 1-3 together, calyx glabrous. N. C. to Fla. and Ala.

hirsùtus. To 8 ft.: lvs. ovate, to 3 in. long, densely grayish-pubescent beneath: fls. 1 in. across, creamy, usually in 3's, calyx pubescent. N. C. to Ga. and Ala.

incanus. To 10 ft. or more: lvs. ovate to oblong-ovate. to 3 in. long, densely gray-pubescent beneath: fis. 1 in. across, in 5-7-fid. racemes, calyx densely tomentose. W. China. Var. Sargentiànus is listed.

inodòrus. To 10 ft.: lvs. ovate, to 4 in. long, glabrous beneath except on veins, usually entire: fls. 2 in. across, 1-3 together, calyx glabrous. N. C. to Ga. and Miss.

insignis (P. Billiardii). To 20 ft.: lvs. ovate, to 2¾ in. long, entire or toothed, smooth above, grayish-pubescent beneath: fis. white, to 1¼ in. across, slightly fragrant, in 15-30-ftd. leafy panieles. A late-flowering hort. hybrid of P. pubescens and P. cordifolius or P. californicus.

Karwinskyanus. Tall shrub with long scandent branches: lvs. narrow-ovate, to 2½ in. long, hairy beneath: fis. about 1 in. across, in 5-13-fid. panicles, calyx hairy. Mex.—See P. mexicanus.

Keteleèri. Shrub with slender sts. to 8 ft. or more: lvs. oval, acuminate, scabrous beneath, nerves pubescent: fls. white, semi-double or double, fragrant, petals ovate-acute. Probably of hort, origin.

latifolius: P. pubescens.

láxus (P. speciosus). To 4 ft.: lvs. drooping, ellipticovate to oblong-lanceolate, to 3 in. long, slightly hairy beneath: fls. to 1½ in. across, 1-3 together, calyx glabrous. Ga.

Lembinei. Hybrid between P. microphyllus and P. coronarius: lvs. ovate to ovate-lanccolate, to 2 in. long, slightly hairy beneath fls. 1½ in. across, very fragrant, in 3-7-fld. racemes. Some of the hort. forms are Avalanche, Boule d'Argent, Candelabra, Erectus, Manteau d'Hermine, Mont Blanc. Var. purpureo-maculatus is P. purpureomaculatus.

Lewisii: of cult is P. Gordonianus, true P. Lewisii of N. W. U. S. differs in lvs. glabrous or nearly so and is not known to be in general cult.

Mágdalenæ. To 12 ft.: lvs. ovate, to 3 in. long, roughpubescent beneath: fls. 1 in. across, in 7-11-fld. racemes, calyx pubescent. China.

maximus. Hybrid between P. tomentosus and P. pubescens: lvs. beneath and calyx tomentose.

mexicanus. To 15 ft. or more, with long scandent branches: lvs. ovate to lanceolate, to 3 in. long, slightly hairy beneath: fls. to 1½ in. across, fragrant, creamy, 1-3 together, calyx hairy. Mex.—The material commonly cult. under this name is P. Karwinskyanus.

microphyllus. To 4 ft. lvs. oblong, to 1¼ in. long, entire, hairy beneath: fls. 1 in. across, very fragrant, usually solitary, calyx nearly glabrous. Colo. to New Mex. and Ariz.

nepalénsis. To 6 ft.: lvs. ovate-oblong, to 4 in. long, glabrous except in axils of veins beneath: fis. 1½ in. across, pure white, in 5-fld. racemes, calyx glabrous. Himalayas.

nivalis. Hybrid between P. pubescens and P. coronarius: lvs. ovate, slightly pubescent beneath: fis. 1½ in. across, in 5-8-fid. racemes, calyx hairy.

pekinénsis. To 6 ft.: lvs. oblong-ovate, to 3 in. long, glabrous except in axils of veins beneath, petioles purplish: fis. about 1 in. across, creamy, slightly fragrant, in 5-9-fid. racemes, callyx glabrous. N. China to Korea. Var. brachýbotrys (P. brachybotrys) has short dense racemes and green

polyanthus. Hybrid between P. Lemoinei and probably P. insignis: lvs. ovate, 1 in. long, usually entire, hairy beneath: fis. 1½ in. across, in cymes or racemes, calyx pubescent. Some of the hort. forms are Favorite, Gerbe de Neige, Pavillon Blanc.

pubéscens (P. latifolius). To 10 ft.: lvs. ovate, to 4 in. long, gray-pubescent beneath: fis. 1½ in. across, in 5-9-fid. racemes, calyx pubescent. Tenn. to Ala. and Ark.

purpuráscens. To 12 ft.: lvs. elliptic- to lanceolate-ovate, to 2 m. long, pubescent beneath: fls. 1 in. across, pure white with purple glabrous calyx, very fragrant, in 5-9-fld. racemes. China.

purpireo-maculatus. Hybrid between P. Lemoinei and P. Coulter: lvs. ovate, to 2 in. long, hairy beneath: fls. about 1 in. across, with purple spot at base of petals, 1-3 together, calyx slightly pubescent. Some of the hort, forms are Fantasie, Nuage Rose, Ophelia, Romeo, Surprise, Caltille Sybille.

pyramidalis: listed name.

satsumanus. To 8 ft.: lvs. ovate to ovate-lanceolate, to 3 in. long, hairy only in axils beneath: fls. 1 in across, somewhat fragrant, in 5-9-fld. racemes, calyx nearly glabrous. Japan.

Schrénkii. To 6 ft. and more: lvs. ovate to oblong lanceolate, to 5 in. long, hairy only on veins beneath: fls. 1½ in. across, in 5-7-fld, racemes, calyx hairy on nerves. Manchuria to Korea.

sempérvirens: name sometimes applied to P. mexicanus.

sericanthus. To 12 ft.: lvs. ovate, to 4 in. long, hairy on veins beneath, the petiole often reddish: fls. 1 in. across, in 5-9-fld. racemes, calyx pubescent. China.

speciosíssimus: P. coronarius var.

specidsus: P. laxus.

spléndens. Hybrid between *P. grandiflorus* and probably *P. Gordonunus*: lvs. nearly glabrous: fls. 2 m. across, in 5-fld. racemes, calyx glabrous.

subcanus. To 10 ft.: lvs. oblong-ovate, to 5 in. long, pubescent on veins beneath: fis. 1 in. across, in 5-9-fld. racemes, calyx densely pubescent. China. Var. Wilsonii (P. Wilsonii) is larger.

tomentòsus. To 10 ft.: lvs. ovate, to 3 in. long, grayish-pubescent beneath: fls. 1 in. across, fragrant, in 5-7-fld. racemes, calyx nearly glabrous. Himalayas.

verrucòsus. To 10 ft.: lys. ovate, to 4 in. long, pubescent beneath: fls. 1 in. across, in 5-7-fld. racemes, calyx pubescent. Origin uncertain.—Some of the material under this name may be P. nivalis.

virginalis. Hybrid between P. Lemoinei and probably P. nivalis: lvs. ovate, to 3 in. long, pubescent beneath: fis. double or partially so, in 3-7-fld. racemes, calyx pubescent. Some hort forms are Albatre, Argentine, Bouquet Blanc, Fleur de Neige, Girandole, Glacier, Virginal.

Wilsonii: P. subcanus var.

Zèyheri. Hybrid between P. coronarius and P. inodorus or P. grandiflorus: lvs. ovate, to 4 in. long, hairy only on veins beneath: fls. 2 in. across, in 3-5-fld. racemes, calyx

PHILÈSIA. Liliaceæ. Evergreen shrub about 3 ft. high, native from Chile to Magellan. P. magellánica (P. buxifolia). Lvs. alternate, narrow-oblong, about $1\frac{1}{2}$ in. long, glaucous beneath: fls. rosy-red, 2 in. long, nodding: fr. a berry.-It thrives in cool temperatures and partially shaded situations and requires peaty soil; sometimes grown under glass. Propagated by cuttings of ripened wood which are slow in rooting.

PHILIBERTELLA: Philibertia clausa.

PHILIBÉRTIA. Asclepiadaceæ. Twining or scrambling herbs and subshrubs native from Tex. to Argentina, with opposite lvs., wheel- or bellshaped fls. in umbels, and long slender frs.; grown in the open S., or under glass in a soil composed of loam, peat and sand. Propagated by cuttings over bottom heat.

clausa (Philibertella clausa. Funastrum clausa). Lvs. evergreen, ovate- or lanceolate-oblong, to 3 in. long: fis. white, ½ in. across, fragrant, in summer. Fla.

PHILLÝREA. Oleaceæ. Evergreen small trees and shrubs native in the Medit. region. with opposite lvs., small white directious fls. in racemes in spring, and fr. a black 1-seeded drupe; grown in mild and warm climates for ornament. Propagated by seeds, cuttings of half-ripe wood under glass, by layers, and by grafting on the

angustifòlia. To 15 ft.: lvs. oblong- or linear-lanceolate, to 2 m. long, commonly entire: fr. 1/2 in. long. S. Eu., N. Afr.

decora (P. Vilmoriniana). To 10 ft.: lvs. oblong to oblong-lanceolate, to 5 in. long, commonly entire, shining above: fr. ½ in. long. W. Asia.

latifòlia. To 30 ft.: lvs. ovate, to 2 in. long, toothed, shining above: fr. ½ in. long. S. Eu., Asia Minor. Var. mèdia (P. media) is lower with smaller lvs. entire or wavytoothed. Var. spinòsa has spiny-toothed lvs.

mèdia: P. latifolia var. Vilmoriniana: P. decora.

PHILODÉNDRON. Araceæ. More or less woody climbers in trop. Amer., bearing thick lvs. which are entire or pinnately cut, sheathing petioles, and unisexual fls. on erect spadices slightly shorter than the fleshy spathes which are white, yellow or red.

Philodendrons are grown as foliage plants in the green-house and in the open in frostless countries, where they should be given supports on which to climb and abundant moisture. Propagated by division of the stems.

acuminatissimum. Lvs. arrow-shaped, the linear-oblong posterior obtuse lobes slightly twisted upwards, the anterior acuminate lobe to 1 ft. long: spathes to 3½ in. long. Ecuador.

Andreanum. Lvs. oblong-arrow-shaped, to 3 ft. long and 10 in. wide, shining green suffused with yellow. Colom-

argyrèum Sanderiànum: hort. name.

asperatum (P. imperiale). Lvs. cordate-ovate, to 1½ ft. long and 1 ft. wide: spathes to 5 in. long, reddish outside, pale yellowish-white inside. Brazil.

bipinnatifidum. Sts. erect: lvs. 2-pinnate into linear or oblong segms., the terminal segm 3-5-lobed: spathes about 8 m. long, purple outside and whitish inside. S. Brazil.

Cárderi: P. verrucosum.

cordatum. Lvs. cordate-oblong, to 16 in. long and 6 in. wide, the posterior lobes to 4 in. long: spathes to 3 in. long. Brazil.

Corsonianum. A hybrid having lvs to 2½ ft. long and to 1½ ft. across, shortly pinnatifid, dark green above and purplish-green beneath with distinct green veins: spathe tube purple-crimson spotted with light green, limb red spotted on outside. Hort. origin.

Devansayeanum. Lvs. ovate-cordate, to 2 ft. long and broad, long-acuminate, red when young: spathes to 6 in. long, margined with red, the tube white. Peru.

dùbium: a listed name of unknown botanical standing. elegantíssimum: hort, name.

erubéscens. Lvs. ovate-triangular, to 10 in. long and 5 in. wide: spathes to 6 in. long, dark purple. Colombia.

fimbriatum: listed name of unknown botanical standing.

gigantèum. Lvs. broadly cordate-ovate, to 3 ft. long and 2 ft. wide: spathes to 10 in. long, the limb pale green and tube purplish outside and red within. W. Indies.

gloriòsum. Lvs. cordate-ovate, to 10 in. long and 8 in. wide, reddish on margins and pale green on nerves and beneath, petioles marked with white. Colombia.

grandifòlium. Lvs. arrow-shaped, to 2 ft. long and 14 in. wide: spathes to 4 in. long, pale greenish-yellow outside and yellowish-white inside. Venezuela, Guiana.

imperiàle: P. asperatum.

lácerum. Lvs. with petioles to 14 in. long and much dissected blades to 12 in. long, lobes of lvs. oblong, obtuse or acute: spathe slender, to 5 in. long, tube purple, limb yellowish, spadix to 11/2 in. long. Cuba.

Lindenii: P. verrucosum.

Mamei. Lvs. cordate-ovate, to 10 in. long and 6 in. wide, deep green above irregularly spotted with silvery-white, petioles pinkish. Ecuador.

micans. Lvs. oblong-lanceolate to ovate-lanceolate, to 3 in. long, base cordate, variegated red and green, petiole to 3 in. long, reddish: fis. not known. Cent. Amer.

pertusum: Monstera deliciosa.

scândens. Vine: lvs. to 10 in. long, cordate, with petiole to 4 in. long; juvenile lvs. reddish, mature lvs. green, usually with 5-6 pairs of prominent vens. Puerto Rico.

Selldum. Lvs. 2-pinnate into oblong lobes, the terminal egm. 3-lobed; spathes to 1 ft. long, white unide. Brazil Paraguay.

speciosum. With tall woody st.: lvs. simple, sagittate, petiole about twice as long as blade: spathes somewhat ficshy, green with purple edges, spadix shorter than spathe. Brazil.

spectabile. A name of uncertain botanical standing, said to have silky or velvety-green lvs. about 15 in. long.

trifoliatum: listed name of uncertain botanical standing.

tripartitum. Lvs. 3-parted, to 10 in. long and 3 in. wide, yellowish-green; spathes to 4 in. long, whitish. Trop Amer.

verrucosum (P. Carderi. P. Lindenn). Lvs. ovate-cordate, to 8 m. long and 6 in. wide, shining green above with paler lines and sunken nerves, lined with salmon-violet beneath, the petioles deep red and armed with bristles: spathes purplish. Costa Rica, Colombia.

Wallisii. Lvs. broadly ovate-cordate, to 1½ ft. long and 1 ft. wide, deep green above: spathes to 5 in. long, brownishgreen. Colombia.

PHILOTRIA: Anacharis canadensis.

PHLEBODIUM: Polypodium.

PHLÈUM. Graminex. Grasses with flat lvs. and spikelets in dense terminal spikes; native in temp, regions of the world and one valuable for pasture and hay; mostly per. See Grasses.

praténse. Timothy. Herds-Grass. To 5 ft.: lvs. to 1 ft. long and ½ in. wide: spikes to 8 in. long, cylindrical, awned. Eu., Asia; nat. in N. Amer.—An abundant meadow

PHLÒMIS. Labiatæ. Per. herbs or low shrubs with opposite lvs. and purple, yellow or white, 2-lipped fls. in axillary whorls subtended by hairy bracts, the upper lip densely hairy.

These are rather coarse plants suitable for the wild-garden and rear plantings. Propagated by seeds, cuttings, division, and P. tuberosa by underground tubers.

alpina. Per. to 1½ ft., sts. square: lvs cordate, lower to 8 in. long and 6 in. across: fis. purplish, in 20-30-fid. whorls, the bracts subulate. Siberia.

cashmeriana. Per. to 3 ft., densely white-woolly, sts. cylindrical: lvs. leathery, linear-oblong, to 9 in. long: fls. pale purple, in whorls to 1½ in. across, the bracts subulate. Hımalayas.

ferruginea: the plant cult. under this name is P. fruticosa.

fruticosa. Jerusalem-Sage. Erect more or less woody herb or shrub to 4 ft., densely white- or yellow-woolly: lvs. ovate or oblong, to 4 in. long, very rugose: fls. yellow, in 20-30-fld. whorls, the bracts ovate. S Eu.

lanata. Shrub, the sts. square, densely yellow-woolly: lvs. ovate, 1 in. or less long, wrinkled: fls. yellow, in 6-8-fld. whorls, the bracts ovate-lanceolate. Italy.

Lychnitis. LAMPWICK PLANT. Shrubby, to 1½ ft., densely tomentose: lvs. oblong-linear, to 3 in. long, clasping, the floral lvs. dalated at base: fis. yellow, in 6-10-fid. whorls, the bracts subulate. S. Eu.

púngens. Per. to 2 ft.: lvs. ovate-lanceolate, shining above, tomentose beneath: fls. purplish-violet, in 6-10-fld. whorls, bracts subulate. S. E. Eu.

Russeliàna: P. wscosa.

sâmia. Per. to 3 ft., pubescent: lvs. ovate-oblong, wrinkled, tomentose beneath: fls. purple, in 10-15-fld. whorls, the bracts subulate. Greece.

spectábilis. To 6 ft., sts. cylindrical, tomentose: lvs. ovate-cordate, to 1 ft. across, on long petioles: fts. rosepurple, in many-fid. whorls to 2 in. across, the bracts thread-like. Himalayas.

tomentosa: the plant grown under this name is P.

tuberòsa. Per to 6 ft., nearly glabrous, with square sts. ard tuber-like roots: lvs. cordate-ovate, to 8 in. long; fls. purple, in 30-40-fld. whorls, the bracts subulate. S. Eu.,

viscosa (P. Russeliana). Shrubby, pubescent, viscid above: Ivs ovate to oblong-lanceolate, to 4 in. long, tomentose beneath: fls yellow, in many-fld. whorls, the bracts subulate. Asia Minor.

PHLOX. Polemoniaceæ. Many ann. and per. herbs with mostly opposite entire lys. and brightcolored salverform fls. in shades of blue, purple. pink, crimson and white, borne in cymes or panicles; popular flower-garden subjects yielding many garden forms.

The annual phloxes are of easy culture in any garden soil but will bloom longer if given abundant moisture and plant-food. Seeds should be sown in early spring or sometimes started in boxes and transplanted. The perennial summer phloxes require fertile soil and plenty of water and should be set 2-3 feet apart. Clumps will bloom for three or four years and should then be divided. Propagated by side snoots. Seeds do not reproduce the type, and named or special forms are multiplied from the strong young shoots that arise from the crown or root as the plant spreads, and clumps may be divided. Most of the phloxes are hardy North.

aculeàta. Cespitose depressed per.: lvs. subulate, ½-1 in. long; fls. pink to white, small, the calyx viscid-pubescent. Ida.—This, like most of the other dwarf species here listed, blooms in early spring.

adsurgens. Per., with creeping shoots, sending up flowering sts. to 1 ft.: lvs. elliptic or ovate upward, to 1 1/4 in. long, glossy, evergreen: fls. rose to salmon-pink with white center, to 1 in. across, in cymes, in late spring. Ore., N.

alyssifòlia. Tufted per. to 4 in.: lvs. linear to oblong, to 1 in. long, margins ciliate and thickened: fls. bluish, to 1 in. across, calyx shorter than tube. Sask. to Mont. south to Wyo, and N. W. Neb.

amèna. Per to 1 ft., decumbent at base: lvs. oblong-lanceolate, to 2 in. long: fls. purple, rarely pink or white, to 34 in across, in terminal compact clusters subtended by an involuce of lvs, in spring and early summer. Ky. to Fla—Rarely cult., the plant grown under this name being P. procumbens, which see for hort, vars.

amplifdia. Per. to 5 ft: lvs. to 6 in. long, lower ones broad-ovate, scabrous: fls pale pink, the petals narrower than those of P. paniculata, the pamcle shorter. Ind. to Ala. and Mo.

andícola. Tiny erect per., spreading by rootstocks; lvs. subulute, ½-1 in. long; fis white, on short pedicels, about ¾ in across. N. D. to Colo.

Arendsii. Per. to 2 ft.: lvs. lanceolate-ovate to linear-lanceolate, to 4 in long; fts. lavender or mauve, 1 in. across, in loose clusters to 6 in across, in summer. Hybrid between P. dwaricata and probably P. paniculata.

argillàcea: P. pilosa.

australis: reddish-purple race of summer perennial phlox, P. paniculata.

bifida. SAND P. One of the subulate phloxes: low tufted harry per, with well-separated nodes, lower lvs. mostly 1-2 m. long, awl-like fis pale violet to white with violet tube; corolla-lobes notched to nearly or about ½ m. deep; stamens partly exserted S. W. Mich. to Tenn., Ark. and kans. Var. álba has white fis.

Brittonii: P. subulata var.

bryoides. Little per 2 in. or less high, with densely imbriented cobwebby pointed narrow lvs.: fls. solitary, white or hlac, less than ½ in long. Neb. to Utah.

cærûlea: advertised as a trailing phlox with bright blue ils : P. stolonifera var. violacea.

cæspitòsa. Cespitose per. with prostrate sts: lvs. subulate, $\frac{1}{2}\frac{1}{2}\frac{1}{2}$ in. long: fls. white to lilac, with corolla exceeding calyx, solitary on numerous branchlets. Mont. to Ore. calyx, soli

camlaénsis: listed name canadénsis: P. divaricata.

carolina. Thick-leaf P. Per. to 4 ft.: lvs. lanceolate to ovate, thick and searcely venry, to 5 m. long; fis. purple varying to rose and white, about \$\frac{3}{2}\$ in. across, in pancles, early summer to fall. Ohio to W. Fla.—Early-blooming phases are widely cult. as P. suffruticosa, in several hort. forms. A variant listed as trifora is reported to represent an early-blooming form.

condensata. Cespitose per. to 1½ in.: lvs linear-acute, to ½ in. long, overlapping, stiff, culiate: fls. white, to ¾ in. across, tube much longer than calyx. Colo. Var. Héndersonii is listed.

costata: same as P. multiflora.

Cowardii: listed as bearing crimson blooms most of the summer; host, race of P. stolonifera.

cuspidata: a name often applied to P. Drummondii var. stellarıs.

decussata: a name applied to hort, forms of P. paniculata and sometimes P. maculata or P. suffruticosa.

diffùsa. Loosely tufted per, a few in high: lvs. linear-subulate, about ½ in long: fis lilac to white, ½ in across, solitary on numerous branchlets. B C. to Calif.

divaricata (P. canadensis). Blue P., or WILD SWEET WILLIAM. Per. to 1½ ft., with many sterile creeping shoots: lvs. ovate to oblong, to 2 in. long: fls. pale violet-blue to mauve, to 1½ in. across, in open clusters, in spring; corollalobes mostly notched or erose. Que. to Fla. and Tex. Color forms are vars. álba and lilácina. Var. Láphamii has entire corolla-lobes and large fls. of rich blue-violet.

Douglasii. Similar to P. diffusa, but herbage glandular. Wash. to W. Mont.

Wash, to W. Mont.

Drúmmondii. Annual or Drummond P. Ann. to 1½ ft.:

lvs. ovate to lanceolate, to 3 in. long, the upper alternate:
fls. rose-red varying to white, buff, pink, red and purple,
1 in. across, in close clusters. Tex. Color forms are represented by such names as álba oculâta, atropurpurea,
cærilea-striâta, cárnea, coccinea, rôsea, violâcea. Var.
rotundâta has large broad petals, and is also known as
grandiflôra and spléndens. Var. stellâris, Star P., has
nariow cuspidate petals which are often cut and fringed.
Other varietal names listed are gigantêa, Isabellina,
Lèopoldii, nâna, Radowitzii.

fimbridta: race of P. Drummondii.

glabérrima. Smooth P. Per. to 5 ft.: lvs. linear or linear-lanceolate, to 4 in. long: fls. purple, about ¾ in. across, in cymes, in early summer. S. E. Va. to W. Fla., E. Tex. and cymes, in 6 S. E. Wis.

glabràta (P. Hoodii var. glabrata): a glabrous-lvd. form of P. Hoodii. Wyo. to N. D.

Héntzii: P. nivalis.

Hoddii. Dwarf cespitose per, to 2 in.: lvs. subulate, to $\frac{1}{3}$ in. long, woolly. fls. white, $\frac{1}{3}$ in. across, solitary. N. W. N. Amer. to W. Neb.—The stock cult. under this name is likely to be P. diflusa or other similar species.

Kélseyi. Per., sts. ascending, to 6 in. long, very leafy: lvs. narrowly oblong; fls. lilac, about ¾ in. across, corolla little exceeding calyx. Mont. to E. Ida.

lanceolata. Shrub to 2 ft.: lvs. few, lanceolate to ovate, thick, glandular: fts. few, lilac, N. Ore, to Wash,

longifidra: P. maculata.

longifòlia. Per., with woody base, sts. to 1 ft., ascending: lvs. linear, 2-3 in. long: fls. hlac to white, corolla about % in. across, in corymbs. N. W. U. S.

maculata (P. longulora) Per. to 5 ft., with purple-spotted st.: lvs. lanceolate, to 5 in. long: fls. pink or purple, rarely pink or white, $\frac{1}{2}$ in. across, in elongated panicles in summer. Conn. to N. C. and In.—Rarely cult., the plant so named usually being a form of P. suffruticosa.

missouliénsis: a large-lvd. form of P. Douglasii, from Missoula, Mont.

multiflora. Per. forming mats to 4 in. high: lvs. linear, to 1 in. long, nearly glabrous: fis. hlac to white, ¾ in. across, solitary on numerous branchlets. Mont. to Colo.

muscoides. Canescent moss-like prostrate per., 1 in. high: fls. solitary, small, white. Wyo. and adjacent states.

nàna. Per. to 1 ft.: lvs. linear, to 2 in. long, viscid: fis. rose to white, 1½ in. across, in few-fid. corymbs. Tex. to New Mex. and Mex.

nivalis. Trailing P. One of the subulate phloxes: hairy per. to 6 in.: Ivs. awl-shaped, ¾ in. long: fis. pink or white, nearly 1 in. across, in spring; corolla-lobes entire or crose, or only shallowly notched if at all. Va. to Fla. Var. £lba has white fis. Var. sylvéstris is listed as having rose-pink fis. to 1¼ in. across, Var. elegantíssima is listed.—Has been confused with P. subulata, and comprises several supposed vars. of that species as Hentzii and setacea.

occidentàlis: P. speciosa.

ovata. Per. to 2 ft.: lvs. ovate to oblong-lanceolate, to 2 in. long: fls. purple or sometimes pink, 1 in. across, in small clusters, in summer. Pa. to Ala. Var. púlchra is small clusters, in summer. P listed as having pastel-pink fls.

paniculâta. SUMMER PERENNIAL P. Per. to 4 ft.: lvs. oblong-lanceolate to oval, thin and veiny, to 5 in. long: fls. pink-purple but varying into many colors as white, salmon, scarlet, li ac, purple, 1 in. across, in large panicles in summer and early autumn. N. Y. to Ga. and Ark. Var. Slèboldii, orange-scarlet.—In many hort. forms it constitutes the common per. summer-blooming phlox of gardens.

pátula. Shrubby, sts. spreading, to 10 in. long: lvs. linear, to 1½ in. long and ½ in. wide: fis. to ¾ in. across, few or solitary, calyx subglabrous, to ½ in. long, deeply cleft. Mont. to Colo.

pilòsa (P. argillacea). Hairy per. to 1½ ft.: lvs. linear to lanceolate, to 3 in. long: fls. purple, varying to pink, violet and white, to ½ in. across, in small clusters, in spring and early summer. Ont. to Fla. and Tex. Var. alba, fls. white. Var. spléadens, fls. lilac-rose, in masses.

planitiàrum: same as P. andicola.

procumbens (P. verna). Supposed hybrid between P. stolontiera and P. subulata, often grown as P. amæna: per. to 1 ft., decumbent at base: lvs. oblong to spatulate, to 2 in. long fis. bright purple, to 1/4 in. across, in spring.

Var. cærûlea, described as having soft blue fls. is P. stoloni-fera var. violacea. Var. ròsea, said to have rose-pink fls. Var. variegàta is listed.

Radowitzii: hort, name for an improved strain of P. Drummondii.

réptans: P. stolonifera.

rigida. Differs from P. Douglasii in having narrower sharp-pointed lvs. with revolute margins. W. Mont. to Wash.

scleranthifòlia. Sts. depressed: lvs. filiform to subulate, to ½ in. long, spine-tipped, glabrous: fls. white, subsessile. S. D. to Ida.

setàcea: see P. nivalia.

speciosa (P. occidentalis). Shrub with herbaceous flowering shoots, 2 (rarely 4) ft.: lvs. linear to lanceolate, to 2½ in. long: fis. rose to lilac, to 1 in. across, in corymbs, spring. Calif. to W. Mont. and B. C.

Stánsburyi. Small per. with woody base, 4 in.-1 ft. high, glandular 'lvs. very narrow, thick: fis. pink or rose, calyxteeth subulate, corolla-tube about 1 in. long. E. Calif. to S. New Mex.

Stellaria. Per. to 8 in.: lvs. linear or linear-lanceolate, to 2 in. long: fis. pale violet-blue or nearly white, ¾ in. across. Var. lilacina is listed as a color form.—The plant across. var. macina is listed as a color form.—The plant cult. under this name is apparently a hybrid between *P. bifida* and *P. subulata*.

stellaris: P. Drummondii var.

stolonifera (P. reptans). Hairy per. to 1 ft., with long creeping sterile shoots: lvs. obovate to lanceolate, to 3 in. long: fls purple or violet, 1 in. across, in cymes, in spring and early summer. Pa. to Ga. Var. violacea, fls. violet.

and early summer. Pa. to Ga. Var. violacea, its, violet.

subulàta. Ground- or Moss-Pink. Per. forming mats,
to 6 in.: lvs. crowded, awl-shaped, ½ in long, evergreen:
fls. bright purple, varying to pink and white, ¾ in. across,
in spring; corolla-lobes shallowly notched. N. Y. to N. C.
Var. Brittonii (P. Brittoni). Fls. lavender-white. Appalachians, Potomae Valley. Var. Nélsonii has white fls.
with rose centers and is of compact habit. Hort. names
listed as subordinate to P. subulata are vars. álba, atrolilácina, atropurpurea, atroviolàcea, austrâlis, cærdlea,
cæruléscens, frondòsa, lilácina, màjor, Moerheimii, ròsea,
rübra, violàcea, Wilsonii.—Some of the hort. kinds named
under this species belom to P. nivalis. under this species belong to P. nivalis.

suffruticosa. Phloxes bearing this name are early-blooming phases of *P. carolina*, which is the tenable name.

sylvéstris: hort. name, probably for plant listed as P. nivalis var.

vérna: P. procumbens.

viscida. Tufted per. 6-8 in., viscid-glandular throughout: 7s. linear, about 1½ in. long: fls. few, about ¾ in. across, lılac. E. Ore.

PHLOX, NIGHT -: Zaluzianskya capensis. Prickly: Gilia californica.

PHÈBE. Lauracex. Trop. trees and shrubs with alternate leathery lvs., small fls. and fr. a berry; one species rarely cult. in S. Calif.

Namu (Persea Namu). Tree: lvs. oblanceolate, to 6 in. long and 2 in. wide: fls. in terminal corymbs about length of lvs., the persanth silky-pubescent. China.

PHŒNICOPHORIUM: Stevensonia.

PHŒNIX. Palmacex.Perhaps a dozen species of diocious feather-palms in Afr. and Asia, unarmed except for the stiff spine-like basal pinne on the lvs., often sprouting or sucketing at the base: trunk, if evident, covered with the bases of old petioles, at least toward the top: pinnæ induplicate in vernation, narrow, long-pointed, without midrib but with a nerve either side the sharp fold or ridge, sometimes fascicled on the rachis: spadices among the lvs.; spathe 1- or 2-valved, narrow and relatively small, more or less persistent, the peduncle of the pistillate spadix often greatly elongating; fls. small, yellowish, borne on the angles or curves of many slender often long branches; stamens 6: fr. an oblong or nearly globular drupe with a single grooved seed.—It is very difficult to make out the identity of many of the planted trees of phoenix, for some of the surest characters of separation are in staminate fls. and frs. which are usually not to be had together; as these palms are directious, one may have only the male or female tree; the conditions seem to be favorable for hybridization although this subject has received little careful attention.

All the species are native in the eastern hemisphere and it is not known how or when the stock of the ornamental kinds reached this country, or what its particular origin may have been. There is also much natural variation in some of the species. Because of the confusion in the cult, phonices it has seemed advisable to place rather full descriptions here as aids in identification. For cult. see Date and Palm.

acadiis. Apparently stemless, the trunk represented by an ovoid bulbiform caudex 1 ft. or less in diam. that rises little above the ground: Ivs. to 6 ft., somewhat glaucous; punne rather lump, to 20 in. long, with strong marginal nerves, nearly opposite and interruptedly fascicled; petiole with many stout spines: spadix 1 ft. or less long, pediuncle very short or none, the 1-valved spathe that splits down the side arising at surface of ground or beneath; fruiting pediuncle remaining very short, often not evident; fr. ellipticoblong, about ½ in. long, red to blue-black, edible, the clusters sometimes half in the ground. N. and Cent. Bengal.—It is a question whether this species is in cult. with us; not all acaulescent phenices belong here.

with us; not all acaulescent phermices belong here.

canariénsis (P. Jubæ. P. tenuis). Strong tree to 50 and 60 ft. over all and more, with solitary straight trunk, the upper crown of foliage and the entire top in young plants strongly ascending but the lower lvs. hanging with age, the top becoming very large and broad, petioles and spines yellowish: lvs. 15–20 ft. long; pinnes very many, light green, long-pointed, standing in different planes, the lower ones of which are long stout spines and those at the base fascicled or irregularly placed as well sometimes as some of those above the spines; beduncle of fruiting clusters clongating often to several ft. and drooping; fr. ellipsoid or globose-ovoid, 1 in or less long, with a pulpy exterior, yellow and varying to reddish. Canary Isls, and now widely spread as a cult. plant; variable.—Trees grown in this country as P. cycadifolia, P. lomensis and P. lomensis specos belong here, although the lomensis of old hort. Interature is supposed to be P. reclinata, and cycadifolia is accounted a form of P. daciphfera. One of the hardiest palms, thriving in Cent. Calif., middle and N. Fla, and upper Gulf Coust, making striking imassive specimens on fertile most soils cycadifolia: see P. canariensis; a name apparently

cvcadifòlia: see P. canariensis: a name apparently applied to different palms.

dactylifera. DATE. Tree to 100 ft. and more with slender trunk for the greater heights, suckering at base, upper part trunk for the greater heights, suckering at base, upper part of crown with erect-ascending foliage and lower purt with down-curving or declined foliage: Ivs. grayish-glaucous, sometimes bluish; pinner 18 in. or less long, narrow and stiff, sharp-pointed, distichous: fr. cylindrical or long-oblong, 1-3 in long, with thick very sweet flesh much prized for food; fruiting peduncle very much developed and elongated, flattened, yellowish or reddish, drooping or hanging with weight of fr.—Long domesticated, in various forms, piobably native in W. Asia and N. Afr. but origin undetermined; commercially cult. for fr. in Calif. and Ariz., and widely planted in warm-temp parts for ornament and interest.

farinífera: P. pusilla.

Hanceana: P. humilis var.

hùmilis (P. Ouseleyana. P. pedunculata). Small plant more or less soboliferous the trunk attaining 6-10 or 12 ft.; lvs, somewhat glaucous; pinnæ scattered and interruptedly fascieled, usually rather limp or flaceid, the marginal nerves faint: fruiting pedundele becoming much elongated: fr. small ovoid, about ½ in. long, the pulp edible. India to Cent. China; variable. Var. Hanceana (P. Hanceana) is a hardy form with trunk 3 or 4 ft., and grayish-green foliage.

hýbrida: a hort. name.

Jubæ: P. canariensis.

leonénsis: see P. canariensis. Loureiri: see under P. Roebelenii.

natalénsis: P. reclinata.

Ouseleyana: P. humilis.

paludòsa (P. siamensis). Small tree or tree-like shrub, forming dense clumps with several creet or inclined trunks to 25 ft., ringed at base: Ivs. 6-10 ft., spreading and curving and forming an attractive mass; petiole scurly, bearing slender spines; pinnæ 1-2 ft. long, both opposite and alternate and 2-ranked, ¾ in. or less broad, not stiff, lighter colored or mealy underneath, striate: fruiting spadix 3-4 ft. long: fr. ovoid, about ½ in., mucronate, red becoming black-purple; seed with basal embryo and in this respect differing from other phonices. Benga' to Cochin-China.

pedunculàta: P. humilis.

pùmila: see P. reclinata.

pusfilla (P. farinifera). Shrubby stoloniferous palm with very short trunk that is entirely covered with sheaths and does not elevate the top high: Ivs. pale green, bearing one or more pairs of spines; pinnæ nearly opposite, in 4 rows or planes, rigid and prominently pointed: spadix 8-12 in. long, much branched and erect, the branches widely spreading; fr. ½ in. long, dull purple-black. S. India and Ceylon, near the sea.—Some of the stock known as P. farinifera may be P. reclinata.

may be P. rechnata.

reclinata (P. natalensis. P. senegalensis. P. spinosa and spinifera). Soboliferous producing several or many sts. in a close clump to 20 ft. or more high but making a single slender trunk to 40 ft. if suckers are removed, the trunks bearing If. scars: 1vs. floccose underneath when young, particularly on the ribs, bearing scattered or paired spines below, reclinate or curved downward at the apex; pinns subopposite or alternate or in groups of 2 or 3, 1 ft. long more or less, firm or subrigid in texture, with sharp stiffish points; staminate fis. narrow and acute in bud and thereby differing from other phenices: fr. ¾ in. or less long, ovoid-ellipsoid, brown or reddish. Trop. Afr. and south to Natal.—The best known African palm if the date is counted out and the most widespread. Variable; a popular and attractive palm, distinguished from P. rupical by the stiffish appearance of the foliage and the tufted habit. The plant known in cult. as P. pumila probably belongs here. Roebelénii. Dwarf fine-lyd, palm now planted in the

Roebelénii. Dwarf fine-lvd. palm now planted in the open in the warm parts of the country and prized also as a pot-plant. A plant was shipped probably from Singapore by Mr. Roebeleni, and described and named by James O'Brien in Gardeners' Chronicle in 1889. It is referred to P. humils by some writers; probably it is the same as P. Loureiri (an older name) of Cochin-China (P. humils var. Loureiri of Beccari); sts. usually several, 2-5 or 6 ft., sometimes swollen at base, erect or somewhat flexuose, covered at least toward top with lf.-bases: lvs. many, shiny green and somewhat glaucous, rather soft, gracefully surving and drooping, bearing numerous narrow long-attenuate opposite or subopposite pinnæ, with slender weak spines on petiole: fr. oblong, about ½ in. long, borne in a many-branched small spadix on a peduncle about 1 ft. long.

rupicola. Trunk slender and solitary, to 20 ft., naked of lf.-biases or becoming so, the crown with declined or drooping lower lvs., the foliage with a soft (or not stiff) appearance: lvs. bright green; pinnæ limp or flaccid, decurved, not conspicuously long-attenuate to sharp points, 2-ranked in one plane and not fascicled, represented by spines on the petiole: fr. oblong, ¾ in. long, shining yellow. India; usually growing among rocks.—A very graceful plant either for the open in the warmest parts of the country or for pots.

senegalénsis: P. reclinata.

siaménsis: P. paludosa.

spinosa (spinifera): P. reclinata.

sylvéstris. WILD DATE. Trunk stout and solitary, to 50 ft., covered with bases of old lf.-stalks, bearing a large rounded very thick crown, lower lvs. decurved and drooping: lvs. long, grayish-green or glaucous-green; pinnæ very many, fascieled and in 2-4 planes, glaucous, rigid and long-acuminate into stiff points, the petiole spines 2-4 in. long; fr. olive-form or oblong-elliptic, about 1 in. long, orange-yellow, scattered on long drooping branches of the spadix, pulp very astringent. India, wild and also cult. for the making of sugar from the sap.—Frequently planted for ornament and interest in the warm parts of the U. S., being about as hardy as P. canariensis; fast-growing useful tree.

ténuis: P. canariensis in the literature, but the plants cult. under this name may belong to other species.

vinifera: a hort, name.

zeyfanica. Ceyton Date. Trunk solitary, to 20 ft., bearing old If.-bases: lvs. relatively short, but with very many rigid pinne 1 ft. or less long standing at right angles in about 4 rows or planes and bright green with sharp points: fr. obovoid-oblong and apiculate at apex, about ½ in. long, red ripening to violet-blue or dark purple; pulp sweet, eaten in its native country. Ceylon, in woods.

PHŒNIX-TREE: Firmiana simplex.

PHOLIDÒTA. Orchidaceæ. Epiphytic orchids with creeping rootstocks, 1- or 2-lvd. pseudobulbs, and small fls. in slender terminal racemes, the sepals and petals similar, lip saclike at the base. Grown in a warm greenhouse; for cult., see Orchids.

articulata. Pseudobulbs oblong-cylindric, superimposed forming an elongate axis, each with 2 lvs. to 5½ in. long: racemes pendulous, densely 7- to many-fid.; fis. about ½ in. across, pinkish-, brownish- or creamy-white. May-Oct. Himalayas, Indo-China, China, Malaya.

conchoidea: P. imbricata.

imbricata (P. conchoidea). Pseudobulbs with 1 lf. to about 20 in. long: infl. to about 21 in. long, above densely many-fld.; fls. about ½ in. across, pale brown or whitish, lateral sepals with a sharp keel. Feb.-Nov. Himalayas, India, Indo-China, China, Malaya, Philippines.

PHOLÍSTOMA. Hydrophyllaceæ. Ann. becoming much branched and vine-like, differing from Nemophila in the succulent texture, prickly sts., spiny caps. and sculptured globose seeds. One species, P. auritum (Nemophila aurita), FIESTA-FLOWER, is grown. Climbing or scrambling to 6 ft.: petioles broadly winged and clasping; lvs. oblong to ovate-lanceolate, to 6 in. long, pinnately lobed, segms. 7-13, oblong or lanceolate, entire or toothed, often hispidulous: fls. lavender to blue or violet and paler outside with darker markings in throat, to 1½ in. across, solitary or in cymes of 2-6. Calif.—For cult. see Nemophila.

PHORADENDRON: see Loranthacem.

PHÓRMIUM. Liliaceæ. Large per. herbs native of New Zeal., probably 2 species, grown in warm climates as foliage clumps and sometimes in greenhouses, furnishing a strong fiber where native. Propagated by seeds sown in Feb. out-of-doors or in pots of rich compost; also by division.

Colensòi (P. Cookianum). To 7 ft.: lvs. to 5 ft. long and 2½ in. broad, less rigid than in P. tenax: fls. yellow, to 1½ in. long.

Cookianum: P. Colensoi.

tènax. New Zealand Flax. To 15 ft.: lvs. basal, to 9 ft. long and 5 in. broad, stiff, tough and leathery, splitting at apex, margined with red or orange line: fls. dull red, to 2 in. long, numerous on long scape. Var. atropurphreum has lvs. reddish-purple, var. aireum lvs. with broad yellow stripes, var. ribrum lvs. red, var. variegātum lvs. striped with creamy-yellow and white, and var. Veitchiānum has broad creamy-white stripes.

PHOTÍNIA. Rosaceæ. Shrubs and trees in Asia with alternate toothed lvs., white fls. in corymbs or short panicles, and fr. a small red berry-like pome.

The deciduous species are mostly hardy North and succeed in sunny positions. Propagated by seeds, by cuttings of young wood under glass, by layers, and by grafting on hawthorn or quince.

arbutifòlia: Heteromeles arbutifolia.

arguta: P. villosa var. lævis.

Beauverdiana. Deciduous shrub or tree to 20 ft., not hardy N.: lvs. oblong, to 4 in. long: infl. 2 in. across. China. crenato-serrata: Pyracantha crenato-serrata.

Dàvidsoniæ. Evergreen tree to 45 ft., grown in S. U. S.: less. oblong, to 5½ in. long, shming above, paler beneath: infl. to 5 in. across. China.

dentata: name of uncertain application.

glàbra. Evergreen shrub to 10 ft., to be grown far S.: lvs. obovate, to 3 in. long: infl. 4 in. across. Japan.

japónica: Eriobotrya japonica.

parvifòlia (P. subumbellata). Deciduous shrub to 10 ft.: lvs. ovate, to 2½ in. long, pale beneath, very short-petioled; infl. 2-8-fid., nearly umbellate. China.

serrulata (Cratægus glabra). Evergreen shrub or tree to 40 ft., adapted to southern parts: lvs. oblong, to 8 in. long, dark and shining above, yellowish-green beneath: infl. to 6 in. across. China, where it is much planted.

subumbellata: P. parvifolia.

villosa. Deciduous shrub or tree to 15 ft., hardy N.: lvs. obovate, to 3 in. long, hairy beneath: infl. to 2 in. across. Japan, Korea, China. Var. lævis (Porthiza arguta) has smaller glabrous lvs.

PHRAGMIPÈDIUM (incorrectly spelled Phragmopedilum). LADY-SLIPPER. Orchidaceæ. Trop. American terrestrial or epiphytic orchida without pseudobulbs: lvs. leathery, conduplicate: fls. in racemes or panicles, lateral sepals united,

lip sac-like and ovary 3-celled. See Orchids for cult. See comment under Paphiopedilum.

Ainsworthii (P. Brownii. P. calurum). Hybrid between P. longifolium and P. Sedenii.

albopurpureum. Hybrid between P. Schlimii and P. Dominianum.

Brownii: P. Ainsworthii.

calurum: P. Ainsworthii.

cardinale. Hybrid between P. Sedenii and P. Schlimii var. albiflorum.

carfcinum. Lvs. narrow, to about 20 in. long and ½ in. wide: racemes loosely 3-7-fld.; fls. medium-sized, pale greenish or whitish with green veins; petals tinted with rose at tips; lip yellow-green with deeper green veins. Mar.—Oct. Peru, Bolivia, Brazil.

caudatum. Lvs. to 2014 in. long and 114 in. wide: racemes loosely 1-4-fid., to almost 3 ft. high; fis. large; sepals yellowish or whitish with green veins; petals linear, to over 30 in. long, dull brownish-crimson; lip bronzy-green. Apr.-June. Peru, Ecuador, Colombia, Costa Rica.

conchiferum. Hybrid between P. caricinum and P. longifolium var. Roezlii.

Dominianum. Hybrid between P. caricinum and P. candatum

Eastonii, Hybrid between P. longifolium and P. Lind-

grande. Hybrid between P. longifolium var. Roezlii and P. caudatum.

gránde atràtum. Hybrid between P. caudatum and P. longifolium var. Hartwegii.

leucorrhodum: form of the hybrid P. Sedenii.

Lindleyanum. Lvs. to 25 in. long and 2½ in. wide: infl. a loose raceme, 3-7-fld.; fls. to 3 in. across, light green with red-brown veins. Autumn and winter. British Guiana.

longifolium. Lvs. to 24 in. long and 1½ in. wide: infl. a raceme up to 10-fid.; fis. to 7 in. across; dorsal sepal pale green with rose venns; lower sepal pale green with darker venns; petals pale yellow-green with rose margins; lip yellow-green tanged with brown and rose. Costa Rica, Panama. Var. Roézlii (P. Roezlu) has broader lvs. and petals margined with red. Colombia.

macrochilum gigantèum. Hybrid between P. caudatum

magnifldrum; a var. of P. longifolium with whitemargined petals.

nitidissimum. Hybrid between P. caudatum and P. conchiferum.

Roézlii: P. longifolium var.

Sargentianum. Lvs. oblong-lanceolate, to 8 in. long: Sargentianum. Lvs. oblong-lanceolate, to 5 in. long; fis. about 3½ in across, in 2-4-fid. loose racemes; sepals pale yellow with red veins; petals whitish streaked with red; lip yellowish with red veins and infolded side lobes speckled with red. Nov.-June. Brazil.

Schlimii. Lvs. to 12 in long and nearly 1 in, wide: fls. up to 7, in racemes (or panicles); dorsal sepal greenish-white stained with pale rose; lower sepal whitish with green venns; petals whitish stained with rose near base; lip rose-carmine and whitish. Nov.-Apr. Colombia.

Schröederæ. Hybrid between P. caudatum and P. Sedenn.

Sèdenii (P. tenellum). Hybrid between P. Schlimii and P. longifolium

tenéllum: P. Sedenii.

Titanum. Hybrid between P. Lindleyanum and P. longifolium.

Urgándiæ. Hybrid between P. Lindleyanum and P. longsfolium.

PHRAGMITES. Graminex. Tall per. grasses with broad lvs. and soft hairy spikelets borne in large panicles; native in swamps and wet areas in north temp. zone and S. Amer. and one planted for ornament. The name is pronounced in three syllables. See Grasses.

communis: P. maxima.

máxima (P. communis. Arundo maxima). Common Reed-Grass. To 15 ft.: lvs. to 1 ft. or more long and 2 in. wide: panicles to 1 ft. long. Swamps N. Amer., Eu., Asia. Var. variegāta has variegāted lvs.

PHRYNIUM: Calathea, Ctenanthe.

PHYGÈLIUS, Scrophulariaceæ, Small shrubs or stout herbs grown in conservatories or in the open in sheltered situations as far north as Philadelphia, and as pot subjects under glass, for the terminal panicles of scarlet drooping tubular fls. having 5 nearly equal lobes: Ivs. opposite: 2 species in S. Afr.

Propagated from seed or from cuttings taken from the late autumn shoots of outdoor plants. The plant is now infrequent in cultivation.

sequalis. Differs from P. capensis in denser infl. with fis. on short pedicels, calyx-segms. lanceolate and corollatube nearly straight.

capénsis. Cape Fuchsia. To 3 ft., sts. 4-angled or narrow-winged: lvs. ovate or ovate-lanceolate, to 5 in. long, toothed: fls. to 2 in. long, somewhat curved, purple-scarlet, in panieles to 1½ ft. long. Var. coccineus is listed.

PHÝLICA. Small evergreen Rhamnacex.shrubs in S. Afr. of many species, one of which is grown sometimes under glass for ornament and probably in Calif. in the open: lvs. alternate and crowded, small and simple: fls. small, largely in close heads or spikes, petals often wanting or bristle-like, stamens 5: fr. a small caps.

ericoldes. To 3 ft., with slender erect tomentose branches: ivs. small and linear or subulate, heath-like, tomentose underneath, margins revolute: fis. very small, in little terminal involucrate heads.

PHYLLÁGATHIS. Melastomaceæ. Subshrubs with short thick sts., large simple lvs., rose fls. in a head, and capsular fr.; greenhouse subjects.

From March to September these plants require high temperatures and plenty of water at the roots. Propagated by cuttings of half-ripened wood or leaf-cuttings in February or March over heat.

rotundifolia. To 2 ft.: lvs. roundish, 6 in. long, plaited and glossy green above tinted with metallic blue and purple, coppery-red beneath with prominent veins: fls. 1/2 in. across. Sumatra.

PHYLLÁNTHUS. Euphorbiaceæ. Monœcious herbs, shrubs or trees with alternate simple lvs. which are often arranged in two ranks on lateral branches so as to resemble pinnate lvs. (distichous), fls. without petals, and fr. a berry or caps.

Two species are grown in warm climates for the edible fruits which are made into preserves and a few others under glass. Propagated by seeds, greenwood cuttings and P. Emblica by layers.

Acidus (P. distichus. Cicca disticha). Otaheite-Gooseberry. Gooseberry-Tree. Tree to 20 ft.: lvs. ovate, to 3 in. long, distichously arranged: fls. very small, reddish, in many-fld. panicles: frs. angled, to 3/4 in. across. S. Asia; nat. in S. Fls. and W. Indies.

álbus: Glochidion album.

angustifdlius: Xylophylla angustifolia.

atropurpureus: Breynia nivosa var.

calfcinus. Shrub to 2 ft., glabrous: lvs. oblong, to ¾ in. ng, very obtuse: fls. small, pink edged with white. long, ver Australia.

distichus: P. acidus.

Émblica. Emblic. Myrobalan. Shrub or tree to 30 ft.: lvs. linear-oblong, to 34 in. long, distichously arranged: fls. small, yellow, clustered in the axils of the lvs.: fr. somewhat lobed, to 1 in. across. Trop. Asia.

latifòlius: Xylophylla speciosa.

mimosæfòlius of cult. with us is P. mimosoides.

mimoscioles. Shrub with rusty-scaly branches and abundant fine and ornamental foliage: lvs. oblong and mucronate, about ¼-¼ in. long on two sides of slender branchlets like pinnate foliage, whitish underneath: fls. very small, axillary, slender-pedicelled. Farther W. Indies.—Sometimes grown under glass.

nivosus: Breynia nivosa. speciòsus: Xylophylla speciosa.

PHYLLAUREA: Codiæum

PHYLLITIS. Polypodiaceæ. Small group of mostly temp. region ferns with simple strapshaped fronds and long sori at right angles to midrib, one of them known in cult. in the open. See Ferns.

Scolopendrium (Scolopendrium vulgare). HARTS-TONGUE-FERN. Hardy: fronds straight or curved, to 1½ ft. long

and 3 in. wide, entire or sometimes wavy-margined. Eu.; native in a few scattered localities in E. N. Amer.—There are many cristate, divided, crisped and dwarf forms known to fanciers, grown in the open, they are of simple cultural requirements

PHYLLOCÁCTUS. Cactaceæ. The proper name for this genus is Epiphyllum (which see), and the plant formerly known as Epiphyllum (Crab or Christmas cactus) is Zygocactus. The plant in cult. as P. latifrons is Epiphyllum oxypetalum, and P. biformis is Disocactus biformis.

PHYLLOCÁRPUS. Leauminosæ. Unarmed trees of western hemisphere tropics with abruptly 1-pinnate lys. and fls. in short racemes in advance of full foliage: pod 1- or 2-seeded, winged on one side, indchiscent. One species, P. septentrionalis, of Guatemala, is planted in S. Fla.: to 60 ft. or more: Ifts. in 4-6 pairs, obovate or oblong, 2 in. or less long, entire, becoming shining: fls. scarlet, fragrant: pod 6 in. or more long.

PHYLLÓCLADUS. Podocarpacex. A few species of evergreen trees and shrubs in the southern hemisphere: true lvs. reduced to scales, the branchlets flattened in leathery leaf-like bodies or cladodes which are toothed or lobed: male fls. in clusters at tips of branches, female borne on cladodes. For cult, see Conifers; grown in Calif.

rhomboidalis. Tree to 60 ft. or shrub: cladodes triangular or rhomboid. Tasmania.

trichomanoides. Tree to 70 ft.: cladodes triangular, lobed or pinnately cut. New Zeal.

PHYLLODIUM: expanded leaf-like petiole and no blade, as in some access and other plants; young plants and shoots often show leaflets on such phyllodia.

Ericacex.Very low ever-PHYLLÓDOCE. green heath-like shrublets with prostrate or ascending branches, small linear lvs., bellshaped or urn-shaped nodding fls. in terminal umbels, and capsular frs.; suitable for the rockgarden where they thrive in moist peaty soil. Propagated by seeds, cuttings or layers.

aleutica. Per. to 10 in. or more: lvs. linear, crowded, scabrous: fls. whitish, subglobose, corolla and filaments glabrous. Aleutian Isls., Alaska.

Brèweri (Bryanthus Breweri). To 1 ft.: fls. rose-purple, in long in terminal racemes, corolla divided to middle, bell-shaped, stamens exserted. Mts. of Calif.

cærdlea (P taxifolia. Andromeda cærulea). To 6 in. high, with ascending branchlets: fis. pink or purple, about ½ in. long, corolla urn-shaped, glabrous, stamens included. Circumpolar; south to Me, N. H. and Alta.

empetrifórmis. To 6 in., ascending: fls. rosy-purple, ½ in. long, corolla bell-shaped, stamens included, sepals obtuse. B. C. to Calif. Var. amábilis is P npponica var. Var. nåna is listed.—Some of the material cult. under this name has urn-shaped corollas and may be P. intermedia.

glanduliflora. To 1 ft: fls. sulfur-yellow, 1/2 in long, urn-shaped, pubescent without Alaska to Mont. and Ore.

intermedia. Hybrid between P. empetriformis and P. glanduliflora: fis. pink, urn-shaped, sepals acute.

nippónica. To 6 in.: lvs. linear, serrulate: fls. white, bell-shaped, stamens not exserted, sepals acute. Japan. Var. amábilis has smaller whitish or pinkish fls.

taxifòlia: P. cærulea.

PHYLLOPÒDIUM. Scrophulariaceæ. or per. S. African herbs or subshrubs, usually sticky-hairy, with lower lvs. opposite becoming alternate above: fls. small, subcylindrical, with limb spreading and the 5 lobes rounded and nearly equal, usually in terminal spikes, with small leafy bracts fused to calyx: fr. a septicidal caps. with bifid valves.

capitatum. Ann. to 7 in., erect or spreading, becoming woody at base, white-pubescent: lvs. lanceolate-elliptic to oblanceolate, to 1 in. long, dentate: fls. orange-yellow, to

nearly 1/4 in. long, many in dense spikes: caps. about A in. long.

PHYLLÓSTACHYS. Graminex. Tall woody grasses with sts. flattened on one side, deciduous lf.-sheaths, tessellated lvs. and spikelets borne in terminal panicles, stamens 3; native in Asia. See Bamboo.

airea (Bambusa aurea). Golden Bamboo. To 15 ft., sts. yellow: lvs. to 5 in. long and ¾ in. wide, long-pointed, glabrous, glaucous beneath, sheaths bristly at apex. China, Japan.

bambusoides (P. reticulata. P. Quilioi). To 45 ft., sts. bright green, st.-sheaths mottled purple: lvs. to 6 in. long and 1 in. wide, glaucous beneath. China. Var. Castilloni (P. and Bambusa Castillon) has yellow sts. striped green and lys. striped with yellow. Var. marliacea (P. marliacea) has wrinkled sts. and dark green st.-sheaths.

Borvana: P. niger var.

Castillani P hambusoides var.

edûlis (P. pubescens). To 100 ft, sts. bright green: lvs. to 4 in. long and 1/4 in. wide, toothed. China.—The young turions are said to be edible.

fastudsa: Semiarundinaria fastuosa.

flexuosa (Bambusa flexuosa). To 18 ft., sts. becoming nearly black, branches flexuose: lvs. to 4 in. long and ½ in. across, glaucous beneath. China.

Hendnis: P. niger var.

Hénryi. Lvs. glabrous, sheath to ¾ in. long, blade to 2½ in. long and ½ in across, ligule short and truncate: fis. in dense solitary panicles at ends of short leafy branches. China.

kumasáca: Shibatæa kumasaca.

marliàcea: P. bambusordes var. mitis: P. sulphurea.

Névinii. Sts. pale green: lvs. linear-oblong, shining above, rough on edges. China.

niger (P. puberula var. nugra. Bambusa nugra). BlackJoint Bamboo. To 25 ft, sts. becoming black, nodes with
lower edge whiter lys to 4 m long and ½ in. wide, glaucous
beneath. China, Japan. Var. Boryana (P. Boryana) has
yellow sts. spotted with purplish-brown. Var. Henonis
(P. and Bambusa Henonis P. puberula). To 60 ft, sts.
greenish becoming yellowish, st.-sheaths not spotted.

pubérula: P. niger var. Henonis.

pubéscens: P. edulis.

Ouilidi: P. bambusoides.

reticulata: P. bambusoides, as far as known cult. material is concerned

ruscifòlia: Shibatæa kumasaca.

sulphurea (Bambusa sulphurea, striata and mitis. P. mitis). Moso Bamboo. To 25 ft., sts yellow: lvs. to 5 in. long and 34 in. wide, glaucous beneath, If.-sheaths with bristles at apex. China, Japan.

viminalis: Shibatæa kumasaca.

violéscens (Bambusa violescens). To 12 ft., sts. turning from violet to yellowish-brown, st.-sheaths violet: lvs. to 6 in. long and 1½ in. wide, toothed, glaucous beneath, petiole purple. China.

víridi-glaucéscens (Bambusa viridi-glaucescens). 25 ft., sts. yellowish-green, st.-sheaths striped purple: lvs. to 4 in. long and ¾ in. wide, glaucous beneath, lf.-sheaths purplish with bristly tips. China.

PHYLLOTÆNIUM: Xanthosoma Lindenii.

PHYMATODES: Polypodium.

PHYMOSIA: Sphæralcea.

PHÝSALIS. HUSK-TOMATO. GROUND-CHERRY. Solanacex. Herbaceous annuals and perennials, sometimes slightly woody at base, straggling, diffuse or creeping: lvs. alternate, often 2 together: fls. usually axillary, blue, yellowish or whitish, not showy, the calvx becoming large and bladder-like and inclosing the globular yellow or greenish 2-celled berry, the corolla wheel- or bellshaped; grown for ornament and some of them for the edible frs. used in preserves and pickles.

Most cultivated species of physalis need a warm sunny exposure. Since they are long-season plants and the high colors of the calyx in the ornamental species do not develop until the fruit is ripe, the seed should be sown early in the spring indoors or in a hotbed. The perennials may be propagated by division of the rhizomes or by soft cuttings.

Alkekéngi (P. Bunyardíi. P. Franchetii). Alkekengi. Winter-Cherry. Chinese Lantern-Plant. Per. but often grown as ann., to 2 ft., with long creeping underground sts.: lvs. ovate, to 3 in. long, chiate: fls. whitish: fr. with blood-red inflated calyx about 2 in long. S. E. Eu. to Japan. Vars. gigantêa and monstrôsa are listed as large forms.—Grown for ornament.

Bûnvardii: P. Alkekengii.

edulis: the plant listed may be either P. ixocarpa or P. peruviana.

Franchètii: P. Alkekengii.

ixocárpa. Tomatillo. Ann. to 4 ft.: lvs. ovate, to 3 in. long, toothed or notched: fls. 3/4 in. across, bright yellow, the throat with 5 black-brown spots: fr. with inflated purpleveined calyx, 1 in or more long, entirely filled by the round sticky purplish berry. Mex.; intro. N.

lobata: Quincula lobata.

peruviàna. Cape-Gooseberry. Partially erect, to 3 ft.: lvs. evenly cordate-ovate, soft-pubescent, often not toothed: fis. ½ in. long, light yellow marked inside with purple, anthers purple: fr. with inflated long-pointed calyx inclosing the yellow edible berry. Tropics.

philadélphica: probably P. subalabrata.

pruindsa. Strawberry-Tomato. Dwarf Cape-Goose-Berry. Stout ann. with angled sts., more or less erect but becoming diffuse, gray-pubescent: lvs. ovate, subcordate but oblique at base, to 4 in. long, coarsely obtuse-toothed to the base: fls. buff-yellow, anthers sometimes tinged purple: fr. yellow or nearly so, edible, in a large pubescent calyx.

Mass. to Fla and west.—Apparently the common husktomato of gardens.

pubescens. Differs from preceding in being more slender and less erect, less pubescent or nearly glabrous, lvs. not toothed to base and mostly narrower and usually nearly entire. Pa. to Calif. and tropics.—The common husk-tomato of gardens was formerly considered to be of this species but how much if any of it belongs here is yet to be determined.

subglabrata. Per. to 5 ft.: lvs. ovate or ovate-lanceolate, to 4 in. long, oblique at base, entire or wavy: Is. yellow with purplish throat, to 1 in across, anthers purplish: fr. with inflated calyx inclosing the red or purple berry. Ont. to Ga. and Colo.

PHYSALODES: Nicandra.

PHYSÀRIA. Cruciferæ. Tufted stellate-pubescent perennials from N. W. Amer. with mostly entire lvs. and yellow fls. having spatulate petals: fr. a somewhat inflated didymous pod (silicle) seemingly lobed at apex with style emerging from sinus. Propagated by seed, cuttings or division and adapted to rock-gardens in well-drained soil.

alpéstris. To 4 in. tall, white-pubescent, sts. ascending, to 6 in. long, unbranched: lvs. spatulate, basal ones petioled: fis. to nearly ½ in. long: pods often tinged purplish, laterally flattened. Arctic regions of N. W. Amer.

didymocárpa. Sts. erect to decumbent, to 6 in. long, short-pubescent: lvs. broadly obovate, to 3 in. long, entire or sinuately toothed: fls. ½ in. long: pods deeply cordate at base. Utah to Colo. north to Sask. and Alta.

floribunda. To 10 in., sts. nearly erect: basal lvs. oblanceolate to spatulate, more erect than in above, sinuately toothed: fls. to 1/4 in. long: pods not strongly cordate at base. Colo.

Geyeri. To 5 in., sts. ascending or decumbent, to 6 in. long: basal lvs. obovate to orbicular, to 2 in. long, petiole winged: fis. to ½ in. long: pods not much inflated, the upper sinus shallow. Wyo., Mont. to Wash.

PHYSIANTHUS ALBENS: Araujia sericofera.

PHYSIC, INDIAN: Gillenia trifoliata. -Nut: Jatropha

PHYSOCÁRPUS (Opulaster).NINEBARK. Rosacex. Deciduous spirea-like shrubs, hardy N., with alternate toothed or lobed lvs. . white or pinkish fls. in umbel-like clusters, and fr. an inflated pod or follicle; native in N. Amer. and N. E. Asia. Hardy in the N. and of easy cult. Propagated by seeds and cuttings of young or old wood.

amurénsis. Similar to P. opulifolius from which it differs in lvs. to 4 in. long and fis. about 1/2 in. across. Manchuria, Korea.

bracteatus. To 6 ft.: Ivs. broad-ovate, to 3 in. long: infl. many-fld.: pods 2, united half their length, pubescent. Colo.

capitatus (Spiræa capitata). Branches partially climbing. to 20 ft. long: lvs. broad-ovate, to 2½ in. long, 3-5-infl. dense: pods usually 5, glabrous. B. C. to Calif.

intermèdius (P. Ramaley). P. missouriensis). To 5 ft.: lvs. ovate, to 2½ in. long: infl many-fld.: pods 3-4, united at base, pubescent. Ont. to Colo. Var. parvifòlius has smaller lvs. and fis.

malvaceus (P. pauciflorus). To 7 ft., sts. quite erect: lvs. orbicular or nearly so, to 2½ in. long, lobes 3-5, doubly crenate-serrate: fis. white, to ½ in. across, in few-fid. umbels: pods usually 2, stellate-pubescent with erect beaks. Wyo. to Utah, Ore. and B. C.

missouriénsis: P. intermedius.

missouriénsis: P. intermedius.

monógynus. To 3½ ft.: lvs. broadly ovate to kidneyshaped, to 1½ in. long, lobes 3-5 and rounded inciselyserrate, glabrous: fls. pinkish to white, to ½ in. across, in
few-fid. umbels: pods usually 2, densely stellate-pubescent
with spreading beaks. Wyo to S. D., Tex. and New Mex.
opulifòlius (Spiræa opulifòlia). To 10 ft.: lvs. ovate,
to 3 in. long: infl. many-fid., to 2 in. across, fls. to ½ in.
across: pods usually 5, glabrous. Que. to Va. and Tenn.
Var. lùtus (var. aureus) has bright yellow lvs. becoming
bronzy. Var. nànus is dwarf with smaller lvs.

pauciflorus: P. malvaceus.

Ramalevi: P. intermedius.

tibética: presumably Neillia thibetica.

PHYSOSIPHON. Orchidacex. Epiphytes of trop. Amer., with commonly clustered 1-lvd. sts. bearing racemes of small to minute fls. of which the sepals are united into a bell-shaped tube inclosing the minute petals and lip. Grown in the cool greenhouse; for cult. see Orchids.

Lóddigesii: P. tubatus.

tubàtus (P. Loddigesia). To about 1½ ft. tall: If. to 5½ in. long: rucemes many-fld.; fls. to ¾ in. long, green, green and orange, yellow, or orange-red. Nov.-Aug. Mex.,

PHYSOSTÈGIA. FALSE DRAGONHEAD. Labiatæ. Per, herbs with slender often wand-like sts. and panicled spikes of gaping fls. in purple, rose or white, whorls 2-fld.; corolla-tube inflated toward the top.

These ornamentals are useful in borders and in wild-gardens and easily cultivated. Propagated usually by division of strong clumps, also grown from seed.

Digitalis. Very similar to P. virginiana from which it differs chiefly in having bluntly-toothed lvs. Ark. to Tex. and Mo.

formosior. To 3½ ft., sts. very leafy: lvs. oblong-lanceolate to ovate-lanceolate, to 4 m. long and 1 in. wide, serrate to denticulate, mostly acummate, glaucous beneath, rather succulent: fis. deep pink, to ¾ in. long, in dense spikes to 6 in. long. N. D.—Differs from P. virginiana in its wider and more blumly toothed lvs. which are not green beneath, in the shorter fis. and in the fr.-calyx globose not oblume.

grandiflora: P. virginiana var.

speciòsa: P. virginiana var.

virginiana (P. virginica. Dracocephalum virginianum). To 4 ft.: lvs. oblong or lanceolate, to 5 in. long, sharply toothed: fls. purphsh-red to rose-pink or lilac, to 1 in. long, in spikes to 8 in. long, summer. Que. to Fla and Tex. Var. álba, fls. white; gigantêa, to 7 ft.; grandiflora, fls. bright pink; speciosa, spikes densely panicled. Other listed vars. are nana, ròsea, rùbra, spléndens, supérba.

PHYTÉLEPHAS. Palmacex. Acaulescent or short-trunked feather-lvd. diccious unarmed palms of several species in northwestern S. Amer.: spadices from lf.-axils and mostly near the ground; staminate spadix a long catkin, the prominent stamens numerous; pistillate spadix comprising a more or less dense head of large fls., the ovary with several cells: fr. a syncarp of several united berry-like parts. See Palm.

macrocárpa. Ivory-Nur Palm. Trunk to 2 ft. long, often or mostly declined or prostrate (or becoming so) and rooting: lvs. very long, erect-curring, to 20 ft. or more; pinnæ about 80 pairs, main ones 2-3 ft. long and 2 in. or less broad, strongly many-nerved, rather stiff; fr.-heads sometimes weigh 25 lbs., and supply "vegetable ivory." Colombia, Ecuador; has been planted in S. Fla.

PHYTEÙMA. HORNED RAMPION. Campanulacex. Many per, herbs with alternate and radical simple lvs., 5-parted blue, purplish or white fls. in terminal heads or spikes, and capsular frs.; fl.-buds mostly long curved and horn-like and fls. not opening widely, with little look of a bellflower; native in Eu. and Asia. Some of the Phyteumas have been referred to the genus

Phyteumas are grown mostly in rock-gardens where they succeed in any good soil, and the larger ones in borders. Propagated by seeds or by division in spring.

betonicæfðlium. To 11/2 ft.: lvs. cor lower long-stalked: fis. blue, in spikes. Eu. cordate-lanceolate.

canéscens. To 3 ft., gray-pubescent and rough: lvs. ovate to lanceolate, toothed: fls. blue, in loose spikes. E. Eu., W. Asia.

Charmélii. To 1 ft.: lvs. oval to lanceolate, toothed: fis. dark blue, in globular heads. Alps.

comòsum. To 6 in. decumbent: lvs. cordate-ovate to lanceolate, coarsely toothed: fis. dark purple, lilac below, the corolla-lobes united into tube above around the longexserted style, borne in umbels. Alps.

Hålleri. To 2½ ft.: lvs. ovate or orbicular, coarsely toothed: fls. dark violet or white, in dense oblong spikes subtended by 2 long drooping bracts. Eu.

hemisphéricum. To 6 in., tufted: lvs. linear or linear-lanceolate, entire: fis. blue or sometimes whitish, in 12-15fld. oval heads. Alps.

hamile. Dwarf, 2-5 in. high, erect: lvs. linear, lower ones nearly or quite reaching the fl-head which is dense and about 34 in. across and subtended by long linear bracts: fls. dark violet. Alps.

limonifòlium. To 2 ft., erect: lvs. lanceolate or narrower, somewhat dentate or entire: fis. blue, in long open spikes, placed singly or in 2's or 3's. Mts., S. E. Eu., S. W. Asia.

lobelioldes. To 2 ft.: lvs. narrow-lanceolate, wavy-toothed: fls. in loose spike-like racemes. Asia Minor.

Michélii. To 2 ft.: lvs. lanceolate to linear, lower long-stalked: fis. violet, rarely white, in dense oblong heads. S. Eu.

nigrum. To 1 ft.: basal lvs. heart-shaped, toothed, long-stalked, st.-lvs. linear: fls. dark blue, in oblong dense heads. En

orbiculare. To 2 ft.: lvs. ovate to linear, toothed: fls. purple, in many-fld. globose heads. Eu.

Scheuchzeri. To 1½ ft.: lvs. oblong to lanceolate, toothed: fis. violet-blue, in dense globose heads 1 in. across subtended by long narrow bracts. S. Eu.

serratum. To 6 in.: lvs. lanceolate, toothed: fis. blue, in globose many-fid. heads to ¾ in. across. Mts., Eu.

Sièberi. To 6 in.: lvs. ovate to lanceolate, toothed: fis. deep blue, in 12-15-fld. globose heads. S. Eu.

spicatum. To 4 ft.: lvs. ovate to linear, toothed, the basal long-stalked: fis. white with greenish tips, in dense oblong spikes. Eu. Var. nigrum is P. nigrum.

Vágneri. Lvs. irregularly toothed, lower long-petioled and cordate at base, upper sessile, linear or linear-lanceo-late: fls. dark violet, in globose spikes becoming elongated. Hungary.

PHYTOLÁCCA. POKEWEED. POKEBERRY. Phytolaccacex. Herbs, shrubs or tree-like plants with alternate simple lvs., small fls. in terminal racemes, and fr. a fleshy berry with staining juice; grown for ornament and P. esculenta as a pot-herb in some countries. Of easy cult. Propagated by seeds.

americana (P. decandra). POKE. SCOKE. Herb to 12 ft strong-smelling: lvs. oblong- or ovate-lanceolate: fis. bi-sexual, white or purplish. Me. to Fla. and Mex.

decándra: P. americana.

dioica (Pircunia dioica). Evergreen soft-wooded tree to 60 ft. and more with thick trunk: lvs. elliptic or ovate: fis. diœcious, white. S Amer.

esculenta (P. Kaempferi). Herb to 3 ft. or more, slightly voody at base: lvs. ovate, edible: fls. bisexual, white. China, Japan.

heterotépala. Shrub: lvs. ovate-elliptic: fis. bisexual, green. Cent. Amer., Mex.

Kaémpferi: P. esculenta.

octándra. Woody herb to 2 ft.: lvs. ovate-lanceolate: fts. bisexual, pinkish-white. Cent. Amer. to Colombia.

PHYTOLACCACEÆ. POKEWEED FAMILY. About 22 American and African genera of herbs. shrubs and trees with alternate entire lvs., regular bisexual or unisexual fls. having no petals, 4-5-parted calyx, 4-5 stamens, superior ovary and fr. a berry, caps. or samara. Agdestis, Ercilla, Petiveria, Phytolacca and Rivina are

PIARÁNTHUS. Asclepiadacex. Leafless S. African herbs of the Ceropegia relationship, very dwarf and succulent, with 5-lobed fls. in pairs or clusters having a simple crown.

cornutus. Sts. procumbent or ascending, to 1½ in. long, globose or oblong, remotely 4-angled, 3-5 tubercled teeth along each angle: fls. white or pale yellow with purplisherimson dots, to 1½ in. across, no distinct tube.

fætidus. Sts. tufted, to 2½ in. long and ¾ in. thick, obtusely 4-5-angled, often mottled with purple: fls. rotate, yellow spotted and lined with purple, ¾ in. across; crown orange-yellow marked with purple-brown.

Nebrownii: hort, name; possibly referable to Caralluma Nebrownia.

PIAROPUS: Eichhornia.

PICEA. Spruce. Pinacex. Evergreen coniferous trees of pyramidal habit and continuing axis, native in cooler parts of northern hemisphere and hardy in cult., with linear 4-angled or compressed lvs. having white bands, catkin-like fls. and drooping cones with persistent scales. in these characters differing from the firs (Abies). For cult, see Conifers.

For cult. see Conifers.

Abies (P. excelsa) Norway S. Branchlets usually droping: lvs. 4-angled, to 34 in. long, dark green and shiny: cones to 7 in. long. Eu.; one of the commonest planted evergreens in N. Amer. Some of the hort. vars. are: argéntea, lvs. variegated with white; argénteo-spica, tips of young branchlets white; airea, lvs. golden-yellow; auréscens, foliage golden-yellow when young, becoming yellowish-green; Bárryi, conical form with thick branches; capitâta, shoots close together at ends of branches, forming heads; chlorocárpa, cones green when young; cincinnâta, lvs. long and spirally twisted; Clanbrasiliâna, compact bush to 7 ft. with whitish branchlets; columnâris, of columnar habit with very short branches; compâcta, dense nearly globose form; cônica, of conical pyramidal habit; Côstickii, listed as of dwarf upright habit; cupréssina, of broad columnar form; diffúsa, dense and wide spreading, foliage light yellowish-green; dumôsa, prostrate; echimæfórmis, dwarf and slow-growing, lvs. long and prickly, resembling a hedge-hog; élegans, of slender conical habit; Ellwangeriana, of broad pyramidal form with crowded branchlets; erythrocárpa, cones violet-purple when young; finedonénsis, tra wide allowed a conical proper servers. a hedge-hog; élegans, of slender comcal habit; Ellwangeriana, of broad pyramidal form with crowded branchlets; erythrocárpa, cones violet-purple when young; finedonénsis, lvs. pale yellow becoming bronzy, then green; Gregoryana, dwarf to 2 ft., with crowded pale branchlets; highlandia, low and dome-like, foliage shining dark green; humilis, very dwarf, foliage small, dark green: invérsa, branches drooping, densely branched; Máxwellii, dwarf form to 2 ft. with very short thick branchlets; Mérkii, low form with thin grass-green lvs.; microspérma, of dense bushy habit; monstrôsa, without branches, only a single st. clothed with stiff lvs.; mucronata, shrub with crowded red-yellow branchlets; nana, dwarf with short orange-yellow branchlets; nana, dwarf with short orange-yellow branchlets; nidifórmis, low form with very dense head, having a nest-like mass of branchlets; nigra, of pyramidal densely branched habit; Ohlendorffii, compact and globular, foliage pale yellowish-green; Pársonsii, straggling dwarf form with drooping branchlets; parvifórmis, of broad pyramidal habit; péndula, branches drooping; procúmbens, prostrate, with horizontal branches in horizontal layers; pymila, dense dwarf form with lvs. blush-green in glabca; pygmæa, dense and small; pyramidalis grácilis, dwarf, nearly globose, foliage bright green; pyramidala (P. excelsa var. erecta), of slender pyramidal habit; Remôntii, dense pyramidal form with erowded yellow branchlets; rèpens, low, branches procumbent or arching, lvs. crowded; tabulifórmis, prostrate, with horizontal branches elongated and without branchlets; virgâta, branches elongated and without branchlets. Other listed varietal names are: borealis, erimata, robusta, Smithii and tenuifolia.

ajanénsis: P. jezoensis.

ajanénsis: P. jezoensis.

álba: P. glauca.

albertiana: P. glauca var. Alcockiana: P. bicolor.

ascéndens: see P. brachytyla.

asperata. Lvs. 4-angled, to % in. long, dark green: cones to 4 in. long. W. China; hardy N. Var. heterolepis (P. heterolepis) has hairy twigs, blue-green glaucescent lvs. and lower cone-scales deeply emarginate. Var. no-tabilis has longer lvs. and cones. Var. ponderosa has thicker bark and larger cones.

aurantiaca. Branchlets orange: lvs. 4-angled, to ¾ in. long, sharp-pointed; cones to 5 in. long. W. China; hardy N.

Balfouriana. Lvs. 4-angled, to ¾ in. long, with 2 white bands above: cones to 3½ in. long. W. China; hardy N. but likely to remain small.

bicolor (P. Alcockiana). ALCOCK S. Lvs. 4-angled, to 34 in. long, with 2 white bands above: cones to 4 in. long. Japan; hardy N. Var. acicularis and var. reflexa have curved lvs. and entire cone-scales.

bifòlia: Abies lassocarpa.

borealis: a form known as the Finnish spruce but not separated botanically from P. Abus.

brachýtyla (P. Sargentana). Branchlets orange-yellow: lvs. flattened, to 1 in. long, white above: cones to 5 in. long. Cent. China; to be tried in north-central regions.—A somewhat more hardy form known as rhombisquamea (P. ascendens) has lvs. to ¾ in. long and cones to 4 in. long, the scales emarginate or erose. Var. complanata (P. complanata). has lvs. to 1 in. long, acute and cones to 6½ in. long with scales truncate or rounded at apex. W. China; hardy N.

Breweriana. Branchlets drooping and whip-like: lvs. flattened, to 1 in. long, with white bands above: cones to 5 in long. S. Ore., N. Calif.—A form pygmæu is listed.

canadénsis: P. glauca.

complanàta: P. brachytyla var.

cornùta: a listed name.

Douglasii: Pseudotsuga taxifolia.

Engelmannii. Lvs. 4-angled or slightly flattened, to 1 in. long. bluish-green: cones to 3 in. long. B. C. to New Mex.; one of the hardiest. Var. argéntea has silvery-gray lvs. and var glaûca steel-blue. Var. Féndleri has drooping branchlets and longer lvs.

excélsa: P. Abres.

excéisa: P. Abnes.

glauca (P. canadensis. P. alba). White S. Branchlets commonly drooping: Ivs. 4-angled, to ¾ in. long, bluishgreen: cones to 2 in. long. Across Canada and in N U. S. Var. albertiana (P. albertana) Alberta S, Ivs. more crowded, cones to 1½ in. long and nearly as broad; B. C. to Mont.; plants grown under this name may be var. densata. Var. airea, Ivs. glolden-yellow. Var. cærdlea, Ivs. glaucous. Var. cónica, dwarf narrowly conical form. Var. densata, Black Hills S, a very hardy form from the Black Hills of S. D., slow-growing and of compact dense symmetrical habit; sometimes grown as var. albertiana. Var. nana, dwarf and dense. Var. párva (var tabultformus), dwarf and flat-topped with horizontal layered branches; tabultformis is var. parva. A var. gloriòsa is listed. tabulifórmis is var. parva. A var. gloriòsa is listed.

Gléhnii. Saghalin S. Lvs. 4-angled, to ½ in. long, deep green: cones to 3 in. long. Japan, Saghalin; very hardy

heterólepis: P asperata var.

hondoénsis: P. jezoensis var.

hudsonia: Abres Fraseri.

Húrstii: unidentified catalogue name.

jezoénsis (P. and Abies ajanensis). Yeddo S. Lvs. flattened, to \(^9\)4 in long, silvery-white above, glossy dark green below: cones to 3\(^1\)2 in long. N. Asia, Japan; hardy N. Var. hondoénsis (P. hondoensis) has shorter lvs. dull green

Kosteriàna: P. pungens var.

Koyamai. Lvs. 4-angled, to 1/2 in. long, with 2 white bands above: cones to 4 in. long. Japan; hardy N.

likiangénsis. Branchlets pale yellow: lvs. 4-angled, with white bands above: cones to 31/2 in. long. W. China.

mariana (P. nigra). BLACK S. Lvs. 4-angled, to % in. mariana (P. nigra). BLACK S. Lvs. 4-angled, to % in. long, dull or bluish-green: cones to 1½ in long. Alaska and northern states to mts. of Va. Some of the hort. vars., are: Beissneri, pyramidal form with light bluish-green lvs.; Doumétii, of dense pyramidal habit; ericoides, slow-growing conical form with very thin lvs.; fastigiâta, of columnar habit; nâna, dwarf form.

Maximowiczii. Japanese Bush S. Lvs. 4-angled, spreading radially, to ½ in. long, dark green and stiff: cones to 2½ in. long. Japan, hardy N.

Meyeri. Lvs 4-angled, to ¾ in. long, bluish-green: cones to 3 in. long. N. China; hardy N.

Mderheimii: P. pungens var.

montigena. Lvs 4-angled, to ½ in. long, with 2 white bands above: cones to 4 in. long. W. China; hardy N.

Morinda: P. Smithiana.

morrisonicola. Lvs. 4-angled, to ¾ in. long, dark green: cones to 2½ in. long. Formosa.

Moseri. Hybrid between P. jezoensis and P. mariana. nlares P mariana

obovata (Abies obovata). Siberian S. Branchlets slightly drooping: lvs. 4-angled, to 34 in. long, dull or bluish-green: cones to 2½ in. long. N. Eu., N. Asia; very hardy. Var. alpéstris, slow-growing form with larger cones. Var fénnica, lvs. dark green.

Omórika (Abies Omorika). Servian S. Lvs. flattened, to ½ in. long, with 2 white bands above and glossy dark green below: cones to 2½ in. long. S. Eu.; hardy N., but requires shelter from winter winds to be at its best. Var. péndula is listed.

orientalis. Branchlets slightly drooping: lvs. 4-angled, to ½ in. long, crowded, glossy dark green: cones to 3½ in. long. Caucasus, Asia Minor; hardy in Cent. New England but does best in sheltered positions. Var. aûrea, lvs bronzygolden. Var. aûreo-spicâta, lvs. yellow when young. Var. nâna (var. compacta), low with wide-spreading branches.

Parryana: synonym of P. pungens.

polita. Tigertail S. Lvs. 4-angled, to 1 in. long, spreading radially, stiff, glossy dark green: cones to 5 in. long. Japan; hardy N.

pungens. Colorado S. Lvs. 4-angled, to 1½ in. long, spreading radially, stiff and spiny-pointed, usually bluishgreen: cones to 4 in. long. Colo., Wyo., Utah, New Mex.; very hardy. Hort. vars. are: argentea, lvs. silvery-white; adrea, lvs. golden-yellow; Bākeri, deeper blue and with longer needles than var. argentea; cærûlea, lvs. bluish-white; compacta, dwarf and compact; glaûca, lvs. bluish. Hoòpsii, very silvery; Hunnewelliana, dense dwarf form; Kosteriana (var. glauca pendula), branchlets drooping, lvs. bluish; Moerheimi, compact, foliage blue; Speckii, foliage blushwhite; víridis, lvs. green.

purpurea. Branchlets orange-yellow: lvs. 4-angled, to ½ in. long, with 2 white bands above and green below: cones to 2½ in. long, purple. W. China; hardy N. in special

retrofléxa. Branchlets bright yellow: lvs. 4-angled, to 1 in. long: cones to 5 in. long. W. China.

ribens (P. rubra. Abies rubra). RED S. Lvs. 4-angled, 14 in. long, dark or bright green: cones to 2 in. long. N. S. to mts. of N. C. Var monstrosa is listed; var. virgata has long slender branches without branchlets.

rithra: P. rubena

Sargentiàna: P. brachytyla.

Schrenkiana. Branchlets drooping: lvs. 4-angled, to 11/2 in. long, radially spreading, dull green; cones to 4 in. long. Cent. Asia; hardy in S. New England. There is a var. glaúca

sitchensis. Sitka S. Lvs. flattened, to 1 in long, spiny-pointed, silvery-white above, glossy green below: cones to 4 in. long. Alaska to Calif., can be grown in central states and S. New England, best in long dry summers. Var. speciosa is more compact and slower-growing.

Smithiana (P. Morinda). Himalayan S. Branchlets drooping: lvs. 4-angled, to 2 in. long, spreading radially, bright or dark green: cones to 7 in. long. Himalayas; can be grown in north central Atlantic states and in S. New England in sheltered positions.

spinulòsa. Branchlets drooping: lvs. slightly flattened, to 1½ in. long, w th 2 glaucous bands above: cones to 4 in. long. Himalayas; to be planted far S.

Watsoniana: P. Wilsonii.

Wilsonii (P. Watsoniana). Lvs. 4-angled, ½ in. long, sharp-pointed, dark green: cones to 2½ in. long. Cent. China; hardy N.

PICKEREL-WEED: Pontederia cordata.

PICKERINGIA. CHAPARRAL - PEA. uminosæ. One spiny evergreen shrub, P. montana, allied to Lupinus but differing in stamens all distinct. To 7 ft., much branched: lvs. palmately 1-3-foliolate, to ½ in. long, nearly sessile, lfts. obovate to oblanceolate, glabrous to tomentose, stipules absent: fls. purple, to 3/4 in. long, almost sessile: pod flattened, straight and linear. Calif.

PICOTEE: Dianthus Caryophyllus.

PICRÁSMA. Simarubacex. A small genus of subtrop. trees and shrubs occurring in Asia, W. Indies and Brazil, having large unequally pinnate lvs. and small fls. in axillary panicles: fr. of 1-5 fleshy or leathery drupes.

quassioldes. Shrub to 8 ft. or more, irregularly branched with sts. often decumbent, bark very bitter: lvs. to 15 in. long, lfts. 9-15, obovate, acuminate, serrate, lowest pair small and stipule-like: fis. green: fr. of 3-5 membranous drupes, each about ¼ in. diam. and 1-seeded. Himalayas.

PICRIDIUM VULGARE: Reichardia picroides.

PÍCRIS. Compositæ. Hairy ann. or per. herbs native in temp. regions of the Old World, with alternate toothed lvs. and heads of yellow ligulate fls. borne in corymbs; pappus of white bristles. Sometimes seen in the flower-garden.

echioldes. Ann. to 2 ft., with appearance of Sonchus: lvs. oblong-lanceolate, wavy-toothed, covered with bristly hairs: heads ½ in. long. Eu., N. Afr.

PICROTHAMNUS: see Artemisia spinescens.

PIE-PLANT: Rheum Rhaponticum.

PÌERIS. Ericaceæ. Evergreen shrubs or small trees in N. Amer. and Asia with mostly alternate toothed lvs., white urn-shaped fls. in terminal panicles, and dry capsular frs.

Pierises require moist peaty or sandy soil and partial shade. They are sometimes forced under glass. Propagated by seeds, by layers, and cuttings of ripe wood under glass which root slowly. The following (except the last two) are hardy North.

floribúnda (Andromeda florabunda). To 6 ft., the branches hairy: lvs. ciliate: fls. 1/4 in. long, in erect panicles to 5 in. long. Apr.-May. Va. to Ga.

formôsa. Small shrubby tree to 20 ft: lvs. elliptic-oblong to lanceolate, to 6 in. long, acuminate, margins finely toothed: fls. white, often tinged pink, panicles drooping, to 6 in. long. E. Himalayas.

japónica (Andromeda japonica). To 10 ft. or more, the branches glabrous: fls. ½ in. long, in drooping panicles to 6 in long. Apr.-May. Japan. Var. variegata (var. albomarginala), lvs. with whitish margins.

lùcida: Lyonia lucida.

mariana: Luonia maruana.

nana (Arcterica nana). Prostrate shrub with puberulous sts.: Ivs. elliptic to elliptic-oblong, to ½ in. long, entire, mucronulate, usually in whorls of 3: fls. to ½ in. long, in terminal 3's or short racemes. N. E. Asia.—Not hardy north of Va.

nítida: Lyonia lucida.

taiwanénsis. Branches glabrous: fls. ¼ in long, nodding, in dense panicled racemes to 2½ in. long. Formosa.

PIGEON-BERRY: Duranta repens.

PIGNUT: Carya glabra.
PIGWEED: Chenopodium.

PILEA (Adicea). Urticaceæ. Small herbs with opposite lvs. and small unisexual fls. in axillary clusters; grown as pot-plants or for edgings in greenhouses or out-of-doors in the S. for the compact habit and small foliage; native in warm and tropical countries. Of easy cult. but require abundant moisture. Propagated by cuttings.

callitricholdes: P. microphylla.

microphylla (P. callurichoides. P. muscosa). ARTILLERY PLANT. Ann. or bien., the fleshy sts. suberect to 1 ft. high: lvs. oblong to ovate with cuneate base, of unequal size, to ½ in. long, enture, petiole much shorter than blade, cystoliths (minute calcium secretions) on lower lf. surface very faint and absent above: fls. in sessile or subsessile cynnes, staminate fls discharging pollen forcibly when dry. Trop. Amer. S. Fls.—A very variable species, growing as a slender impoverished plant in crevices among rocks or as a robust plant in the border. Requires protection in the N. Much grown in greenhouses.

muscosa: P. microphylla.

nummulariæfðlia. CREEPING CHARLEY. Per. with creeping sts. rooting at nodes: lvs. orbicular, to ¾ in. across, crenate. W. Indies.

serpyllacea. Similar to P. microphylla in general habit and appearance, differing in its orbicular lys. rounded at base, and fis. in pedunculate cymes, the peduncles usually longer than the lys. Trop. Amer.

serpyllifòlia. Material listed in the trade under this name is probably *P. microphylla*, as the true *P. serpyllifolia* is not known to be cult.

PILEOSTÈGIA. Saxifragaceæ. A monotypic shrubby E. Indian genus. P. viburnoides. Vi burnum-like shrub: lvs. opposite, petioled, ovatelanceolate to oblong, 3-5 in. long, entire, persistent, leathery: fls. small, in terminal panicles; petals 4-5, falling off in a cap; stamens 8-10; ovary inferior, 4-6-celled.

PILOCÈREUS. Cactaceæ. The older and accepted name for this genus is Cephalocereus, which see. The following names under Pilocercus are referable to other genera; some are insufficiently described and are here placed provisionally under their original name. Certain cactus writers retain the genus Pilocercus.

acránthus: see Haageocereus acranthus.

albispinus (Cereus albispinus). Columnar, usually simple; ribs 8-12, woolly at top; radial spines 8-13, white tipped with red. W. Indies. Var. Wéberi has weak branches and shorter spines.

arrábidæ: Cephalocereus arrabidæ.

atro-viridis. To 3 ft., branches to 8 in. thick and tipped with white hairs; ribs about 8 and wavy; radial spines 8; central spines 3 and ¾ in. long, white. Colombia.

Báckebergii (Cereus Backebergii). Tree-like, to 15 ft., light bluish-green; rubs 9-15 with arcoles having silky white wool; radial spines 10-12 and ½ in. long; central to 2 in. long: fls. yellowish-green, whitish inside. Venezuela.

brasiliénsis: Cephalocereus brasiliensis.

Celsianus: Oreocereus Celsianus.

chrysacánthus: Cephalocereus chrysacanthus.

Cóllinsii: Cephalocereus Collinsis.

colombianus: Cephalocereus colombianus.

Dautwitzii: Espostoa lanata.

erythrocéphalus: Denmoza rhodacantha. euphorbioides: Cephalocereus euphorbioides.

fossulàtus: Oreocereus Celsianus var. foveolatus.

Fricii (Cereus Fricii). Tree-like, little branched; ribs 4-5, areoles woolly; radial spines 7, to 1 in. long; central usually 1, to 2 in. long; fls. white, greenish outside. Venezuela.

gigantèus: Carnegiea gigantea.

Gounéllei: Ccphalocereus Gounellei.

Haagei: Espostoa lanata.

Hoppenstedtii: Cephalocercus Hoppenstedtii.

Houllétii: Cephalocereus Palmeri. lanugindsus: Cephalocereus lanuginosus. leucostèle: Cephalocereus leucostele.

Llànosii. Similar to Cereus peruvianus. S. Amer.

 $macroc\'ephalus:\ Cephalocereus\ macrocephalus.$

Moritzianus: Cephalocereus Moritzianus.

nóbilis: Cephalocereus nobilis.

pentædrophorus: Cephalocereus pentædrophorus

Púrpusii: Cephalocereus Purpusii.

remolinensis (Cereus remolinensis). Much branched, 30-40 ft., shining green; ribs 6-7, the areoles densely woolly when young; radial spines 7-13 and to ½ in. long; central to 1 in. long; fls. creamy-white tipped with lilao-rose, to 2½ in. long. Colombia.

Russelianus: Cephalocereus Russelianus.

Sartoriànus: Cephalocereus Sartorianus.

senilis: Cephalocereus senilis.

sericàtus: see Espostoa lanata. setòsus: Cephalocereus Gounellei.

Smithianus: Cephalocereus Smithianus.

Straussii: Clerstocactus Straussii. Tetétzo: Pachycereus Tetetzo.

Tróllii: Oreocereus Trollii.

PILOGYNE: Melothria punctata.

PIMÈLEA (Banksia of some writers). RICE-FLOWER. Thymelæaceæ. Shrubs native in Australia and New Zeal., with simple entire lvs., white, pink or reddish fls. in terminal heads, bisexual or diœcious, fr. a drupe.

Pimeleas are grown out-of-doors in warm climates and in the greenhouse. Propagated in early spring by cuttings of half-ripened shoots under glass in a temperature of 55-60°. coarctica: listed name of dwarf plant reputed to have glaucous lvs, abundant minute white fis. and white fr.--The name is not botanically known.

decussata: P. ferruginea.

ferruginea (P. decussata). To 3 ft.: lvs. opposite and crowded, ovate or oblong, to ½ in. long, margins revolute: fls. rose, in round heads which are subtended by pink or red involueral lvs. or sometimes only tinged. W. Australia.

graciliflòra. To 2½ ft : lvs. opposite, lanceolate, to ¾ in long, dotted above: fls. white, in globular heads. W. Australia.

ligustrina. To 6 ft.: lvs. opposite, ovate or oblong, to 1½ in. or more long: fis. white, in globular heads. Australia, Tasmania

spectábilis. To 4 ft.: lvs. opposite and crowded, linearoblong to lanceolate, to 1½ in long: fis. white or pinkish, in large globular heads subtended by involucial lvs. tinged on margins. W. Australia.

PIMÉNTA. Myrtacex. Aromatic trees of trop. Amer. with opposite simple leathery lvs., small fls. in cymes, and drupaceous fr.; one species furnishes allspice and another grown for the oil which is used in the preparation of bayrum. Adapted to trop. climates.

acris (Amomis caryophyllata). BAY-RUM-TREE. To 45 ft.: lvs. elliptic to obovate, to 6 in. long: fls. white; calyx 5-lobed: fr. about 1/3 in long. W. Indies, S.

officinalis. Allspice. Pimento. To 40 ft.: lvs. oblong, to 7 in. long: fls. white; calyx 4-lobed: fr. dark brown, 1/2 in. long. W. Indies, Cent. Amer.

PIMENTO: from Spanish pimiento, pepper; in U. S. applied as a general term to Capsicum, and sometimes to a specific cult. variety.

PIMPERNEL: Anagallis.

PIMPINÉLLA. Umbelliferæ. Herbs with pinnately compound lvs., small white or yellow fls. in compound umbels, and ovate frs.; anise is cult. for its use in medicine and cookery. Propagated by seeds sown where plants are to stand.

Anisum. Anise. Ann. to 2 ft.: basal lvs. simple or ternate, st.-lvs. 1-2-pinnate or ternate, entire or toothed. Greece to Egypt

mágna. To 2½ ft., stout: If.-segms. usually undivided, ovate to lanceolate, to 1½ in. long, teeth or lobes very pointed: fis white or in var. rôsea pink, in large terminal umbels of 10-15 rays. Fu.

PINACEÆ. PINE FAMILY. About a dozen genera of resinous trees and shrubs of wide distribution, having linear needle-like lvs., fls. in cones, and fr. a hard woody cone. The family was established by Lindley in 1847 and until recently included the Taxodiaceæ and Cupressaceæ, two groups here treated as separate families. Pinaceæ is technically distinguished by the cones, formed of distinct scales and bracts, the former with 2 usually winged seeds. See Consfers. The family contains many valuable timber trees and numerous ornamental subjects, as Abies, Cedrus, Keteleeria, Larix, Picea, Pinus, Pseudolarix, Pseudotsuga, Tsuga.

PINÁNGA. Palmaceæ. Bamboo-like unarmed ringed monœcious feather-palms of the Indo-Malayan region, 60 or more species: trunks solitary or plant gregarious or colonizing: pinnæ mostly short, often broad, sometimes truncate and toothed at apex, upper ones mostly confluent: spadices among the lvs., short, commonly with few or several strands from the base; fls. in 3's, the middle one pistillate; stamens 6 or more: fr. small, ovoid or ellipsoidal. Sometimes grown under glass and to be expected in S. Fla. See

decora. St. tall: lvs. arching and graceful; pinnæ of mature lvs. apparently 2 pairs, broadly lanceolate and gradually acuminate, strongly several-nerved. Borneo.—Described from juvenile plants and character doubtful; perhaps two palms have passed under this name.

Kùhlii. Attractive plant because of the neat tufted habit and coral-red refracted spadices: sts. several, to 30 ft., many-ringed: lvs. 3-4 ft. long, pliable; pinne 3-6 pairs, 1-2 ft. long and to 3 in. broad, strongly several-ribbed, the upper ones truncate and toothed, the lower sharply acuminate; spadix 1 ft. long, of several branches: fr. nearly ½ in. long S. Andaman Isis., Sumatra, Java.

pátula. Plant colonizing: st. solitary, 6 ft. or more, ringed and smooth: lvs. 4-5 ft. long; pinne strongly severalnerved, 16-36, the lower and middle ones 6-12 in. long and long-acuminate and 1-2 in. broad, the upper ones broader and confluent and truncate and toothed at apex: spadices on the trunk below the lvs., short-peduncled, with several rather stout branches: fr. ellipsoid, orange-red, 3/4 in. long. Sumatra.

PINCUSHION, BLUE: Brunonia australis. -Flower: Scalvosa.

PINE: Pinus. Australian-: Casuarina. -Barren Beauty: Pyxdanthera barbulata. Cypress-: Callitris. Dammar-: Agathis. Ground-: Lycopodium obscurum Hoop-: Araucaria Cunninghami. Huon-: Dacrydum Franklinii. Kauri-: Agathis. New-Caledonian-: Araucaria columnaris. Norfolk-Island-: Araucaria excelsa. Running-: Lycopodium clavitum. Screw-: Pandanus. Umbrella-: Sciadopitys verturilata.

PINEAPPLE. A composite body representing the fruiting inflorescence of *Ananas comosus*; see *Ananas*.

Some years ago, along the east coast of Florida, the pineapple was raised on a very considerable scale in the open and under slat sheds as far north as 27.5°. In other parts of that state, as in Lee, Orange and Pinellas counties it was grown to some extent under lath sheds. At one time the crop was in excess of a half million crates annually, but now the pineapple, as a commercial fruit, has almost disappeared from Florida. This was brought about by a combination of circumstances, among which may be mentioned diseases (in particular, a wilt caused by a virus spread by mealy-bugs), a succession of cold winters. high freight rates, and the development of its culture elsewhere, particularly in Cuba, Puerto Rico and Hawaii. At present most of the fresh fruit entering the markets of the eastern United States comes from Cuba and Puerto Rico. The western states are supplied with fresh fruit from Hawaii and the canned fruit trade is furnished almost entirely with large quantities from the Hawaiian fields. The largest areas are in Hawaii where 75 per cent of the world's crop is produced. Most of the product is canned.

Commercial propagation of pineapple is by means of (1) rations, or suckers, that come from the base of the old fruiting stem, (2) stem slips developed along the trunk or stem of matured plants, and (3) fruit slips, produced around the base of the fruit. The crown, or leafy part on top of the fruit, will also produce a plant, but it is slow in coming into fruit and it is not usually employed in commercial plantings. Plants will also develop from old stems if they are cut up and partially buried in the earth.

The exact nature or character of the soil is not important. It may vary from light sand to heavy clay. It is important, however, that it be thoroughly well drained, for although the pineapple requires abundant water for its development, it will not grow where the drainage is poor and water stagnates. In some localities excess lime and manganese have caused trouble. The difficulties due to the presence of manganese are caused by its effect on the availability of iron and have been overcome by using iron sulfate spray.

Pineapples are planted in beds of three or more rows. In Hawaii the three-row system is

largely used in planting Smooth Cayenne, while beds with a larger number of rows are preferred in the West Indies for smaller-fruited varieties. The number of slips to the acre will vary from 7,500 to 15,000 depending on the distance apart they are set and the number of rows to each bed. The usual distances apart for the plants vary from 18-24 inches. Slips are set just deep enough to keep them in an upright position. On light soils it is usual to drop a small amount of cotton-seed-meal into the centers of the plants. This forms a cake and prevents their being filled with sand

Tillage must be shallow (an inch or so) inasmuch as pineapple roots are near the surface. The favorite tool is the scuffle hoe with which shallow cultivation and weed destruction are readily accomplished. Old plantations are not cultivated. In Hawaii mulching with special

paper has come into considerable use.

The extent to which fertilizers are used will depend on the nature of the soil, the number of plants set to an acre, and the age of the plantation. On light sandy soils fertilizers are applied in large quantities, a ton or more to the acre being not unusual. Applications are usually made in October, February and June. Tankage and dried blood are good sources of nitrogen, potash may be furnished from high or low grade sulfate of potash, and phosphoric acid from ground bone, raw or steamed. In Hawaii high analysis fertilizers with ammonium sulfate as a nitrogen source are used.

Yields vary with intensity of culture. The first and heaviest crop in Hawaii may be 30 tons to the acre. Three crops are usually harvested before replanting which may total 50-60 tons to the acre.

If intended for shipment to distant points pineapples are commonly picked a week or so before reaching full maturity. If intended for local consumption or for canning at nearby establishments they may be allowed to become much riper, thereby developing their full delicious flavor. There is perhaps no more luscious fruit than a well-grown field-ripened pineapple. For shipment, fruits are wrapped in paper and packed in crates, in rows, the crowns and bases alternating. The superior varieties are packed in cases with excelsior.

Insect and disease control presents a serious problem. The wilt is caused by a virus spread by mealy-bugs. Another virus is spread by thrips. Spraying with contact insecticides, particularly oil emulsions, controls these insects and thus checks the spread of the diseases. Nematodes are often troublesome. They are best handled by rotating the crop, and planting crotalaria or Natal-grass to starve them out. Several soil and fertilizer troubles may arise, but these can usually be overcome without much difficulty.

Varieties of pineapples in commercial plantings have never been great in number when compared with other fruits. In Hawaii the favorite is Smooth Cayenne and this has been the most important fancy variety in other parts of the world. In Florida in years past, and in the West Indies now, the most important variety by far is Red Spanish. Here and there other varieties, Porto Rico for example, a very large kind, and Abbaka a small fruit of very high quality, are seen. Into commercial plantings

today only two varieties, Smooth Cayenne and Red Spanish, enter to any extent.

PINEAPPLE-FLOWER: Eucomis comosa.

PINEWEED: Hypericum gentianoides.

PINGUÍCULA. BUTTERWORT. Lentibulariaceæ. Small herbs with basal entire lvs. usually covered above with a sticky secretion on which insects adhere, white, purple or yellow fis. solitary on a scape, the corolla 2-lipped and spurred at base, and capsular frs.; of wide distribution in moist ground.

Butterworts are grown mostly on rocks or in moist rockgardens. Propagated by seeds and offsets when produced. australis: P. elatior.

elàtior (P. australis). To 1 ft.: lvs. to 1½ in. long: fls. purple varying to white, 1 in. across, the lobes 2-parted. N. C. to Fla.

grandiflora. To 8 in.: lvs. oval; fls. violet, 1 in. long and ¾ in. across, the lobes wavy. W. Eu.

lùtea. To 1 ft.: lvs. ovate, to 2½ in. long: fls. goldenyellow, to 1½ in. long and broad, with nearly regular corolla-limb. N. C. to Fla. and La.

Reûteri. Per. to 6 in., glandular-pubescent: lvs. ovateoblong: fls. lilac-blue, to ¾ in. long, upper lobes subacute. Swiss Alps.

vulgāris. To 6 in.: lvs. ovate, to 1½ in. long: fls. violet or purple, ½ in. long and broad. N. N. Amer., Eu., Asia.

PINGUIN: Bromelia Pinguin.

PINK: Dianthus. Cushion: Silene acaulis. Fire: Silene virginica. Ground: Phlos subulata, Gilia dianthoides. Indian: Silene laciniata, Lobelia cardinalis. Moss:: Phlos subulata. Mullein:: Lychnis coronaria. -Root: Spigelia marilandica. Sea:: Armeria. -Shower: Cassia grandis. Swamp:: Helonius bullata. -Vine: Antigonon leptopus. Wild: Silene caroliniana.

PINNA: a primary division or leaflet of a pinnate leaf.

PINNATE: feather-formed; with the leaflets of a compound leaf placed on either side of the continuing rachis.

PINNATIFID: cleft or parted in a pinnate (rather than palmate) way.

PINNATISECT: cut down to the midrib in a pinnate way.

PINNULE: a secondary pinna or leaflet in a pinnately decompound leaf.

PIÑON, PINYON: Pinus cembroides.

PINUS. PINE. Pinaceæ. Commanding evergreen trees having two kinds of lvs., the scale-like ones deciduous, the permanent lvs. linear and borne in clusters usually of 2-5, staminate fis. in catkins, and cylindric or nearly globose pistilate cones with woody scales; native in the northern hemisphere, and furnishing many valuable timber and ornamental trees, most of them adapted to large areas and extended grounds but a few dwarf and compact forms. For cult. see Conifers.

albicaulis. WHITEBARK P. Lvs. in clusters of 5, to 21/2 in. long, stiff, dark green: cones ovoid, to 3 in. long. B. C. to Calif.; very hardy.

aristata. Hickory P. Bristle-Cone P. Sometimes shrubby: lvs. in clusters of 5, to 1½ in. long, dark green with whitish exudations of resin: cones cylindric-ovoid, to 3½ in. long. Calif. to Colo.; stands in S. New England but grows very slowly.

arizónica: P. ponderosa var.

Armandii. Lvs. in clusters of 5, to 6 in. long, bright green and thin: cones oblong-conical, 6 in. and more long. China, Formosa, Korea; hardy N.

attenuata (P. tuberculata). KNOB-CONE P. Lvs. in clusters of 3 or rarely 2, to 5 in. and more long, pale yellowish or bluish-green: cones conic-oblong, to 6 in. long. Ore. to Calif.

austriaca: P. nigra.

Ayacahûite. Mexican White P. Lvs. in clusters of 5, to 6 in. long, bluish-green: cones cylindric-conical, to 15 in. long. Mex. to Guatemala. Var. brachýptera has larger seeds. Var. Veitchii has longer cones.

Balfouriana. FOXTAIL P. Lvs. in clusters of 5, to 11/2 in.

long, stiff, dark green: cones cylindric, to 5 in. long, drooping.

Banksiàna (P. divaricata). JACK P. Lvs. in clusters of 2, 1 in. long, stiff and twisted, bright or dark green: cones conic-oblong, to 2 in. long. N. S. to N. Y. and Minn.

brùtia: P. halepensis var.

Bungeana. LACEBARK P. Lvs. in clusters of 3, to 4 in. long, stiff, light green. cones come-ovate, to 3 in. long. N. W. China; hardy N. but may remain bushy.

canariénsis. Lvs. in clusters of 3, to 12 in. long, glossy light green, drooping: cones cylindric-ovoid, to 8 in. long. Canary Isls.

caribæa. Slash P. Lvs. in clusters of 3 or 2, to 12 in. long, glossy dark green: cones conic-oblong, to $6\frac{1}{2}$ in. long. S. U. S., Cent. Amer.

Cémbra. Swiss Stone P. Lvs. in clusters of 5, to 5 in. long, dark green: cones ovoid, to 3½ in. long. Eu, N. Asia; hardy N., but very slow growing. Var. aårea, foliage yellowish. Var. columnaris is of columnar habit. Var. sibírica has shorter lvs. and larger cones.

cembroides. Mexican Srone P. Piñon or Pinyon. Lvs in 3 or 2, to 2 m. long, dark green: cones nearly globose, to 2 m. long. Ariz. to Mex.; to be planted far S. Var. edùlis (P. edulas). Nur P. Lvs stiff, dark green. Wyo. to New Mex.; apparently hardier. Var. monophylla (P. monophylla. P. Fremontuna). Lvs. usually solitary, stiff and spiny-pointed. Calif. to Colo. Var. Parryana (P. Parryana. P. quadrifola). Lvs. in clusters of 3-5, stiff, pale clusters green. glaucous-green. Calif.

clausa. Sand P. Lvs. in clusters of 2, to 3 in. long, dark green: cones conic-ovoid, to $3\frac{1}{2}$ in. long. Fla., Ala.

contorta. Shore P. Lvs. in clusters of 2, to 2 in. long, stiff and twisted, dark green: cones come-ovoid, to 2 in. long. Alaska to Calif.; not hardy in northeastern states. Var. latifolia (P. Murrayana). Longer-Pole P. Lvs. longer, lighter green. Rocky Mts.; hardy E.

Coulteri. Lvs. in clusters of 3, to 12 in long, dark bluish-green: cones cylindric-ovoid, to 14 in. long, drooping. Calif.; can be grown in sheltered places in S. New England.

densifiora. Japanese Red P. Lvs. in clusters of 2, to 5 m. long, bright bluish-green: cones conic-ovoid to oblong, 2 m. long. Japan; hardy N, but sometimes suffers in severe winters. Hort. vars. are: álbo-termináta, tips of lvs. yellowish-white; aûrea, lvs. yellow; globòsa, dwarf globose form; oculus-draconis, lvs. with 2 yellow bands; péndula, branches drooping or prostrate; umbraculifera, Tannosno, Japanese Umbrella-like head.

divaricata: P. Banksiana.

echinata (P. mutis). Shortleaf P. Lvs. in clusters of 2, to 5 in. long, dark bluish-green: cones conic-oblong, to 2 in. long. N. Y. to Fla. and Tex.

edulis: P. cembroides var.

excélsa: P. nepalensis.

fléxilis. Limber P. Lvs. in clusters of 5, to 3 in. long, stiff, dark green: cones ovoid, to 6 in. long. Alta. to Calif. and Tex.; hardy N. Var. refléxa, taller, with longer lvs. and cones. Ariz.

Fremontiàna: P. cembroides vas. monophylla.

Gerardiana. Lvs. in clusters of 3, to 4 in. long, bluish-green: cones to 9 in. long. Himalayas.

glabra. CEDAR P. Lvs. in clusters of 2, to 3 in. long, soft: cones ovoid, to 2½ in. long. S. C. to Fla. and La.

halepénsis. Aleppo P. Lvs. in clusters of 2 or rarely 3. Medit. region; to be planted in mild climates. Var. brûtia (P. brutia. P. pyrenaica). Lvs. longer, stiffer, darker green.

Heldreichii. Graybark P. Lvs. in clusters of 2, to 2) in long, stiff, bright green: cones ovoid, 3 in. long. Balkan Peninsula; hardy N. Var. leucodermis (P. leucodermis) has more whitish bark and grayish-white smooth twigs.

horizontàlis: P. nigra var. cebennensis.

insígnis: P. radiata.

insularis. Benguet P. Lvs. in clusters of 3, or rarely 2, to 10 in. long, pliable, bright green: cones ovate-conic, to 4 in. long. Philippines, Burma.

Jéffreyi. Lvs. in clusters of 3, to 8 in. long, pale bluisheen: cones conic-ovoid, to 12 in. long. Ore. to Calif.; hardy N.

koraiénsis (P. mandshurica). Korean P. Lvs. in clusters of 5, to 4 in. long, dark green: cones conic-oblong, to 6 in. long. Japan, Korea; hardy N., but grows slowly in northern climates and should be planted in sheltered positions. Var. gladca has bluish-green foliage.

Lambertiana. Sugar P. Lvs. in clusters of 5, to 4 in. long, sharp-pointed, with white lines on back: cones cylindric, to 20 in. long. Ore. to Lower Calif.; hardy N., needs protection from winter winds.

Larício: P. nigra.

leiophýlla. Lvs. in clusters of 3, to 4 in. long, lf.-sheaths deciduous: cones to 2 in. long. New Mex., Ariz., N. Mex.

leucodérmis: P. Heldreichin var.

longifòlia: P. Roxburghir.

luchuénsis. Lvs. in clusters of 2, 6 in. long: cones ovate-conic, 2 in. long. Lu-Chu Isls. south of Japan.

mandshirica: P korajensis

marítima: P. Pinaster.

Massoniana. Lvs. in clusters of 2, to 8 in. long, thin, light green: cones ovoid, to 3 in. long. China, probably not hardy N.—The material usually cult. under this name is P. densifora.

Merkùsii. Tenasserim P. Differs from P. insularis in lvs. in clusters of 2 and narrow-cylindrical cones to 3 in. long. Philippines.

mitis: P. echinata.

mongólica of the trade is probably P. tabulæformis.

monophylla: P. cembroides var.

monspeliénsis: P. nigra var. cebennensis.

montàna: P. Mugo.

Montezumæ. Lvs. usually in clusters of 5, to 12 in long, often bluish-green: cones conical, to 12 in. long. Mex. to Guatemala. Var. Hártwegii has shorter lvs. and smaller

monticola. Western White P. Lvs. in clusters of 5, to 4 in long, stiff, bluish-green; cones cylindric, to 11 in. long. B. C. to Calif.; hardy N.

Mùgo (P. montana). Swiss Mountain P. Lvs. in clusters of 2, to 2 in long, crowded, bright green: cones ovoid, to 2½ in long. Eu.; hardy N. Var. compácta, dense globose form. Var. gállica is listed. Var. Mùghus (var. globose form. Var. gállica is listed. Var. Mùghus (var. prostrata). Commonly a prostrate shrub with shorter cones. Var. Pumflio (P. Pumho). Usually shrubby. Var. rostràta (P. montana var. uncinata. P. uncinata). Tree to 80 ft.: cone-scale apices pyramidal and with deflexed hook-like processes France, Spain Var. rostundata. Tree to 30 ft. with several sts. Var. Slavinii. Low, compact and spreading with crect branchlets, foliage bluish-green.

muricata. Bishop P. Lvs. in clusters of 2, to 7 in. long, stiff, usually twisted, dark green: cones oblong-ovoid, to 3½ in long Calif.

Murrayana: P. contorta var. latifolia.

Nélsonii. Lvs. in clusters of 3, to 31/2 in. long, grayishgreen; cones cylindric. Mex.

nepalénsis (P. excelsa). Himalayan White P. Blue P. Lvs. in clusters of 5, to 8 in. long, drooping, grayish-green: cones cylindric, to 10 in. long. Himalayas. Var. zebrina, lvs. with yellow areas, appearing as if zoned.

lvs. with yellow areas, appearing as if zoned.

nigra (P. austriaca. P. Lariceo. P. nigra var. austriaca).

Austrian P. Lvs. in fascicles of 2, to 6½ in. long, stiff, dark green: cones ovoid, to 3½ in. long. Eu., Asia Minor; hardy and good. Var. calábrica is var. Poiretiana. Var. caramánica (var. Pallasiana). Crimean P. Tree with broad pyramidal head and glossy lvs. W. Asia. Var. cebennénsis (P. monspeliensis. P. horizontalis). Lvs. slender, cones smaller. S. France, Pyrenees. Var. globòsa is very dense. Var. Hornibrookiàna. Low and spreading, lvs. stiff and crowded, to 2½ in. long. Var. monstròsa. Of columnar habit, the branchlets irregular and contorted. Var. péndula has drooping branches. Var. Poiretiàna (var. calabrica). Corsican P. Tree with narrower head and lighter twisted green lvs. S. Eu. Var. prostràta has prostrate branches, var. pygmæa is dwarf, and var. pyramidàlis is narrow with ascending curved branches. ascending curved branches.

occarpa. Tree to 50 ft.: lvs. in fascicles of 3, 4 or 5, erect, to 12 in. long, bright green: cones ovoid, to 3½ in. long, persistent, hanging from elongated usually curved peduncle. Mex. and Cent. Amer.—Doubtfully in cult. although listed.

palústris. Longleaf P. Lvs. in clusters of 3, forming tufts at ends of branchlets, to 18 in long, dark green: cones cylindric, to 10 in. long. Va. to Fla. and Miss.; adaptable in the S.

Parryana: P. cembroides var.

parviflora. JAPANESE WHITE P. Lvs. in clusters of 5, forming tufts at ends of branchlets, to 1½ in. long, bluishgreen: cones ovoid, to 3 in. long, Japan; hardy N. Var. glatica has glaucous lvs. Var nana is less vigorous and has shorter lvs. Var. pentaphylla (P. pentaphylla) is the wild

pátula. Lvs. usually in clusters of 3, to 12 in. long, drooping, grass-green: cones conic-ovoid, to 4½ in. long. Mex.

pentaphýlla: P. parviflora var.

Pedce. Macedonian P. Lvs. in clusters of 5, to 4 in. long, bluish-green: cones cylindric, to 6 in. long. Balkan Mts.; very hardy.

Pináster (P. maritima). CLUSTER P. Lvs. in clusters of 2, to 9 in. long, stiff, glossy green: cones conic-ovoid, to 7 in. long. Medit. region; will stand only S. and in Calif., although it may be grown in favored positions in S. New England if protected. Var. Hámiltonii has shorter lvs. and

Pinceana. Lvs in clusters of 3, to 6 in. long: cones cylindric, to 3 ½ in. long. Mex.

Pines, ITALIAN STONE P. LVs. in clusters of 2, to 8 in. long, stiff, bright green; cones ovoid, to 5½ in. long. Medit.

Poiretiana: P. nigra var.

ponderosa. Western Yellow P. Lvs. usually in clusters of 3, to 11 in. long, dark green. cones ovoid-oblong, to 6 in. long. B. C. to Mex. and Tex.; hardy N. Var. arizonica has shorter lvs. and cones. Ariz., New Mex. Var. pendula has drooping branches. Var. scopulorum (P. scopulorum), Rocky Mt. Yellow P., is smaller.

pumila. Dwarf Stone P. Shrub with prostrate branches: lvs in clusters of 5, to 3 in. long: cones ovoid, to 1¾ in. long. N. Asia.

Pumílio: P. Mugo var.

púngens. Table Mountain P. Lvs. in clusters of 2 or 3, to 2½ in. long, stiff and twisted, dark green: cones conic-ovoid, to 3½ in. long. N. J. to Ga

pvrendica: P. halepensis var. brutia.

quadrifòlia: P. cembroides var Parryana.

radiata (P. insignis). MONTEREY P. Lvs. in clusters of 3, to 6 in. long, bright green cones conic-ovoid, to 7 in. long. S. to Lower Calif. Var. binata. Lvs. in clusters of 2. stouter. Santa Rosa and Guadalupe Isls.

resinosa. Red P. Lvs. in clusters of 2, to 6 in. long, flexible, glossy. cones conic-ovoid, to 2½ in. long. Newf. to Pa. and Minn.; a good species for ornament. Var. globosa is a dwarf globose form.

rhaética. Hybrid between P. Mugo and P. sulvestris.

rigida. Pitch P. Lvs. in clusters of 3, to 5 in. long, stiff and spreading, dark green cones ovoid, to 4 in. long. N. B. to Ga. and Ky. Var. serótina (P. serotina), Pond P., is a round-topped tree with longer lvs. and shorter cones.

Róxburghii (P. longifolia). CHIR P. Lvs in clusters of to 1 ft. long, drooping, light green: cones conic-ovoid, to 7 in. long. Himalayas.

Sabiniana. DIGGER P. Lvs. in clusters of 3, to 12 in. long, pale blush-green cones ovoid, to 10 in, long, Calif.

scopulòrum: P. ponderosa var.

serótina: P. rigida var.

sinénsis: P. tabul: formis.

Strobus (Strobus Strobus). WHITE P. Lvs. in clusters of Strobus (Strobus Strobus). WHITE P. Lvs. in clusters of 5, to 5 in. long, soft, blush-green: cones cylindric, to 4 in. long. E. N. Amer. Hort. vars. are: aurea, foliage yellowish, at least when young; contórta branches twisted, bearing tufts of lvs.; Dawsoniana, lasted as dwarf and spreading; dénsa is var. nana; fastigiâta, with narrow pyramidal head; gladca, lvs. bright blush-green; nana, dwarf bush form; nívea, lvs. silvery-white beneath; prostrâta, dwarf with trailing branches; umbraculífera, dwarf umbrella-shaped

avivéstris. Scots P. Lys. in clusters of 2, to 3 in. long. sylvéstris. Scors P. Lvs. in clusters of 2, to 3 in. long, stiff and twisted, bluish-green cones conic-oblong, to 2½ in. long. Eu., Asia; one of the hardiest. Hort. vars. are: argéntea, lvs. silvery; aurea, lvs. golden-yellow when young; engadinénsis, slow-growing, lvs. shorter, Tyrol; fastigiata, with narrow-pyramidal head; lappónica, lvs. broader and shorter, N. Eu.; nana, low dense bush; péndula, branches drooping; pumila, dwarf globose bush; rigénsis, bark very red; scótica, bark very red; lvs. shorter; Watereri, columnar, lvs. steel-blue.

tabulæfórmis (P. sinensis). CHINESE P. Lvs. in clusters of 2 or 3, to 4 in. long, stiff: cones ovoid, to 2½ in. long. China; hardy N. Var. densåta has 2 lvs.

Tada. LOBLOLLY P. Lvs. in clusters of 3, to 9 in. long, bright green: cones conic-oblong, to 5 in. long. N. J. to Tex.

taiwanénsis. Formosa P. Lvs. in clusters of 2, 31/3 in. long, near ends of branches: cones conic-oblong, 2 in. long.

Tanyosho is listed; this is the common name of P. densiflora var. umbraculifera.

Teocote. Lvs. in clusters of 3, to 8 in. long, stiff: cones cylindric-ovoid, 2½ in. long. Mex.

Thúnbergii. Japanese Black P. Lvs. in clusters of 2, to 4½ in. long, sharp-pointed, bright green: cones conicovoid, to 3 in. long. Japan; hardy N. In var. óculusdraconis the lvs. have 2 yellow bands.

Torreyana. Torrey P. Lvs. in clusters of 5, to 13 in. long, stiff, dark green: cones ovoid, to 6 in. long. S. Calif.

tuberculàta: P. attenuata.

umbraculifera: P. densiflora var. uncinàta: P. Mugo var. rostrata.

virginiana. Scrub P. Lvs. in clusters of 2, to 3 in. long, stiff and twisted; cones conic-ovoid, to 2½ in. long. N. Y. to Ga. and Ala.

Watereri: P. sulvestris var.

vunnanénsis (P. sinensis var. vunnanensis). Lvs. usually in clusters of 3, to 8 in. long: cones ovoid, to 3½ in. long. W. China.

PINXTER-FLOWER: Rhododendron nudiflorum.

PINYON: Pinus cembroides.

PÎPER. Pepper. Piperacex. Many species of herbaceous and woody plants over the world, various in habit and appearance, having alternate lys. and minute fls. borne in catkin-like mostly slender spikes; a few are grown in collections of economic plants and sometimes as foliage subjects; erect bushes or root-climbers. Of easy cult. Propagated by cuttings under glass, or by seed when available.

auritum. Lvs. broadly ovate, to 20 in. long and 7 in. wide, cordate, petiole slender, to 2 in. long, usually pubescent: fl.-spikes to 10 in. long, on short peduncles. Mex.

Cubèba. Cuben. Climbing or tree-like: Ivs. oval or narrower: berries brownish, used for medicinal purposes.

magnificum is listed, but is of unknown botanical standing.

metállicum: hort. name for a form with thick metallicgreen lys

nigrum. Pepper. Climbing: lvs. ovate to nearly orbicular. berries yellowish-red, furnishing when dried commercial black pepper, or white pepper when the pericarp is removed. Old World tropies and now widely dispersed.— For the pepper of vegetable-gardens see Pepper and Сапянсит.

ornatum. Climbing: lvs. ovate-orbicular, peltate, spotted pink above when young and white when old. Celebes.

PIPERÀCEÆ. PEPPER FAMILY. genera comprise this widely distributed and populous family: herbs or woody plants with entire lvs., very small fls. without perianth borne in dense spikes or racemes, having mostly 2-6 stamens, superior 1-celled ovary and fr. a berry. Macropiper, Peperomia and Piper grown for foliage or the last for economic products.

PIPERIA MICHAELII: Habenaria elegans.

PIPEWORT: Errocaulon.

PIPSISSEWA: Chimaphila.

PIPTADÈNIA. Leguminosx. Trop. shrubs or trees with bipinnate lvs. and small white fls. in heads or spikes; one species furnishes a gum and the tree may be planted for ornament in warm countries.

rígida. Tree or shrub: lfts. linear, oblique, 1/3 in. long, shining: fis. in axillary spikes to 11/2 in. long: pods linear, to 5 in. long. Brazil.

PIPTANTHOCEREUS: Cereus.

PIPTÁNTHUS. Leguminosæ. Shrubs, deciduous or partially evergreen, with lvs. of 3 entire sessile lfts., yellow papilionaceous fls. in terminal racemes, and linear flattened pods; native in Himalayas and China and adapted to S. U. S.

cóncolor. To 6 ft.: lfts. ovate-lanceolate, to 41/2 in. long: pods to 41/2 in. long, glabrous. China.

laburnifolius (P. nepalensis). To 10 ft.: lfts. lanceolate, to 5½ in. long, glaucous beneath: pods to 4½ in. long, slightly pubescent. Himalayas.

nepalénsis: P. laburnifolius.

tomentòsus. To 7 ft.: lfts. ovate to ovate-lanceolate, tomentose beneath: pods to 3 in. long, tomentose. China.

PIQUÈRIA. Composita. Shrubs or herbs with opposite entire or toothed lvs. and clustered small heads of white or whitish disk-fls.: pappus none or of scales: trop. America.

Under the name Stevia, florists grow one species of figureria for the profuse small winter bloom, and it is also dapted to bedding-out. It is propagated by cuttings and livision as well as by means of seeds.

trinervia (Stevia servata of hort.). Per.: Ivs. lanceolate o oblong-lanceolate, toothed: heads 3-5-fid., white, fragrant, borne in small panieled corymbs. Mex., Cent. Amer. and Hatti. Var. variegata has Ivs. edged or splashed with white; often grown as a pot-plant.

PIRCUNIA: Phytolacca dioica.

PISÒNIA. Nyctaginaceæ. Trees and shrubs of trop. and subtrop. regions, with simple lvs. and small unisexual or bisexual fls. borne in panicles; intro, in Calif.

Brunoniana. To 20 ft. or more, glabrous: lvs. oblong, to 5 in. long: fls. greenish, $^{1}_{5}$ in. long: fr. linear, to $1\frac{1}{2}$ in. ong, with very sticky ribs. S. Sea Isls., New Zeal., Ausrola

PISTACHE: Pistacia.

PISTACHIO: Pistacia vera.

PISTÀCIA. PISTACHE. Anacardiaceæ. Trees and shrubs, deciduous or evergreen, bearing combound lvs., small diocious fls. without petals, is stamens, 1-celled ovary and dry drupaceous r.; about 20 species in the Medit. region to Asia, in Canary Isls. and 1 in Mex. and Calif.; one

in Canary Isls. and 1 in Mex. and Calif.; one grown for its nut or kernel which is used in concetionery, and others yielding gums and oils; not hardy in northern states.

The pistaches may be grown in any climate suitable to he olive. Trees may be planted 25 feet apart, about one nale to every six females to insure pollmation. Propagated by budding and grafting, also by seeds.

atlantica. Deciduous tree to 60 ft.: lfts. 7-11, petiole vinged. fr. dark blue, 1/3 m. long. Algeria.

chinénsis. Deciduous tree to 60 ft.: lvs. of 5-6 pairs of fts.: fr. searlet turning purple. China.

Lentíscus. Evergreen tree to 15 ft.: lvs. of 3-5 pairs of eathery lfts., petuoles winged: fr. reddish turning to black. dedit. region.

mutica. Lvs. deciduous, lfts. of 2-4 pairs, oblong to vate, obtuse, puberulent, petiole winged: fis. in stiff straight anneles fr. obovate, apiculate. Asia Minor.

Simaruba (Elaphrum Simaruba). Deciduous tree to 0 ft., bark flaking off: lvs. pinnate, to 8 in. long, lfts. 3-7, vate to elliptic, acute or acuminate, entire: fls. in racemes: r. 3-angled, glabrous. S. Fla., W. Indies, E. and Cent.

Terebinthus. Small deciduous tree: lfts. 9-13, petiole omewhat winged: fr. dark purple and wrinkled. Medit.

texàna. Tree to 30 ft. lvs. partially or wholly persistent, rith winged petiole and 4-9 pairs of oblong-spatulate lfts.: r. oval, brown, about 1/4 in. long. Tex., Mex.

vèra. Pistachio. Spreading deciduous tree to 30 ft.: vs. of 1-5 pairs of lfts.: fr. reddish and wrinkled, containing he green or yellow seed or kernel of commerce. Medit. egion and Orient.—Grown for its comestible nut; much steemed in Medit. countries. The pistachio thrives in egions to which the olive is adapted. It may be budded or rafted on other species of the genus. There are several ort vars.

PÍSTIA. Araceæ. Free-floating per. native in rop. Amer. and southernmost U. S., grown in quaria and ponds in warm regions. The sumner temperature of the water should be between 0-80° and the plants should be shaded from lirect sunlight in the middle of the day for best esult. P. Stratiotes. Water-Lettuce. Stoniferous and having long feathery hanging roots, he rosettes of lvs. about 6 in. across: lvs. oboate or round, very obtuse, to 5 in. long, bright reen and velvety-scurfy: spathes very small.

PISTIL: the ovule-bearing body (becoming the seed-earing organ), with style and stigma.

PISTILLATE: having pistils and no stamens; female.

PISUM. PEA. Leguminosæ. Herbs with pinate lvs., the terminal lft. represented by a

branched tendril, papilionaceous fls. solitary or few in the axils, and flattened pods; widely grown for the edible seeds and pods and some forms for forage. For cult, see *Pea*.

arvénse: P. sativum var.

sativum. Garden P. Ann., climbing to 6 ft.: Ifts, oval to oblong: fis. white, 1-3 together: pods to 4 in. long. Eu. and Asia. Var. arvénse (P. arvense), Field P., has pinkish fis. with purple wings and greenish keel, and is grown for forage. Var. humile, Early Dwarf P., is a low form with small pods. Var. macrocárpon, Edible-podded P., has soft pods to 6 in. long.

PITANGA: Eugenia uniflora.

PITCÁIRNIA. Bromcliaceæ. Herbs or somewhat woody at base, mostly terrestrial, native in trop. Amer., with narrow lvs. in rosettes and red, yellow or nearly white fls. in spikes or racemes; sometimes seen in choice greenhouse collections. For cult. see Bromcliaceæ

aphelandræflòra. Lvs. narrow, erect or recurved, pale green with brown spine at apex, margins minutely spinulose. fls. to 2½ in. long, on short pedicels. Brazil.

corállina. Lvs. about 3 ft. long and 4 in. wide, the petioles with brown spines: fls. coral-red, in racemes about 1 ft. long on red stalks to 1 ft. long. Colombia.

punicea. Lvs. to 10 in. long and ½ in. wide, slightly spiny, white-scaly on the back: fis. scarlet, in racemes to 9 in. long on very short stalks. Mex.

Whitei: listed name of unknown botanical standing.

PITCHER-PLANT: Nepenthes, Sarracenia. California: Darlingtonia californica.

PITHECELLÒBIUM (Pithecolobium). Leguminosæ. Broad trees and shrubs with 2-pinnate lvs., small fls. in heads or spikes, and flattened usually twisted and contorted pods; grown for ornament in trop. and semi-trop. regions. Some species yield tannin and the wood is useful for minor building purposes.

dúlce (Inga dulois). GUAYMOCHIL. HUAMUCHIL. OPI-UMA. MANILA TAMARIND. Tree to 50 ft., spiny: fls. white, in dense sessile heads, pubescent: pods spirally twisted, to 5 m. long, red. Trop. Amer., Philippines, E. Indies.

flexicaule: Ebenopsis flexicaulis.

guadelupénse. Differs from P. Unguis-cati in being usually without spines, petioles shorter than petiolules and ovary pubescent. S. Fla. to N. S. Amer.

Junghuhnianum. Tree with orange-yellow fls. in brushlike axillary long-peduncled heads 1 in. or so across: lfts. 3 or 4 pairs, oblong, entire, glossy, 1½-2 in. long. Java.—Planted in S. Fla.

3 or 4 pairs, outling, entire, glossy, 173-2 in. long. 3ava.—Planted in S. Fla.

lanceolatum. Tree to 40 ft., spiny: fls. white, in dense spikes to 5 in. long: pods nearly straight or curved, to 5 in. long Mex., Cent. Amer., N. S. Amer.

Saman: Samanea Saman.

Unguis-càti. Cats-Claw. Black-Bead. Shrub or tree to 15 ft., spiny: lvs with petioles longer than petiolules: fls. greenish-yellow, in stalked heads, ovary glabrous: pods spirally twisted, to 4 in. long, red. Fla., W. Indies, N. S. Amer.

PITHECOCTÈNIUM. Bignoniaceæ. Woody evergreen vincs with lvs. of 2–3 lfts. and 3–parted thread-like tendrils, bell-shaped fls. in terminal racemes or panicles, and large prickly capsular frs.; native from Mex. to Argentina and hardy only in warm climates. Propagated by cuttings.

clematideum: P. cynanchoides.

cynancholdes (P. clematideum). Lfts. ovate, to 2 in. long: fls. white, to 2 in. long: fr. 2½ in. long, covered with yellowish spines. Argentina, Uruguay.

echinatum (P. muricatum, Bignonia siderafolia). Lits, ovate, to 4 in. long: fls. white turning yellow, to 2 in. long: fr. to 8 in. long, covered with sharp tubercles. Mex. to Brazil.

muricatum: P. echinatum.

PITHECOLOBIUM: Pithecellobium.

PITTOSPORÀCEÆ. PITTOSPORUM FAMILY. Trees and shrubs, sometimes climbing, with alternate simple lvs., bisexual polypetalous fis.

having 5 sepals and 5 petals, 5 stamens, superior ovary, and fr. a dehiscent caps, or indehiscent and berry-like; native mostly in Australia, but Pittosporum is widely distributed in Old World tropics. Billardiera, Bursaria, Hymenosporum, Pittosporum and Sollva are grown for ornament in the warmer parts of the country and sometimes under glass.

PITTÓSPORUM. Pittosporacex. Evergreen trees and shrubs with simple lys., fls. solitary or in panicles, and fr. a caps. with leathery valves; native in tropics and subtropics of Old World; of good habit, attractive in foliage, flower and fruit.

Pittosporums are cultivated in southern California and southern states for ornament and hedges, and $P.\ Tobira$ is sometimes seen under glass. Propagated by seeds sown in a cool greenhouse, by cuttings of half-ripened wood, or by grafting, principally on $P.\ undulatum$.

bicolor. Small tree: lvs. oblong-lanceolate, tomentose beneath, margins usually recurved: fls. purple and yellow, about 1% in. long, solitary or few: fr. tomentose, New S.

Buchánanii. Shrub or tree to 20 ft.: lvs. oblong, to 5 in. long, acute: fls. dark purple, solitary: fr. about 1/3 in. diam. New Zeal.

Colensoi. Small tree: lvs. oblong, to 4 in. long, acute, leathery: fis dark purple, usually solitary: fr. about ½ in. across New Zeal

crassifolium. Karo Shrub or tree to 30 ft.: Ivs. obovate, to 3 in. long, obtuse, leathery, shining above, white-to-mentose beneath, margins revolute: fls red or purple, to ½ in. long, in terminal clusters: fr. to 1½ in. long, tomentose. New Zeal.

eriolòma. Shrub to 12 ft.: lvs. obovate, to 3 in. long, leathery, margins revolute: fls yellowish, ½ in. long, in terminal clusters: fr to ¾ in. across. Lord Howes Isl.

eugenioldes. TARATA. Tree to 40 ft: lvs elliptic, to 4 m long, acute, margins usually undulate: fls. yellowish, fragrant, to 1/2 m. long, in terminal compound umbels: fr. 1/2 m long. New Zeal. Var. variegatum has variegated foliage.

Fairchildii. Shrub to 15 ft.: lvs. obovate, to 3 in. long, obtuse or acute, leathery: fls. purple, solitary or in 2-4-fld. terminal clusters: fr. to 1 in. across. New Zeal.

ferrugineum. Tree to 60 ft.: lvs. ovate to lanceolate, to 4 in long, rusty-tomentose when young, long-petioled: fls. greenish-white, ¼ in. long, in terminal clusters: fr. ⅓ in. across Malaya to Australia.

floribundum. Small tree: lvs. lanceolate, to 8 in. long, leathery and shining, margins undulate: fis. yellow, small, in terminal compound corymbs. Himalayas.

grandiflorum; hort. name.

heterophfilum. Spreading shrub to 10 ft.: lvs. of various shapes, small, glabrous: fls. pale yellow, very fragrant, small, few together. Rocky places, China.

H6smeri. Tree to 25 ft.: lvs. oblong, to 10 in. long, brown-tomentose beneath, margins revolute: fls. cream-colored, about ½ in. long, in corymbs: fr. to 2 in. across, becoming orange-yellow. Hawaiian Isls. Var. longifòlium has lvs. to 16 in. long and 3½ in. wide.

Kirkii. Shrub to 12 ft.: lvs. linear-obovate, to 5 in. long, very leathery, margins thickened: fls. yellow, in terminal umbels: fr. 1½ in long. New Zeal.

Màyii: hort. name.

nigricans: P. tenuifolium.

phillyreoides. Narrow-leaved or Willow P. Tree to 20 ft, the branchlets drooping: Ivs. linear-lanceolate, to 4 m. long: fls. yellow, ½ in. long, solitary or in axillary clusters: fr. ½ in. long, deep yellow. Australia.

Rálphii. Differs from P. crassifolium in the lvs. not revolute and the fr. only $\frac{2}{3}$ in. long. New Zeal.

revolutum. Tall shrub: lvs. elliptic, to 4 in. long, rusty-tomentose beneath: fls. pale yellow, ½ in. long, in terminal clusters: fr. to ¾ in. long. Australia.

rhombifolium. Queensland P. Tree to 80 ft.: lvs. rhomboid-oval, to 4 in. long, coarsely toothed above middle: fls. white, 1/4 in. long, in terminal compound corymbs: fr. 1/4 in. long, becoming orange-yellow. Australia.

tenuifòlium (P. nigricans). Tawhiwhi. Kohuhu. Tree to 30 ft.: Ivs. oblong, to 2½ in long, margins undulate: ffs dark purple, to ½ in. long, solitary or in axillary clusters: fr. ½ in. across. New Zeal.—There is a variegated form.

Tobira. Japanese P. Shrub to 10 ft, useful as a hedge plant in southernmost states: lvs. obovate, to 4 in. long, obtuse, very thick and leathery, margins revolute: fls. white or greenish, fragrant, to ½ in. long, in terminal clusters: fr. to ½ in. long, tomentose. China, Japan. Var. variegātā has lvs. variegated with white.

umbellatum. Tree to 25 ft.: lvs oblong, to 4 in. long, pale below, leathery: fls. in many-fld. terminal umbels: fr. ½ in. across. New Zeal.

undulatum. Victorian Box. Tree to 40 ft.: lvs. oblong to lanceolate, to 6 in. long, acuminate, shining, margins usually undulate: fis. white, fragrant, to ½ in. long, in terminal clusters: fr. to ½ in. across. Australia.

viridiflorum. Cape P. Shrub to 25 ft.: Ivs obovate, to 3 in. long, acute or obtuse, leathery and shining, margins often revolute: fis. yellowish-green, to ¼ in. long, in dense terminal clusters: fr. ¼ in. long. S. Afr.

PITYROGRÁMMA (Ceropteris). Gold- and LVER-FERNS. Polypodiaceæ. Conservatory SILVER-FERNS. ferns and grown in the open in warm countries, sometimes known as Ceropteris and Gymnogramma, with mostly 2-pinnate tufted fronds interesting for the white or bright yellow powder on the under surface; sori linear, borne along veins on back of segms.; native mostly in trop. Amer. They are plants of simple requirements, readily grown in an intermediate temperature in pots and pans. See Ferns.

calomélanos (Gymnogramma calomelanos). Silver-F. Fronds to 3 ft. long and 10 in. wide, powdery white beneath, segms. toothed or cut, stipes as long as blades Trop Amer., trop. Afr. Var. aireo-flava (Gymnogramma chrysophyllum, P. chrysophyllu). Gold-F., has gold-colored powder.

chrysophýlla: P. calomelanos var. aureo-flava.

Lauchèana: hort, form or hybrid related to P. calomelanos var. aureo-flava.

sulphirea (Gymnogramma sulphurea). JAMAICA GOLD-F. Fronds to 1 ft. long and 5 in. wide, powder sulfur-yellow, segms. cut, stipes much shorter than blades. W. Indies.

tartarea (Gymnogramma tartarea). Fronds to 2½ ft. long and 1 ft. wide, white powdery beneath, segms. entire or cut, stipes as long as blades. Trop. Amer.

triangularis (Gymnogramma triangularis). California Gold-F. Fronds to 7 in. long and 6 in wide, on stipes to 1 ft. long, deep golden-yellow beneath, sometimes white. Calif. to Alaska.

PITYROSPERMA ACERINUM: Cimicifuga japonica.

PLAGIÁNTHUS. Malvaceæ. Trees and shrubs, seldom herbaceous, native in Australia and New Zeal., with alternate simple lvs., small bisexual or unisexual fls. and frs. of 1 or several carpels; sometimes grown in S. Calif.

betulinus. Tree to 60 ft.: lvs. ovate to ovate-lanceolate, to 3 in. long, coarsely toothed: fls. small and not showy, in panicles to 9 in. long. New Zeal.

divaricatus. Shrub to 8 ft., branches much interlaced, slender: lvs. linear-oblong, to 1 in. long, obtuse, entire, leathery: fls. small, solitary or fascicled, axillary. New Zeal. Lvallii: Gava Luallii.

pulchéllus. Shrub: lvs. lanceolate, to 3 in. long, coarsely toothed: fls. small, in axillary racemes. Australia

PLANÈRA. Ulmacex. Decidous elm-like tree to 40 ft., native from S. Ill. to Fla. and Tex., not hardy far N. P. aquatica. WATER-ELM. Lvs. alternate, ovate, to $2\frac{1}{2}$ in. long, toothed: fis. small, unisexual or bisexual, in clusters: fr. a small drupe with crested ribs.-Propagated by seeds sown in spring, by layers, and by grafting For other Planera names, see on the elm. Zelkova.

PLANE-TREE: Platanus.

PLANTAGINÀCEÆ. PLANTAIN FAMILY. Three genera of herbs and subshrubs of wide distribution, with basal lvs. and sometimes alternate or opposite ones on the st., mostly bisexual small not showy fls. in heads or spikes, having 4-lobed scarious corolla, 4-parted calyx, 4 exserted stamens, superior ovary, and fr. a caps. or nutlet inclosed by the calyx. A few plantagos

are sometimes planted for interest, although they are weedy subjects, and some of the species are true weeds about dwellings and in lawns.

PLANTAGO. PLANTAIN. Plantaginaceæ. Herbs or rarely shrubs mostly of temp. regions, some of them rarely grown in the garden but mostly weedy plants. Propagated by seeds.

asiática. Per. to 1½ ft.: lvs. forming rosette, mostly ovate, to 10 in. long, petioles often as long as blades ffs. inconspicuous, in long dense spikes: caps. circumscissile below the middle. Alaska to Calif. and Colo.

Cynops. Subshrub to 1½ ft.: lvs. linear, to 3 in. long: fls. whitish, in heads ½ in. long. S. Eu.

macrocárpa. Per. to 15 in.: lvs. lanceolate, to 15 in. long, petioles long and somewhat winged: fls. whitish, in spikes to 2 in. long on scapes often longer than lvs.: caps. 1/4 in. long. Wash. to Alaska.—Advertised as a rock-garden plant.

major var. asiática: P. asiatica.

marítima. Ann., bien. or per., acaulescent: lvs. linear, to 10 in. long: fis. in dense spikes to 5 in. long. Seashores and salt marshes, N. Amer., Eu , Asia.

patagónica. Ann. to 1 ft.: lvs. linear to oblanceolate: fls. in dense cylindrical or oblong spikes. Mex., S. Amer.

Psýllium. Ann. to 8 in : lvs linear or linear-lanceolate, to 1½ in long: fls. in ovoid spikes ½ in. long. S. Eu. to India.

Pürshii. Ann. to 15 in., woolly: lvs. linear, to 3 in. long: fls. in dense cylindrical spikes to 5 in. long. Ind. to B. C. and N. Tex.

PLANTAIN: Musa paradisiaca, Plantago. Poor Robins: Erigeron pulchellus. Rattlesnake: Goodyera. Water:: Alisma. Wild: Heliconia Bihai.

PLATANTHERA: Habenaria.

PLÁTANUS. PLANE-TREE. The only genus of *Platanaceæ*. Deciduous monœcious large trees with pale bark shedding in plates, large alternate palmately-lobed lvs., and unisexual fls. in dense globular drooping heads in spring; native in N. Amer., S. Eu. to India. Sometimes known as sycamore, but this name belongs to *Ficus Sycamorus*.

Plane-trees thrive best on rich moist soil and withstand transplanting well. The species herein are hardy North with the exception of *P. racemosa* which will thrive only in the southern states. They are useful as street trees and for extensive lawns, and bear heavy pruning; sometimes in confined formal areas they are sheared to dense small heads. Propagated by seeds, by cuttings under glass, by layers, and varieties sometimes by grafting

aceriólia. London P. Hybrid between P. occidentalis and P. orientalis: to 120 ft.: lvs. with 3-5 triangular lobes about ½ length of blade: fr.-heads 2 or sometimes more to a st., bristly. Common tree often passing as P. orientalis. Var. Kelseyana, lvs. variegated yellow. Var. Súttneri has lvs. blotched with creamy-white.

americana: listed name of no botanical standing. califórnica: P. racemosa.

occidentalis. Button wood. To 150 ft.: lvs. with 3-5 shallow triangular lobes: fr.-heads usually solitary, smooth. Me. to Fla. and Tex.

orientalis. Oriental P. To 100 ft.: lvs. with 5-7 narrow lobes about 1/2 length of blade: fr.-heads 2-6 to a st., bristly. S. E. Eu., W. Asia.—Not often seen in this country, at least not in the N.: see P. acerifolia.

racemòsa (P. californica). To 90 ft.: lvs. thick, with 3-5 deep entire lobes, tomentose beneath: fr.-heads 2-7 to a st., bristly. S. Calif., Lower Calif.

PLATYCARYA. Juglandacex. Chinese deciduous monoccious shrub or tree to 40 ft., P. strobilàcea. Lvs. of 7-15 ovate- to oblonglanceolate lfts. to 4 in. long: fls. without perianth, the staminate in slender catkins to 5 in. long, the pistillate in cone-like catkins to 2 in. long that bear small winged nutlets under the scales.—A sumach-like bush, not hardy N. Propagated by seeds and layers.

PLATYCÈRIUM (Alcicornium). STAGHORN-FERN. Polypodiaceæ. Large epiphytic ferns with two types of fronds, the sterile flat, rounded,

shield-shaped, entire, parchment-like, clasping the tree or support on which they grow, the fertile fronds erect, spreading or drooping, with antler-like segms. bearing naked sori beneath; trop. Afr. and Asia to temp. Australia.

The staghorn-ferns are striking plants when old and well-grown. P. bifurcalum does well in a cool temperature but the others are tropical. Most of them produce suckers, by which (as well as by spores) they may be propagated. They thrive or pieces of tree-fern trunks or even on boards if provided with a chunk of peat and moss for foothold, which may contain a little charcoal; a little bone-meal may be added now and then if needed. They may be checked a little in winter.

æthidpicum: P. Stemaria.

alcicorne: P. bifurcatum.

angolénse. Fertile fronds not lobed, to 1½ ft. long, rusty-tomentose beneath. W. Afr.

bifórme. Sterile fronds lobed above; fertile fronds much forked, to 5 ft. long; spores borne on 2 kıdney-shaped appendages. Java.

appendages. Java.

bifurcatum (P. alcicorne). Common S Grayish-green, pubescent; sterile fronds wavy-margined; fertile fronds clustered, drooping, to 3 ft. long, forked into narrow segms, sori extending to tips. Australia, Polynesia. Var. majus is larger, greener, more leathery.

grande. Nearly glabrous: both sterile and fertile fronds stag-like, to 6 ft. long, the son borne in patch at base of first fork. Australia.

Hîlii. Deep green: fertile fronds erect, 1½ ft. or more long, repeatedly forked, sorn not extending to tips. Australia. Var. màjor is listed.

Stemaria (P. athiopicum). TRIANGLE S. Fertile fronds twice forked, drooping, to 3 ft. long, white-tomentose beneath, sori extending part way down forks. W. trop.

Veîtchii. Sterile fronds brownish; fertile fronds to 2 ft. long, narrow at base, becoming 4 in. wide where branches into 6-8 lobes, white-harry beneath. Australia.

Wállichii. Similar to P. grande but yellowish-tomentose. Malaya.

Willinckii. Java S. Fertile fronds in 3's, drooping, forked into long narrow segms. bearing sori nearly to tips.

PLATYCLINIS: Dendrochilum.

PLATYCODON. BALLOON-FLOWER. Campanulacex. One showy per. herb native in E. Asia and differing from Campanula chiefly in the opening of the caps. at the top: fls. wide-open to almost rotate, blue-purple but varying to other colors in cult. The flower-buds are swollen and balloon-like just before opening.

Plants thrive in open or loamy soils in full sun and are hardy in the North. Propagated leadily by seeds, blooming the second year, and by division in spring; handsome subjects.

grandiflorum (Campanula grandislora). To 2½ ft.: lvs. ovate to ovate-lanceolate, to 3 in. long, sharp-toothed, glaucous beneath: fis. deep purple-blue, open-bell-shaped, to 3 in. across, solitary on ends of branches. June-Aug. Var. álbum, white. Var. autumnāle flowers later. Vars. azūreum, cærūleum, blue. Var. iaponicum has a 10-lobed star-like corolla. Var. Marièsii grows to 1½ ft. and has large fis. Var. micránthum, small-fid. Dwaif forms are listed as nānum and pūmilum and partially double forms as semi-dūplex and semi-plēnum. Early-blooming kinds are var. præcox, sometimes listed as pracox giganteum. The name P. glaucum probably designates P. grandislorum itself.

Marièsii: P. grandiflorum var.

PLATYLOMA: Pellæa falcata.

PLATYMISCIUM. Leguminosæ. Trop. American trees or shrubs with opposite pinnate lvs., yellow papilionaceous fls. in racemes, and flattened pods; intro. in Calif.

polystachyum. Roble. Tree to 90 ft.; lfts. shining; fis. orange, ½ in. across, in partially drooping racemes on old wood: pods 2½ in. long and 1 in. wide, 1-seeded. Trinidad, N. S. Amer., Panama.

PLATYSTÈMON. Papaveraceæ. Californian ann. suitable for the flower-garden. Propagated by seeds. P. californicus. Cream - Cups. To

1 ft.: lvs. linear-oblong, entire: fls. cream-yellow, 1 in. across, solitary on long stalks: fr. of many linear carpels distinct or partially united. Var. crinitus is more hairy, the yellow fls. often tipped with pink or green.—In Calif. it covers great areas of open country in spring.

PLECTRANTHUS. Labiatæ. Trop. and subtrop. herbs and subshrubs of the Old World, comprising nearly 100 species closely allied to Coleus, differing in stamen filaments all free and not basally fused.

glaucócalyx. Erect per. to 3 ft.: lvs. narrowly ovate, to 2½ in. long, coarsely serrate, hispid above and pubescent beneath: fis. bluish, many in cymose panicles. E. China.

PLECTRITIS. Valerianaceæ. Ann. herbs, mostly of the Pacific northwest, by some authors merged with Valerianella but differing in sts. usually simple or monopodially branched, cymes congested, ovary 1-carpelled, and frs. winged laterally.

congesta (Valerianella congesta). To 2 ft., sts. sometimes branched: lvs. opposite, entire: fls. rose-pink, to ½ in. long, limb bilabiate, spurred, in head-like clusters: fr. broadly winged. B. C. to Calif.

PLEÈA. RUSH-FEATHERLING. Liliaceæ. A monotypic genus represented by a rush-like herb of pine land coastal swamps from N. C. to Fla.: lvs. few, erect, striate, slender: fls. in slender terminal racemes; sepals longer than petals; stamens 9-12, anthers 2-celled, introrsely dehiscent and versatile; styles 3: fr. a septicidal caps. P. tenuifòlia. Per. 1-2½ fl. high: lvs. 6-9 in. long: fls. 1 in. across, greenish outside, white within, 3-9 on erect pedicels in erect racemes.

PLEIOBLÁSTUS. Graminex. Shrubs with tufted or creeping rootstocks and erect or arching sts., differing from Arundinaria in each node having 3–7 buds or branches and bristles of the apex of persistent lf.-sheaths smooth and flexnous. See Bamboo.

Chino (Arundinaria Maximowiczii. A. Simonii var. Chino. Bambusa Laydeckeri). To 6 ft.: lvs. 2-10 in. long and to ¾ in. wide, 3-7-veined and green beneath. Japan.

distichus (Bambusa and Sasa disticha. B. angustyolia. B. Vulmorinu). To 2½ ft.: lvs. to 2½ in. long and ½ in. wide, finely toothed, bright green, arranged in two ranks. Japan.

Hindsii (Arundınaria and Thamnocalamus Hindsii. A. erecta. Bambusa gracults). To 12 ft., sts. dark olive-green: lvs. to 8 in. long and ¾ in. wide and gradually narrowed at base, glaucous beneath, glabrous. China, Japan.

hùmilis (Arundinaria and Sasa humilis. A. gracilis). To 3 ft., st.-sheaths not ringed with hairs at base: lvs. to 6 in. long and ¾ in. wide, pale green, nearly glabrous, lf.-sheaths bristly at apex. Japan.

pumilus (Arundinaria and Sasa pumila). To 2 ft., sts. covered with a waxy bloom, st.-sheaths tessellate around the base: lvs. to 6 in. long and ¾ in. wide, toothed, hairy. Japan.

Simonii (Bambusa and Arundmaria Simonii). To 25 ft.: lys. to 1 ft. long and 1 in. wide, rounded or broadly wedge-shaped at base. China. Var. Chino is P. Chino. Var. variegatus (var. striatus), lys. striped white.

variegatus (Arundinaria and Sasa variegata. A. Fortunes). To 3 ft.: lvs. to 6 in. long and 34 in. wide, toothed, hairy on both sides, striped with white. Japan. Var. pygmaus is P. viridi-striatus var. vagans.

viridi-striatus (Sasa and Arundinaria auricoma. Bambusa Fortunei aura). To 4 ft., sts. purplish-green: lvs. to 8 in. long and 1 in. wide, finely toothed, pubescent beneath and nearly glabrous above, striped green and yellow. Japan. Var. vagans (Sasa and Arundinaria pygmæa. S. variegata var. pygmæa). To 2 ft., with hairy lvs. entirely green, rootstocks creeping and spreading forming dense clumps.—The plants grown as Sasa aureo-striata and S. argenteo-striata may belong here, the latter perhaps a silver-striped form.

PLEIOGÝNIUM. Anacardiacex. Diœcious tree from Queensland, Australia, with compound

lvs., fls. in axillary racemes, 10 stamens, 5–12-celled ovary and somewhat compressed drupaceous fr. **P. Solándri** (Spondias Solandri). Burdekin-Plum. Evergreen to 60 ft.: lvs. of 7–9 ovate to oblong entire lfts. to 4 in. long: fls. greenish, densely clustered: fr. 1½ in. across, used for jellies and jams. Cult. in Calif. and Fla.

PLEIONE. Orchidaceæ. Old World terrestrials with ann. pseudobulbs bearing 1 or 2 deciduous lvs. and 1- to several-fld. scapes: fls. showy; sepals and petals similar; lip much broader, often with fringed keel. Grown in cool greenhouse; see Orchids.

lagenària. Lvs. to 10 in. long: scape 1-fid.; fi. large, to 3 in. across; sepals and petals rosc-lulac; lip yellow with marginal portion blotched with purple and white, traversed by 5 longitudinal fringed lines. Oct.—Nov. Burma.

maculata. Lvs. to 9 in. long scape 1-fld; fl. to 2 in. across; sepals and petals white; lip yellow with marginal purple streaks, white side lobes and 5 funged longitudinal keels. Oct.-Nov. Himalayas, Burma.

præcox (P. Wallichiana). Lvs. to 12 in. long scapes 1-2-fid.; fls. about 3 in. across; sepals and petals light rosepurple; lip rose with yellow disk and 5 denticulate keels. Nov.-Dec. Himalayas, Burma.

Wallichiana: P. pracox.

PLEIOSPILOS. Aizoacex. Stemless plants without internodes separated from Mesembry-anthemum, bearing 1 or 2 pairs of short thick ovate lvs. and large showy terminal fls. in the foliage; stigmas 9–14. S. Afr.

Archeri. Differs from P. Hilmari in flatter lvs., tube of lvs. and bracts longer, and inner petals shorter.

Bòlusii (M. Bolusn). Lvs. 2, thick, stone-like, connate, 2 in. long and broad, at maturity with shrivelled ones underneath fls. sessile, golden-yellow, to 3 in. across, with numerous very narrow petals.

canus (Punctillaria cana). Lvs. with whitish bloom: fls. lossely arranged; petals spreading, becoming recurved and lasting for several days.

compáctus: P. nobilis.

Dekenāhii (Punctillaria Dekenahii). Lvs. to 3 in. long, 1 in. wide, ½ in. thick at base and 1 in. at apex, grayishgreen dotted with dark green: fls. yellow with metallic sheen, to 3 in. across.

dimidiatus. Lvs. 2, to 2 in. long and 1 in. wide, glaucous with green dots: fls. with many petals in 3-4 series.

Férgusoniæ. Distinguished from P. magnipunctatus by the peduncled fls. which have 5 sepals and acuminate petals.

Hilmari. Lvs. 2, turgid and nearly cylindric, to 1 in. long and ½ in. wide and thick, glaucous and reddish, dotted: fls. yellow, 1½ in. across.

longibracteatus. Lvs. 2, to 1¼ in. long and ½ in. wide: fls. yellow, whitish at base, bracts exceeding the sepals, 1 in. long.

magnipunctatus (M. magnipunctatum. Punctullaria magnipunctata). Lvs. to 3 in. long, ½ in. wide and ¾ in. thick, covered with dots: fls. bright yellow, 2¼ in. across.

Nélii. Similar to P. Bolusn but more compact, with short-stalked fls.

nobilis (P. compactus. M. nobile and compactum. Punctillaria compacta). Branching: lvs. to 3 in. long, ¾ in. wide and ½ in. thick, covered with dark green dots: fis. bright yellow, pale at base, to 2½ in. across.

optatus (M. optatum, Punctillaria optala). Lvs. to 2 in. long, ½ in. wide and thick, glaucous, dotted with dark green: fis. bright yellow, whitish at base, to 1½ in. across.

Púrpusii (Punctillaria Purpusii). Differs from P. magnipunctatus in lvs. more acute and less stout, and sessile fis.

prismáticus (P., M. and Punctillaria Roodix). Lvs. to 2½ in. long, 1 in. wide and ¾ in. thick, united for about ½ in. at base, covered with inconspicuous dots: fls. yellow, 2 in. across.

Roddiæ: P. prismaticus.

simulans (M. simulans). Lvs. to 3 in. long, 2 in. wide and ¾ in. thick near apex, gray-green dotted with dark green: fls. yellow varying to white, to 3 in. across.

willowmorénsis. Distinguished from P. nobilis by its broader obtuse sepals and shorter broader bracts.

PLEROMA: Tibouchina.

PLEURISY-ROOT: Asclepias tuberosa.

PLEUROTHÁLLIS. Orchidaceæ. Epiphytes of trop. Amer., cespitose or repent in habit, with 1-lvd. sts. and small fls. in racemes or solitary from the axil of lf.; petals usually smaller than sepals; lip simple or 3-lobed. Grown mostly as Cattleyas, in shallow pans near glass; see Orchids.

Roézlii. St. to 6 in. high: If. oblong-lanceolate, to about 9 in. long, erect-spreading: infl. longer than If., nodding, about 5-9-fld.; fis. deep wine-purple, 1½ in. long. Feb.—Mar. Colombia.

tridentâta. Lvs. lanceolate or oblong-lanceolate, to about 2½ in. long and ¾ in. wide, minutely 3-toothed at apex fls. very small, axillary, several, yellow or greenish, sometimes tinged with purple. Venezuela.

velaticaulis. To nearly 2 ft. high: lvs. elliptic to oblong-lanceolate, up to 9 in. long and 3½ in. wide: racemes densely many-fid., shorter than or surpassing lf., inclosed at base by a leathery spathe; fls. yellowish. Cent. Amer., W. Indies, Venezuela, Ecuador.

PLUCHEA. Marsh - Fleabane. Compositæ. Ann. or per. herbs or shrubs of semi-trop. and temp. regions of New World, having hairy camphor-scented alternate lvs. and many-fld. small pink or rose-colored heads in corymb-like or glomerate cymes: involucral bracts lanceolate, outermost shorter than inner, marginal fls. pistillate and inner ones perfect, pappus consisting of one row of capillary bristles.

camphorata. Ann. to 5 ft.: lvs. elliptic to lanceolate, to 6 in. long, on terete sts., margins usually toothed: involucres about 1/3 in. long, densely pubescent, outer bracts elliptic, inner ones long-acuminate. Salt marshes, Mass. to Fla. west to Tex.

PLUM. The group of fruits comprising the plums is assembled of several natural species of widely different nativities. An understanding of these sources is essential to a clear analysis of plum culture.

(A) The Domesticas, Prunus domestica, probably originally from southwestern Asia. Here are included the common plums and prunes long grown in Europe and the eastern states and on the Pacific coast. Such varieties as Bavay (Green Gage), Bradshaw, Lombard, Agen, Egg plums, Reine Claude, Grand Duke, Washington, belong here. The Damson plums are P. domestica var. institia. To be associated with these kinds are the myrobalan and cherry plums, Prunus cerasifera, probably of similar nativity. This latter species is much employed as a stock on which to work the Domesticas, and it yields a few minor varieties of pomological fruits as De Caradeuc, Golden Cherry.

(B) The Japanese plums, P. salicina (P. triflora) represented by Abundance, Santa Rosa, Formosa, Red June, Burbank, Satsuma, Kelsey, and others. The Japanese kinds thrive over a wider extent of territory than the Domesticas.

(C) The American plums, products in recent time of several native species as of *P. americana*, *P. nigra*, *P. hortulana*, *P. Munsoniana*, *P. angustifolia*. Varieties of this native group are Wild Goose, Golden Beauty, Cheney, Hawkeye, De Soto, Forest Garden, Newman, Miner, Wolf, Weaver, Wayland, and many others. These plums thrive over a wide range in the interior country and the South.

These more than half a dozen species contribute, by their diverse climatic requirements, to the growing of plums over practically the whole of the United States and far north into Canada. The European plum is of the greatest importance, being largely grown in the fruit regions of New England, the Great Lakes states and provinces, and particularly on the Pacific coast where it

furnishes the varieties raised for prunes. The Japanese plum is grown over much the same region and in addition somewhat farther south along the Atlantic coast and in the Mississippi Valley. The Damson plums extend the range of these two species somewhat farther north. The native species are valuable in extending plum culture into the far north and, by their resistance to heat and disease, into the lower Mississippi Valley and the Gulf states.

Soil requirements are various, although any well-drained agricultural land is suitable for some varieties of plum. In general, the European varieties grow best on the heavier loams whereas the Japanese and American types thrive on the lighter lands. Adaptation to diverse soil types is possible by the use of suitable stocks.

Propagation is by budding, rarely grafting, on many different seedling stocks, the method being that described for the apple. Myrobalan stock is the most widely employed in both the East and West. Japanese varieties are sometimes worked on peach stocks especially for growth on light soils and in the South. Where hardiness is wanted, some of the American species are used as stocks. Rooted cuttings of the Marianna stock (supposed to be a cerasifere hybrid) find occasional use in the South.

Planting distance for plums of practically every sort is 20 by 20 feet on the square. Small-growing Damsons may succeed with less space and some rank-growing Japanese varieties may profit by a few feet more. Either one- or two-year-old nursery trees are set, usually in early spring.

Tillage and fertilizer, together with covereropping, are the same as described for the peach. The plum will endure more neglect than the peach and in home plantings will yield fair crops under sod conditions. Mulching with manure or the application of nitrate of soda, 1 or 2 pounds to the tree in the early spring, will benefit trees in sod. Under thorough cultivation and on good land plum trees rarely show any noticeable response to fertilizers.

Pruning at planting time is essentially that indicated for the apple. After the scaffold limbs are started, little pruning is advisable until the trees come into bearing. The mature trees may be thinned out by removing crowding or crossing limbs and in case the trees are not making vigorous growth or are becoming taller than is desirable the limbs may be headed back, usually cutting to side branches. With some Japanese varieties renewal pruning such as is given the peach but less severe is a good practice. Pruning may be undertaken at any time when the trees are dormant, preferably in late winter or early spring in the East.

Harvesting and marketing of plums are not peculiar. In the fresh state the fruits are carefully hand-picked, usually into small baskets, while the fruit is mature but still firm. For the cannery and jam factory it may be more nearly ripe and for prune making the fruit is allowed to ripen fully and fall from the tree. Tree-ripened fruit is the best for home use. In the East, the standard package for fresh plums is the climax basket in several sizes. Fresh prunes may be marketed in round half-bushels. The California product is shipped in small wooden baskets, four baskets to a crate. The bulk of the Pacific coast crop is made into prunes.

Yields vary with the variety and care. In the

eastern states from 1 bushel to 3 or 4 may be expected from the mature tree under good conditions. On the Pacific coast larger yields are frequent. Although by careful cold storage at 32° F. plums can be held for a month or more in firm condition, such storage is a doubtful practice as usually the flavor is lost. Plums in good condition for marketing are highly perishable and are usually rushed to market under refrigeration. Fresh prunes keep longer than most other plums.

Varieties of plums are many, and one should know to what class or group they belong. Where the European and Japanese kinds can be grown to advantage, it is questionable whether other sorts are worth planting. Many varieties of plums, especially the Japanese and native kinds, do not fruit without other varieties nearby as pollenizers. Varieties are listed in order of ripen-

ing. Commerical varieties are starred.

Varieties adapted to the fruit sections of New England, the Hudson Valley and the Great Lakes: Abundance (Japanese), Santa Rosa (Japanese), *Burbank (Japanese), Pearl, *Bradshaw, Washington, *Italian Prune, Stanley, *Grand Duke, Imperial Epineuse, *French Damson, Gold Drop, Jefferson, *Reine Claude.

Hardy native varieties for northern planting: Bixby, Mankato, Opata, Omaha, Waneta, Emerald, Brackett, Stoddard.

Varieties for southern Florida and the Gulf

coast: Excelsior, Terrell, McRea.

Japanese varieties for southern planting: Red June, Bartlett, Santa Rosa, Abundance, Climax, Burbank, Chabot, Satsuma, Kelsey.

Native varieties for southern planting: Munson, Clifford, Wild Goose, Wilder, Forest Garden,

Miner, Wayland.

Varieties for the Pacific coast, Japanese varieties: *Beauty, *Burbank, *Climax, *Duarte, *Formosa, *Kelsey, *Santa Rosa. European varieties: *Agen, Golden Drop, Giant, *Grand Duke, Imperial Epineuse, *Italian Prune, Jefferson, *Pond, *Reine Claude, Tragedy.

Pests and diseases are a serious problem with the plum as well as with the peach, particularly curculio and brown-rot. They can be controlled with dry-mix lime-sulfur and lead arsenate as described for the peach. A second or third application may be necessary at intervals of two or three weeks after the first spray. Black-knot, a fungous disease which causes black warty excrescences on the twigs and limbs, may cause serious damage. Control is to cut out and destroy the affected parts as soon as the disease appears. Spraying the trees as the buds are breaking with lime-sulfur 1-8 or bordeaux-oil emulsion 6-12-100 with 3 per cent oil has given good results with severe infestations.

PLUM, BATOKO-: Flacourtia indica. Burdekin-: Pleiogymum Solandri. Coco-: Chrysobalanus Icaco. Date-: Diospyros Lolus. Governors-: Flacourtia indica. Hog:: Spondias Mombin. Jambolan-: Syzygnum Cuminii. Japan-: Eriobolrya japonica. Kafir-: Harpephyllum caffrum. Marmalade-: Achras Zapota. Natal-: Carissa grandiflora. Pigeon-: Coccolobis floridana. Spanish-: Spondias purpurea.

PLUMBAGINACEÆ. PLUMBAGO OF LEAD-WORT FAMILY. Herbs and small shrubs of about 10 widely distributed genera, mostly in the Medit. region and eastward, having certain medicinal uses but mostly grown as ornamental subjects. The family, which is allied to Primulaceæ, is characterized by bisexual regular gamopetalous fls. having 5-toothed calyx which is often ribbed and membranaceous, 5-lobed or -parted corolla,

5 stamens, superior 1-celled ovary, and fr. inclosed by the calyx. Acantholimon, Armeria, Ceratostigma, Limonium, Plumbago are herein treated

PLUMBAGO. LEADWORT. Plumbaginaceæ. Herbs and small shrubs with alternate entire lys. and blue, red, or white salver-shaped fls. in terminal spikes; grown out-doors in subtrop. countries and under glass in intermediate temperatures. Propagated by cuttings of nearly mature wood, by division and seeds.

capensis. Partially climbing or upright and straggling: lvs. oblong, to 2 in. long: fis. azure-blue, corolla-tube 1½ in. long, limb to 1 in. or more across. S. Afr.—Common in greenhouses and in the open in warm countries. Var. álba has white fis., also common.

coccinea: P. indica var.

findica (P. rosea). Partially climbing: lvs. ovate-elliptic, to 4 in. long: fis. purplish-ted, corolla-tube 1 in. long. S. Asia. Var. coccinea has larger scarlet fis.

Lárpentiæ: Ceratostigma plumbaginoides.

ròsea: P. indica.

scandens. Climbing or trailing: lvs. ovate- or oblong-lanceolate, to 5 in. long: fls. white, corolla-tube to ¾ in. long, limb of corolla ½ in. or less across. Trop. Amer.

Willmöttiæ: Ceratostiama Willmottianum.

PLUMÈRIA. FRANGIPANI. A pocynacex. Deciduous trees and shrubs with thick soft branches and very milky sap and alternate long pinnatelyveined lys., large funnelform fls. in terminal cymes, and fr. of 2 leathery follicles; about 50 species in trop. Amer., some of them grown for ornament in warm countries, and for the perfume. Propagated by cuttings in early spring. Fls. mostly appear when trees are leafless.

acuminàta: P. rubra.

acutifòlia: P. rubra var.

álba. To 35 ft. lvs. very narrow, to 10 in. long and 1/2 in. wide, white-pubescent beneath: fls. white, fragrant. W.

emarginata. Small tree: lvs. to 7 in. long and 3 in. broad, more or less pubescent underneath, shallowly emarginate at apex. the veins at nearly right angles to the midnib and in this respect differing from the closely related Cuban P. obtusa in which the veins are strongly ascending: fls. white, with rounded lobes 1 in. or more long (in P. obtusa lobes shorter, not known to be in U. S.). Cuba; planted in Fls.

ribra (P. acuminata). To 15 ft.: lvs. to 16 in. long and 4 in. wide, glabrous: fls. pink, red or purple, very fragrant. Mex. to Venezuela; nat. in W. Indies. Var. acutifòlia (P. acuttolia) has corolla white usually with yellow center and sometimes flushed rose.

PLUMOSE: plumy; feather-like; with fine long hairs along the side as the pappus of some composites.

POA. Graminex. Small sod-forming ann. and per, grasses employed for lawns and in pastures and meadows, having flat or convolute lvs. and spikelets in open or narrow panicles; of wide distribution in temp. and cold countries. See Grasses, Lawns.

alpina. Mountain Spear-Grass. Per. to 1½ ft.: lvs. to 3 in. long and ½ in. wide: panicles to 3 in. long, branches spreading. Eu., Asia, N. N. Amer.

amábilis: Eragrostis amabilis.

ánnua. Dwarf Meadow-Grass. Ann. to 1 ft.: lvs. to 4 in. long and 17 in. wide: panicles to 4 in. long, branches spreading. Eu., Asia, N. Amer.

bulbosa. Tufted per, to 16 in., sts. bulbously thickened at base: lvs. to 3 in. long and ½ in. wide: panieles to 2 in. long. Eu., Asia.

compréssa. Canada Blue-Grass. Wire-Grass. Per. to 2 ft., decumbent at base with creeping rootstocks, bluishgreen: lvs. to 4 in. long and 🐈 in. wide: panicles to 3 in. long, branches erect or ascending. Eu., Asia; nat. in N. Amer.

nemoralis. Wood Meadow-Grass. Per. to 3 ft.: lvs. to 5 in. long and $\frac{1}{12}$ in. wide: panicles open, branches erect or spreading. Eu., Asia.

palústris. Fowl Meadow-Grass. Tufted per. to 5 ft.:

lvs. to 6 in. long and 16 in. wide, soft: panicles open, to 1 ft. long, nodding, yellowish-green or purplish. Eu., N. N. Amer.

pilòsa: Eragrostis pilosa.

praténsis. Kentucky Blue-Grass. June-Grass. Tufted per. to 3 ft. lvs. to 6 in. or more long and 1/2 in. wide. panucles to 8 in. long, branches spreading or ascending. Eu., Asia; nat. in N. Amer.

trivialis. ROUGH-STALKED MEADOW-GRASS. Per. to 3 ft., often decumbent at base: lvs. to 7 in. long and ½ in. wide: panicles open, to 6 in. long, branches ascending or spreading. Eu.: nat. in N. Amer.

POD: a dehiscent dry pericarp; a rather general uncritical term.

PODACHÆNIUM. Compositæ. Shrubs or tree-like with large opposite lvs. and small heads of white ray-fls. and yellow disk-fls. borne in panicled corymbs; pappus of bristles and scales; native Mex. to N. S. Amer. and one grown outof-doors in S. Calif.

éminens (Ferdinanda eminens). To 25 ft.: lvs. ovate or orbicular, to 1 ft. and more long, entire or angular-lobed, gray-tomentose beneath: heads to 1 in. across. Mex., Cent. Amer.

PODALÝRIA. Leguminosæ. Shrubs of S. Afr. with alternate simple lvs., purple, rose or whitish papilionaceous fls., and leathery swollen pubescent pods; grown in Calif.

calyptrata. To 6 ft.: lvs. to 1% in. long and 1 in. across, pubescent and green on both sides.

sericea. To 6 ft., sometimes procumbent: lvs. oblong, silvery-silky on both sides.

PODOCARPÀCEÆ. PODOCARPUS FAMILY. A few genera of evergreen coniferous resinous trees of the southern hemisphere, grown for ornament in S. U. S. or rarely in conservatories. Until recently this family has been united with Taxaceæ but differs in technical characters of the fl., particularly in anthers composed of only 2 cells rather than several: fr. a naked seed surrounded by a fleshy aril and berry-like: lvs. usually needlelike or broadly oblong and alternate. The cult. genera are Dacrydium, Phyllocladus, Podocarpus, Saxegothæa.

PODOCÁRPUS. Podocarpaceæ. Trees and shrubs with flat mostly narrow but sometimes broad persistent lvs., yellow catkin-like male fls. and greenish inconspicuous female fls., and berry- or drupe-like frs. often on fleshy red or purple stalks; native in the mts. and highlands of warm regions, many of them in the southern hemisphere. For cult., see Conifers. The foliage of most of the species does not at first suggest the Conifera. The podocarpuses are grown in the open far south in the eastern and central U. S. and in Calif., and sometimes under glass as tub plants.

acutifòlia. Much branched shrub to 10 or more ft.: lvs. linear, to 1 in. long, thin. New Zeal.

alpina. Shrub or tree to 15 ft.: lvs. linear, to 1/2 in. long, pale beneath. Tasmania, Australia.

andina. Tree to 45 ft.: lvs. linear, to 11/4 in. long, with 2 glaucous bands beneath. Chile.—Some of the material in the trade may be P. saligna.

chinénsis: P. macrophylla var. Maki.

dacrydioldes. Kahika. Tree to 100 ft. or more: lvs. overlapping, to ½ in. long or on young trees ¼ in. New Zeal.

elongata. Tree to 70 ft.: lvs. linear-lanceolate, to 3 m. and more long, thin, pointed. S. and trop. Afr.—Prized in S. Calif. in juvenile stage for its attractive habit and bright green foliage, as a tub and decorative plant.

ferruginea. Miro. Tree to 80 ft.: lvs. linear, to $\frac{9}{4}$ in. long, crowded. New Zeal.

gracflior. Tree to 60 ft.: lvs linear-lanceolate, to 4 in. long and $\frac{1}{4}$ in. wide. Cent. Afr.

Hállii. Tree to 60 ft.: lvs. linear-lanceolate, to 11/4 in. long, leathery. New Zeal.

japónica: P. macrophylla var. Maki.

longifòlia: P. macrophulla.

macrophylla. (P. longifolia). Tree to 60 ft.: lys. lanceolate, to 4 in. long, glossy dark green above, paler beneath. Japan. Var. appréssa is a low form with shorter lvs. Var. Maki (P. chinensis, P. japonica, P. sinensis). has smaller lvs. and is usually shrubby.—Apparently the commonest species in cult.

Nagi. Tree to 90 ft.: lvs. lanceolate to ovate, to 3 in. long and about 1 in. broad (like Agathis), paler beneath.

neriifòlia. Tree to 70 ft.: lvs lanceolate, to 6 in. long, slightly glaucous beneath, midrib in a groove. China to New Guinea.

nivalis. Much branched shrub to 8 ft.: lvs. to 3/3 in. long, leathery, with thickened margins. New Zeal.

nubigena. Tree or shrub: lvs. linear-lance olate, to 1% in.

long, with 2 glaucous bands beneath. Chile. saligna. Tree to 60 ft.: lvs. linear-lanceolate, to 4 in.

long, blue-green above and pale beneath. Chile.

sinénsis: P. macrophylla var. Maki.

spicata. Matat. Tree to 80 ft., with pendulous branches when young: lvs. linear, to ½ in. long, glaucous beneath, leathery. New Zeal.

spinulosa. Spreading shrub: lvs. linear, to 2½ in. long, stiff, pungent-pointed. Australia.

Totara. Tree to 100 ft.: lvs. linear, to 1 in. long, dull green, leathery. New Zeal.

PODÓLEPIS. Compositæ. Ann. and per. herbs of Australia with deciduous tomentum, alternate entire linear to lanceolate lys., and terminal heads of yellow, pink or purple ray-fls. and diskfls.; bracts of involucre stiff and showy; pappus

Species of podolepis are grown as everlastings and thrive in sunlight in porous soil Propagated by seed, sown under glass in April or outdoors when the soil is in proper con-dition.

affinis: P. canescens.

aristata (P. chrysantha). Ann. to 1 ft.: heads solitary, 1 in. or more across, rays yellow, 3-4-lobed.

canéscens (P. affinis). Ann. to 1 ft.: heads solitary, about ¾ in. across, rays yellow, 3-4-lobed.

chrysántha: P. aristata.

grácilis. Ann. to 1 ft. or more, much branched: rava purple or lilac, entire or 2-lobed, ½ in. long.

PODOPHÝLLUM. MAY - APPLE. dacex. Per. herbs with large peltate palmately lobed lvs., solitary white fls., and fr. a fleshy berry; useful for shady places in the wild-garden; native in N. Amer. and Asia. A drug is obtained from the rhizomes of the native species. Propagated by division and seed.

emòdi. To 1 ft.: lvs. to 10 in. across, 3-5-lobed: fls. to 1½ in. across: fr red, to 2 in. across, edible. Himalayas. Var. màjor is listed as having pink fls.

peltatum. To 1½ ft.: lvs. to 1 ft. across, 5-9-lobed: fls. 2 in. and more across: fr. yellowish, 2 in. long. Que. to Fla. and Tex.

PODRÀNEA. Bignoniacex. A small African genus allied to Pandorea, differing in having an inflated calyx when in fl, the ovary oblong, not ovoid, and fr. an elongate linear caps. with flexible leathery valves, not short and oblong with stiff woody valves. See Pandorea for cult.

Brycei (Pandorea Brycei. Tecoma Reyinæ-Sabæ). Lvs. of 9-11 lanceolate long-pointed entire lits to 2 in long: fls. pale pink marked with red and throat yellow, 1½ in long and 2 in. across, in any-fld. panicles. Rhodesia.

Ricasoliana (Pandorea and Tecoma Ricasoliana. T. and Bugnonia Mackenn). Lvs. of 7-11 ovate short-pointed toothed lfts 1 in. long: fls. pale pink striped with red, 2 in. long, in loose panieles. S. Afr.

POGONIA. Orchidaceæ. Terrestrial orchids, chiefly American, with sts. bearing usually a solitary lf. and a single bracted terminal fl., having sepals and petals nearly equal, and toothed bearded lip. Grown out-of-doors in shady or moist situations; see Orchids.

divaricata: Cleistes divaricata.

ophioglossoides. To about 21 in. high, with a solitary If. to 3½ in. long on the st.: fls. (rarely 2) rose-pink, fragrant. Mar.—May (in S.), June-Aug. (in N.). Newf. to Fla. and Tex.

verticillàta: Isotria verticillata.

POINCIÀNA. Leguminosæ. Trees or shrubs with 2-pinnate lvs., showy fls. in panicles or racemes, the stamens often long-exserted, calyxlobes strongly imbricate, and flat pods; native in warm regions. Cult. as for Casalpinia.

Conzáttii. Small tree: lfts. 8-10, oblong to obovate: fls. vellowish-red to brilliant red in sessile racemes: pods curved, pubescent. Mex.

Gilliesii (Casalpinia Gilliesii). Straggling shrub or small tree, not prickly, branchlets glandular-pubescent: lits. numerous and very small: fls. light yellow with bright red stamens; pods to 4 in. long. S. Amer.

pulchérrima (Cæsulpinia pulcherrima). BARBADOS PRIDE. BARBADOS FLOWER-FENCE. DWARF POINCIANA. More or less prickly glabrous shrub to 10 ft.: lits. to ¾ in. long: fis. orange or yellow with bright red stamens to 2½ in. long: pods to 4 in long. Tropics. Var. flava, fis. yellow.

règia: Delonix regra.

POINSETTIA: Euphorbia pulcherrima: culture under Euphorbia.

POISON-BULB: Crinum asiaticum. POKE: Phytolacca americana. POKEBERRY: Phytolacca. POKER-PLANT: Kniphofia. POKEWEED: Phytolacca.

POLANÍSIA. Capparidacex. Coarse weedy ann, herbs of warm and trop, countries, probably 30 species, differing from Cleome in the absence of a conspicuous stalk (gynophore) to the ovary. P. trachyspérma of N. Amer. is sometimes grown as Cleome gigantea and C. grandis by error or admixture; it is a glandular plant, not showy, with purple and whitish fls. and much shorter stamens than the Cleome.

POLEMONIACEÆ. PHLOX FAMILY. Bland herbs or rarely shrubs or small trees, of about 12 genera in Eu., Asia and N. Amer., characterized by bisexual mostly regular fls. having 5 sepals, 5-lobed gamopetalous corolla, 5 stamens, superior usually 3-celled ovary, and capsular frs. The family furnishes many garden ornamental subjects, as Cantua, Cobæa, Collomia, Gilia, Loeselia, Phlox, Polemonium.

POLEMÒNIUM. Polemoniaceæ. Mostly per. herbs with alternate pinnately dissected lvs. and blue, purplish, white or yellowish often nodding fis. in terminal corymbs; grown in the flower-garden or border. Of easy cult. in rich loam. Propagated by division or seeds sown in fall.

álbum: plants in trade under this name may be vars. of P. cæruleum or P. Richardsonii.

amœnum. To 2 ft.: lvs. of 15-21 lanceolate lfts.: fls. pale blue, ¾ in. long. Wash.—By some authors considered a variant of P. carneum.

Archibaldiæ. To 2 ft.: lvs. of 13-19 oblong-lanceolate lfts.: fls. purple, ¾ in. long. Mts., Colo., Utah.

boreale: see P. Richardsonii.

cerileum. JACOBS-LADDER. GREEK VALERIAN. CHARITY. To 3 ft.: lvs. of 11-21 lanceolate lfts.: fls. blue, 1 in. across, drooping. Eu. Var. álbum has white fls. Var himalayanum (P. grandsforum) has lilac-blue fls. to 1½ in. across. Var. tangditum is probably not distinct from var. album. In var. variegatum the foliage is variegated.

carneum. To 2 ft.: lvs. of 5-17 ovate to oblong-lanced late lfts. to 11/4 in. long: fls. salmon fading purplish, to 11/2 in. across. Calif., Ore.

cashmirianum: listed name of unknown botanical

confertum. SKUNKWEED. To 8 in.: lvs. of 30-40 orbicular or oblong lfts; fls. blue or violet, 1 in. long. Mts., Wyo. to New Mex.

delicatum. To 4 in , very slender: lvs. of 11-23 ovate to oblong sticky-harry lits: fls. violet, ½ in. across, sepals acute. Mts., Colo., Utah, Ariz., New Mex.

élegans. To 6 in . viscid: lfts, numerous, ovate to elliptic. ry small: fls. blue with yellow throat, about ½ in. long. Wash

eximium. To 9 in , tufted: lvs of many linear palmately divided lfts.: fls. blue, in dense heads. Calif.

Fárreri: perhaps referable to P. czruleum var. himalaya-

filicinum. To 3 ft. or more: lvs. fern-like, the lfts. lance-olate: fls. deep blue or purple, $\frac{1}{2}$ in. across. New Mex.

flavum. To 3 ft.: lvs. of ovate to oblong-lanceolate lfts.: fls tawny-red outside, yellow inside, about 1 m. across. Mts. of New Mex. Var. cærûleum may not differ from type.

Forrestii: listed name of unknown botanical standing.

grandiflorum: P. cæruleum var. himalayanum.

Haydenii. Per. to 1 ft, sts glandular-puberulent above: st.-lvs. usually 3-5, lfts 15-25, ovate to oblanceolate, to ½ in. long: fls blue, to ½ in. long, campanulate, in narrow infl. Mont., Ida., Wyo.

himalayanum: P. cæruleum var.

hùmile: P. Richardsonii.

mellitum. To 10 in.: lvs. of 30-60 oval to linear lfts.: fls. white or cream, 1 in. long. Rocky Mts.

micranthum. Ann to 10 m: lvs. to 2 in. long, lfts. elliptic to lanceolate, to 3% m. long; fls. white, minute, solitary Wash to Mont south to Calif.

mode. To 2 ft, harry: lvs. of 13-21 oblong or lanceolate lfts.; fls. purple, $\frac{1}{2}$ in long. Rocky Mts.

occidentale. To 3 ft, glandular-pubescent: lvs. of 15-27 ovate-oblong or lanceolate lits. to $1\frac{1}{2}$ in long: fis. blue or violet, $\frac{1}{2}$ in long. Alaska to Colo. and Cahi.

parvifolium. To 1 in. or less: lvs of 11-25 very small oval or orbicular lfts.: fls. dark violet, ½ in. long, sepals obtuse. Mts., Mont.

pauciflorum. To 1 ft, glandular-pubescent: lvs of 12-24 narrow-lanceolate lfts. ¾ in long; fis yellow tinged red, 1½ in. long, sometimes solitary. Mex., Aliz.

pildsum: P. viscosum var.

pulchéllum: P. Richardsonii var.

pulchérrimum. To 1 ft.: lvs. glabrous to puberulent, of 15-27 oval lfts.: fls violet or rose, yellowish at base, 1/2 in. long, sepals acute. Mts., Alta. to B. C., Wyo. and

réptans. To 1 ft.: lvs. of 5-15 ovate to lanceolate-oblong lfts.: fis light blue, to $\frac{3}{4}$ in long N. Y. to Ala. and Kans. Var. himalàicum is probably P. cæruleum var. himalayanum.

var. nimalaicum is probably P. cæruleum var. himalayanum.
Richardsonii (P. humule). To 9 in., with villous-hairy
sts.: lvs. of 15-21 round-ovate to oblong lfts., hairy: fls.
blue to purplish, ½ in. across. Arctic regions.—The name
P. humule vas applied to another species many years prior
to its use for this plant. The plant known as P. boreale
(P. humule var. boreale) is tall and glabrescent, native of
arctic Eurusia, and now treated as a variant of P. hundum,
neither form known to be in cult. in U. S. Var. álbum has
white fls. and var. pulchéllum (P. pulchellum) smaller
violet to white fls. violet to white fls.

robústum. To 3 ft.: lvs. of 11-17 lanceolate lfts.: ffs. rose or purplish, to 35 in. long. Mts. of Colo.

roseum: listed name for a pink form.

Van-Brúntiæ. To 2½ ft, with stout horizontal roots: lvs. of 3-5 or more ovate or lanceolate lfts.: fls. bluish-purple, ¾ in. across. Vt. to Md.

viscosum. To 4 in., sticky-pubescent: lvs. of 30-41 orbicular lits. to ½ in. long: fis. blue or violet, ¾ in. long. Mts., Alta. to Ida. Var. pilosum, plant woolly-pilose, fis.

POLIÁNTHES. Amaryllidaceæ. Herbs with tuberous roots, grass-like basal and st.-lvs. and white fis. in terminal racemes or spikes, the perianth-tube long. Mex.

Tubers or bulbs should be set out early in June and covered with about an inch or more of fine light soil. One, the tuberose, is a popular garden plant. The roots should be dug before frost and stored over winter in a dry warm place. Tuberoses are summer and autumn bloomers; they may be forced for bloom in April to June by starting in January and kept in a temperature of 75-80°. The bulbs may be retarded in a cool dry place and forced for November bloom. tarded in a cool dry place and forced for November bloom.

tuberosa. Tuberose (that is, tuber-ose). To 3½ ft.: lvs. to 1½ ft. long and ½ in. wide, those on the st. clasping

and successively smaller: fls. waxy-white, very fragrant, 21% in. long, the double form mostly planted. Unknown wild.

POLIOTHÝRSIS. Flacourtiaceæ. Chinese tree adaptable far S. Propagated by seeds, cuttings of green wood and roots. P. sinénsis. To 40 ft.: lvs. ovate or ovate-oblong, to 7 in. long, toothed: fls. monoccious, greenish-white, small, without petals, in terminal panicles to 8 in. long: caps. 34 in. long.

POLLEN: spores or grains borne by the anther, containing the male element; sometimes, as in orchids and milkweeds, it is not granular.

PÓLLIA. Commelinaceæ. Per herbs in tropics of the Old World, having large lvs. borne near the top of the st. and white or pale rose fls. in terminal panieles; sometimes found in greenhouse collections. Requires the treatment of other glasshouse spiderworts.

condensata. Sts. to 6 ft.: lvs to 1 ft. long and 3 in. wide. Trop. Afr. Var. variegata has lvs. variegated with yellowish-white.

POLYANDROCÓCOS. Palmacex. Two tall unarmed monœcious Brazilian feather-palms, one of which has been planted in Fla.; spadix among the lvs., long and simple, staminate in the upper part; stamens 15–20; pistillate fls. subtended by bracts that enlarge in fr., making a close cylindrical spike: fr. ellipsoid or obovoid, concave at apex. For cult. see Palm.

caudéscens (Diplothemium audescens). Trink to 20 ft., closely ringed, bearing a heavy dense crown of stiff foliage: pinnæ very many, 2 in. or less broad, with very strong midrib and other nerves faint, somewhat crenate near the point: stamens 90-120: fr. obovoid, about ¾ in. long, punctate, pubescent in apical cavity. Bahia to Espirito Santo.

POLYANTHUS: Primula polyantha.

POLYCALYMMA: Myriocephalus Stuartii.

POLYCODIUM: Vaccinium stamineum.

POLYGALA. MILKWORT. Polygalaceæ. Many herbs or shrubs planted out-of-doors in warm climates or grown in the greenhouse, and some of them native in N. Amer.; characters of Polygalaceæ, which see.

Some species may be transplanted from the wild and these should mostly be placed in shady situations in light soil; propagated by seed. The tender species are propagated by cuttings in spring, over heat.

álba. Ann. or bien. to 1½ ft.: lvs. linear, to 1 in. long: fls. white, in spike-like racemes. Minn. to Mex.

amara. Per. to 10 in.: lvs. obovate, lower ones in rosette and longer than st.-lvs.: fls. pale blue or whitish, bracts shorter than pedicel: caps. small. Eu.

apopétala. Shrub to 15 ft. or more: lvs. lanccolate, obtuse: fis. pinkish-purple, in terminal racemes. Lower Calif.—Planted on Pacific coast.

brachypoda. Erect: fis. reddish-purple, in racemes. Native country unknown.

calcarea. Per. to 8 in., tufted: lvs. in rosettes, oboval to linear-lanceolate, variable in size: fis. blue, seldom white or rose, in terminal clusters. Eu.—Differs from P. amara in its larger bracts and caps.

Chamsbuxus. Creeping evergreen shrub to 1 ft.: lvs. lanceolate to obovate, to 1 in. long fis. yellow, 1 or 2 together. Eu.; stands in S. New England. Var. grandiflora (vars. atropurpurea and purpurea) has purple wings and yellow petals. Var. lutea is listed as having clear yellow fis.

cruciàta. Ann. to 10 in.: lvs. linear to spatulate, usually in 4's: fls. rose, wings usually bristle-pointed, in short thick sessile spikes. Me. to Minn. south to Fla. and Neb.

Dalmaisiàna. A hybrid with P. myrtifolia var. grandifora as one parent: fls. purplish- or rosy-red, blooming almost continuously.—Greenhouse bush, planted out far S. and in Calif.

grandifiòra: P. myrtifolia var.

hebeclàda (P. rhodoptera). Per. to 1 ft.: lvs. linear to cuneate, puberulous, margins somewhat revolute: fis. yel-

low with pink wings, on long pedicels in lax terminal racemes. Brazil.

lutea. Tufted ann. to 1 ft.: lys. oblong-lanceolate, about

lùtea. Tufted ann. to 1 ft.: lys. oblong-lanceolate, about 1 in. long. fis. orange-yellow, ½ in. long, in dense spike-like racemes to 1½ in. long. L. I. to Fla. and La.

myrtifòlia. Shrub to 8 ft.: lvs. oblong or obovate, to 1 in. long: fls. greenish-white veined with purple, the lower petal with a conspicuous frunged crest, borne in short terminal racemes. S. Afr.—Greenhouse, or in the open in warm regions. Var. grandiflora (P. grandiflora) has large rich purple fls.

paucifòlia. Fringed P. Flowering Wintergreen. Pertrailer to 6 or 7 m.: upper lvs. clustered and ovate or oblong, lower ones distant and becoming scale-like: fls. rose-purple or rarely white, 1-4 together, appearing terminal, with conspicuous fringed crest on corolla. N. B. to Ga. and Minn.; sometimes colonized about woods.

polfgama. Bien. to 1½ ft.: lvs. spatulate to oblong, to 1 in. long: fls. purple or rose, ¼ in. long, in loose racemes to 4 in. long. N. S. to Fla. and Tex.

rhodóptera: P. hebeclada.

sanguinea: P. viridescens.

Sénega. Seneca Snakeroot. Per. to 1½ ft.: lvs. lanceolate or oblong-lanceolate, to 2 in. long: fls. white or greenish, very small, in terminal spikes to 2 in. long. N. B. to N. C. and Ark.

Váyrediæ. Per. to 8 in.: lvs. lanccolate, usually deflexed and drooping: fis. purple with yellowish keel, in short axillary racemes. Pyrenees.

virgata. Shrub to 15 ft.: lvs. linear: fls. purple or pink, in many-fid leafless racemes. S. Afr.—Planted sometimes in warm regions.

viridéscens (P. sanguinea). Ann. to 15 in.: lvs. oblong or linear-oblong, about 1 in. long. fls. rose-purple, varying greenish or white, in globose heads ½ in. across. N. S. to N. C. and La.

POLYGALÀCEÆ. MILKWORT FAMILY. Herbs, shrubs or trees, sometimes climbing, of about 10 widely distributed genera, Comesperma, Polygala and Securidaca being known as cult. subjects. The family is characterized by simple lvs., bisexual irregular fls. with 5 sepals of which 2 resemble petals, 3–5 petals often united, 8–10 stamens, superior 2-celled ovary, and fr. usually a caps. but sometimes a samara or drupe. Grown somewhat for ornament.

POLYGAMOUS: bearing unisexual and bisexual flowers on the same plant or in the same inflorescence; a sexually mixed inflorescence.

POLYGONACEÆ. Buckwheat or Knotweed Family. About 40 widely distributed genera of herbs, vines, shrubs or trees having jointed sts., simple lvs. with stipules usually united into a prominent more or less tubular sheath or ocrea, and small bisexual or unisexual fls. without petals and with 2-6-parted calyx, 2-9 stamens, superior 1-celled ovary, and fr. an achene. A few genera yield food products and others are cult. for ornament, as Antigonon, Atraphaxis, Chorizanthe, Coccolobis, Eriogonum, Fagopyrum, Homalocladium, Muehlenbeckia, Oxyria, Polygonella, Polygonum, Rheum, Rumex, Tovara, Triplaris.

POLYGÓNATUM (Salomonia). Solomons-Seal. Liliacex. Several per. herbs of north temp. zone with creeping roots, sts. leafy toward the top, and greenish drooping fls. solitary or in umbels in the axils, the perianth-segms. united; suitable for the wild-garden. They thrive in shady positions in deep rich soil. Propagated by division.

biflorum (P. pubescens). SMALL S. To 3 ft.: lvs. to 4 in. long and 2 in. wide, pubescent beneath: fis. 1-4 together, to 1/2 in. long. N. B. to Fla. and Tenn. Var. major is a large form.

commutatum (P. giganteum). GREAT S. To 8 ft.: lvs. to 6 in. long and 4 in. wide, glabrous: fls. 1-8 together, ¾ in. long. N. Amer.

gigantèum: P. commutatum.

grandiflòrum: listed name, probably of hort. origin. latifòlium. To 4 ft.: lvs. to 6 in. long: fls. 1-5 together, ¾ in. long. Eu.

major: P. bistorum var.

multiflorum. To 3 ft.: lvs. 3 in. long and 1½ in. wide, glabrous: fls. 2-8 together, 23 in. long. Eu., Asia. Var. måjor is listed.

officinàle (Conrallaria Polygonatum). To 1½ ft.: lvs. to 5 in. long and 2 in. wide: fts. 1-2 together, ¾ in. long, fragrant. Eu., Asia.

pubéscens: P. biflorum.

POLYGONÉLLA. Polygonaceæ. Ann. and per. herbs of E. N. Amer., with jointed sts., alternate lvs., and small white or greenish fls. in panicled racemes; allied to Polygonum; sometimes offered but of little hort. merit.

americana. Per. to 4 ft., sts. somewhat flexuous: lvs. linear to linear-spatulate, to 1 in. long, fleshy: racemes to 3 in. long, dense: fr. winged. Dry soil, Ga. to Ala., Mo. and Tex.

articulata (Delopyrum articulatum). Ann. to 11/2 ft.: lvs. linear or linear-subulate, to 1 in. long: racemes to 11/2 in. long: fr. not winged. Coast, Me. to Fla.

POLYGONUM. KNOTWEED. FLEECE-FLOWER. Polygonaccæ. Many species, mostly herbs, sometimes twining or aquatic, with alternate simple lvs., small fls. in racemes, spikes, or heads, and fr. a small achene; grown in borders or the wildgarden. Plants of varied character, in many parts of the world, a few of the kinds of good ornamental value for their profusion of little white, greenish or red fls. and sometimes for the abundant foliage; some of the natives, little known in cult., are known as Smartweeds, growing in low places. Of easy cult. Propagated by seeds and division.

affine (P. Brunonis). Per. to 1½ ft.: lvs. mostly basal, oblanceolate, 6 in. or more long, finely toothed: fis. bright rose-red, in dense spikes to 3 in. long, in autumn. High Himalayas.

alpinum. Per. to 3 ft.: lvs. lanceolate to ovate-lanceolate, to 6 in. long, ciliate on margins: fis. white, in panicled racemes, in summer. Alps and Asia.

amphtbium (Persicaria amphtbia). Aquatic per. with sto 20 ft. long which roots at joints: lvs. rather thick, floating, oblong to lanceolate, to 4 in. long; fls. light rose, in dense terminal racemes to 1 in. long, in late summer. In ponds and lakes, N. Amer. and Eu.; sometimes nat. in pools.

amplexicable (P. oxyphyllum). MOUNTAIN FLEECE. Per. to 3 ft.: lvs. ovate to lanceolate, to 6 in. long, the upper st.-clasping: fls. rose-red or white, in spikes to 6 in. long, in mid-summer. Himalayas. Var. album has white fls. Var. atropurpareum is listed as having mahogany-red fls. Var. rubrum has red fls.

Albertii. China Fleece-Vine. Silver Lace-Vine. Twining per. vine to 20 ft.: lvs. ovate-lanceolate, to 2½ in. long: fls. greenish, fragrant. in long erect panicled racemes, in late summer. W. China, Tibet.

baldschuánicum. Closely resembling P. Aubertii but with larger rose-colored fis, in denser drooping panicles. Bokhara.

Bistorta. SNAKEWEED. Per. to 2 ft.: lvs. basal and cauline, oblong-ovate, truncate at base, with long winged petiole: fls. white or pink, in a dense spike to 2 in. long, in late summer. N. Eu. and Asia.

bistorioles (Bistorta bistorioles. P. calophyllum). Per. to 2½ ft.: lvs. mostly basal, oblong or lanceolate, to 10 in. long: fls. white, in dense racemes to 2 in. long. B. C. to Calif. and Rocky Mts.—Differs from P. Bistorta in the longer narrower lvs. commonly tapering into unwinged petioles.

Brundnis: P. affine.

calophýllum: P. bistortoides.

capitatum. Per. with trailing branches to 10 in. long: lvs. elliptic, to 1½ in. long: fls. pink, in dense heads to ¾ in. across. Himalayas.

compáctum: P. cuspidatum var.

cuspidatum. Japanese K. Mexican-Bamboo. Per, to 8 ft.: lvs. oval to nearly orbicular, to 5 in. long, abruptly pointed: fis. small, greenish-white, in axillary panieled racemes, in late summer and autumn. Japan. Var. compactum is a condensed form about 2 ft. high. Var. crispulum is listed.—The name cuspidatum was employed earlier

in the genus but is apparently an undetermined or dead name and under the International Rules does not invalidate the present use of it; under other interpretation, however, the name cannot be employed again and both P. Sieboldii and P. Zuccarinii have been used instead.

filiforme: Tovara virginiana var. filiformis.

multiflorum. Climber, with tuberous root: lvs. cordateovate, 2-5 in. long, evergreen in mild climates: fis. greenish, in slender panicles, in autumn. Japan.

orientalis). Princes-Feather. Hairy ann. to 6 ft.: lvs. broadly ovate, to 10 in. long: fis. bright pink or rose, in dense spikes to 3½ in. long, in autumn. Asia, Australia; nat. in N. Amer. Var. variegatum is listed as having variegated foliage.

oxyphyllum: P. amplexicaule.

Paronýchia. Per. with prostrate or ascending sts to 3 ft.; lvs. linear-lanceolate, to ¾ in. long, margins revolute: fls. white or rose, in leafy terminal spikes. B. C. to Calif.

Persicaria. Ladys-Thumb. Ann. to 2 ft.: lvs. lanceolate or narrower, usually with triangular spot near middle: fls. pink or greenish-purple, in dense spikes to 2 in. long, in summer. Eu.; nat. in N. Amer.

polygaloides. Ann. to 8 in.: lvs. narrow-linear, to 1 in. long: fls. white or pinkish, the bracts with white petal-like margins. Wash. to Mont.

polystàchyum. Shrubby per. to 6 ft.: lvs. oblong-lanceolate, to 9 in. long and 3½ in. wide. fls. white or pink, in large terminal panieles, in autumn. Himalayas.

réptans: probably an error for repens which is a synonym of P, capitalum.

rivulare. Ann. to 3 ft., erect, usually simple: lvs. lanceolate, to 4 in. long and ¾ in. wide, sheaths glabious and culiate: fls. rose-pink, in lax cylindrical spikes to 1½ in. or more long. Chile.

sachalinense. Sacaline. Coarse per, to 12 ft.: lvs. oval-oblong, 1 ft. and more long, slightly heart-shaped at base: fls. greenish, in short axillary clusters, in autumn. Saghalin Isl.—Sometimes grown for rough forage or as a coarse cover or screen.

scándens. Twining per.: lvs. ovate, to 5 in. long: fls. greenish-yellow, in axillary leafy racemes to 10 in. long. N. S. to Fla. and La.

sericeum: the plant grown under this name is P. alpinum.

Sièboldii: sec P. cuspidatum.

Spācthii. Erect per. to 12 ft., roots much knotted, sts. thick with enlarged nodes, internodes about 10 in. long: lvs. cordate-ovate, to 18 in. long and 9 in. wide, petiole blood-red, to 6 in. long, margins undulate and somewhat ciliate: fls. whitish, in short axillary clusters. China.

sphærostachyum. Tufted per.: lvs. linear or linear-oblong, wavy-toothed: fls. crimson, drooping, in dense solitary spikes. Himalayas.

tinctòrium. Erect per. to 3 ft.: lvs. ovate, obtuse, tapering into petiole pellucid-dotted, ciliate: fls. bright crimsonpink, in dense cylindrical spikes to 3½ in. long. China.—Source of an indigo-blue dye of commercial importance in Orient.

vaccinifòlium. Per. to 1 ft. with trailing branches: lvs. orbicular, to ¾ in. long, slightly glaucous beneath: fis. rose, ⅓ in. across, ın racemes to 3 in. long. Himalayas.

virginianum: Tovara virginiana.

viviparum (Bistorta vivipara). Per. to 1 ft.: lvs. oblong to linear, to 8 in. long: fls. pale rose or white, in narrow terminal racemes. N. Amer., Eu., Asia.

Wéyrichii. Per. to 3 ft.: Ivs. ovate, to 7 in. long, white-tomentose beneath: fls. white or greenish, in racemes forming a large terminal panicle. Saghalin.

Zuccarinii: see P. cuspidatum.

POLYMNIA GRANDIS: Montanoa bipinnatifida.

POLYPETALOUS: having several distinct (separate) petals.

POLYPODIACEÆ. Common - Fern Family. Most of the common low ferns without distinct trunks, planted in the open and grown under glass, belong to this variable family of wide distribution: fronds or lvs. simple or pinnate, or palmate in some species, bearing sori on backs or margins, usually covered with an indusium. The most important genera known to hort. are Acrostichum, Adiantum, Anopteris, Asplenium, Athyrium, Blechnum, Camptosorus, Cheilanthes, Coniogramme, Cryptogramma, Cyclophorus, Cyrtomium, Cystopteris, Davallia,

Dennstaedtia, Diplazium, Doodia, Doryopteris, Dryopteris, Elaphoglossum, Hemionitis, Humata, Hypolepis, Microlepia, Nephrolepis, Notholæna, Odontosoria, Onoclea, Onychium, Pellæa, Phyllitis, Pityrogramma, Platycerium, Polypodium, Polystichum, Pteretis, Pteridium, Pteris, Sadleria, Stenochlæna, Struthiopteris, Woodsia, Woodwardia. For cult. see Ferns.

POLYPÒDIUM. POLYPODY. Polypodiaceæ. A great genus of ferns growing in all parts of the world, of various habit and often epiphytic: fronds simple or compound; sori naked, on backs of veins. Some of the species are good in the rock-garden, others are tropical and therefore greenhouse subjects, of diverse kinds but mostly easy to grow. A number of them are root-climbers. Propagation is by spores, and readily by division of clumps or rhizomes. See Ferns.

aureum (P. glaucum. Phlebodium aureum). HARES-FOOT-FERN. GOLDEN P. Coarse fern with brown-sealy rhizomes: fronds to 4 ft. long and 1 ft. wide, deeply cut or pinnate, pinnæ to 1 ft. long and 2 in. wide, often glaucous beneath. Trop. Amer.

diversifolium. Fronds leathery, of two forms, about 9 in long and 2 in. wide and entire, or to 1½ ft. long and 9 in. wide and deeply pinnatifid, pinnas to 5 in. long. New Zeal., Australia, Tasmania.

Dryopteris: Druopteris Linnwana.

falcatum: P. vulgare var. occidentale.

fraxinifòlium. Ashleaf P. Fronds to 4 ft. long and 1½ ft. wide, pinnate, pinnæ entire, to 9 in. long. Colombia to Brazil and Peru.

glaucophýllum críspum: form of P. aureum.

glauco-pruinatum (P. glaucum. Phymatodes glaucum). Fronds to 1½ ft. long and 8 in. wide, deeply pinnatifid, segms. entire, ½ in. or more wide. Philippines.

glaucum: P. aureum or P. glauco-pruinatum.

glycyrrhiza: P. vulgare var. occidentale.

hespèrium: P. vulgare var.

hexagonópterum: Dryopteris hexagonoptera.

incanum: P. polypodioides.

irioldes. Fronds to 3 ft. long and 3 in. wide, entire, leathery. Trop. Asia, Afr., Pacific Isls.

Knightiæ: hort. form of P. subauriculatum.

Lingua: Cyclophorus Lingua. Lòwii: a form of P. aureum,

Mandaianum: a wavy-lvd. form of P. aureum.

occidentale: P. vulgare var.

Pálmeri. Rhizomes very thick, white-scaly: fronds to 8 in. long and 3 in. wide, the fertile smaller, oblong to linear, entire. Mex. to Panama.

pennigerum: Dryopteris pennigera.

percussum (Phymatodes percussum). Fronds to 1 ft. long and 1½ in. wide, entire, narrowed toward both ends, very leathery. Colombia to Peru and Brazil.

Phegópteris: Dryopteris Phegopteris.

Phyllitidis (Campyloneuron Phyllitidis). STRAP-FERN. Fronds to 3 ft. long and 4 in. wide, simple, leathery, shining, sometimes wavy-margined. Fla. to Uruguay.

Phymatodes (Drynaria vulgaris. Phymatodes vulgaris). EAST INDIAN P. Similar to P. aureum but with slender blackish rhizomes, smaller fronds and different venation. Asia, Afr.

polypodioides (P. incanum). RESURRECTION-FERN. Fronds evergreen, leathery, to 7 in. long and 2 in. wide, pinnatifid into oblong entire segms., gray-scaly beneath. On trees, Del. to Tex., trop. Amer.

pustulatum. Fronds variable to 9 in. long and 3% in. wide and entire, or to 1½ ft. long and 6 in. wide and deeply pinnatifid into linear-lanceolate segms. to 3 in. long. New Zeal., Australia.

quercifòlium (Drynaria quercifolia). OAK-LEAVED-FERN. Fronds leathery, of two kinds; fertile long-stalked, to 3 ft. long, pinnatifid into oblong entire segms. to 9 in. long; sterile esseile, shape of oak lvs., to 1 ft. long and 8 in. wide, lobed. India, Malaya to Australia.

Reinwardtii: a hort. form of P. subauriculatum.

Scoùleri. Fronds to $1\frac{1}{2}$ ft. long, leathery, pinnate into segms. to $\frac{3}{4}$ in. wide, slightly wavy. Coast, B. C. to Calif.

subauriculatum (Goniophlebium subauriculatum). Jointed

P. Fronds to 3 ft. long and 1 ft. wide, pinnate into entire or toothed segms. to 6 in. long and ½ in. wide. Trop. Assa to Australia.

vendsum: a name of uncertain application.

virginianum. American Wall-Fern. Formerly included in P. vulpare but rhizomes not sweet, fronds smaller, the lower segms. as long as or longer than middle ones. E. N. Amer., on cliffs and rocks, north to Labrador.

E. N. Amer., on chiffs and rocks, north to Labrador.

vulgare. Common P. Wall-F. Forming mats, rhizomes
sweet: fronds to 2 ft. long and 5 in. wide, deeply pinnatifid
into segms. to 2 in. wide, the lowest usually shorter than
middle ones. On rocks, banks and trees, Eu. Asa, W. N.
Amer. Var. hesperium (P. hesperium). Fronds pinnate,
to 7 in. long, pinnæ oblong or oval. B. C. to Calif. Var.
occidentale (P. falcatum. P. glycyrrhiza. P. occidentale).
Fronds pinnate, to 1½ ft. long and 7 in. wide, pinnæ to
2½ in. long. Calif. to Alaska.—There are many crested,
dissected and plumed forms.

POLYPODY: Polypodium. Limestone: Dryopteris Robertuana.

POLYPÒGON. Gramineæ. Grasses, mostly annuals with flat lvs. and spikelets borne in spikelike panicles; native in temp. regions and one sometimes planted for the ornamental fluffy spikes. See Grasses.

monspeliénsis. Annual Beard-Grass. Ann. to 2 ft.: lvs. to 6 in. long and 1/4 in. wide, rough: panicles to 4 in. long, dense, awns to 1/4 in. long. Eu., Asia; nat. in N. Amer.

POLYPTERIS. Compositæ. Erect herbs with entire alternate lvs. and rose-purple or flesh-colored radiate heads in loose panicles; pappus of scales; native in N. Amer. One sometimes cult.

Hookeriana (Palafoxia Hookeriana. Othake Hookerianum and O. sphacelatum). Ann. to 4 ft., sticky above: lvs. lanceolate, to 4 in. long, rough: heads 1 in. or more across, rays rose-red, deeply 3-lobed, the bracts of involucre tipped purple. Neb. to Mex.

POLÝSCIAS. Araliaceæ. Aromatic shrubs and trees from tropics of Old World and Pacific, with pinnate exceedingly variable lvs., very small fls. in umbels or heads which are often panicled, and berry-like frs.; known in cult. usually as Aralia and Panax. Certain authors prefer to put the following species in Nothopanax.

These araliads are planted in greenhouses and out-of-doors far South, being much employed in tropics for hedges and division plantings. Of easy cultivation. Propagated mostly by cuttings of firm wood; also by eye-cuttings over heat. Old stools placed over bottom heat will yield cuttings which may be rooted in heat. Cleft- or wedge-grafting is also employed.

Balfouriana (Aralia Balfouriana). To 25 ft.: lvs usually of 3 orbicular coarsely toothed lfts. to 4 in. across, somewhat heart-shaped at base, often blotched with white at the margin. New Caledonia.

filicifòlia (Aralia filicifòlia). To 8 ft.: lvs. 1-pinnate, on the same plant, the lfts. varying from oblong and entire to 7 in. long, to very narrow, pinnatifid and sharply toothed, and to 1 ft. long. Pacific Isls.—A cut-lvd. form was once grown in this country as Panax gracillima.

fruticosa (Aralia fruticosa). To 8 ft.: lvs. at least 3-pinnate, the lits. varying from narrowly ovate to lanceolate, to 4 in. long, toothed or deeply cut. India to Polynesia. Var. plumata (Panax excelsum) has small, very fine and narrow segments. One of the leaf forms has been called Panax dessectum.

Guilfoylei (Aralia Guilfoylei). To 20 ft.: lvs. 1-pinnate, the ovate to orbicular lits. remotely toothed, to 5 in. long, usually margined or blotched with white. Polynesia. There are many leaf forms, the most important being var. lacinitae with the white margins cut into pronged teeth, var. monstrosa (Aralia monatrosa) with lits. irregularly cut and jagged, and var. Victoriæ (Aralia Victoriæ) having much divided and cut lits, useful in pots.

obtusa. Tree to 12 ft.: lvs. bipinnate, glabrous; lfts. small, nearly orbicular, rounded or truncate or subcordate at base, sharp-toothed or cut, perhaps variegated. Java; grown in S. Fla. and southward.

POLYSTACHYA. Orchidaceæ. Cosmopolitan epiphytic orchids with leafy sts. and terminal racemes or panicles of small fis. with lateral

sepals and 3-lobed lip united to column-foot. See Orchids for cult.

affinis (P. bracteosa). Lvs. thin, to over 7 in. long: infl. usually racemose, downy, to 1 ft. long: fls. golden-yellow. May. W. Afr.

bractedsa: P. affinis.

blaceosa. A agama.

Iuteola (P. manuta). A widely distributed species of both hemispheres, to about 22 in. high: lvs. to 12 in. long and 1½ in. wide: infl. loosely paniculate (less often racemose), many-fld., exceeding lvs.; fls. greenish-yellow. Trop. Amer., trop. Asia.

minuta: P. luteola.

POLÝSTICHUM. Polypodiacex. Ferns of temp. regions, mostly in woods, with fronds pinnatifid to 4-pinnate into sharp-toothed segms.; sori round, covered by indusia. Here are included some of the ferns formerly known as Aspidium. The native species are sometimes transferred to grounds; others are cool greenhouse subjects of easy cult. See Ferns.

acrostichoides (Aspidium and Dryopteris acrostichoides). Christmas-Fern. Dagger-Fern. Hardy: fronds evergreen, to 2 ft. long and 5 in. wide, 1-pinnate into linear-lanceolate segms., those bearing spores contracted. N. S. to Tex.

aculeatum (Aspidium aculeatum. Dryopteris aculeata. P. angulare). Hardy, dark green: fronds to 2 ft. long and 6 in. wide, 1-pinnate into pinnatifid segins. Widely distributed in Old World and S. Amer.—Very variable. Var. dénsum (P. angulare var. densum) has the fronds in a dense mass. Var. proliferum (P. proliferum) is a proliferous form.

adiantiforme (P. capense. P. coriaceum). Fronds triangular, leathery, to 3 ft. long and 2½ ft. wide, 1-3-pinnate, segms. oblong, to 1 in. long, coarsely toothed. Tropics.

Andersonii. Fronds to 3 ft. long and 8 in. wide, nearly 2-pinnate into triangular segms minutely scaly beneath, rachis proliferous below tip. Alaska to Wash. and Mont.

angulàre: P. aculeatum.

aristatum (Aspudium aristatum. Lastrea aristata). EAST INDIAN HOLLY-FERN. Stipes to 1½ ft. long: fronds to 2 ft. long and 1 ft wide, 1-3-pinnate, segms. pinnatifid and spiny-toothed. Asia to Australia. Var. variegātum has segms. banded with whitish-green.

Braunii (Aspudium Braunii). Shield-Fern. Hardy: fronds to 2 ft. long, 2-pinnate, segms. sharp-toothed, covered with hair-like scales. N. N. Amer, Eu.

californicum (Aspidium californicum). Fronds to 2½ ft. long and 8 in. wide, 1-pinnate into pinnatifid linear segms. Wash, to Calif.

capénse: P. adiantiforme.
coriàceum: P. adiantiforme.
falcàtum: Cyrtomium falcatum,
ímbricans: P. munitum var.

Lémmonii. Fronds to 1 ft. long and 2 in. wide, pinnate into many small pinnately lobed or divided segms., margins wavy-toothed. Alaska to N. Cahf.

lobatum (P. aculeatum var. lobatum). Differs from P. aculeatum in somewhat shining fronds distinctly tapering to base, mostly sessile pinnules at an acute angle to rachis, the lowest considerably larger than one next to it.

Lonchitis (Aspudium Lonchutis). MOUNTAIN HOLLY-FERN. Hardy: fronds leathery, evergreen, to 2 ft. long, 1-pinnate into lanceolate segms. to 1½ in. long, spiny-toothed and strongly auricled at base. Mts., N. Amer., Eu., Asia.

montanum: Dryopteris oreopteris.

munitum (Aspidium munitum). GIANT HOLLY-FERN. Hardy: stipes to 2 ft. long: fronds leathery, evergreen, to 3½ ft. long and 10 in. wide, 1-pinnate into linear sharptoothed or cut segms. Alaska to Mont. and Calif Var. imbricans has smaller fronds with crowded obliquely imbreated pinne.

plumòsum var. compáctum and var. dénsum: listed names, probably to be referred to variations of P. munuum. proliferum: P. aculeatum var.

scopulinum. Fronds to 1 ft. long and 2½ in. wide, pinnate into few large pinnately lobed or divided sharp-toothed segms. Wash. to Calif., Que.

setdsum: a name of uncertain application.

tsus-siménse (Aspidium tsus-simense). Small and suitable for fern-baskets: fronds thin, 2-pinnate, to 2 ft. long including the stipe. Japan.

varium. JAPANESE HOLLY-FERN. St. partly creeping:

fronds to 2 ft. long and 1 ft. wide, 2-3-pinnate, somewhat leathery. China, Japan.

viviparum. Fronds to 1½ ft. long and 6 in. wide, pinnate into many lanceolate segms., auricles of the pinnæ forming distinct lits. W. Indies.

POMADÉRRIS. Rhamnaceæ. Shrubs and trees of the Australia-New Zeal. region with alternate mostly tomentose and stellate simple lvs., small greenish fls. in cymes, corymbs or panicles, and little capsular frs.; grown for ornament in the S. and Calif. Propagated by cuttings of half-ripened shoots under glass.

apétala. To 20 ft.: lvs. oblong, to 4 in. long, white-tomentose beneath, rusty on venus. fls. greenish-white, in panicles to 7 in. long, without petals. Australia, New Zeal.—Planted as a yard and street tree in Calif.

Édgerleyi. To 1 ft., sometimes procumbent: lvs. oblong, to 1 in. long, rusty-tomentose beneath, bristly above: fls. in cymes, without petals. New Zeal.—Planted in Calif.

ellíptica. To 8 ft.: lvs. oblong, to 3 in. long, white-tomentose beneath: fls. bright yellow, ¼ in. across, in much branched panicles, with petals. New Zeal.

lanígera. Tall shrub: lvs. oblong or ovate-lanceolate, to 3 m. long, soft-tomentose beneath: fis. in panicles, with petals. Australia.

phylicæfòlia. To 4 ft.: lvs. linear or linear-oblong, to $\frac{1}{3}$ in. long, margins revolute to midrib, rough-hairy above: fls. in small cymes, without petals. New Zeal.

rugòsa. To 8 ft.: lvs. oblong-lanceolate, to $1\frac{1}{2}$ in. long, pubescent beneath, rusty on veins: fls. in cymes, without petals. New Zeal.

POME is from the Latin pomum, fruit; the English word, however, designates a particular kind of fruit represented by apples, pears, quinces, having a peculiar morphological structure: the ovary is immersed in a thick outer part that supplies most of the edible flesh; in prevailing cases the outer part completely covers the carpels, only the old styles protruding at the apex when the fruit is mature, but in the medlar the carpels are exposed on top. In pomology the Latin element retains its original signification, the word meaning the subject and practice of fruit-growing, whether the fruits are pomes, grapes, berries, avocados, citrus, nuts, plums, persimmons, dates.

POMEGRANATE: Punica Granatum.

POMELO: Citrus paradisi; see Citrus Fruits (page 183).

POMERACK: Eugenia malaccensis.

POMME BLANCHE: Psoralea esculenta.

POMPELMOUS: Citrus maxima.

PONCÌRUS. Rutacex. A small stiff-growing spiny deciduous tree of China, planted for ornament and hedges in the southern states and in protected places as far north as Philadelphia and much employed as stock for citrus fruits to improve their hardiness. P. trifoliata (Citrus trifoliata, Ægle sepiaria), Trifoliate—Orange, blooms in spring on bare branches in axils of large spines, the fls. white, opening flat, and sometimes 2 in. across: Ifts. 3, oval or oblong, to 2 in. or more long, petiole winged: fr. small but orangelike and aromatic, to 2 in. diam., downy, pulp scant and acid.—A parent in hybridization: see Citrus Fruits. Propagated by seeds.

POND-APPLE: Annona glabra.

PONDWEED: Potamogeton. Cape: Aponogeton distachyus.

PONGAMIA. Leguminosæ. Tree to 40 ft., grown for ornament in S. U. S., and the seeds furnishing an oil. P. pinnata (P. glabra). KARUM or POONGA OIL TREE. Lvs. pinnate, of 5-7 ovate lfts. to 4 in. long, strong-smelling: fls. papilion-

aceous, purplish, pink to white, in loose racemes to 5 in. long: pods woody, thick and flat, to 2 in. long and 1 in. across. Trop. Asia, Australia.

PONGELION: Ailanthus.

PONTEDÈRIA. Pontederiacex. American aquatic per. herbs with thick parallel-veined lvs. having long petioles and blue fis. in spikes; grown in ponds and bog-gardens. The water should be about 1 ft. deep. Propagated by division.

cordata. PICKEREM-WEED. To 4 ft., from a rootstock: lvs. to 10 m. long and 6 in. wide, heart- or arrow-shaped at base: fls. with upper lobe having 2 yellow spots. N. S. to Fla. and Tex. and S. Var. angustifolia (P. montevidiensis) has much narrower lvs.

paniculata: Eichhorma Martiana.

PONTEDERIÀCEÆ. PICKEREL-WEED FAM-ILY. Six genera native in swamps or ponds: lvs. various: fis. bisexual, somewhat irregular, having 6-parted corolla-like usually showy perianth, 3 or 6 stamens, and superior ovary: fr. a caps. or achene. Eichhornia and Pontederia are grown in ponds and tanks.

POONGA OIL TREE: Pongamia pinnata.

POOR MANS WEATHERGLASS: Anagallis arvensis. POPINAC: Acacia Farnesiana. White: Leucana glauca.

POPLAR: Populus; see Liriodendron Tulipifera.

POPONAX: Acacia macracanthoides.

POPPY: Napaver, Meconopsis. Bush: Dendromecon rigida. California: Eschscholzia californica. Celandine: Stylophorum diphyllum. Flaming: Stylomecon heterophylla. Horned: Glaucum. Matilija: Romneya Coulteri. Mexican Tulip: Hunnemannia fumarixfolia. Plume: Macleaya cordata. Prickly: Argemone. Sea: Glaucum. Snow: Eomecon chromatha. Tree: Dendromecon rigida. Water: Hydrocleys nymphoides. Wind: Stylomecon heterophylla.

PÓPULUS. POPLAR. ASPEN. COTTON WOOD. Salicacex. Many species of directions trees and bushes with soft white wood, widely distributed in the northern hemisphere, having alternate long-stalked lvs. and fls. in drooping catkins before the lvs., the seeds surrounded by copious silky hairs; widely planted for avenues, windbreaks and ornament. The term cottonwood is applied mostly to P. deltordes and associates, as P. Sargentii, P. Fremontii, P. Wislizenii; the pistillate tree becomes offensive from the "cotton" discharge from the capsules.

Poplars are of easy cultivation in almost any soil and are of prompt and rapid growth. The roots are likely to stop drains or cause heaving of sidewalks, so should be planted with caution. Propagated by hardwood cuttings, suckers, or sometimes by seeds, and the weeping soits are grafted on the upright forms.

acuminăta. To 45 ft.: lvs. rhombic-lanceolate, to 4 in. long, broadly cuneate at base, glossy dark green above, light green beneath. Sask. to Colo.

adenópoda. Chinese A. To 75 ft. or more: lvs. ovate, to 4 in. or more long, truncate or heart-shaped at base, pale green below with grayish pubescence at least when young. China.

álba. White P. Abele. To 90 ft. or more: lvs. ovate, to 5 in. long, palmately 3-5-lobed or -toothed, rounded or slightly heart-shaped at base, white- or gray-tomentose beneath. Eu., Asia. Var. Bolleāna is var. pyramdalıs. Var. globōsa is a small form with dense oval head. Var. nivea has lobed lvs. densely white-tomentose beneath. Var. pendula, branches drooping. Var. pyramidālis (P. Bolleana) is of columnar habit. Var. Ríchardii (P. Richardii) has lvs. wellow above. yellow above.

Andrewsii. Hybrid between P. Sargentii and P. acuminata, having oblong-ovate lvs. to 4 in. long.

angulata. Probably a hybrid, perhaps between P. bal-samplera and P. nugra, having ovate lvs. to 7 in. long and 5 in. wide, truncate or heart-shaped at base, light green beneath. Var. cordata is a stammate hardier form.

angustifòlia (P. fortissima). To 60 ft.: lvs. lanceolate or ovate-lanceolate, to 4 in. long, rounded or wedge-shaped at base, light green beneath. Sask. to Ariz. aurea: P. tremuloides var.

Bailevana: P. Jackii.

balsamífera: P. deltoides.

berolinénsis. Hybrid between P. laurifolia and P. nigra var. idlica, of columnar habit, with ovate long-pointed lvs. to 4 in. long, having a narrow translucent border.

betulifòlia: P. nigra var.

Bolleana: P. alba var. pyramidalis.

canadénas: P. alba var. pyramidalis.

canadénsis. Carolina P. Hybrid probably between P. nigra and P. balsamifera, staminate plants only, with triangular-ovate lvs. to 4 in. long, truncate at base, somewhat ciliate on margins. Var. aûrea (P. Van Geeriu), has yellow lvs. Var. erêcta is of pyramidal form. Var. Eûgenei (P. Eugenei). Eugenei P., is of narrow-pyramidal habit. Var. marilândica (P. marilandica) has wide-spreading branches. Var. regenerâta (P. regenerala) comes into Ii. about two weeks earlier than var. serôtina (P. serotina) which has wide-spreading ascending branches.

cándicans. Balmor-Gilead. To 90 ft., pistillate plants only: lvs. triangular-ovate, to 6½ in. long and 4 in. wide, heart-shaped at base, whitish and pubescent beneath. Probably a hybrid of European origin.—Sometimes confused with P. Tacamahaca var. Michauxii.

canescens. Gray P. Resembling P. alba but with smaller lvs. only obscurely lobed and gray beneath. Eu., W. Asia.

carolinénsis, caroliniàna. This name in the trade may be applied to more than one poplar, but it probably refers to P. canadensis, mostly to var. Eugener.

cathayana (P. suaveolens). To 90 ft.: lvs. ovate to ovate-lanceolate, to 4 m. long and 2½ m. wide, rounded or wedge-shaped at base, glossy above and whitish beneath. Asia.—Likely to be confused with P. Maximourizm.

certinénsis. Considered to be staminate plants of P. berolinensis, but material in the trade under this name may belong elsewhere.

chinénsis: see P. nigra var. italica.

cordata: probably P. angulata var.

deltoides (P. balsamifera. P. monilifera). Cottonwood. To 90 ft., with broad head: lvs. ovate, to 7 in. long, truncate or somewhat heart-shaped at base, glossy above. Que. to Fla. and Tex.—The Notway poplar is probably a form of this species or a hybrid; it is a vigorous hardy tree planted in Minn. and Dak.—See P. Tacamahaca.

élegans: P. nigra var. plantierensis.

Eùgenei: P. canadensis var.

fastigiàta is P. nigra var. italica, and its var. Wilsonii is P. Wilsonii.

fortíssima: P. angustifolia.

Frèmontii. To 90 ft.: lvs. triangular, to 2½ in. long and 3 in. wide, truncate or slightly heart-shaped at base, glossy above. Calif. to Ariz.

generosa. Hybrid between P. trichocarpa and P. angulata with lvs. pale green beneath and with translucent narrow margins.

graca: P. tremuloides.

grandidentata. Large-toothed A. To 60 ft.: lvs. ovate, to 4 in. long, conreely toothed, truncate or wedge-shaped at base, grayish-tomentose beneath but becoming glabrous. N. S. to N. C. and Tenn.—For the pendulous form see P. pseudo-grandudentata.

heterophylla. Swamp C. To 90 ft. or shrubby in cult.: lvs. broud-ovate, to 7 in. long, heart-shaped or rounded at base, pale green and often slightly pubescent below. Conn. to Ga. and La.

Jáckii (P. Baileyana). Hybrid between P. Tacamahaca and P. balsamifera, with broad ovate lvs. heart-shaped at

koreana. To 75 ft.: lvs. to 6 in. long and 3¼ in. across, rounded at base, dark green and wrinkled above, whitish beneath, with red midrib. Korea.

lasiocárpa. To 60 ft.: lvs. ovate, to 1 ft. long, heart-shaped at base, light green and pubescent beneath, with red midrib. China.

laurifòlia. To 45 ft.: lvs. elliptic-ovate to lanceolate, to 5 in. long, rounded at base, whitish and slightly pubescent beneath. Siberia. Var. Lindleyana (P. Lindleyana, P. salacifolia) has narrower lvs. with wavy margins.

Lindleyana: P. laurifolia var.

MacDoùgalii. To 100 ft.: lvs. broad-ovate, to 3 in. long, truncate at base, margin usually finely crenate-serrate. S. Calif., Ariz.

macrophylla: hort. name, sometimes referable to P. candicans, sometimes to P. angulata.

marilándica: P. canadensis var.

Maximowiczii. To 90 ft.: lvs leathery, elliptic to nearly orbicular, to 5 m. long, slightly heart-shaped at base, whitish beneath and pubescent on veins. N. E. Asia, Japan. moniiffers: P. balsumicra.

moninters: P. bassimiera.

nigra. Black P. To 90 ft.: lvs. triangular, to 4 in. long and 3 in. wide, wedge-shaped or rounded at base, light green beneath. Eu., Asia. Var. betulifòlia has lvs. pubescent when young. Var. itálica (var. pyramidalis. P. sinensis. P. fastigiata), Lombardy P., narrow-columnar habit and usually only stammate trees. Var. plantierénsis (var. elegans), columnar form with pubescent petules and branchlets. Var. thevestina has whitish trunk and grayish branches.

Nolestii: hort. name; probably a hybrid.

pekinépsis: P. tomentosa.

Petrowskyana. Hybrid between P. balsamifera and probably P. laurifolia, with ovate lvs. to 6 in. long, pale beneath.

Przewálskii: P. Simonii.

psedo-grandidentata (P. grandidentata var. pendula). Probably a hybrid, having pendulous branches and lvs. similar to P. tremula.

Púrdomii. Lvs. ovate or oblong-ovate, to 10 in. long, rounded or slightly cordate at base. China.

pyramidàlis: hort, name for a narrow-headed or fastigiate poplar, oftenest applied to P. nigra var. italica.

Rasumowskyana. Hybrid between P. nagra and probably P. laurifolia, with elliptic to orbicular lvs. to 6 in. long.

regenerata: P. canadensis var.

Ríchardii: P. alba var.

robústa. Hybrid between P. angulata and P. nigra var. planturensis, of vigorous growth.

rotundifòlia. Lvs. orbicular, to 4 in. across, often heart-shaped at base. Himalayas. Var. Duclouxiàna has lvs. short-acuminate and fruiting catkins to 6 in. long.

salicifòlia: P. laurifolia var. Lindleyana.

Sårgentii. Resembling *P* balsamıfera but with light yellow branchlets, pubescent buds, and mostly smaller lvs. Sask. to New Mex. and Tex.

serótina: P. canadensis var.

Sièboldii. JAPANESE A. To 60 ft.: lvs. ovate, to 3 in. long, rounded or wedge-shaped at base, pubescent when young. Japan.

Simonii (P. Przewalskii). To 35 ft.; lvs. rhombic-ovate, to 5 in. long and 3 in wide, rounded at base, whitish or pale green beneath. China. Var. fastigiata is of narrow pyramidal habit. Var. péndula has drooping branches.

sinénsis: P. nigra var. italica.

suavèolens: P. cathayana.

szechuánica. To 120 ft.: lvs. ovate-oblong, to 8 in. long and 5 in. wide, rounded or wedge-shaped at base, whitish beneath. China.

Tacamaháca. Tacamahac. Balsam P. To 90 ft.; lvs. rather thick, ovate to ovate-lanceolate, to 5 in. long, rounded at buse, whitish beneath. N. N. Amer. Var. Michaùxii has lvs. pubescent on the veins beneath.—This species was formerly known as P. balsamifera but is not the plant Linnæus described under that name.

tomentòsa (P. pekinensis). Chinese White P. To 90 ft.: lvs. triangular-ovate, to 6 in. long, acuminate, truncate or slightly cordate at base, gray-tomentose beneath. China.

trémula. EUROPEAN A. To 90 ft., with open head: lvs. thin, orbicular to oval, to 3 m. long, truncate at base, with large teeth, beconing glabrous beneath, with flattened petioles. Eu., Asia., N. Afr. Var. Davidiàna has lvs. with shallower teeth. Var. péndula has drooping pranches. Var. villôsa has silky-pubescent lvs. when young.

tremuloides (P. græca). QUAKING A. To 90 ft.: lvs. ovate to orbicular, to 3 in. long, truncate at base, finely toothed, with flattened petioles. N. Amer. Var. aûrea (P. aurea) has broader lvs. changing to orange-yellow in autumn. Var. pendula ("Parasol de St. Julien") has drooping branches.

trichocárpa. Western Balsam P. To 180 ft.: lvs. broad-ovate, to 5 in. or sometimes 10 in. long, truncate or rounded at base, whitish or rusty beneath. Alaska to S. Calif.

trístis. Small tree: lvs. narrow-ovate, 4 in. long and 2 in. wide, rounded at base, whitish and pubescent beneath. Cent. Asia.

Van Geèrtii: P. canadensis var. aurea.

vólga: listed name.

Wilsonii. To 75 ft, pyramidal: lvs. ovate, to 7 in. long and 6 in. wide, heart-shaped or rounded at base, reddishtomentose beneath but becoming glabrous. China.

Wislizenii. To 90 ft.: lvs. triangular-ovate, to 4 in. long and as broad, truncate at base, yellowish-green. W. Tex., New Mex.

Woóbstii. Hybrid between P. laurifolia and probably P. tristis, with lance clate lys.

yunnanénsis. Lvs. elliptic-ovate, to 6 in. long, wedge-shaped at base, whitish beneath, with red midrib. China.

PORANA. Convolvulaceæ. Twining herbs with alternate cordate-ovate entire lvs. and small white, blue or purple fls. in cymes or panicles; sometimes grown in S. U. S.

paniculata. To 30 ft.: Ivs. to 6 in. long, white-pubescent beneath: fls. white, to ½ in. across, in many-fld. panicles. India.—A profuse bloomer. Sometimes known as "White Corallita," but not related to Antigonon.

PORFÌRIA. Cactaceæ. A single species, P. Schwartzii (P. coahuilensis, Haagea Schwartzii), allied to Mammillaria. St. solitary, depressed-globose, to 15% in. diam.; tubercles blue-green, to 1½ in. long, areoles woolly becoming glabrous; spines to about ¼ in. long, radials 16, uppers longer than lowers, gray-white, central 1, brownish: fls. pale pink to white, to 1¼ in. across, inner segms. with pink stripe, stamens white, style pink, stigma-lobes 5, yellowish-green. Var. albiflòra has pure white fls.

PORRECT: directed outward and at right angles to the principal axis, as in some spines of cacti.

PORTERANTHUS: Gillenia.

PORTHIÆA ARGUTA: Photinia villosa var. lævis.

PORTIA-TREE: Thespesia populnea.

PORTLÁNDIA. Rubiaceæ. Shrubs or small trees from Mex. and W. Indies, with opposite leathery lvs., large white or purple fls. having campanulate or funnelform 5-lobed corolla, and fr. a leathery caps.; one species is grown in the American tropics. Propagated by cuttings.

platantha. Shrub to 3 ft., evergreen: lvs. oval: fls. white, showy, 3 in. or more across and 6 in. long; resembles somewhat a Solandra.

PORTULACA. PURSLANE. Portulacaceæ. Fleshy or supple herbs with mostly alternate lvs., sun-blooming fls. of many colors subtended by a leafy involucre, and capsular frs. opening by the top falling off like a lid; grown as annuals in the flower-garden and one sometimes as a potherb.

grandiflora. Rose-Moss. Prostrate or to 1 ft. high: lvs. terete, to 1 in. long: fls. rose, red, yellow, white, often striped, 1 in. or more across. Brazil.—A favorite garden ann. for warm sunny places.

marginata. Sts. thick and red: lvs. spatulate, ¾ in. long, margined with red: fls. yellow. Venezuela.

oleracea var. sativa. Kitchen-Garden P. To 1½ ft., the sts. thick and soft and mostly erect: Ivs. obovate, to 1½ in. long: fis. bright yellow, ½ in. across. Probably cultigen. Var. gigánthes is a prostrate form with double fis. I in. across, grown for ornament.—P. oleracea itself is purslane or "pusley," a familiar garden weed.

pilosa. St. with tufts of white shaggy hairs: Ivs. terete, ½ in. long: fls. red. ½ in. or less across. N. C. to Fla. and Mex. Var. hortualis, Shagoy Garden P., has larger redpurple fls. to ¾ in. across. Cultigen.

PORTULACÀCEÆ. PURSLANE FAMILY. About 20 genera of widely distributed rather fleshy herbs or subshrubs with simple entire often terete lvs. and bisexual fls. having usually 2 sepals, 4–5 fugacious petals, few or many stamens, superior 1-celled ovary and capsular fr. A few are grown for ornament and pot-herbs, as Anacampseros, Calandrinia, Claytonia, Lewisia, Montia, Portulaca, Portulacaria, Spraguea, Talinum.

PORTULACÀRIA. Portulacaceæ. S. African succulent shrubs or small trees, of which one is

grown in Calif. and under glass in the N.; also recommended for fodder in warm dry regions.

afra. To 12 ft., with soft wood: lvs. opposite, obovate, to ½ in. long, fleshy: fls. pink, about 1/2 in. long, in clusters.

POSOQUÈRIA. Rubiacex. Shrubs or small trees in trop. Amer. with opposite entire leathery lvs., fragrant white to red fls. in terminal corymbs having very long slender tube and 5-lobed limb, and fr. a fleshy berry; one species grown in S. Fla. Propagated by cuttings.

latifòlia (Oxyanthus isthmia). Tree to 20 ft.: lvs. oval to oblong, to 10 in. long: fis. white, salverform, to 6 in. long: fr. yellow, globose, 2 in. across. Mex. to S. Amer.

POSSUM-HAW: Ilex decidua.

POTAMOGÈTON. Pondweed. Potamogetonacex. Many aquatic plants sometimes grown in ponds and aquaria: lvs. often of two kinds, submerged and floating: fls. inconspicuous, in small spikes above the water.

crispus. Lvs. linear-oblong, to 4 in. long, obtuse, crisped: spikes 1/2 in. long, on stalks to 2 in. long. Mass, to Va., Eu.

POTAMOGETONACEÆ. Weak herbs in water, floating or submerged, in many parts of the world; they are without showy fls. or hort. distinction, but may be interesting and useful in aquaria and pools. Only Potamogeton appears in the North American trade; there are 8 other genera.

POTATO (Solanum tuberosum) is the most valuable member of the family Solanaceæ from the standpoint of human food supply. Its great value is due to the popularity of its starchy underground tubers, the quantity and quality of which varies principally with choice of variety, climate and character of soil. It is best adapted to moderately cool temperate climate and to regions having rather short days late in the growth period, ample rainfall and deep friable soil. The tubers represent surplus or stored carbohydrates which have been synthesized in the foliage and deposited below ground mostly late in the season after the foliage has reached maximum size. Under cool humid conditions, the plant may blossom and bear fruit or seed-balls resembling small green tomatoes. These seed-balls may be entirely devoid of seed (parthenocarpic) or they may contain from 75 to 300 seeds which, when planted, will produce a variety of types.

World production of potatoes approximates five billion bushels, the countries ranking highest being in order, Russia, Germany, France and the United States. In the United States annual production varies from 350 to 400 million bushels or approximately 3 bushels per capita. The principal producing states are Maine, Michigan, Minnesota, New York, Wisconsin, Idaho and Pennsylvania. Yields average slightly above 100 bushels, usually from 100 to 500 bushels to the

acre.

The potato crop is propagated by tuber-cuttings or seed-pieces planted from 12 to 18 inches apart in rows 32 to 36 inches apart to provide for inter-row cultivation. Depth of planting varies from 2 to 4 inches depending on the soil type. The seed-pieces should weigh not less than one ounce and carry from one to three "eyes" to insure at least one vigorous sprout or stalk for each plant. Larger seed-pieces usually are not economical. When recommended planting practices are observed, from 15 to 20 bushels of seed are sufficient to plant an acre of land.

Among the factors which are most likely to limit yields is disease carried in the seed tubers. Most serious diseases of this type are leafroll, mosaic, yellow-dwarf, bacterial ring-rot, psyllidyellows and purple-top. The best control of these is to plant healthy seed, as neither seed treatment nor spraying is effective. For the convenience of growers who are not familiar with these disease problems, public agencies have been set up to provide a system of seed inspection and certification in nearly all of the important potato seed-producing states.

In choosing a variety, the grower should be guided largely by prevailing practice and local or regional soil, climate and market conditions. In the Pacific coast states, Russet Burbank and White Rose are most extensively grown; in the Rocky Mountain region, Russet Burbank, Triumph, Rural and Red McClure; in the southern states, Bliss Triumph, Irish Cobbler and Katahdin; while east of the Mississippi River and north of the Ohio River such varieties as Rural, Green Mountain, Cobbler, Katahdin and Chippewa are most important. For farm and home gardens where early maturing varieties are desirable, such kinds as Warba, Cobbler and Chippewa may be chosen. Recently several new and promising varieties have been introduced and are now on trial. Among them are Houma, Earlaine, Sebago, Pontiac and Sequoia. See Potomato.

The potato crop draws heavily on soil nutrients and has a relatively high water requirement. Therefore, it is usually profitable to maintain the soil in good moisture-holding condition and in a state of high fertility. Successful growers either turn under forage crop residues or green-manure crops to provide soil humus. They also supply relatively large applications of commercial fertilizer. On the lighter, sandier soils of the Atlantic seaboard, applications of 1,000 pounds to the acre of 10-20-10, 5-10-10 or 10-16-14 are recommended. On the heavier soils farther inland and where stable manure is available, 500 pounds to the acre of such mixtures as 10-20-10 and 4-16-4 may be used profitably. Where potatoes are grown in rotation with other crops, the fertilizer should be applied in the row on each side of the seed-pieces. Automatic machine planters which apply both seed and fertilizer at one operation are now used extensively by growers who plant five acres or more annually.

Potatoes cannot be grown profitably without seed treatment and spraying of the plants against certain diseases and insects. Control of seab and rhizoctonia is mainly by keeping the soil sufficiently acid and seed disinfection with dilutions of formaldehyde or such mercury compounds as corrosive sublimate and yellow oxide of mercury. Late blight (*Phytophthora infestans*), the principal fungus affecting the foliage, is controlled by thorough spraying with 5-5-50 bordeaux mixture. To control the Colorado potato beetle and other foliage insects such arsenicals as calcium arsenate and lead arsenate are added to the bordeaux mixture.

POTATO, AIR: Dioscorea bulbifera.

POTENTÍLLA. CINQUEFOIL. Rosaceæ. Many herbs or sometimes subshrubs of the north temp. and frigid zones, with compound lvs. and yellow. white or red fls. solitary or in terminal cymes.

Potentillas are grown mostly in the border or rockgarden, but some are useful in the flower-garden; most of them are hardy North. Propagated by seeds and division. adschárica. To 1½ ft.: lvs. palmately 3-5-parted, the lfts. toothed and ciliate: fls. yellow, in many-fld. loose clusters. Caucasus.

álba. To 10 in.: lvs. palmately 5-parted, white-sılky beneath fls. white, to 1 in. across, in 3's. Cent. Eu.

alchemilloides. To 1 ft.: lvs. palmately 3-7-parted, white-silky beneath: fls. white, to $1\frac{1}{2}$ in. across, in clusters. Pyrenees.

alpéstris (P. Crantzu. P. filiformis). To 8 in.: lvs. palmately 5-parted into deeply toothed lobes, dull green: fls. yellow, sometimes with orange spot at base, to 1 in. across, in clusters. Eu.

alpina: doubtful name in the lists.

amahnoides: a listed name.

ambígua. Sts. creeping or ascending, tufted: lvs. of 3 rather leathery 3-toothed lfts., glaucous beneath: fis. yellow, to 1 in. across, solitary. Himalayas.

andícola. Tufted per. with many-fid. branches to 6 in. high, silky-pubescent: lvs. pinnately 3-5-parted into ovate toothed lfts.: fls. yellow. Colombia.

Anserina (Argentina anserina). SILVER-WEED. Tufted herb with radical pinnate lvs. silky at least underneath; Ifts. oblong, serrate to lacerate: fis. yellow, solitary on long peduncles, to 1 m. across. Shores and banks across the continent and in Eurasia, spreading by long runners. Var. cóncolor is P. argentea.

apennina. Small silvery-silky plant: lvs. 3-parted into lfts. 3-toothed at apex fis. white, rarely pink, usually in clusters of 3. Apennines. Var. aurea is listed.

arborea: hort. name, probably P. fruticosa.

argéntea. To 11/2 ft.: lvs. palmately 5-parted into deeply lobed lits., white-tomentose beneath: fis. sulfur-yellow, ½ in. across, in clusters. Eu., Asia, N. Amer. Var. calábra (P. calabra) has lvs. white on both sides. Italy.

arguta (Drymocallis agrimonioides). To 3 ft.: lvs. pinnate into 7-11 toothed lits., hairy on both sides: fls. creamywhite, ½ in across, in dense clusters. N. B. to Va. and Colo.

argyrophfila. To 1½ ft.: lvs. palmately 3-parted into coarselv toothed lfts., white-tomentose below fls. yellow, 1 in. across, in clusters. Himalayas.—Variable, or else more than one species is involved in the forms, some of which run to red forms; see P. atrosanyainea. Var. insignis has the basal lvs. quadrifoholate or quinquefoliolate.

atrosanguinea. Closely resembling the last, but with red or purple fis. Himalayas.

aurea (P. chrysocraspeda). To 1 ft.: lvs. palmately 5-parted into toothed lobes, with silvery hairs on margins and veins: fls. yellow, ½ in. across, in few-fld. clusters. Eu.

bicolor. Hybrid probably between P. argyrophylla and P. atrosangumea, with orange and red fis.

bicrenata. To 3 in.: lvs. palmately 5-parted into entire Ifts., 3-toothed at apex, white-tomentose bene ½ in. across, in clusters of 1-3. Wyo., New Mex.

bifúrca (P. *imbrwata*). To 8 in.: lvs. pinnate into 5-15 2-3-parted lfts.: fls. yellow, $\frac{1}{2}$ in. across. Himalayas.

Blaschkeana. To 3 ft.: lvs. palmately divided into 7 deeply dissected lfts., white-tomentose beneath: fls. 34 in. across, in many-fld. clusters. Alta. to Wyo. and N. Calif.

Brénnæ: probably a misspelling of P. Brennia.

Brénnia. Hybrid between P. alpestris and P. nivea, with the basal lvs. 4-5-parted.

Brèweri. To 10 in.: lys. pinnate, basal lys. with 7-17 cuneate lfts., densely white silky-villous: fis. yellow, to ½ in. across, with obcordate petals. Calif. and Nev. Var. expánsa is smaller, with smaller fis. and less hairy lits.

Buccoana. To 2 ft.: lvs. 3-parted, coarsely toothed: fls. yellow, about 1/2 in. across, in many-fld. clusters. W. Asia. calábra: P. argentea var.

calýcina. Plant rough-hairy, to 10 in.: lower lvs. pinnate, upper ternate: fis. nodding, campanulate, with the white petals shorter than purple calyx. Asia Minor.

canadénsis (P. pumila). Small creeping per. to 4 in. high, with the first fl. from the node above the first well-developed internode: lvs. palmately 5-parted, lfts. dull, scarcely veiny, narrowly obovate: fls. yellow, about 1/4 in. across. N. S. and Ont. to Pa. and Ohio.—Plants listed as P. canadensis may be P. simplex.

cascadénsis. St. erect or ascending to 1 ft.: basal lvs. pinnate into 7-13 deeply incised slightly hairy lfts, less than ¾ in. long fls. yellow, ¾ in. across, calyx silky-strigose, Wash. to Calif.

cauléscens. Subcespitose from a stout rootstock, fl.-sts. ascending, slender, to 1 ft.: Ivs. palmately 3-5-parted with lfts. oblong-obovate and coarsely serrate towards apex: fls. white, rarely pink, to ¾ in. across. S. Eu.

chrysantha. To 2 ft.: lvs. palmately 5-9-parted into

toothed hairy lfts.: fls. golden-yellow, to 1 in. across, in few-fld. clusters. S. Eu.

chrysocráspeda: P. aurea.

cinèrea. Tufted, to 4 in.: lvs. palmately 5-parted into oblong or obovate toothed lfts., thick and hanv: fis. pale

omong or obvate toothed its., thek and harry its. pare yellow. Alps.

Clusiana. To 4 in.: lvs. in rosettes, palmately 5-parted into toothed and ciliate lfts.: fls. yellowish-white, 34 in. across, in clusters of 1-3. Austria, Germany.

Convallària (Drymocallis Contallaria). To 3 ft., stickyorientation of the street of t

Crántzii: P. al pestris.

crinita. To 1 ft.: lvs. pinnate, with 11-15 toothed silky-pubescent lfts.: fls. yellow, about ½ in. across, in many-fld. clusters. Colo. to New Mex.

Cryptotèniæ. Erect: lvs. 3-parted, the lfts. toothed: fls. yellow, in panicled clusters. Japan.

dahùrica: P. fruticosa var.

dáscia. To 2 ft.: lvs. palmately 3-7-parted, with lfts. coarsely toothed and pubescent on both surfaces: fls. ½ in. across. Wash. to Calif. and Mont.

delphinénsis. To 1½ ft.: lvs. palmately 5-parted, lfts. cuneate-obovate, obtuse, appressed-pubescent, strongly serrate: fls. yellow, to 1 in. across. Alps.

Detômmasii. Sts. ascending: lvs. palmately 5-7-parted into toothed lfts. silky-pubescent beneath: fls. yellow, 1 in. across, in clusters. S. Eu.

dissécta. Erect, branching, glabrous: lvs. palmately 5-parted into pinnatifid lfts.; fls. in clusters. Hudson Bay.

divisa. Per. with sts. spreading or diffuse, to 4 in. long: lvs. palmately 3-5-parted, lfts. obovate, deeply cleft, pubescent above and densely white-tomentose beneath fis. cymose, less than ½ in. across. S. D. and Alta. to Colo.

Dómbeyi. Sts. decumbent, to 1 ft.: lvs. pinnate, with 3-5 lfts. toothed at tips fls. yellow. Chile.

Drúmmondii. To 2 ft.: lvs. punnate into 5-11 sharp-toothed lfts., soft-pubescent: fls. bright yellow, ¾ in. across. Mts., Alta. to N. Calif.

effùsa. To 1½ ft., much branched. lvs. pinnate, with 5-11 toothed tomentose lfts. fls. yellow, about ¼ m. across, in loose clusters. Sask. to New Mex.

engadinénsis: hybrid.

erécta: P. recta.

eriocarpa. To 8 in.: lvs. of 3 coarsely toothed lfts.: fls. yellow, 1½ in. across, solitary or twin. Himalayas.

Fárreri: P. fruticosa var.

filifórmis: P. al pestris.

fissa (Drymocallus fissa). To 1 ft., very leafy and branched, glandular-hirsute: lvs. pinnate, with about 9 orbicular deeply incised lifts.: fls. to ¾ in. across, many in a narrow cyme, petals much exceeding sepals. S. D. to Alta., Colo. and Utah.

flabellifòlia. To 1 ft.: lvs. of 3 deeply toothed lfts., very thm: fls. bright yellow, ¾ in. across, in loose clusters of 1-3. Mts., B. C. to Ida. and Calif.

formòsa: P. nepalensis.

fragifórmis. To 8 in.: lvs. 3-parted into broad coarsely toothed hairy lfts.: fls. yellow, to ¾ in. across, in few-fld. clusters. Siberia, Aleutian Isls. Var. minor is listed.

Frièdrichsenii: P. fruticosa var.

frigida. To 3 in., sts. often decumbent: lvs. 3-parted, harry: fls. yellow. Alps.

frutéscens: a name of uncertain botanical standing: probably P. fruticosa.

probably P. fruticosa.
fruticosa (Dasiphora fruticosa). Shrub to 4 ft.: lys. pinnate, with 3-7 silky-pubescent lfts. to 1 in. long, margins revolute: fls. bright yellow, to 1½ in. across, in few-fld. clusters. North temp. zone. There are many vars. as: álbicans, lfts. white-tomentose beneath, Chuna; dahūrica, 1½ ft., lfts. ½ in. long, fls. creamy, Chuna, Siberia; Fárreri, lfts. ½-¾ in. long; Frièdrichsenii, hybrid between the type and var. dahūrica; mandshūrica, low, lfts. small, densely whitish silky-pubescent on both sides; montāna, dwarf, about 1 ft. high; ochroleūca, fls. creamy-white; parvifòlia, dwarf, lfts. ¼ in. long, Asia; Pūrdomii, lfts. ¾ in. long, nearly glabrous beneath, fls. pale yellow, China; tenufloba (var. tenufola), lfts. nearly linear; Veitchii, lfts. glaucous beneath, fls. creamy-white, China; Vilmoriniāna, lfts. white-tomentose beneath, fls. creamy, China. Vars. Beesiana and nāna are listed. Beesiana and nana are listed.

fúlgens. To 2 ft.: lvs. pinnate, with many toothed lfts. silvery-pubescent beneath: fls. yellow, about ½ in. across, in panicled clusters. Himalayas.

gélida. To 2 ft.: lvs. 3-parted, the lfts. to ¾ in long and coarsely toothed: fls. yellow, to 1 in. across, in 1-4-fld. clusters. N. Asıa.

Gibsonii: listed as having brilliant scarlet fls.

glandulosa (Drymocallis glandulosa). To 2 ft., sticky: lvs. pinnate into 7-9 toothed lifts.: fis. yellow, ½ in. across, in many-fid. clusters. S. D. to Calif. Var. Wrangelliana (P. Wrangelliana), to 4 ft., very glandular, basal lvs. to 1 ft. long.

glaucophýila. To 1 ft.: lvs. palmately 5-7-parted into coarse-toothed somewhat glaucous lfts.: fis. 1/2 in. across, in 3-12-fid. clusters. B. C. to New Mex.

Gòldbachii: P. thuringiaca var, elongata.

Górdonii: Horkelia Gordonii.

grácilis. To 2½ ft.: lvs. palmately 5-7-parted, the lfts, white-tomentose beneath and cut halfway to midrib: fts. yellow, to ¾ in. across, in clusters. B. C. to Ore. and Mont. Var. rigida is listed.

grammopétala. To 1 ft.: lvs. 3-parted, the lfts. toothed, silky-pubescent beneath: fls. yellowish-white, in 3-7-fld. clusters. S. Eu.

grandiflora. To 15 in.: lvs. 3-parted, the lfts. toothed, hairy, to 1 in. long: fls. golden-yellow, to 1 in. across, in clusters. Eu.

heptaphýlla: P. thuringiaca.

Hippiana. To 2 ft.: lvs. pinnate, with 7-11 deeply toothed silvery-pubescent lfts.: fls. bright yellow, to 1 in. across, in loose clusters. Sask. to New Mex.

hirta. To 1 ft., sts. often decumbent: lvs. palmately 5–7-parted, the lfts. harry and deeply toothed: fls. bright yellow, $\frac{1}{2}$ in. or more across, in few-fld. clusters. Eu.

Hookeriana. To 8 in.: lvs. mostly 3-parted into cut lfts., silky-pubescent on both sides: fis. 1/2 in. across, in dense cymes. Sask. to Mont.

Hopwoodiana. Hybrid between P. nepalensis and P. recta: fis. dark red at base, pale yellow in center, rose at tips.

hébrida. A group of hybrids between P. nepalensis and P. argyrophylla, with purple fls.

imbricata: P. bifurca.

insígnis: P. argyrophylla var.

Kleiniana. Ann. with prostrate sts. to 2 ft.: lvs. palmately 3-5-parted into toothed lfts.: fls. yellow, 1/4 in. across, in panieled cymes. Asia.

Knáppii: P. leucopolitana var.

kúrdica. To 3 ft.: lvs. palmately 5-parted, lfts. coarsely toothed, pubescent: fls. yellow. S. W. Asıa.

Leschenaultiana. Sts. to 10 in. long, ascending or decumbent: basal lvs. with 5-9 obovate lfts., cauline lvs. ternate, pubescent: fls ½ in. across, yellow, rarely white. Asia, Himalayas.

leucopolitàna var. Knáppii (P. Knappii). Sts. prostrate or ascending, to 8 in. long: lvs. palmately 5-parted: fis. pale yellow. Eu.

Leutiàna: listed name.

Levièri. To 1 ft.: lvs. palmately 3-5-parted, the lfts. deeply toothed, silky-pubescent, clinto: fis. yellow, about 1/2 in. across, in loose clusters. Caucasus.

libanótica. Low, glandular-hairy: lvs. 3-parted, the lfts. coarsely toothed: fls. white, in clusters. Lebanon, on limestone cliffs.

Macnabiana. Hybrid between P. argyrophylla and P. atrosanguinca.

Matsumùræ. Sts. ascending to 6 in.: lvs. of 3 obovate or orbicular toothed lfts. to 1 in. long, slightly hairy: fls. yellow, ½ in. across, long-stalked. Mts., Japan.

megalantha. Subcespitose: basal lvs. cordate-orbicular, to 3 in. wide, deeply crenate and emarginate at apex, pubescent, cauline lvs. similar but smaller: fls. bright yellow. 1½ in. across Japan.

Meyeri. Similar to P. argentea but with shorter less divided lfts. Asia Minor.

monspeliénsis: P. norvegica var. hirsuta.

montenegrina. To 1½ ft.: lvs. 3-parted, the lfts. toothed and slightly hairy: fls. golden-yellow, large. S. E. Eu.

multifida. To 4 in.: lvs pinnate, the lfts. deeply cut into linear segms., white-hairy beneath: fis. yellow, small, in 2-3-fid. clusters. Eu.

nana vars. argéntea and multiflòra: listed names.

nepalénsis (P. formosa). To 2 ft. and more: lvs. palmately 5-parted, the lfts. toothed, green and hairy: fls. rose-red, 1 in. across, in forking panicles. Himalayas. Var. Willmottiæ ("Miss Willmott") is a dwarf free-flowering form or derivative with magenta-rose fls.

nevadénsis. Sts. prostrate: lvs. palmately 3-5-parted, the lfts. coarsely toothed, silky-pubescent beneath: fls. yellow, in 3-4-fld. clusters. Spain. Var. minor is listed.

nítida. Forming mats 1 in. or more high, the whole plant silky-hairy: lvs. 3-parted, the lfts. entire or toothed

at tip: fls. rose, rarely white, to 1 in. across, solitary. High Alps. Var. elongata is listed.

nivalis. To 11/2 ft.: lvs. palmately 5-7-parted, the lfts. toothed at apex or entire, silky-hairy on both sides: fls. white, in many-fld, clusters. S. Eu.

nívea. Cespitose, sts. to 8 in. high: lvs. ternate, densely white-tomentose below, lfts. oblong-cuneate, coarsely toothed: fls. 2-6 in a cyme, petals obcordate, yellow, ¾ in. long. Arctic and alpine regions of N. Amer., Eu. and Asia.

norvégica. To 1½ ft., ann. or bien.: lvs. 3-parted into oblong toothed lobes, rough-hairy: fis. yellow, in clusters. Eu. and Asia. Var. hirsuta (P. monspeliensis) has lfts. broadly obovate and more bluntly toothed. N. Amer., Eu., Asia.

O'Briana: listed name.

olýmpica: listed name.

ornithopioides: name of doubtful status.

pacifica. Similar to P. Anserina but peduncles and sts. becoming glabrous, and differs in technical fr. characters. N. Amer., E. Asia.

palistris (Comarum palustre). Marsh C. Decumbent: lvs. palmately 5-7-parted into toothed lobes: fls. red or purple, to 1½ in. across, in clusters or solitary. Swamps, N. Amer, N. Eu., N. Asia.

pensylvánica. To 2½ ft.: lvs. pinnate into 5-15 deeply lobed líts., gray-tomentose beneath: fls. yellow, in dense cymes. N. Amer.

perfecta. A reputed hybrid with maroon fls. shaded with yellow.

pimpinelloides. To 1 ft.: lvs. pinnate, with 15-25 deeply toothed lfts. and palmately parted stipules: fis bright yellow, ½ in. across, in many-fld. clusters. S. E. Eu.

pinnatifida: a monstrous form of P. reptans with lacerate sepals and stipules and very small petals.

profinqua. To 1½ ft., often decumbent, silky-hairy: lvs. of 9-11 oblanceolate coarsely toothed lfts, white-tomentose beneath: fls yellow. Alta. to Ariz.

pseudorupéstris (Drymocallis pseudorupestris). To 1 ft.: lvs. pinnate into 7-9 toothed or cut lfts.: fls. white, ¾ in. across, in loose clusters. Alta. to Wyo. and Ida.

pulchérrima. To 2 ft.: lvs. of 5-7 oblanceolate toothed lfts. white-tomentose beneath: fls. yellow. Alta. to New Mex. Var. comminis is the commonest variation, with basal lvs. long-petioled, digatately 5-7-parted, rarely subpinnate, sepals and peduncles densely gray-pubescent.

pùmila: P. canadensis.

Púrdomii. To 1 ft.: basal lvs. pinnate, to 6 in. long, lfts. very broad at base, dentate, green: fis. to ¾ in. across, yellow, with carpels harry and styles subterminal. N. China.

purpurea. Procumbent, sts. to 4 in.: lvs. of 5 lfts. toothed apex: fls. pale purple, $\frac{1}{2}$ in. across, solitary or twin. Himalayas.

pygmæa: P. rupestris var.

pyrenàica. To 1 ft.: lvs. palmately 5-parted, the lfts. to % in. long, toothed at apex: fls. golden-yellow, 1 in. across, in raceme-like clusters. Pyrenees.

recta (P. erecta). To 21/2 ft.: lvs. palmately 5-7-parted, the lfts. toothed, green and hairy: fls. yellow, to 1 in. across, in many-fld. clusters. Eu. Var. macrántha is listed.

rèpens: probably an error for P. reptans.

réptans. Pubescent, with creeping shoots: lvs. digitate, with 5 obovate toothed lits.: fls. yellow, to 1 in. or more diam., solitary from axils. Eu., Asia.

rivalis. To 2 ft.: lvs. pinnate, with 3-5 coarsely toothed lfts., green and pubescent: fls. yellow, ½ in. across, in loose clusters. B. C. to Mex.

rupéstris. To 1½ ft., much branched, hairy: lvs. pinnate, with 5-7 toothed lifts: fls. white, to 1 in. across, in loose clusters. Eu. Var. pygmèa is a dwarf form, to 4 in. high, with smaller fls. Var. alba is listed.

Russelliana. Hybrid between P. nepalensis and P. atropurpurea: fis. scarlet.

Sanguisórba. Erect: lvs. pinnate, the lfts. oboyate, cuttoothed fls. yellowish-white, usually in 2's. Siberia.

sanguisorbifòlia: the European form of P. pensylvanica.

Saxifraga. To 8 in.: lvs. palmately 5-parted into lanceo-late leathery lfts. silvery-pubescent beneath: fis. white, in loose cymes. Alps.

Siègfriedii: P. verna var. pseudo-incisa.

simplex. Sts. prostrate or ascending, to 3 ft. or more long: lvs. palmately 5-parted into toothed lits.: fls. yellow, ½ in. across, solitary. N. B. to Ga. and Tex.

speciosa. To 10 in.: lvs. of 3 obovate thick toothed lfts., white-tomentose at least beneath: fls. white or yellowish, in across, in few-fld. clusters. S. Eu.

spléndens: name of doubtful status, applied to several

stérilis. To 4 in., creeping: lvs. palmately 3-parted, lfts. toothed, harry above: fis. white. Eu.

stolonifera. With stolons: basal lvs. pinnate, with 2-3 pairs of subelliptic or obovate coarsely toothed lits.: fis. yellow, to 1 in. across. N. E. Asia, Bering Isl.

supina. Procumbent ann., pubescent, pale green: lvs. pinnately 3-5-parted, lfts. deeply toothed: fls. pale yellow. Eu., N. Afr., W. Asia.

Thurberi. To 2½ ft.: lvs. palmately 5-7-parted, lfts. coarsely toothed: fis. reddish-purple, about ½ in. across, in loose clusters. New Mex. to N. Mex.

thuringlaca (P. heptaphylla). To 1 ft.: lvs. palmately 5-7-parted, lfts. toothed, green and harry: fls. yellow. Eu. Var. elongata (P. Goldbachu) is more robust, with lfts. paler on the lower surface and more deeply toothed. European

thymacea: listed name.

Tommasiniana: a confused name, to be considered as one of the many forms of P. verna.

Tonguei: P. tormentillo-formosa.

Tormentilla. Sts. slender, erect or ascending, to 1 ft. or more: basal lvs. long-petioled, ternate, 4-5-parted: fis. yellow, ½ in. across. Eu., W. Asia.

tormentillo-formosa (P. Tonguei). Prostrate per., hybrid between P. nemoralis and P. nepalensis, with shoots pubescent, to 1 ft. long, spreading and ascending to a height of 6 in.: lvs. 3-5-foliolate, with lfts. obovate, coarsely dentate. fls. 1/2 in. across, petals obovate, yellow, red at base.

transcáspia. Robust per. to 2 ft.: lvs. 5-7-parted, lfts. oblong-lanceolate, remotely toothed: fls. yellow. Asia.

tridentata (Sibbaldiopsis tridentata). To 1 ft., woody at base: lvs. 3-parted, lfts. 3-toothed at apex, shining above: fls. white, 1/2 in. across, in loose clusters. Greenland to Ga. and Minn

truncata: Horkelia truncata.

unifiora. To 2 in., densely tufted: lvs. of 3 coarse-toothed lits. white-tomentose beneath: fis. yellow, 34 in. across, usually solitary on scapose sts. Arctic-alpine regions of E. Asia and N. W. N. Amer.

Veitchii: P. fruticosa var.

verna. Matted sts. to 6 in. or more long: lvs. palmately 5- or rarely 7-parted into obovate lfts. to 1½ in. long, toothed or cut, sts. and lvs. puberulent: fls. golden-yellow, in few-fld. cymes. Eu., W. Asia. Var. pseudo-incisa (P. Stepfriedii) has lfts. more deeply and sharply toothed and pubescence strongly spreading. Vars. aurea and nana are listed.

villosa. To 1 ft.: lvs. 3-parted, lfts. coarsely toothed, silky above, white-tomentose beneath: fls. yellow, 1 in. across, in few-fld. clusters. Alaska to Wash., Siberia.

Vilmoriniàna: P. fruticosa var.

virgata. Erect, branched: lvs. palmately 7-9-parted, lfts. pinnately cut, white-tomentose beneath: fis. yellow, small, in many-fid. clusters. Eu.

visians. Sts. to more than 1 ft., usually red, divaricately branched: lvs. 5-7-parted, cuneate-obovate or suboblong, coarsely toothed: fls. yellow, to 1 in. across. Serbia.

Warrensii: a variation of P. erecta with large bright yellow fls.

Willmottiæ: P. nepalensis var. Wrangelliana: P. glandulosa var.

POTÈRIUM. Rosacex. Deciduous spiny erect subshrub native in S. Eu., sometimes planted in S. U. S. P. spinosum (Sanguisorba spinosa). To 1 ft., much branched: lvs. pinnate, of 7-15 pubescent lfts. 1/8 in. or less long: fls. unisexual, greenish, without petals, in spikes to 1 in. long: fr. red, globose, to ½ in. across.—For other plants listed as Poterium see Sanguisorba.

PÒTHOS. Araceæ. Climbing shrubs native in the tropics of the Old World, with entire or lobed lvs. and bisexual fls. borne on spadices. Cult. under glass or lath in our area, as for *Philodendron*; but the kinds commonly grown as Pothos are of other genera.

argyrèus: Scindapsus pictus var. argyræus.

aureus: Scindapsus aureus.

cordatus: Anthurium cordatum.

nitens. Hort. name of doubtful botanical standing: lvs. cordate-ovate, glossy purplish-green. Malaya.

POTOMATO. A name once applied to the combination potato-tomato plant produced by grafting one on the other. The grafting can be performed either way, but the hope that by this means one can produce good crops of both potatoes and tomatoes on the same plants is fanciful. although both tubers and tomatoes may be produced if the potato is the stock. See Cornell Bulletin 61, December 1893, as to name; and the literature of the subject is considerable. Recently this combination plant has been called topato.

POURRETIA: Puna chilensis.

PRÀTIA. Lobeliacex. Small creeping or prostrate herbs suitable for the rock-garden or greenhouse: lvs. alternate, toothed: fls. 2-lipped, split to base at back, solitary in the axils: fr. a berry.

angulata. Per., sts to 1 ft. long: lvs. to 1 in. long and ¾ in across: fls white streaked with purple, ¼ in. long: berry reddish-purple, ¼ in. long. New Zeal.

begonifòlia. Per.: lvs. to ½ in. across, denticulate: fls. green streaked with pink, to ½ in. long: berry black, to ¼ in. long Malaya to S. China.

hýbrida: probably hort, name.

mácrodon. Per., sts. to 4 m. long, somewhat fleshy and forming patches: lvs broadly obovate to orbicular, to ½ in. long, coarsely toothed: fls. pale yellow, to ½ in. long, fragrant. New Zeal.

PRÉMNA. Verbenacex. Trees or shrubs of the Old World tropics, with opposite lvs., small white or greenish fls. in pubescent corymbs or panicles, and fr. a small drupe; one species is grown out-of-doors in S. Fla.

odorata. To 25 ft.: lvs. broad-ovate, more or less cordate, to 8 in. long, tomentose beneath: fls. 1/2 in. long, in terminal corymbs 8 in. across: fr. dark purple. Philippines.

PRENÁNTHES. RATTLESNAKE ROOT. Compositx. Per. herbs of the Old and New Worlds. having alternate lvs. and creet or drooping small heads of ligulate fls. borne in terminal spike-like panicles; pappus of white or brown bristles. By some authors the American species are re-tained under Nabalus and the Euro-African under Prenanthes. Adapted to borders and wild-gardens.

aspera (Nabalus asper). To 4 ft., rough-hairy: lvs. to 3 in. long and 1 in. wide, toothed: heads light yellow, 1/4 in. across, erect and short-peduncled; pappus straw-color. Ohio to Neb. and La.

purpurea. To 5 ft., glabrous: lvs. lanceolate, nearly entire, glaucous beneath: heads bluish-purple, on slender flexuose peduncles. S. Eu.

virgàta (Nabalus virgatus). To 4 ft., glabrous: lvs. lanceolate, lower ones sinuate to pinnatifid, to 10 in. long: heads with white to pinkish fls. to 36 in. long. N. J. to Fla.

PRÈNIA. Aizoaceæ. Mesembryanthemum segregate: succulent herbs, with prostrate sts. or flowering branches: lvs. linear-lanceolate, keeled on back: fls. in terminal few-fld. cymes or solitary; petals numerous, united into tube at base; stigmas 5, filiform. S. Afr.

Sladeniana (M. Sladenianum). Glaucous ann.: lvs. to 2 in. long, becoming reflexed, often with pink edges, united at base: fls. white, 1/2 in. long, 2 of sepals very large and in long. inclosing fl.

PRETTY FACE: Brodizea ixioides.

PRIDE-OF-CALIFORNIA: Lathyrus splendens.

PRIDE-OF-INDIA: Melia Azedarach.

PRIM: Liquetrum vulgare.

PRIMROSE: Primula. Arabian-: Arnebia cornuta. Cape-: Streptocarpus. Evening-: Enothera.

PRÍMULA. PRIMROSE. Primulaceæ. Wellknown attractive mostly low per. herbs with basal lvs., fls. of many colors, in heads or umbels or in whorls one above another, corolla with slender tube and spreading lobes; mostly native to the north temp. zone, many kinds grown in gardens and greenhouses. Primulas have received much attention in recent years and are becoming fanciers' plants.

becoming fanciers' plants.

The hardy primroses thrive in any good garden soil. Seed should be sown in spring or early summer in flats or pans and the seedlings transplanted. Large plants may be propagated by division. Seed of the greenhouse species (mostly P. sinensis and P. malacoudes) should be sown in January if wanted for Christmas bloom, in soil composed of equal parts loam, leafmold and sand. Frequent transplantings should be given until September when the plants should be set in the pots in which they are to bloom. Shade and moisture should be provided during the summer. A good temperature for these primroses is 55-60° F. The hardy outdoor kinds are largely spring and early summer bloomers.

acaulis: P. vulgaris.

álgida. To 8 in.: lvs. oblong, to 2 in. long: fls. violet, 1/3 in. across, in many-fld. heads in May-June. W. Asia.

Alliònii. Lvs. ovate or oblong, to $1\frac{3}{4}$ in. long, gray-green and sticky: fis. rose with white eye, to $\frac{3}{4}$ in. across, in 1-7-fid. umbels on very short scapes, in spring. Maritime

alpícola. To 16 in.: lvs. elliptic to oblong-elliptic, to 6 in long, suddenly contracted or obscurely cordate at base, crenulate, upper side rugose, glabrous: fls. yellow to violet, many in umbel, corolla-tube nearly ½ in. long, limb to ¾ in. across, spreading. Tibet. Two variants are recognized, lūna, fls. yellow and violacea, fls. purple or violet and rarely white

alpina: P. Auricula.

americana: a confused name; some of the material so listed may be P. incana or P. intercedens.

amèna. To 8 in.: lvs. oblong, to 4 in. long, wrinkled and minutely pubescent, margins remotely toothed: fis. rose-purple, to 1 in. across, in loose umbel on scape. Caucasus.—Reputedly confused in cult. with the scapeless P. Sibthorphi.

angustifòlia (P. angustıfolia var. Heleniæ). To 2 in.: lvs. lmear-oblanceolate, to 2 in. long: fls. rose-pink, ½ in. across, usually solitary, in early summer. Colo.

anisodòra. To 2 ft.: lvs obovate, to 8 in. long: fls. dark purple, almost black, in superimposed whorls. China.

aurantiaca. To 10 in.: lvs. oblanceolate, to 6 in. long, narrowed into winged petiole: fis. deep ruddy-orange, ½ in. long, in 6-12-fid. superimposed umbels. China.

Aurícula (P. alpina). Aurícula. To 8 in.: lvs. thick, persisting, obovate, to 4 in. long: fls. of many colors, about 1 in. across, in many-fld. umbels, in spring. Alps of Eu. Var. ciliàta (var. Balbisu), lvs. not farinose, margins densely long-ciliate.—See Auricula.

auriculata. To 14 in.: Ivs. lanceolate to oblong-spatulate, to 10 n. long, often less, glabrous, finely and sparsely toothed: fis. rose to violet with whitish eye, to ¾ in. across. Asia Minor to Caucasus.

azùrea: listed name.

Barnardoàna: listed name.

Beesiana. To 2 ft.: lvs. oblong, narrowed to winged petiole: fls. rose-lilac with yellow eye, ¾ in. across, in superimposed whorls in early summer. China.

Briscoei. Hybrid between P. Bulleyana and P. japonica.
Bullesiàna. A strain of hybrids between P. Bulleyana
and P. Beesana, in shades of cream to orange, purple or
lilac, pink to crimson.

Bulleyana. To 2½ ft.: lvs. ovate-lanceolate, narrowed to winged petiole: fls. deep yellow, to 1 in. across, in superimposed whorls, in summer. China.

burmánica. To 2 ft.: lvs. oblanceolate, to 1 ft. long, narrowed into long winged petiole: fls. reddish-purple with orange eye, ½ in. across, in 16-fld. superimposed umbels. Burma.

cachemiriana: P. denticulata var.

cærìlea. To 3 in.: lvs. ovate, to 4 in. long, pubescent beneath and puckered above: fls. purplish-blue, 1 in. across, in 1–2-fld. umbels. China.

calýcina: P. glaucescens var.

canéscens: listed name.

capitata. To 1½ ft.: lvs. oblong-lanceolate, to 5 in. long, narrowed to winged petiole, silvery beneath: fis. purplishblue, ½ in. across, in dense heads. Himalayas. Var. Mooreana is P. Mooreana.

capitellata. To 10 in.: lvs farinose, becoming glabrous, narrowly oblanceolate to spatulate, remotely toothed to

entire, shorter than scape: fis. rose, to ¼ in. across, subsessile in dense heads. Persia to Afghanistan.

carniólica. To 8 in.: lvs. obovate or oblong, shining: fis. rose with white eye, turning lilac, to 1 in. across, in many-fid. umbels. Alps.

cashmiriana: P. denticulata var. cachemiriana,

chinénsis: P. sinensis.

chionántha. To 1½ ft.: lvs. lanceolate to oblong, to 10 in. long, narrowed to winged petiole, yellow-mealy beneath: fls. white, fragrant, to ¾ in. across, in superimposed umbels. China. Var. atrosanguínea is listed with deep red fls.

chrysòpa. To 10 in.: lvs. oblong-elliptic, 1½ in. long, on petioles to 5 in. long; fls. lilac with yellow eye, ½ in. across, lobes bifid, in 2-4-fld. umbels or sometimes 2 superimposed umbels. China.

chungensis. To 20 in. or more: lvs. oblong-oval, to 1 in. or more across, crenulate: fls. 4-8 in a terminal umbel and also in whorls, yellow (limb pink?), fragrant, about ½ in. long. China.

Clusiàna. To 7 in.: lvs. ovate or oblong, to 3½ in. long, shining, with narrow cartilaginous margins: fls. rose or illac, 1 in. or more across, the lobes bifid, in 1-6-fld. umbels. Alps.

Cockburniana. To 11/2 ft.: lvs. obovate, to 4 in. long: fls. orange, 1 in. across, in 2 superimposed umbels. China.

Colúmnæ: P. veris var. suaveolens.

conspérsa. To 10 in.: lvs. oblong-lanceolate, to 2 in. long: fls. hlac with orange eye and yellow tube, to ¾ in. across, the lobes bifid, in superimposed umbels in summer. China.

cortusoides (P. dentifiora). To 1 ft.: lvs. ovate-oblong, heart-shaped at base, to 3½ in long, lobed: fis. rose, to 3¼ in across, in many-fid. umbels in May and June. W. Siberia.

côttia. To 5 in.: lvs. obovate, to 3 in. long, sticky and covered with red glands: fls. rose with white eye, to 1½ in. across, in 2-12-fld. umbels. Cottian Alps.

crispa (P. cupitata var. crispa). To 8 in.; lvs. oblong or oblanceolate, to 3 in. long, narrowed into winged red petiole: fls. orange, in head-like umbels. China.

crispata. To 1 ft.: lvs. in rosettes, oblong, to 4 in. long, narrowed into winged petiole: fls. lilac or blue, about 1/2 in. across, in umbel-like heads. Himalayas.

cuneifòlia. To 5 in.: lvs. obovate-cuneate, to 1 in. long: fls. pink or rose 34 in. across, in 1–6-fld. umbels. E. Siberia.

decipiens (P. magellanica. P. farinosa var. magellanica). To 20 m., usually less: lvs. spatulate to ovate or rhombio, to 4 m. long, serrulate-dentate, farinose or glabrous beneath: fls. white, sometimes tinged hlac, lobes to ¾ in. wide, involucral bructs lanceolate, flat, calyx glabrous or remotely farinose with lobes as long as tube. S. Chile, Colo. and Utah.

defléxa. To 2 ft.: lvs. in rosettes, oblanceolate, to 11 in. long, white-hairy: fls. dark blue or rose-purple, 1/2 in. long, in globose heads 1 in. across. W. China.

In globose nexus 1 in. across. w. Chima.

denticulata. To 10 in.: lvs. ovate-lanceolate, to 2 in. long, narrowed into winged petiole: fls. lilac, ½ in. across, in dense heads in early spring. Himalayas. Var. alba has white fls. Var. cachemiriana (P. cashmiriana) is more farinose, with rich purple fls. with yellow center. Var. grandiflora is a more vigorous hort. form. Vars. rosea and rubra are color forms.

dentiflòra: P. cortusoides.

deòrum. To 10 in.: lvs. oblong or lanceolate, to 2 in. long, stiff, with cartilaginous margins: fis. purple, ½ in. across, in nodding one-sided 5-10-fid. umbels. Bulgaria.

diarálica: listed name.

dùplex: a double garden form.

edina. Hybrid between P. Beesiana and P. Bulleyana: fis. yellow and violet.

effisa. To 1½ ft.: lvs. cordate-ovate, 1½ in. long, slightly lobed or toothed, on stalks to 5 in. long; fls. lavender-rose with yellow tube, ½ in. long, in superimposed umbels. W. China.

elàtior. OXLIP. To 8 in.: lvs. wrinkled, ovate or oblong, to 3 in long, pubescent beneath: fls. yellow, to 1 in. across, in many-fld. umbels in spring. Eu. to Persia. Var. álba, fls. white. Var. atrocærdlea, fls. dark blue.

elongàta. To 1 ft.: lvs. obovate, to 5 in. long, glabrous above, sometimes farinose beneath, crenulate: fls. goldenyellow, to 1 in. across, in 5-8-fld. umbels. Sikkim-Himalayas.

Elwesiàna. To 6 in.: lvs. ovate-lanceolate, to 4 in. long, nearly entire, leathery: fis. violet, solitary. Himalayas.

Érikssonii: an improved strain of P. malacoides.

eròsa. To 7 in.: lvs. obovate, to 5 in. long, with jagged teth: fls. purple or violet, ½ in. across, in many-fld. umbels. Himalayas.

farindsa. BIRDSEYE P. To 1 ft.: lvs. obovate-lanceolate, tarinosa. Birdderfe P. To 1 it.: ivs. obovate-lanceolate, to 5 in. long, silvery or farinose beneath: fls. usually likac-purple with yellow eye, ½ in. or more across, in many-fld. umbels in early summer. Boreal or alpine regions in Old World.—The plants so named in N. Amer. belong to other species. The plant in the trade as var. gaspénsis is probably P. laurentiana.

Fairei. To 4 in.: lvs. ovate to oblong-ovate, to 2 in. long, yellow-farinose beneath, margins crenulate-dentate to entire: fls. rose, to ½ in. across, several to many in umbel. Japan.

floribúnda. BUTTERCUP P. To 8 in.: lvs. ovate, to 3 in. long: fls. yellow, ½ in. across, in many-fld. superimposed umbels, in winter and spring in a greenhouse. Himalayas. Var. grandiflora has fls. to 1 in. across.

flórida. To 1 ft., white-mealy: lvs. oblong or ovate, to 3 m. long, subcordate at base: fls. blue-purple, about 1 m. across, in 9-fld. umbels. China.

Florindæ. To 4 ft.: lvs. ovate-cordate, to 8 in. long, toothed, with reddish petiole 1 ft. long: fls. sulfur-yellow, 1/2 in. across, drooping, in terminal 30-40-fld. mealy umbels, in summer. Tibet.

Forbesii. Baby P. To 14 in.: lvs. ovate, to 2 in. long, heart-shaped at base: fls. rose or lilac, to ½ in. across, in superimposed whorls, in winter and spring in the green-house. China, Burma.

formosum: listed name of plant said to be 4 in, high and with various-colored fls.

Forestii. To 3 ft., producing rootstocks several ft. long: lvs. ovate-elliptic, to 1½ in. long, wrinkled above, mealy beneath: fls. yellow with orange eye, fragrant, ¾ in. across, in many-fid. umbels. China.

frondòsa. To 5 in.: lvs. oblong, 1 in. long, silvery beneath: fls. rosy-hlac, 1/2 in. across, in many-fld. umbels in spring. Balkans.

geraniifòlia. To 1 ft.: lvs. orbicular-cordate, to 2 in. long, 11-15-lobed, each lobe many-toothed: fls. rose, to ½ in. across, on slender pedicels to ½ in. long. Thet.

Giraldian (P. muscarioides). To 1 ft.: lvs. narrow-oblong, narrowed into winged petiole: fls. blue, ¼ in. across, in heads. China.

glaucéscens. To 5 in.: lvs. lanceolate, to 4 in. long, shining and glaucous, with broad cartilaginous margins: fls. rose to purple, 1 in. across, in 2-6-fld. umbels, May-June. Alps. Var. calýcina (*P. calycina*) is more robust with larger fls.

glutinòsa. To 4 in.: lvs. lanceolate, to 2½ in. long, glandular-sticky: fls. deep blue turning violet, to ¾ in. across, fragrant, in 1-6-fld. heads. Alps.

glycy6sma. To 2½ ft.: lvs. ovate-lanceolate, to 1 ft. long, narrowed into winged petiole fls. deep purple, ½ in. or less across, in 2-many-fld. superimposed umbels. China.

grándis. Tall herb: lvs. ovate, to 6 in. long, on petioles to 1 ft. long, wrinkled, pubescent below: fls. pale yellow, tullar, ½ in. long, on slender nodding pedicels 2 in. long, in many-fid. umbels. Caucasus.

Héleniæ: P. angustifolia.

helodóxa. To 2 ft.: fls. deep yellow, in superimposed umbels in summer. China; requires protection.

heucherifòlia. To 6 in.: lvs. rotund, cordate, 7-9-lobed, somewhat pilose, petioles red-villous: fis. purple, to ½ in. across. Tibet and China.

hirauta. To 4 in.: lvs. broad-obovate, to 5 in. long, glandular-sticky: fls. rose, lilac or white, to 1 in. across, with slender pedicels, in 1-many-fld. umbels. Mts. of Eu.

hébrida: of the japonica type with very large purple fls.

incana. Differs from P. decipiens in its densely farinose calyx whose lobes are shorter than the tube, with lilac petals to $1\frac{1}{6}$ in. wide. Sask. to Colo. and Utah.—Material listed as P. americana may belong here.

integrifòlia. To 2 in.: lvs. oval or oblong, to 1½ in. long, glandular, entire: fls. rose-hlac or rarely white, to 1 in. across, in 1-3-fld. umbels. Alps, Pyrenees.

intercèdens. Closely allied to P. mistassinica, differing in lvs. often farinose beneath and the seeds strongly angled and reticulated.—Some of the material listed as P. americana may belong here.

involucrata. To 1 ft.: lvs. ovate or oblong, to 1 in. long, leathery, pale, on petioles 2 in. long: fis. white, fragrant, ¾ in. across, in 3-6-fid. umbels. Himalayas.

japônica. To 2 ft.: lvs. obovate-oblong, to 6 in long, narrowed into winged petioles: fls. purple, rose or white, 1 in. or more across, in many-fld. superimposed umbels in summer. Japan. Color forms are alba, attocerulea, attrosanguinea, eximea, ròsea, salmònea, spléndens.

jesoàna. Per. 8-24 in. high: lvs. all basal, palmately 7-9-lobed, reniform-orbicular, to 4 in. across, petioles to 1 ft. long, erect. purplish, glabrous: fis. rose-purple with

yellow eye, salverform, to ½ in. long and ¾ in. across, in 1-4 umbels. Japan.—White-fld. forms are known.
Julize. To 3 in.: lvs. orbicular-cordate, with winged petiole: fls. rose or red, to 1 in. across, scapeless, on pedicels to 2 in long. Caucasus. Var. alba, fls. white. Var. crispa, lvs. somewhat curly on margin.

kewénsis. Hybrid between P. floribunda and P. verticillata: to 1½ ft.: lvs. obovate, to 8 m. long, narrowed into winged petiole: fls. bright yellow, fragrant, ¾ in. across, in superimposed umbels, in winter and spring in the greenhouse. Var. farinòsa is covered with silvery-white powder.

Kingii. To 8 in.: lvs. elliptic-lanceolate, to 3 in. long, nearly entire: fls. scarlet, to 3/4 in. across, in 4-6-fld. umbels. Himalayas.

Kleynii: P. veris var.

laurentiàna. To 18 in.: lvs. farinose, spatulate to narrowly rhombic-ovate, to 5 in. long, dentate, usually petioled: fls. llac, pedicels erect or ascending to nearly 2 in. long, 1-17 in umbel. Lab., E. Que. to N. E. Me.

lépta. To 4 in. lvs. oblong-oval, to 2 in. long, crenulatedentate, cliate, minutely husute beneath: fls. bluish-purple, about ½ in. across, fragrant, scape yellow-farinose. N. W. Yunnan.

leucóchnoa. To 18 in., usually less: lvs. linear-lanceolate, 5-9 in. long. acute. margins revolute: scapes 1-3; fls. purple. to 34 in. across, in umbels of 2 or more, pedicels somewhat pendulous. China.

leucophélia. Similar to P. elatior, from which it differs chiefly in lys. densely white-tomentose beneath. Carpathian Mts.

lichiangénsis. To 14 in.: lvs. ovate-oblong, lobed, heart-shaped at base: fls. rose to red with greenish eye, fragrant, in umbels. China.

Littoniana. To 2 ft.: lvs. broad-lanceolate, 8 m long, hairy: fls. vrolet-blue, fragrant, $\frac{1}{2}$ m. across, in dense spikes to 5 in. long. China. Var. major, slightly larger than type with lavender and crimson fls.

longiflòra. To 1 ft, mealy: lvs. oblong, to 3 in. long: fls. violet with yellow throat, $\frac{8}{4}$ in. across, the corolla-tube 1 in. and more long, in many-fld. umbels. Alps.

luteola. To 10 in.: lvs. lanceolate, to 8 in long: fls. sulfur-yellow, ½ in. across, in many-fld. umbels in summer. Caucasus.

macrócalyx: P. veris var.

magellánica: P. decipiens.

malacoides. FAIRY P. To 1½ ft.: lvs. ovate, to 3 in long, heart-shaped at base, on petroles to 7 in. long: fls. lilae and rose, to ½ in. across, in many-fld. superimposed umbels, in winter and spring in the greenhouse. China. Var álba has white fls. and var. rôsea bright rose fls. Var fimbriàta is said to have lacerate petals. Var. gigantèa is a more vigorous cult. form. Var. nàna is dwarf. Var. Lèlandii has large fls. said to reach 1½ in. across. Var. robūsta has large fls. in great profusion. Var. supérba is an improved form.

marginata. To 5 in, mealy: lvs. oblong, to 4 in. long, with silvery margins: fis. violet-rose, to 1 in. across, in 2-20-fid. umbels in spring. Alps.

Menziesiana. To 4 in.: lvs. elliptical, to 11/2 in. long, crenate, soft-hairy: fis. blue-violet with white eye, in heads to 1 in. across. Bhutan.

microdónta. To 1 ft.: lvs. broad-ovate, to 5 in. long, longpetio ed: fls. yellow, ½ in. across, in many-fld. umbels. China. Var. álba is listed with fls. very pale yellow to white. For vars. alp cola and violàcea, see P. alpicola.

mínima. Lvs. obovate, to 1 in. long, shining: fls. rose or white, to 1 in. across, the lobes bilid, 1-2 on very short scapes. Mts. of Eu.

mistassinica. To 6 in.: lvs. spatulate or obovate, to 1½ in. long: fls. pink to pale blue, sometimes with yellow eye, ½ in. across, in 2-8-fld. umbels. N. N. Amer. Var. leucantha (var. alba) has white fls.

modésta. To 6 in.: lvs. spatulate, to 21/2 in. long, dentate-serrate, farinose: fls. lilac to purple, to 3/8 in. across, in 8-10-fld. umbels. Japan.

Mderheimii. Hybrids having large fls. in shades of red, pink and orange.

Mooreana. Differs from P. capitata in larger lvs. which are coarsely reticulated and snow-white beneath and bright green above. China.

multifldra: listed name.

muscarioides: P. Giraldiana.

nippónica. To 6 in.: lvs. spatulate, to 1½ in. long, farinose or glabrous, margins with few large teeth: fls. white, to 1 in. across, usually 2-5 in umbel on slender flexuous scape. Japan

nivalis. To 10 in.: lvs. ovate-oblong to lanceolate, to 5 in. long: fls. purple or white, to ¾ in. across, in many-fld. umbels. Caucasus to China. Var. Moorecroftiana is less densely or not at all farinose and has deep violet fls

nutans. To 8 in.: lvs. oblong-ovate or oblong-lanceolate, to 4 in. long, narrowed into winged petiole: fis. violet, ¾ in. across. nodding. in small dense heads. China.

obcónica. To 1 ft.: lvs. oblong-ovate, to 4 in. long, with irritating hairs: fs. lilac or pink, to 1 in. across, in many-fid. umbels, in winter in the greenhouse. China. Var. atrosanguínea, fls. dark red. Var. grandiflóra has fls. to 1½ in. across. Var. gigantèa is a large form. Var. álba has white fls. Var. rôsea, fls. rose.

oblanceolata. Lvs. oblanceolate, to 1 ft. long, glaucous: fls. rose, 1 in. or more across, in superimposed umbels.

obtusifòlia. To nearly 1 ft.: lvs. elliptic-spatulate to oval, somewhat dentate or entire, glabrous or farinose: fis. bluish-purple, to 1 in. across, in 4-15-fid. umbels. Himalayas.

officinalis: P. veris.

Palinuri. Lvs. obovate or oblong, to 8 in. long and 3 in. wide, toothed: fis. deep yellow, in many-fid. umbels, on scapes longer than lvs. S. Italv.

nannônica: P. neris var. inflata.

Párryi. To 1 ft.: lvs. obovate-oblong, to 8 in. long, narrowed to winged petiole: fls purple with a yellow eye, 1 in. across, in many-fid. umbels in summer. Rocky Mts.

Paxiàna. To 1½ ft.: lvs. heart-shaped, to 5 in. long and 7 in. broad, 7-12-lobed, on petioles 10 in. and more long: fls. blue-lilac, 1 in. across, in superimposed umbels. China.

pedemontana. To 6 in.: lvs. ovate or oblong-lanceolate, shining: fis rose or rarely white, 1 in. across, in few-to many-fid. umbels. Alps.

Polssonii. To 5 ft.: lvs. narrowly oblong, to 5 in. long, stiff and glaucous; fls. rose, to 1½ in. across, in super-imposed umbels in summer China.

polyántha. Polyanthus. A hybrid group, probably having parentage of *P. veris, P. elatior* and *P. vulgaris*. to 1 ft.: lvs. obovate, narrowed into winged petrole: fls. of many colors, in many-fld. umbels or sometimes solitary, in spring; an old garden plant. Color forms include álba, cærůlea, rôsea and růbra.

prionòtes. To 15 in : lvs. oblong to narrowly elliptic, to $7\frac{1}{2}$ in long, glabrous, margins toothed: fis. purple, in manyfid. umbels. Tibet.

pseudosikkiménsis. Similar to P. siklimensis, but with smaller lvs. and larger bright yellow fls. on scapes to $1\frac{1}{2}$ ft. Yunnan.

pubescens. A group of hybrids between P. Auricula and P. hirsula. fis. rosy crimson with white center.

pudibúnda. To 8 in.: lvs. obovate-spatulate, 3½ in. long, long-petroled: fis. yellow, ½ in. across, in 3-4-fid. umbels. Himalayas.

pulverulenta. To 3 ft.: lvs. obovate, to 16 in. long: fls. purple with orange-brown eye, 1 in. across, in superimposed umbels on a silvery scape, in summer. China.

Rèidii. To 4 in : lvs. oblanceolate, to 3 in. long, bullate and sparsely villous above, harry beneath: fls. pale creamwhite, to 34 in. across, in several-fld. umbels on stiff scape. Himalayas.

Reinii. Densely hairy: lvs. round or kıdney-shaped, to 6 in across, deeply toothed, cordate at base: fls. pale violet, in 2-6-fld. clusters. Japan.

ròsea. To 8 in.: lvs. oblong, to $2\frac{1}{2}$ in. long: fls. bright rose, $\frac{3}{4}$ in. across, in loose heads, in spring Himalayas. Var. grandiflòra has large fls.

rotundifòlia. To 1 ft. or more: lvs. orbicular-cordate, to 4 in. across, toothed, crenate or erose, somewhat mealy, often lobulate, long-petioled: fts. purple, many in superimposed umbels, scape puberulous and mealy. Himalayas.

rûfa. To 8 in., hairy: lvs. elliptic, 2½ in. long, reddishpubescent: fls. deep yellow, ½ in. across, in many-fld. umbels. China.

Rúsbyi. To 10 in.: lvs. oblong-spatulate, denticulate, with margined petiole to 5 in. long: fls. deep purple with yellow eye, 6-10 to a scape. New Mex., Ariz.

saxátilis. To 10 in.: lvs. oblong, to 3 in. long, heartshaped at base, lobed and crisped: fis. rose-hlac, to ¾ in. across, in 1–10-fid. umbels. N. Asıa.

scótica. Similar to P. farinosa but smaller, with bluishpurple fis. having yellow eye. Scotland.

seclûsa. To 1½ ft., hairy: lvs. cordate-ovate, to 10 in. long: fis. red, about ½ in. across, in superimposed umbels. China.

secundifiòra. To 8 in. or more: lvs. oblong, to 3 in. long, narrowed into winged petiole, yellow-mealy beneath when young: fis deep violet, ¾ in. across, in 6-10-fid. one-sided umbels. China.

serratifòlia. To 2 ft., often less: lvs. oblong to ovate, to 8 in. long, glabrous, irregularly serrate: fls. yellow, striped

or blotched orange, in superimposed umbels with lax pedicels. S. W. China.

sibfrica. To 8 in.: lvs. ovate, to ¾ in. long, pale green: fls. lılac or rose, to ⅓ in. across, in few-fld. loose umbels. Arctic Eu., Asia, N. Amer.

Sièboldii. To 8 in.: lvs. ovate-oblong, to 4 in. long, lobed, heart-shaped at base: fls. white, rose or purple, to 2 in. across, in many-fld. umbels in spring. Japan. Var. grandiflòra is a garden form. Var. álba, fls. white. Var. rùbra, fls. red.

sikkiménsis. To 2 ft.: lvs. oblong, to 5 in. long, wrinkled, sharp-toothed: fls. yellow, 1 in. across, in many-fld. umbels in late spring. Himalayas.

sinénsis (P. chinensis). CHINESE P. To 8 in.: lvs. round, to 4 in. long, lobed, often heart-shaped at base, long-petioled: fls. in many colors, to 1½ in. across, in manyfid. umbels, blooming in winter in the greenhouse. China. Var. álba magnifica has large white fls. Var. filicifòlia has crisped lvs. Var. fimbriàta has fringed or crested fls. Var. stellata, Star P., has fls. in superimposed umbels.—Popular florist plant in many forms.

sinopurphrea. To 1½ ft.: lvs. oblong-oval, to 10 in. long, narrowed into winged petrole: fls. deep purple, in many-fld. umbels. China.

Smithiana. To 2 ft.: lvs. oblong-lanceolate, to 5 in. long, obtuse, thm, usually glabrous, margins serrate: fls. yellow, to 1 in. across, on slender pedicels to ½ in. long, in superimposed umbels. Sikkim-Himalayas.

spectábilis. To 4 in.: lvs. oblong, to 4 in. long, stiff and glossy: fis. rosy-purple, 1 in. across, in 1-7-fid. umbels in summer. Alps.

sphærocéphala. To 1 ft.: lvs. oblanceolate, to 5 in. long, narrowed into winged petiole: fls. purple, in small globular heads. China.

stellata: P. sinensis var.

suavèolens: P. veris var.

suffrutéscens. To 4 in : lvs. thick, spatulate, toothed at apex: fls. red-purple, $\frac{1}{2}$ in. across, several to a scape. Calif.

szechuánica. To 10 in.: lvs. ovate to oblong-ovate, to 3 in. long, thin, glabrous: fls. yellow or violet, to 34 in. across, lobes entire, reflexed, in 6-10-fld. umbel. China. Var tuba-purpūrea is listed.

Thômassinii. Hybrid between P. veris var. suaveolens and P. vulgaris, differing from the former parent in its orange-spotted pale yellow fls. Pyrences.

variábilis: name applied to plants of the polyantha group.

Veitchii. To 1 ft.: lvs. round, to 4 in. long, silvery beneath, long-petioled: fls. rose, in a many-fld. umbel or umbels superimposed. China.

umbels superimposed. China.

veris (P. oficinalis). Cowslip. To 8 in.; lvs. ovate or ovate-oblong, to 3 in long, pubescent beneath; fis yellow, fragrant, to 1 in. across, in many-fid. umbels in spring. Eu Var. álba, fis. white. Vars. abrea and cærdlea are listed Var coccinea, fis. crimson. Var. grandifibra is a more vigorous larger-fid. cult. form. Var. inffâta (P. pannonica) has calyx as long as corolla-tube. Var. Kleynii (P. Kleynii) is listed as having yellow fis. shading to apricot. Var. lûtea, fis. pale yellow. Var. macrocalyx (P. macrocalyx), fis. orange-yellow with calyx to 34 in. long. Var. suaveolens (P. suaveolens, P. Columnæ). has lvs. densely whitetomentose beneath, and slightly fragrant fis. Var. supérba is a hort. form perhaps not distinct from var. grandifora.

verticillata. To 2 ft.: lvs. lanceolate, to 8 in. long, narrowed into winged petiole: 3s. yellow, fragrant, to 34 in. across, in superimposed umbels, in winter in the greenhouse. S. Arabia.

vinciflòra: Omphalogramma vinciflorum.

viscòsa. To 8 in: Ivs. oval to lanceolate, to 7 in. long, rank-smelling, yellowish-green, glandular: fis. rose-lilac, fragrant, 1/2 in. across, in many-fid. umbels in late spring. Alps and Pyrenees.

vittàta. To 10 in.: lvs. narrow-oblong, to 6 in. long: fls. purple, $\frac{1}{2}$ in. across, in many-fld. umbels or 2 superimposed umbels. China.

vulgàris (P. acaulis). To 6 in.: lvs. oblong, to 3 in. long, wrinkled: fls. yellow, purple or blue, 1½ in. across, solitary on long sts., in spring. Eu. Color forms are listed as álba, atropurpùrea, azùrea, cærùlea, lilácina, ròsea, rùbra. Var. horténsis is a term used to indicate garden mixtures of many forms. Var. supérba is offered as an improved form.

Wáltonii. To 2 ft.: lvs. oblong, to 8 in. long: fls. violet, ½ in. across, in large many-fld. umbels. Tibet.

Wárdii. To 10 in., tufted: lvs. oblong, to 1½ in. long, narrowed into winged petiole: fls. rose or violet, in few-fld. umbels. China.

Wâttii. To 6 in.: lvs. oval to broadly lanceolate, to 1½ in. long, pubescent beneath, remotely so above, margins coarsely dentate: fis. purple with white center, to ¾ in.

across, bell-shaped, in drooping 3-6-fld. umbel. E. Himalayas.

Webbiana: listed name.

Wilsonii. To 2 ft.: lvs. oblanceolate, to 8 in. long: fls. burple or yielt, to 34 in. across, in superimposed umbels.

Winteri. Plant white- or yellow-mealy: lvs. obovate, 4 in. long: fls. pale purple with yellow eye, 11/4 in. across, in many-fld umbels. Himalayas.

Wulfeniana. To 2 in., tufted: lvs. lanceolate to oblong, to 2 in. long, shining: fls. rose with white throat, 1 in. across, in 1-3-fld. umbels. Alps.

yargongénsis. To 4 in : lvs. ovate-oblong, to 2 in. long: fis. deep nursie lk in second to 1 2 de les longs. deep purple, 1/2 in. across, in 1-3-fld. nodding umbels. Tibet

zambalénsis. To 4 in.: lvs. ovate-oblong, to 2 in. long, margins revolute: fls. deep rose-lilac, 1 in. across, in 3-5fld. umbels. Tibet.

PRIMULACEÆ. PRIMROSE FAMILY. Nearly 30 genera of herbs, or seldom suffruticose, widely distributed particularly in the northern hemisphere, furnishing many flower-garden and greenhouse plants. Family characterized by the bisexual regular fls. with 5 petals more or less united, 1-celled ovary with many seeds, 1 style. and dehiscent fr. The genera in cult. are Anagallis, Androsace, Cortusa, Cyclamen, Dodecatheon, Douglasia, Glaux, Lysimachia, Omphalogramma, Primula, Samolus, Soldanella. Steironema, Trientalis.

PRINCES-FEATHER: Amaranthus hybridus var. hypo-chondriacus, Polygonum orientale.

PRINSÈPIA. Rosacex. Deciduous Asian spiny shrubs with simple lvs., yellow or white fls. in axillary clusters or racemes, and fr. a purple or black drupe; grown for ornament and hardy N.

Propagated by seeds sown as soon as ripe or stratified, by cuttings of young wood under glass, and by layers.

sinénsis. To 6 ft.: lvs. ovate-lanceolate to lanceolate, to 3 in. long: fts yellow, ½ in. across, Mar -Apr.: fr. purple, ½ in. long. Manchuria.

uniflora. To 5 ft.: lvs. narrow-oblong, to 21/2 in. long: white, 1/2 in. across, Apr.-May: fr. black, bloomy, 1/2 in. fls. white, ½ long. China.

PRITCHARDIA: Eupritchardia. P. grandis: Licuala. P. Wrightii: Colpothrinax.

PRIVET: Liquetrum

PROBOSCÍDEA. UNICORN-PLANT. Martuni-Broad-topped sticky-pubescent thickstemmed ann. and per. herbs with large long-stalked lvs., large yellowish-purple fls. in few-fld. axillary racemes, and woody curved caps. having a beak which splits into 2 hook-like appendages; 9 known species, in the western hemisphere.

These plants are grown for ornament or for the young fruits which are pickled as cucumbers or used in mixed pickles. In the South seeds may be sown where the plants are to stand but in the North they may be sown in hotbeds and transplanted.

ánnua: Mar ynia annua,

formòsa: P. Jussieui.

frågrans. Ann., sts. to 2 ft.: lvs. broad-ovate or deltoid, mostly broader than long, at maturity usually 5-lobed: fls. deep purplish. Mex.—The plant commonly grown under this name is P. Jussieui.

Jussiedi (P. and Martynia louisiana. M. Proboscidea). COMMON U. or PROBOSCIS-FLOWER. Clammy, low and spreading, to 3 ft. broad, the branches in opposite pairs: lys. nearly orbicular to ovate-cordate, to I ft. across, wavy-margined but not lobed: fls. creamy-white to violet or light red, to 2 in. long; fr. hanging, to 6 in. long, half the length being the slender beak. Del. and Ind. to New Mex. Var. roses, fls. rose.—Grown in the garden under such names as Martynus craniolaria, formosa, fragrans

louisiana: P. Jussieui. lùtea: Ibicella lutea. tricolor: hort. name.

PROBOSCIS-FLOWER: Proboscidea Jussieui.

PROCUMBENT: trailing or lying flat, but not rooting.

PROLIFEROUS: bearing offshoots or redundant parts; producing other similar structures on itself, as when a head of calendula has secondary heads springing from it.

PROMENÆA. Orchidaceæ. Trop. S. American epiphytes with 1-3-lvd. pseudobulbs and commonly 1-fld. lateral infl., the sepals and petals similar, lip 3-lobed. Grown in warm greenhouse; see Orchids.

citrina: P. xanthina.

xánthina (*P. citrina*). Lvs. to 4 in. long and about ¾ in. wide: fls. to 2 in. wide, citron-yellow with side lobes of lip and column spotted with red. Nov.-July. Brazil.

PROPAGATION of plants is accomplished by two different means: (1) by seeds and spores, which are normal reproductive bodies, the seeds and sometimes the spores the direct result of sexual processes; (2) by vegetative or asexual parts. The second category may be again divided into propagation (a) by division of the plant, (b) by separation of naturally detachable parts, as bulblets and offsets, (c) by layers, (d) by cuttings, (e) by graftage.

Although plants have been propagated from immemorial time and great skill has been developed in the practices, yet modifications of these experiences are constantly arising. Many of the old ideas on multiplication of plants are being challenged and physiological studies have resulted in and will continue to suggest considerable changes in method. Persons desiring to develop the greatest success in the work should keep in touch with investigations as they are published. The skilled propagator develops a kind of intuitive sense as to how a plant new to him may be increased and handled to best advantage. The propagation of plants, as a subject, is much more than habit and manual skill.

Seedage is the subject and the practice of propagating plants by means of seeds. The practice is not only interesting in itself as a development of skill but it brings the practitioner into close relationship with fascinating natural objects. There is peculiar satisfaction in being the agent that causes the release of the dormant energy in the seed and sets the processes into cumulative action until the plant has attained its term. Many persons do not wish to wait for the slow processes of seed propagation, in the perennial plants, and therefore purchase their stock ready raised; but thereby they miss one of the major rewards in gardening, for the plant is as interesting in its beginnings as in its endings.

Seeds of most annuals, herbaceous perennials and many trees and shrubs are best stored dry in a fairly cool place. It is well to use screw-top bottles or other air-tight containers and keep them in a cool cellar or storage room. It is better to rely on fresh seeds and, before sowing, test their ability to germinate by placing a few in soil or between moist flannel pads at a temperature of 65°-70° F. in the house or greenhouse.

Seeds of annuals and herbaceous perennials may be germinated indoors or sown outside in spring or early summer. Most tree and shrub seeds are planted in prepared outdoor seed-beds in autumn or early spring. If the seeds are fresh, germination usually follows rapidly, but a few varieties of garden flowers and a number of trees and shrubs, handled by ordinary methods, may require from a few months to one or even two years to sprout. Such seeds are said to be "dormant" or to require a "rest" or "after ripening" period before germination can occur.

The simplest form of dormancy is caused by a hard seed-coat which, through excessive drying. has become impermeable to water and to gaseous exchange. Familiar examples are canna, moonflower, black locust and sweet pea. All seeds of this type are better if kept moist during storage. This method of storage is known as "stratification" and consists of mixing the seeds with moist peat moss, placing them in a box and keeping in a cool room or cellar at a temperature of preferably between 35° and 50° F. This to a large extent prevents the initial hardening of the seedcoats. Dry sweet pea seed is benefited by soaking in water, if not put into the ground until the soil is warm. Seed of canna, moonflower and others with hard shells may be scraped until the outer shell is pierced or is very thin to allow entrance of water. Seeds of black locust and certain other legumes are frequently soaked in concentrated commercial sulfuric acid for fifteen minutes or until small white spots appear upon the seed-coat. They must then be thoroughly washed in water before sowing.

Dormancy is caused in seeds of holly and orchids largely by a lack of stored food required for germination. Orchid seeds are germinated in flasks containing a sugar solution. Seeds of many rosaceous plants, including certain kinds of hawthorn, cotoneaster, viburnum and others, may normally require at least a year for germination. These are said to require an "after ripening period"—an interval during which certain internal processes are completed and which must take place before germination can occur. It has been found that the after ripening process of these slower seeds can be hastened artificially by stratifying them-keeping them moist and at a cool temperature—for one to several months before sowing. Different periods of stratifica-tion are required for different kinds of plants. For many with a short stratification period, fall sowing or burial of the seed-flat outdoors over winter may be all that is necessary to secure good germination in spring. Seed of flowering dogwood, stored dry and sown in spring, may normally require at least twelve months for germination. If secured in fall, however, stratified for sixteen weeks, and sown in May, seedlings may be obtained in a very few weeks. However, not all hastening treatments are as simple as this. Peony and certain species of Lilium, for example, have two definite stages in their germination process, the first involving the formation of the seedling root, the second the development of the shoot. The root develops readily but the shoot requires a period of low temperature first. If seedlings of such plants are desired in quickest time, they should be sown outdoors in early summer to secure root development while the weather is warm. Cool temperatures of winter affect the after ripening of the shoot and the young seedlings develop in spring. If sown in autumn these seeds would require two years to germinate. The process could be speeded up further by use of a greenhouse and stratification. Stratification is essentially a time-saving procedure for use with slow seeds. Descriptions of the best handling methods for the commoner seed types are available and should be consulted for more specific information.

In sowing seeds, the general rule is to cover them twice or thrice their thickness. This rule applies to the greater number of kinds of seeds, but in many plants of a naturally short season of bloom or growth, examples of which are the garden pea and sweet pea, it may be advisable to sow the seed deeper. Also, in sowing very minute seeds, as tobacco, petunia, begonia, and others of like size, care should be taken to place them only under the surface of the soil—simply pressed down with a smooth surface or allowed to settle into the soil with the soaking in of the water. The soil for all seeds should be loose and ponous, to allow the excess moisture to escape and the warmth to penetrate, but should be firmed directly over the seeds to induce an upward flow of moisture.

Seedlings germinated in the house are frequently subject to a serious disease, known as "damping-off," which causes them to rot at the surface of the soil. The disease is likely to appear when the soil is kept too moist and warm. It can be prevented by pre-sterilizing the seed with a material such as red copper oxide and by sterilizing the soil before sowing with formaldehyde or with heat derived from steam or electricity.

One of the most common mistakes is sowing all seeds at the same time without regard to the season, thus causing a failure with some, while others grow freely. Seeds of tender plants should be sown only when the ground has become thoroughly warm, while seeds of the so-called hardy plants may be sown as early in the spring as the ground is fit to work.

Very small seeds are sometimes mixed with sand or other inert material to allow of more uniform distribution; and the bed is frequently shaded with lath or cheese cloth until the seed-lings are established.

If seeds are not sown where the plants are to stand, the seedlings must be transplanted before they begin to crowd or become "drawn." This operation the gardener calls "pricking out." This means taking the young plants from the seed-box as soon as they are large enough to be handled—usually when the first true leaves have developed—and replanting them in other boxes or pots, either singly or at a greater distance apart than they were when in the seed-boxes. Transplant on a cloudy day, and just before a rain, if possible, if the plants are going in the open ground. Plants usually "take" quickly if transplanted on freshly plowed or spaded ground. Shade if necessary for a day or two, but do not cover closely. If the plants are of considerable size, it is good practice to remove part of the leaf surface to reduce evaporation.

Division is the simple process of producing two or more new and complete plants by the splitting apart of one original parent. Plants readily propagated by this method are those with many branching "crowns," rootstocks or rhizomes, those with tubers or tuberous roots, or which produce suckers, offsets or runners. Thus rhubarb and canna are multiplied by dividing the roots or rhizomes into pieces bearing an eye or bud; dahlia is increased by breaking apart the clustered "tubers" so that each has a portion of the stem with its dormant buds attached. Division is performed mostly in the resting season. Early flowering plants are usually divided after ripening in autumn, while those flowering in late summer may be left until just before growth starts in spring. The removal and planting of naturally detachable parts such as bulbels from about the mother bulb, bulblets from the

axils of leaves or flowers, plantlets from the leaves of kalanchoë or certain ferns is sometimes referred to as "separation," but the process involved is essentially a form of division.

Layerage is the rooting of branches while still part of the parent. Some plants form natural layers; with others the production of roots on above-ground parts is a purely artificial process.

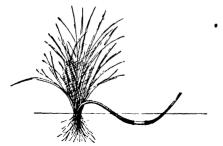

Fig. 10. A girdled layer.

The operation entails the covering of a stem or side growth with soil or other suitable medium into which rooting is likely to take place. The initiation of root production may be encouraged by wounding the portion of the root so covered. Tonguing, twisting, notching and ringing are methods frequently practiced. When sufficient roots have been produced, the shoot is removed and potted or planted out for growing into size.

Simple layering is that of a side shoot of perennials such as dianthus or viola or of shrubs such as magnolia or rhododendron. Strong branches are notched, bent down to the soil, and held in place with a peg or stone. The region of the cut is well covered with sandy soil. Layering can be done in spring or, more frequently, in autumn. The branch may be severed from the parent at the end of one year. Quick-rooting layers may

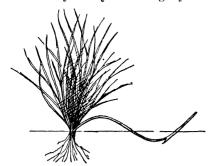

Fig: 11. A notched layer.

be transplanted immediately, but slower types such as rhododendrons should be left a second year for plenty of root to form. Figs. 10 and 11 illustrate simple layers in a diagrammatic way.

Tip layering is adapted to shrubs, such as black raspberry and forsythia, making long slender shoots which fall to the ground. In late summer, when growth is practically completed, the tips of such young shoots are pegged down to the soil and lightly covered. By late fall or spring these tips can be severed about 6 inches above the ground. By spring the young plants with roots, crown eyes and "handles," will be ready for transplanting to permanent locations.

Serpentine layering is particularly adapted to

such vines as grape and clematis. In early spring long vigorous stems are taken down and undulated or arched so that occasional nodes are buried beneath the soil, the intervening ones and the tip being exposed. The lower nodes are nicked with a knife, pegged into place, and covered with soil. At the end of a year the stem is cut from the parent plant and the individual sections severed to leave an upper growing bud ahead of each root system. Transplanting can be done during the second year.

Stooling is a method of layering in which the parent plant is cut off just above the ground in spring. As new shoots develop their bases are, in successive stages, covered over with soil. These young shoots root into the soil and can be removed as rooted plants in autumn. Many stiff-wooded shrubs such as hydrangea and mock-orange can be handled by this system. Certain modifications of the method, known as mound stooling and trench layering, have particular application in the vegetative propagation of apple and quince understocks.

Air layering is a special form in which the layered part is not in the ground but is an upright shoot, wounded or ringed just below a node. The roots are struck in a marcot box or split pot containing peaty soil, or in moist sphagnum moss bound around the wounded part. When sufficient roots have formed, the shoot is cut from the parent plant and potted. The atmosphere should be moist at all times and careful watering of the new plant is necessary until it becomes well established. Air layering is particularly useful for lowering the heads of "leggy" or seraggly specimens of rubber plants, crotons or other tall foliage subjects.

Cutting propagation differs from layerage in the fact that the part is severed before roots are formed. Cuttings, therefore, are parts of plants inserted in sand, soil or water with the intention that they shall produce roots and make new plants. They are of various kinds. They may be classified, with reference to the age of the wood or tissue, into two classes: those made from perfectly hard or dormant wood (taken from the winter twigs of trees and bushes), and those from more or less immature or growing "wood." They may be classified again in respect to the part of the plant from which they are taken, as root-cuttings, tuber-cuttings (as the ordinary "seed" planted for potatoes), stem-cuttings and leaf-cuttings.

Dormant stem-cuttings are employed with grapes, willows, poplars, privets, spireas and many other kinds of easily rooting trees and shrubs. Such cuttings are ordinarily taken in fall or winter, but cut into the proper lengths and then buried in sand or moss where they do not freeze, that the lower end may heal over or callous. In spring these cuttings are set in the ground, preferably in a rather sandy and well-drained place. Usually, hardwood cuttings are made with two to four joints or buds, and when they are planted only the upper bud projects above the ground. They may be planted erect, or somewhat slanting. That the cutting may reach down to moist earth, it is desirable that it should not be less than 6 inches long; and it is sometimes better if it is 8 to 12 inches. If the wood is short-jointed, there may be several buds on a cutting of this length; and to prevent too many shoots from arising from these buds, the

lowermost buds are often cut out. Roots start readily if the lower buds are removed, since the

buds grow into shoots and not into roots. Cuttings of currants. grapes, honeysuckles, and the like may be set in rows far enough apart to admit of easy tillage either with horse or hand tools. and the cuttings may be placed 3 to 8 inches apart in the row. After the cuttings have grown for one season, the plants are usually transplanted and given more room for the second year's growth, after which they are ready to be set in permanent plantations. In some cases, the plants are set in the field at the end of the first year; but two-year plants are stronger and usually preferable. Dormant cuttings are shown in Figs. 12 and 13, ready for setting in spring.

Softwood or greenwood cuttings are made from the young shoots of coleus, geranium, fuchsia and many other greenhouse, house, and outdoor perennial plants. They are rooted under cover, in a greenhouse, coldframe or dwelling house. The shoots should be mature enough to break when bent sharply. When the wood is so soft that it will bend and not break, it is too immature,

in most plants, for the making of good cuttings. Softwood cuttings are usually

Fig. 12. Cutting

of grape, made of the just-rip-

ened cane.

3 to 5 inches long and bear two or three joints or nodes. If there are two nodes, the lower leaves are removed and the upper ones cut in two, so that they do not present their entire surface to the air and thereby lose, by evaporation, an excessive amount of moisture. If the cutting bears only one node, the lower end is usually cut just above the next lowest node. In either case the cuttings are inserted to a depth of 1 to $1\frac{\pi}{2}$ inches in a rooting medium composed of welldrained sand. Mixtures of sand and peat moss are used for rooting certain plants while water is satisfactory for very easy varieties such as English ivy; but one should avoid ordinary soil or any material that holds too much moisture and be-comes muddy and sour. The bed is kept uniformly moist throughout its depth and the cuttings shaded until they begin to emit roots. Occasional ventilation is necessary to prevent the air from becoming too close and to minimize the danger of damping-off or other disease attack. A gentle bottom heat of 65-75° F., provided by fermenting manure, electrical resistance cable, or other means will increase the speed of rooting. Figs. 14, 15, 16 illustrate three types of softwood cuttings.

Fig. 13. Hardwood cutting, made from ripened cane of currant.

Fig. 14. A softwood cutting; it is set in earth up to the horizontal line.

Half-ripewood cuttings are made in late June and July from the ripening young shoots of various types of trees and shrubs. They represent a stage between the hardwood dormant cutting and the softwood green cutting in which

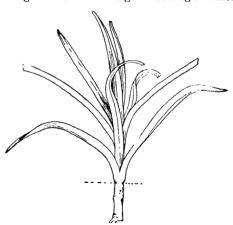

Fig. 15. Carnation cutting.

the shoots are green and in leaf but becoming woody. They are illustrated in Figs. 17 and 18. Since a true distinction is often difficult to make between "softwood" and "half-ripewood" cuttings, there is a growing tendency to classify all leafy summer cuttings under the simple term

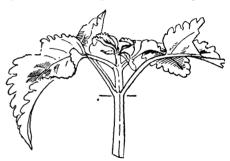

Fig. 16. Coleus cutting.

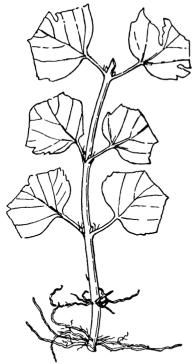

Fig. 17. Half-ripewood cutting of viburnum.

"softwoods" regardless of the type of plant or, within limits, the degree of maturity of the cut-ting involved. As designated here, however, three or more nodes are comprised in the halfripewood cutting. The leaf surface is somewhat reduced; it is inserted in sand or sand and peat moss in a frame or propagating house, and given care similar to that accorded the ordinary soft or greenwood cutting. Fig. 18 is a thuja or arborvitæ cutting. Evergreens of this kind can be rooted in hotbeds in summer or in the greenhouse during fall and early winter. Later in the year such cuttings become practically true hardwoods inasmuch as the wood is ripened and the leaves are persistent.

Synthetic growth substances such as indolebutyric or naphthalene-acetic acid have come into use in recent years for the encouragement of earlier rooting or the production of heavier root systems by soft- or half-ripewood cuttings. These effects are secured with many of the easily rooting plants as well as with certain more difficult ones such as flowering dogwood, Viburnum Carlesii and hemlock. The treatment is effected by soaking the cuttings for a few hours in a liquid solution of one of these acids or by dipping their bases in a preparation of the acid in powder form before inserting them in the rooting medium. The acid powders are easier to use than the liquids and usually as effective.

Rooted softwood cuttings are commonly grown in pots until ready for transplanting to their permanent quarters. Half-ripewood cuttings may be either potted or planted in prepared soil outdoors for growing into size.

Root-cuttings are employed for blackberries, raspberries, perennial phlox, anchusa and certain other woody and herbaceous plants. With

trees and shrubs they are usually made of roots from the size of a lead pencil to a little finger, cut into 3- to 5- inch lengths. Such cuttings are stored as are hardwood stem-cuttings and allowed to callous. In spring they are planted in a horizontal or inclined position in moist sandy soil and covered to a depth of 1 or 2 inches. Rootcuttings of herbaceous perennials, about 2 inches long, may be directly potted in the greenhouse in fall or planted in the greenhouse bench or in outdoor coldframes. They will be of size for transplanting at the end of the first year.

Leaf-cuttings are often employed for the fancy-leaved begonias, gloxinias and a few other plants. The young plant usually arises most readily from the leaf-stalk or petiole. The leaf, therefore, is inserted in the rooting medium much as is a softwood cutting. Begonia leaves, however, develop young plants from the main veins, if these veins or ribs are cut. For this to occur, well grown and firm begonia leaves, with the main veins cut, are placed upon moist sand and

weighted down with pebbles.

The leaf-bud cutting is a variation which has acquired increasing usage in recent years. It consists not only of leaf-blade and petiole but of these with axillary bud and a portion of the stem attached. It has been very successful for the propagation of blackberries, is now being used for camellias, hollies, hybrid rhododendrons and various other plants. With such subjects it possesses the advantage of easier rooting than

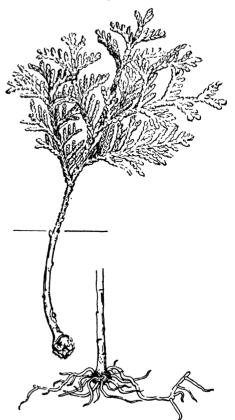

Fig. 18. Cutting of arbor-vitæ. The full cutting shows the formation of callus at base; the detail, later, has the roots well formed.

the stem-cutting and a more certain ability to produce shoot growth than the simple leaf-cutting. Maturing young leaves are used as cuttings in midsummer. Leaf-bud cuttings of rhododendrons, after potting, must be maintained at a relatively high temperature for a few weeks in order to secure rapid shoot growth before winter.

Plants may be propagated by means of cuttings or cions that are inserted in another plant rather than in soil. The practice is discussed

under the article Graftage.

PROPHET-FLOWER: Arnebia echioides.
PROSARTES: Disporum.

PROSÒPIS. Leguminosæ. Trees or shrubs with 2-pinnate lvs., the lfts. usually small and numerous, greenish-yellow fls. in axillary spikes, and straight or sickle-shaped pods; the first species is of economic importance in arid regions, for forage and as a honey plant.

glandulosa (P. juliflora var. glandulosa). Mesquite. Much branched shrub to 9 ft. or sometimes small tree to 20 ft. high, with axillary spines: spikes to 3½ in. long: pods to 8 in. long. Tex., N. Mex., S. Calif., characteristic of the region.

pubescens (Strombocarpa odorata and pubescens). Screw Bean. Tornillo. Spreading shrub to 15 ft. or small tree to 35 ft., with axillary spines: fts. greenish, in spikes to 3 in. long: pods to 1½ in. long. Tex, Utah, Calif.

Stephaniana. Low tree, spiny: spikes about 3 in. long: pods to 1 in. long, black. S. W. Asia.

PROSTANTHÈRA. Labiatæ. Shrubs of Australia with opposite lvs. and white or red 2-lipped fls.; grown out-of-doors in S. Calif. Propagated by cuttings of young wood.

lasianthos. Shrub or small tree: lvs. oblong-lanceolate, to 3 in. long, pale or glaucous beneath, margins often recurved: fls. tinged pink or blue, ½ in. long, in terminal racemes.

nívea. To 6 ft.: lvs. linear, to $1\frac{1}{2}$ in. long, entire: fls. white or tinged with blue, $\frac{3}{4}$ in. across, axillary, forming leafy racemes

rotundifòlia. To 7 ft.: lvs. broad-ovate, to ½ in. long, nearly entire: fls. blue or purple, about ½ in. long, in terminal racemes.

Sièberi. Tall shrub: lvs. ovate-lanceolate or oblong, to 1 in. long, deeply toothed: fis. blue or purple, 1/4 in. across, in terminal racemes.

PRŌTEA. Proteaceæ. Trees, shrubs or stemless perennials, mostly from the Cape region of S. Afr.: lvs. alternate, entire, leathery: fls. in many-fld. usually sessile solitary heads inclosed in an involucre of imbricated bracts: fr. a densely bearded nut.

compacta. Shrub: lvs. imbricated, to 414 in. long and 11/2 in. wide: heads terminal, 4 in. long inner bracts pink to carmine.

grándiceps. Shrub to 5 ft.: lvs. elliptical, to 5 in. long, apex obtuse, base broad and somewhat cordate, glaucous usually with reddish margins, coriaceous and strongly veined, sessile: heads terminal, to 4½ in. long and 6 in. across, inner bracts red to purplish with rounded tips, beard white, orange, purple or black.

mellifera. Shrub to 8 ft.: lvs. to 3½ in. long and ½ in. wide: heads terminal, 5 in. long, bracts sticky, dark red or greenish-white with pink tips and marg ns.

obtusifòlia. Shrub: Ivs. to 4% in. long and 1½ in. wide, obtuse or emarginate: heads terminal, 3% in. long, bracts ciliate.

scolymocéphala. Shrub to 3 ft.: lvs. to 2½ in. long and ½ in. wide: heads terminal, to 1 in. long, bracts pale green.

Sûsanniæ. Shrub: lvs. to 5 in. long and ¾ in. wide: heads terminal, 3¾ in. long, bracts pubescent.

PROTEACE. PROTEA FAMILY. South hemisphere trees and shrubs, sometimes herbs, abundant in Australia and S. Afr.: lvs. usually alternate: fls. bisexual or unisexual, with 4-parted perianth, 4 stamens, and superior 1-celled ovary,

borne in racemes, clusters or bracteate heads: fr. a nut, drupe or caps. A few genera yield edible nuts and dyes and the following are grown for ornament in warmer parts of the country, particularly in Calif.: Banksia, Dryandra, Embothrium, Gevuina, Grevillea, Hakea, Hicksbeachia, Isopogon, Knightia, Lambertia, Leucadendron, Leucospermum, Lomatia, Macadamia, Persoonia, Petrophila, Protea, Roupala, Stenocarpus, Telopea.

PRUINOSE: covered with a bloom, like a plum or a cabbage leaf.

PRUNE. Any variety of Domestica plum (Prunus domestica) with firm meaty flesh, and which readily makes dried fruit. Some of the prunes are commercially grown in the East, but they are sold in the green state as are other plums; and they are adapted to all the uses of other plums. Prunes are cultivated like other plums. Fruits for drying are allowed to fall from the tree, then carefully gathered. They are dipped in lye to prevent fermentation and to hasten the drying, often being rinsed thereafter. They may then be dried in kilns, or in warm sunny regions like California on trays in the open air. In this country the product is raised and prepared on the Pacific coast. See Plum.

PRUNELLA (Brunella). Labiatæ. More or less weedy low-growing per. herbs, with purple or violet fls. in dense bracted heads or spikes; useful for the rock-garden or slightly shady parts of the border. They grow readily in common conditions.

atropurpurea: a hort. form with bronzy lvs. and purple

grandifiòra. To 1 ft.: lvs. ovate, toothed or entire fls. purple, 1 m. long. June-July. Eu. Color forms are vars. álba, carminea, ròsea, and rùbra.

hastæfðlia (P. pyrenaca). To 1½ ft., soft-pubescent: lvs. oval-hastate, 1 in long, toothed: fls. blue-violet, 1 in. long June-Sept. Spain, Portugal.

incìsa: P. vulgaris. laciniàta: P. vulgaris var. pyrenàica: P. hastæfolia.

vulgàris (P. incisa). Self-Heal. Heal-All. To 2 ft., sts. often procumbent: lvs ovate to oblong-lanceolate, to 4 in. long, entre or toothed: fls. purple or violet, rarely white, to ½ in. long. May-Oct. Eu., Asia; nat. in N. Amer. Var. laciniata has cut lvs.

Webbiana: hort. name for a floriferous plant with bright purple fls.; botanical position uncertain.; some of the material so listed appears to be P. grandylfora.

PRUNING. All woody plants, and practically all others, are pruned by nature if not by man. Branches arise from buds, and yet there are any number more buds on a tree or bush than can grow full-size branches. A large part of the twiglets die and fall, probably having contributed to the welfare of the plant in their short life. The trunk of a tree has shed perhaps hundreds of twigs in its course from seedling to sapling and maturity, otherwise it would not be a smooth continuous bole. Twigs in disadvantaged positions, as on the inside and under side, fail and fall, as the droppings on the ground testify. Eventually the full-formed characteristic plant is produced; its form and character constitute its charm, and this charm should be retained.

The pruning of ornamental plantings, therefore, has for its object the maintenance of the plant in its normal, natural condition. It may be corrected, if need be, by removing superfluous, injured and wayward growths and by keeping it

within bounds; and broken, diseased and wounded places on trees should be treated and the head so directed from the first as to avoid dangerous crotches and to make it shapely. Beyond all this, the plant should be left largely alone unless, for some special reason, it is desired to trim it into a formal shape; and in this case the work should be in the hands of a trained person and not a tree butcher or a person who happens to be possessed of pruning-shears. As to trees, the knowledge of insects and diseases, and of the physiological processes, now requires educated and trained men, and trees become more valuable as property values rise and as men and women become more sensitive to their surroundings.

When it is desired to grow a product of extra size and excellence, pruning must be undertaken to reduce competition between numbers, whether the product is roses or peaches. The gardener prunes his chrysanthemums for the production of extra-large blooms, and his greenhouse tomatoes for first-class fruit. No vineyardist expects an acceptable crop of fruit without pruning, nor any grower of blackberries and raspberries without at least removing the spent canes. Anybody can cut off limbs and make a great display with saws and pruning-shears, but real pruning requires discrimination and intelligent experience. Pruning is a process of educating the plant for the purpose of correcting its faults and developing its most desirable attributes.

Pruning has two objects: to trim the plant or make it assume a designed shape; to render it more vigorous or more fruitful, or to make other changes in its character. These objectives are well illustrated in the pruning of ornamental shrubs. If one wants the shrubs sheared into formal shape, the shearing may be undertaken at almost any season; in fact, it is better to practice it two or three times each year, to keep the plants attractive and neat. If only once, it is well to perform it early in the season so that new growths may quickly arise and cover whatever damage may be wrought. If, however, the desire is to obtain more flowers, the case is very different. Some shrubs and trees bear their flowers on the wood of the preceding year. Such, for example, are the early-flowering shrubs as lilaes and snowballs. The flower-buds are made the previous year. In this case, pruning in winter cuts off the flower-buds. The proper time for pruning them, therefore, is just after the flowers have passed. The flower-buds form later in the season for the production of flowers the following spring. Other shrubs, however (particularly those that blossom late in the season), bear on wood of the current year's growth. Some kinds of clematis blossom in late summer and fall on the wood of the season. Roses present a similar case. The greater the quantity of strong wood in any season, therefore, the greater the bloom in that season. With such shrubs, it is well to prune in winter or early spring, and rather heavily. The abundance of new shoots may be expected to bear flowers later in the season. Following are shrubs which, for best results in flower-bearing, may be pruned when dormant (in winter): camellia, Jackmanii type of clematis, cornus, hibiscus (shrubby), hydrangea, many loniceras or honeysuckles, philadelphus or mock-orange, some spireas. Shrubs that may be orange, some spireas. pruned when in leaf (after blooming): lilac, deutzia, weigelas, exochorda, spring-flowering

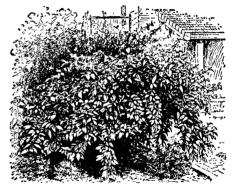

Fig. 19. Bush in its natural attractive form.

loniceras, tree peony, flowering almond, some spireas and viburnums, wisteria. Fig. 19 shows a plant form that is likely to be ruined by persons who shear bushes.

Fruit-trees, particularly apples, during the first years after planting, are pruned to space the limbs and build a strong framework. Important considerations are: (1) spacing the limbs vertically along the main trunk so that only one is inserted on the trunk at any one level; (2) avoiding the formation of crotches in which the two arms are of equal size; the main trunk should be of greater diameter than any branch arising from it; (3) choosing for permanent limbs only those that make a wide angle with the trunk. Fig. 20 shows a properly formed system of scaffold branches. Later pruning may be to stimulate the formation of vigorous fruiting wood, to facilitate spraying and picking and to keep the trees from becoming unmanageably tall. Peaches are given rather heavy detailed pruning for the purpose of thinning the crop. Annual pruning is essential for peaches and grapes. Apples and other temperate zone fruits may be pruned every two years. Citrus and some subtropical

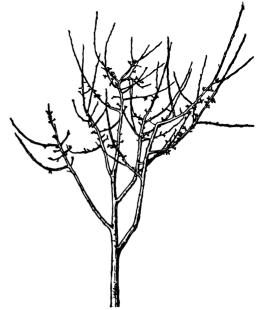

Fig. 20. A properly formed system of scaffold branches.

fruits need very little pruning of any kind. Heavy pruning is rarely justified except in neglected orchards where the growth is much too thick. Excessive pruning of fruit-trees may result in considerable reduction of crop. Pruning should be so managed that the tops of the trees will be open, that no two limbs interfere with each other, that the fruit will not be so abundant as to overload the tree. Before one can prune a fruit-tree intelligently one must know its fruit-bearing habit and be able to distinguish fruit-buds and flower-buds.

The wound made by pruning heals by being covered with callus tissue, which grows out from the cambium region and rolls over the face of the exposure. The hard wood itself never heals; that

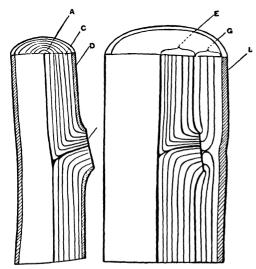

Fig. 21. Healing of pruning wound. Left, pruning wound on side of trunk showing annual growth rings. A, pith, C, wood, D, bark. Right, the same wound healed over. E, wood formed prior to cut, G, annual layers of wood formed after cut, L, bark. The cambium is between the bark and the wood.

is, the cells do not have the power of making new cells; the old wood is covered up, or hermetically scaled as a cap is put on a fruit-jar, as indicated in Fig. 21. It is evident, therefore, that no kind of dressing will hasten the healing of the wound. The merit of a dressing is to keep the cut wood sound and healthy until the callus naturally covers it over. A good dressing is thick linseed-oil paint, but special kinds are on the market. Water-soluble asphalt emulsions are among the best. A dressing should be adhesive and enduring, and have antiseptic properties. Small wounds on sound limbs or trunks are usually not dressed in orchard pruning.

The time or season for pruning, so far as the wound is concerned, is ordinarily in spring just as growth starts; but the season also influences fruit-bearing and wood-making, and these questions should be considered. Those wounds heal best that are on strong main limbs, where there is a full flow of nutritious sap. The limb should be cut off so that the wound is approximately parallel with the trunk on which it sits, and close to it. With many trees there is an enlarged shoulder at the base of each limb. Correct practice is to start the cut close to the trunk on

the upper side of the branch and slant the saw slightly outward (Fig. 22). Stubs projecting beyond this shoulder will not heal properly. One has only to observe the trunks of trees as one passes, or the knots in fire-wood, to understand the decay and damage that result from long stubs, whether left by the pruner or by storms, for knot-holes are only decayed branches. The injury may invade the trunk far beyond the knot-hole.

It is generally best to prune hardy orchard trees late in winter or early in spring, but much depends on climate and also on the extent of the work and available labor supply. It is ordinarily better, however, in the North, to leave peaches and other tender fruits until after the buds have swollen, or even after the flowers have fallen, that one may determine how much they have been injured by the winter. Grape vines should be pruned in winter or preferably not later (in the North) than the first of March. If pruned later than this, they may bleed. Such loss of sap, however, is of little importance and should not prevent late pruning if earlier pruning has been impossible. These remarks may be made to apply to other woody plants as well as to fruit-trees.

Tree surgery, or the treating of wounds, depredations and damages, is a different practice from pruning although pruning may be involved in it. Special knowledge and equipment are required for it.

Pruning and trimming should be contrasted although they are ordinarily confounded. Trimming is an affair of the shaping of plants and not to the thinning of them, or to training for wood, fruit or other special object. Trimming is mostly employed on hedges. It is also practiced to keep evergreens in shape. Many ornamental plants are also trimmed into various forms, although it is a question whether such practice is often desirable. Fruit-trees should be pruned, as a rule, rather than trimmed: they should be allowed to take their natural form, the pruner taking out

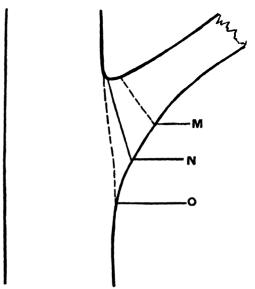

Fig. 22. Position of cut in removing branch. N, correct line of cut for quick healing, M, too far out, a stub is left, O, too close, the wound is larger than necessary.

the superfluous and unnecessary wood and keep-

ing them within manageable bounds.

Training is still another practice. It directs the parts, often placing them on trellises or walls. The plant must first be pruned, and the nature of the pruning may be modified by the form of training. If grapes are to be trained on the Kniffin system, pruning is one thing; if on the horizontal-arm system it is quite another

PRÙNUS, THE STONE-FRUITS, Rosacex, Orchard, ornamental and interesting deciduous and evergreen trees and bushes, mostly of the north temp. zone, of about 200 species, with alternate and prevailingly simple lvs.: fls. normally bisexual, white or pink, solitary or in clusters and often preceding the foliage; stamens 20 or more; pistil single, inside the calyx-cup: fr. a drupe, mostly edible, with a single pit or stone.

For Hortus Second it is best to keep the genus Prunus intact, to include the plums, apricots, peaches, cherries, and cherry-laurels. The cherry species fall into several groups, of which three may be mentioned: the umbellate, in which the flowers are in small umbel-like clusters, as in the orchard kinds, although in some cases they may be only 1, 2 or 3; the racenose cherries, with the flowers in distinctly elongated clusters or racemes, as the choke-cherry; the cherry-laurels, with flowers racemose and leaves persistent (evergreen).

All the prunus plants are tractable in cultivation. Most

All the prunus plants are tractable in cultivation. Most of the kinds are hardy in the northern parts of the country. They are not particular as to soil. Usually they are propagatable directly from seeds sown in autumn or strathed until spring. Named varieties are started from firm-wood cuttings under glass or are budded on closely related stock, commonly the latter. The usual stocks are common plum, myrobalan plum, peach, cherry. Note the statements under some of the species in this account, and consult Almond, Apricot, Cherry Peach, Plum.

ácida: P. Cerasus var. caproniana.

mouinoctialis: form of P. subhirtella var. pendula.

alabaménsis. Racemose cherry like P. serotina but a smaller tree, the lvs. underneath as well as petioles and rachis of raceme tomentose or pubescent, lvs. relatively broader. Ala.

alleghaniensis. Plum: shrub or small tree: lvs. lance-ovate to narrow-obovate, long-pointed, serrate, becoming glabrous: fls. about ½ in. across, white turning pink, calyx somewhat pubescent outside: fr. about ½ in. diam., dark purple and glaucous. Conn. to Pa.

americana. Small native plum tree 20-30 ft. or much loss: lvs. obovate or oblong-obovate and acuminate, dull, sharp-serrate, petiole usually glandless: fls. about 1 in. across, calyx-lobes not glandular: fr. about ³/₄ in. diam. but in some strains larger, yellow or red, stone swollen. New England to Man., west and south.—Blackhawk, Hawkeye, DeSoto and other plums belong here.

Amygdalus (P. communis. Amygdalus communis).

Almond. Glubrous tree to 25 ft.: lvs. oblong-lanceolate and acummate, closely serrate, somewhat shiming above: fls. mostly before lvs., 1½ in. or less across, pink: fr. oblong and flattened, 1½ in. or more long, with dry inedible flesh, varying in thickness of stone and edibleness of kernel. Probably W. Asia.—There are double-fld. forms in different that the state of the s tints, variegated-lvd. and pendulous., with varietal names.

angustifòlia. Chickasaw Plum. Small twiggy glabrous tree or a bush: lvs. lanceolate, standing trough-like, shining, tree or a busic vis. nanceointe, standing trough-like, sinings, closely fine-serrate; fis. ½ in. across, white: fr. about ½ in. diam., red or yellow. Del., west and south to Fla. and Tex.—Produces Caddo Chief. Var. varians. More robust and fr. larger: stone pointed at apex. Var. Watsonii. Sand Plum of Kans. southwest. Bush, with very zigzag twigs.

apétala (P. ceraseidos). Small tree or shrub: lvs. oblong to obovate, to 2 in. long, acuminate, sharp-serrate, pubescent: fls. with small petals soon perishing, the calyx purple, with the lvs. Japan.

Armeniaca. Apricot. Small tree with ovate to roundovate, often cordate, abruptly pointed, closely serrate lvs.
pubescent on veins underneath: fls. 1 in. or less across,
pinkish or white, solitary in advance of lvs.: fr. large, becoming nearly smooth with very short st; stone mostly
smooth. Perhaps W. Asia. Var. mandshûrica. Lvs. more
cuspidate, sharply serrate: fr. with st. about ¼ in. long.
Var. sibfrica. Lvs. narrower and smaller, long-acuminate:
fr. small and scarcely edible, splitting. For plumcot, see
P. sulicina.

Arnoldiana: see P. triloba.

avium. Sweet Cherry. Large tree with central leador and birch-like bark: lvs. oblong-ovate to -obovate, large, soft, doubly serrate: fls. about 1 in. across, with the lvs. in clusters, white: fr. globular or oblong, long-stemmed. Eurasia.—Often spontaneous in the form known as Mazzard, the seedlings used as stocks. There are double-fld, cut-lvd. and drooping forms. Var. actiana (var. sylvestris) is the wild or run-wild form bearing very small sweet dark colored fr. Var. durácina. Bigarreau or Hard-Fleshed Cherries, Var. Juliana, Heart Cherries. Var. regâlis (P. effusa), Duke Cherries, with narrow growth and sour flesh, thought to be hybrid with P. Cerusus.

azórica: P. lusitanica.

Béssevi. SAND CHERRY. Glabrous little bush, diffuse or Bessey!. SAND CHERRY. GIADTOUS ILLIE DUSH, diffuse or nearly prostrate: lvs. elliptic to oval, finely serrate: fis. about ½ in. across, white: fr. about ½ in. diam. or more, black, edible. Plains, Man. to Kans. and Colo.—Sometimes employed as stock for hardness and for dwarfing.

Blireana: see P. cerasifera.

brigantina (P. brigantiaca). Apricot: small tree or origantina (P. origantiaca). Apricot: small tree or shrub: lvs. ovate, short-acuminate, sharply serrate, pubescent underneath: fls. short-stalked, white or pink, about ½ in. or more across: fr. small, yellow, smooth, subacid; seed oily and fragrant. S. France.

Buergeriàna. Racemose cherry, 20-30 ft.: lvs. elliptic to oblong and acuminate, serrulate, glabrous except in axils underneath: fls about ¼ in. aeross: fr. small, black. Japan, Korea; hardy N.

campanulàta. Handsome umbellate cherry to 25 ft., xampanuara. Handsome umbellate cherry to 25 ft., young growth glabrous: Iva. oblong-ovate, sharply serrate, acuminate, nearly or quite glabrous underneath: fis with the Ivs. or in advance of them, long-pedicelled, calyx and corolla dark deep rose-red; fr. ovoid, about ½ in. long, red. S. Japan; thrives in S. Calif.

canéscens. Shrubby cherry with pubescent branchlets and ivs., the latter ovate or longer, short-acummate, serrate: fls. 2-5 together, nearly 1/2 in. across, pink: fr. about 1/2 in. diam., red. China; hardy N.

Capuli (P. serotina var. salicifolia. P. Capollin). Capollin. Lvs. narrow and long-acuminate: racemes stout, closely flowered: fr. large, sometimes 1 in. across. Trop. Amer.; grown for fruit and ornament.

caroliniana (Laurocerasus caroliniana). Native evergreen cherry-laurel to 40 ft. or more: lvs. oblong-lanceolate and acuminate, nearly or quite entire: fis. small, creamwhite, in racemes: fr. ½ in. or less long, shimp black. N. C. to Tex, mostly near coast.—Known as Wild-Orange and Mock-Orange.

ceraseidos: P. apetala.

ceraseidos: P. apetala.

cerasifera (P. myrobalana). Cherry or Myrobalan Plum. Slender small tree glabrous or essentially so at maturity: Ivs. small and thin, 2 in. long, short-ovate, finely serrate: fis. 1 in. or less across, white, single or 2 or 3 together, before Ivs.: fr. mostly 1 in. or less diam., globular, red or yellow, sweet, very juicy. S. W. Asia.—Much used as stock. Runs into more or less weeping and leaf-margined forms Var. atropurpirea (var. Pissardia) is purple-Ivd.; several derivatives of it are listed, as P. Bliveana (supposed to be hybridized with P. Mume), P. Hessei, P. Moseri, P. Veichtii. Var. divaricata (P. divaricata) is more bushlike, branches very slender, Ivs. rounded at base, fis. smaller and coming with the Ivs. Var. Woodii (P. Spaethi), Ivs. dark purple, holding color all summer. Maranna and similar plums are apparently offshoots of P. cerasifera, perhaps by hybridization.

cerasoides (P. Puddum). Like P. campanulata but lvs. broad-oval and very sharply toothed: fr. pointed. Hima-

Cérasus. Sour Cherry. Small round-topped or much spreading variable tree, suckering from root: lvs. shortspreading variable tree, suckering from root: lvs. short-ovate to somewhat obovate, stiffish, abruptly short-pointed, doubly serrate: fls. about 1 in. across, white to pink, a little in advance of lvs. or with them, sometimes double: fr, ½ in. or so diam., red, sour. Eurasia; sometimes spontaneous.—There are double- and pink-fld. forms Much cult, as an orchard fr. in two forms, var. austèra or Morello with colored juice and var. caproniàna (P. acida) or Amarelle with light or uncolored juice. Var. Rhéxii has double white fls. Var. semperificrens, Eversedooming or ALI SAINTS CHERRY, blooms on shoots of the season, in summer.

Chamæcérasus: P. fruticosa.

cistèna. Purpleleaf Sand Cherry. Hybrid between P. pumila and P. cerasifera var. atropurpurea: lvs., pedicels and calyx reddish.

Cocomflia. Often bushy, with thorny branches: lvs. oval to obovate, sharp-serrate, tapering at base: fls. mostly in pairs, whitish, about ½ in. across: fr. about 1 in. or less diam., yellow. Italy.—Allied to P. ceras/era.

communis: P. Amygdalus.

concinna. Umbellate bush cherry, becoming nearly or quite glabrous in all parts: lvs. narrow, to 1 in. wide, with not more than 10 pairs of veins, finely serrate: fls. 1 in, or less across, 4 or fewer together, white, before the lvs.: fr. about ½ in. long, black. China.—Ornamental.

Conradine. Umbellate cherry allied to P. concinna, tree to 25 ft., glabrous or nearly becoming so: lvs. 2 in. or so broad, with more than 10 pairs of veins: fls. 4 or fewer together, whitish or pinkish, nearly 1 in. across: fr. nearly ½ in. long, red. China.

cornits. Like P. Padus, of which some writers consider it a var., but has lvs. rounded at base, reddish hairs in axils underneath, commonly pubescent racemes, calyx glabrous inside, and stone smooth. Himalayas.

cuneata: P. pumila var. susquehanæ,

dasycárpa. Purple Apricot. Small tree like apricot, to 20 ft., branches purplish: lvs. plum-like, ovate to oval, to 23/2 in. long, closely serrate, usually pubescent on veins underneath: fls. 1 in or more across, white, before the lvs.: fr. 1½ in. diam., pubescent, dark purple, acid Unknown wild; perhaps a hybrid with P. cerasifera.

Davidana. Peach-like, glabrous tree to 20 or 30 ft.: lvs. narrow and willow-like, finely serrate: fls. 1 in. or more across, white or light pink to red, very early and often taken by frost, sessile: fr. about 1 in. diam., pubescent, flesh dry. China; hardy N.—Has been used as a stock.

dehiscens: P. tangutica.

demissa: P. virginiana var.

depréssa: P. pumila var.

Dielsiana. Umbellate cherry, tree to 30 ft. or sometimes bushy, much like P. Pseudocerasus: fis. pink or white, before the lvs., 3-5 in an involucrate cluster, bracts fimbriate, calyx-lobes longer than the tube: fr. small, red.

divaricata: P. cerasifera var.

doméstica. Common Plum. Small tree, with twigs more or less pubescent at least when young: lvs. ovate to obovate, rather thick, dull green, pubescent underneath: fis. 1 in. or rather thick, dull green, pubescent underneath: is. I in. or less across, whitish, solitary or few together and mostly in advance of lvs.; blossoms sometimes double (var Plantieri): fr. various, mostly oblong or ovoid Eurasia; sometimes spontaneous. Var. insittia. Damson, Bullace. Usually a more compact grower and young growth more pubescent: lvs. smaller: fr. much smaller, often in clusters.

Dúnbari. Hybrid between P. maritima and P. americana: lvs. larger than in the former and more sharply ser-rate, less pubescent: fr. larger, purple.

effùsa: P. avium var. regalis.

emarginata. Allied to *P. pensylvanica* but a smaller tree or a shrub, lvs. obtuse or only acute and closely or indistinctly serrulate, often pubescent underneath: fr. about ½ in. diam., becoming black. N. Ariz to B. C.

fruticosa (P. Chamacerasus). European Dwarf or Ground Cherry. Bush 3-4 ft., sometimes with pendulous branches, glabrous or becoming so: Ivs. oval to oblanceolate or narrow-obovate, about 2 in. long, closely serrate: fls. ¾ in. across, white, with the young foliage: fr. about ¼ in. across, red-purple. Eu., Siberia.—Sometimes worked on tall or standard stocks.

glàbra var. albiplèna: probably P. glandulosa var. albiplena is meant.

glandulosa. One of the flowering almonds, but properly a cherry: shrub 3-5 ft.: lys. oblong to ovate-oblong, broadest at about the middle or sides nearly parallel, not acuminate, apex blunt: fis. white to pink: fr. about ½ in. diam., red. Japan, China.—Common in cult., usually double as in var. albiplena. Var. rosea has pink fis. Var. sinénsis has double pink fis. and lanceolate or oblong-lanceolate lys.

grácilis. Oklahoma Plum. Bush to 15 ft., with oval or ovate-elliptic lvs. slightly pubescent above and densely so underneath: fis. about ½ in. across, white, preceding the lys.: fr. about ½ in. dam., reddish with thin bloom. W. Ark. to N. Tex.; hardy N.

Grayana. Somewhat like P. Padus, but Ivs. with setaceous teeth and long point, the petiole not glandular: tree to 30 ft.: fls. about ½ in. across, white, in racemes: fr. about ¼ in. diam., black. Japan; hardy N.

Héssei: see P. cerasifera.

hortulana. Hortulan Plum. Tree to 30 ft., not forming thickets, glabrous or lightly pubescent on veins or under side of the obtusely serrate lvs. which are oblong-ovate to elliptic and long-acuminate: fls. preceding lvs., about ½ in. across, white: fr. 1 in. or less diam., red to yellow. Ky., Tenn. to Iowa and Okla.—Parent of Cumberland, Golden Beauty. Wayland and other orchard plums. Var. Mineri has thicker and duller coarsely toothed lvs. and late firmer fr.; here belong Miner, Clinton and other plums.

humilis. Bush cherry to 4 or 5 ft.: lvs. 2 in. or less long, elliptic-ovate and somewhat acute, serrulate, glabrous: fis. appearing with lvs., solitary or in pairs, white to pinkish, ½ in. across: fr. ½ in. long, red. China; hardy N.

ilicifòlia. Islay. Evergreen glabrous shrub or tree to

30 ft.: lvs. 2 in. or less long, spiny-toothed and holly-like: fis. about 1/2 in. across, white, racemose: fr. 3/2 in. or less diam., dark red to nearly black. S. Calif.

incans. Bush cherry, 3-6 ft.: lvs. small, variously oblong, obtuse or short-pointed, serrate, tomentose underneath: fts. with the lvs. or just in advance, ½ in. across, rose: fr. about ¼ in. diam., red. S. E. Eu. and W. Asia; hardy N.

incisa. Small cherry tree or big bush: lvs. ovate to obovate and acuminate, double-serrate, pubescent both surfaces: fis. with the lvs., nodding, red and pink, short-pedicelled, less than ½ in across: fr. about ½ in. long, purpleblack. Japan; hardy N.

injucunda: P. umbellata var.

insititia: P. domestica var.

integrifòlia: P. Lyonii.

Jacquemontii. One of the flowering almond or dwarf cherry kind, shrub-like, glabrous, to 10 or 12 ft.: lvs. elliptic to obovate, acute, serate: fls. in advance of lvs., about ½ 10. across, pink: fr. about ½ 11. diam., red. Hima-

japónica. A dwarf flowering cherry, known as flowering almond, closely allied to *P. glandulosa* but less frequent in cult. and differing in ovate sharply serrate lvs broadest below the middle: fls. about 1 in. across, blush or pink, usually double in cult.: fr. ½-½ in. diam., red. China.—Several races or forms are cult.

lanata (P. americana var. mollis. P. Palmeri). Small round-headed tree occurring in thickets: lvs. obovate to nearly oblong, acuminate, pubescent underneath, petioles mostly without glands: fr. nearly globose, about 1 in. diam., red or vellow. Ill. and Iowa to Tex.

Lannesiàna: P. serrulata var.

Laurocérasus (Laurocerasus officinalis). CHERRY-LAUREL. Evergreen bush or small tree: lvs. oblong, remotely small-toothed, shining and thick: fis. about ½ in. Laurocérasus (Laurocerasus across, white, very fragrant, in racemes not longer than the lvs.: fr. about ½ in. long, dark purple. S. F. Eu. to Persia.— Much planted in southern states and Calif. There are many leaf forms and others, as angustifolia, Bertinu, caucasica, japonica, latifolia, maynotizefolia, parvifolia, rotundifolia, schipkaensis, serbica, versaillensis, Zabetiana.

lobulata. Cherry, to 35 ft.: lvs. oblong to obovate, acuminate, sharply double-serrate, harry underneath on veins: fls. preceding lvs., white: fr. about ½ in. diam., red.

Iusitánica (P. azorica). Portugal-Laurel. Much like P. Laurocerasus, but tree larger, Ivs. crenate-dentate and racemes surpassing the Ivs. Portugal, Spain; planted far S. Leaf forms are angustifolia, myritfolia, variegala.

Lyonii (P. integrifolia). ISLANDS CHERRY. Evergreen bushy tree to 30 ft.: lvs. ovate to ovate-lanceolute, acute, margins entire or on young shoots denticulate: fls. about ¼ in. diam., white, in axillary racemes: fr. 1 in. or more diam., dark purple. Isls. of S. Calif., and planted in the region.—By some considered to be a form of P. ilusfolia.

Mackii. Racemose cherry, to 50 ft., parts pubescent or becoming nearly glabrous: lvs. oblong to elliptic-ovate, acuminate, sharply glandular-serrate: fls. white, about 1/2 in. across: fr. about 1/2 in. diam., black. Manchuria, Korea, China; hardy N.

Mahaleb. Mahaleb or St. Lucie Cherry. Green-twigged tree to 30 ft.: lvs. broad-ovate to orbicular, ab-ruptly short-pointed, 2½ in. or less long, glabrous both sides except perhaps on midrib underneath: fls. ¾ in. or less across, in umbels, white and fragrant: fr. about ¼ in. long, black. Eu. and W. Asia.—Cult. for ornament and as stock for other cherries; sometimes escaped. A form has pendulous branches pendulous branches.

mandshùrica: P. Armeniaca var.

martima. Beach Plum. Straggling bush or sometimes tree-like: lvs. 2 in. or less long, oval to obovate, obtuse or short-pointed, serrate, pubescent underneath: fls. about ½ in. across, white, preceding lvs.: fr. ½ in. or less dam., red or yellow, edible. N. B. to Va, on or near coast.

Maximowiczii. Racemose cherry, tree to 50 ft.: lvs. obovate, double-toothed, acute, glabrous except perhaps on veins underneath; fis. about ¾ in. across, whitish, after the lvs.: fr. about ¼ in. diam., red to black. Manchuria, Korea, Japan; hardy far N.

melanocárpa: P. virginiana var.

mexicana. Big-Tree Plum. Tree to 25 ft., not suckering: lvs. large, oblong to obovate, short-acuminate, sharp-serrate, pubescent usually both surfaces: fis. ¾ in. across, white, preceding lvs.: fr. 1 in. or more long, purplish-red and glaucous. Ky. and Tenn. to Okla. and Mex.; hardy N.

mira. Peach-like, tree to 30 ft., glabrous except on midrib underneath: lvs. lanceolate and tapering, crenate-serrate: fls. about 1 in. across, 1 or 2 in a place, white, nearly sessile: fr. about 1 in. diam., tomentose, stone smooth. W. China; hardy in central states.

Mòseri: see P. cerasifera.

Moser: see P. cerasifera.

Mume. Japanese Apricor. Differs from common apricot in bark greenish or gray, lvs. smaller and narrower and not cordate and long-pointed and often pubescent underneath, fr. smaller and stone mostly pitted. Japan; hardy N., particularly when worked on plum.—There are double-fid. and other forms, constituting the "flowering plums" of Japan.

Munsoniàna. WILD Goose Plum. Tree to 25 ft., suckering from roots and forming thickets: Ivs. rather thin, oblong-lanceolate, often trough-like, glossy above, finely serrate, mostly slightly pubescent on veins underneath: fis. ½ in. or more across, white, commonly preceding Ivs.: fr. about ¾ in. long, red or yellowish, slightly glaucous. Ky, Tenn., Kans, Tex.; hardy N. in vars. Newman, Robinson and others.

myrobalàna: P. cerasifera.

myrtifòlia (P. sphærocarpa). Myrtle-leaved Cherry-Laurel. Evergreen tree to 40 ft., glabrous: allied to P. occidentalis but Ivs. such smaller (2-4 in. long), elliptic to ovate: fls. yellowish-white, 1/8 in. diam.: fr. subglobose, about 1/2 in. diam., black-purple. S. Fla, W. Indies, Mex. to Brazil.—Another myrtifolia is a form of P. lustianica.

nàna: P. tenella

nigra (P. americana var. nigra). Lvs. commonly broader than in P. americana and obtusely or closely glandular-serrate, petiole with 2 glands; fls. larger, white changing to pink, calyx-lobes glandular-serrate; fr. often larger. N. B. far west and south to N. Y. and Wis.—Yields Cheney, Itaska and other orchard vars.

nikkoénsis: P. nipponica.

nipponica (P. nikkoensis). Umbellate cherry allied to P. niosa, but petioles glabrous rather than pubescent, pedicels longer (to 1 in), fis. twice larger; bushy tree to 20 ft. with ovate long-acuminate lvs. and white or pale pink bloom. Japan; hardy N.

nucipérsica: P. Persica var. Nectarina.

nucipersica: P. Persica var. Nectarina.
occidentàlis (Laurocerasius occidentalis). West Indian
Cherry-Laurel. Evergreen glabrous tree to 40 or 50 ft.:
lvs. oblong or elliptic, 4-8 in. long, acuminate, entire: fis.
white and fragrant, about ½ in. long, in dense raceines
shorter than the lvs.: fr. ellipsoid, about 1 in. long, purple.
Jamaica and Cuba to St. Vincent.—The name occidentalis
has been applied also to P. Lyonii.

orthosépala. Probable hybrid between P. angustifolia var. Watsonn and P. americana: shrub to 6 ft., with larger lvs, frs. and fls. than in P. angustifolia.

Pàdus (Padus racemosa). European Bird Cherry. Tree to 30 or 40 ft.: Ivs elliptic to obovate, short-acuminate, sharply serrate, glabrous except on veins underneath: fts. about ½2 in. across, white, fragrant, appearing with full leafage on drooping or spreading racemes, calyx pubescent inside, petals twice longer than stamens: fr. about ½ in. diam, black, stone sculptured. Eu to Japan. Var. commutata. Livs. appearing early, with coarse serratures, green underneath. E. Asia —Planted for ornament, sometimes in pendulous, red-fld., double-fld., spotted-lvd. and

Pálmeri: P. lanata.

pedunculàta. Bush of the Amygdalus section: lvs. elliptic to oblong, dentate: fls. pink, solitary: fr. ovoid, about $\frac{1}{3}$ in long, pubescent; stone smooth. Siberia.

pensylvánica. WILD RED CHERRY. Small tree to 35 ft.: lvs. ovate or oblong-lanceolate, long-pointed, finely toothed, glabrous. fls. ½ in. across, in umbels, white: fr. ¼ in. across, red. Newf. to N. C., west to Colo.

Pérsica (Amygdalus Persica. Persica vulgarus). Peach. Small glabrous tree: lys. long-lanceolate, finely serrate: fls. solitary in advance of foliage, sessile, 2 in. or less across, pink: fr. ½ in. diam., pubescent, stone pitted and wrinkled. China.—Cult. for edible fr. and also in ornamental forms as double-fld, purple-lyd., dwarf, pyramidal, pendulous with various Latin names. Sometimes spontaneous. Var. compréssa (var. platycarpa), Flat and Peen-to Peach, fr. flattened endwise. Var. Nectarina (P. and var. nucipersica), Nectarine, fr. smooth.

pilosiúscula. Umbellate cherry, shrub or tree to 40 ft.: lvs. obovate to oblong, acuminate, serrate, pubescent on veins underneath: fls. with the lvs. or just preceding them, about ¾ in. across, pink: fr. about ⅓ in. long, red. China, hardy in parts of N.

Pissárdii: P. cerasifera var. atropurpurea.

plantierénsis, Plantièri: double-fid. form of P. domestica.

Pseudocérasus. Small cherry, to 25 ft., with much the look of *P. Cerasus*: lvs. ovate to broad-ovate, firm, more or less pointed, sharp-serrate, somewhat hairy on veins underneath: fls. just in advance of full foliage. I in. or less across, white and fragrant: fr. a very early red edible cherry ¾ in. or less diam. China.—Now intro. for experimental purposes.

pubigera. Like P. Padus: lvs. minutely serrulate: fis.

smaller, the petals nearly as long as stamens; stone smooth. W. China.

Púddum: P cerasoides.

pulchérrima: listed name.

pūmila. Sand Cherry. Decumbent at base when old but growths erect 3-5 ft., all parts glabrous: Ivs. narrow-oblanceolate to oblong-lanceolate and mostly acuminate, 2-3 in. long, margins closely serrate toward apex, lighter underneath: fls. white, slender-pedicelled, mostly 2-3 together with the Ivs., ½ in. or more across: fr. about ½ in. across, purple-black, stone subglobose. Sandy shores. Great Lakes. Var. depréssa (P. depressa). Prostrate dwarf cherry on beaches and shores, Que. to Mass. and Ont., probably not in general cult. but to be distinguished from P. pumila: Ivs. less acuminate and thinner, more glaucous underneath: fr. small with ellipsoidal stone. Var. susquehame (P. susquehame. P. cuneata). Erect to 3 or 4 ft.: Ivs. short, mostly short-obovate or spatulate to elliptic-ovate, toward apex bearing appressed teeth: fls. with the Ivs., white, about ½ in. across: fr. about ½ in. diam. Woods, hills and shallow bogs, Me. to Penna. and Man.

Réverchonii. Hog Plum. Shrub to 6 ft., forming thickets: lvs. ovate-lanceolate to lanceolate, acuminate, conduplicate, glandular-serrate, somewhat pubescent underneath: fis. with or before the lvs., white, about ½ in. across: fr. about ¾ in. dam., yellow to red. Okla., Tex.

Rhéxii: P. Cerasus var.

rufa. Lake *P. campanulata* but young parts densely reddish-tomentose, lvs. narrower and glandular-serrate. Humalayas.

sachalinénsis: P. Sargentii.

salicina (P. triflora). Japanese Plum. Small tree to 25 ft.: 1vs. oblong-obovate or -ovate, pointed, usually shining above and not conspicuously rugose, closely serrate, mostly glabrous underneath: 18. ½ in. or less across, mostly in advance of 1vs., white: fr. various, yellow or bright red, often pointed. China.—Cult. in several orchard vars. Plumoet is apparently a hybrid between P. salicina and P. Armenaca. Plum peach may be a hybrid with P. Persica.

Sárgentii (P. serrulata var. sachalinensis). Fls. 2-4 in sessile umbels: teeth on lvs very sharp: fls. pink, very early. Japan.—Handsome and hardy tree growing to large size.

sericea. Racemose cherry, to 50 ft. or more: lvs. elliptic to obovate, pointed, silky underneath: fls. about 1/2 in. across: fr. 1/2 in. or more long, black. China.

serotina. WILD BLACK CHERRY. Large forest tree: lvs. oblong to lanceolate to oval, acumunate, with appressed callous teeth, nearly or quite glabrous underneath: fis. white, about ½ in. across, with the lvs., in racemes, fragrant: fr. ½ in. or less diam., purple-black. N. S. to Dak., Fla. and Tex.—Leaf and habit forms are in cult. Var. salicifolia: see P. Capuli.

salicifòlia: see P. Capun.

serrulàta. One of the Japanese flowering cherries (see P. Sieboldiu, P. subhirtella, P yedoensis). Tree to 60 ft. and more: lvs. ovate or narrower, long-acuminate, acutely or short-aristate serrate, somewhat glaucous underneath: fis. white but with many pink double forms, not fragrant, 1½ in. or less across, in clusters with fimbriate bracts, with or in advance of foliage: fr. size of pea, black. Japan, Korea, China. Var. Lannesiàna (P. Lannesiana). Teeth on lvs. long-aristate: fis. pink, fragrant. Var. sachalinénsis is P. Sargentin. Var. spontanèa. Considered to be an original form of the species: fis. white or pink, single.

sibírica: P. Armeniaca var.

Sièboldii. Small tree, like *P. serrulata* but branchlets and under side of lvs. soft-pubescent: fls. pink or white, single and double. Japan, but unknown wild.—Includes the plant known as *P. Waterers*.

Simonii. APRICOT PLUM. Narrow-headed glabrous tree to 25 ft.: lvs. narrow-obovate, dull, rather thick, trough-like, obtusely serrate: fls. nearly sessile, preceding lvs., white, about ¾ in. across: fr. 1-2 in. diam., flattened lengthwise, dull red, flesh yellow, with strong flavor. China.

sinénsis: applied to dwarf flowering almonds, particularly to P. glandulosa.

Spaèthii: P. cerasifera var. Woodii.

sphærocárpa: P. myrtifolia.

spinosa. Sloe. Blackthorn. Thorny suckering bush, or tree to 10 or 12 ft.: Ivs. many and small, obovate to ovate, obtuse, serrate, pubesent or glabrous underneath: fls. ¾ in. or less across, white, before the lvs.: fr. about ¼ in. diam., blue to black, glaucous. Eu., W. Asia.—Planted for ornament; fls. sometimes double; sometimes purple-lvd.

Ssiori. Racemose cherry, to 50 ft. or more: lvs. oblong to obovate, acuminate, aristate-serrate, nearly glabrous underneath: fls. white: fr. about ½ in. across, black. N. E. Asia; hardy N.

subcordata. Pacific Plum. Tree to 25 ft., or sometimes shrubby: lvs. broad-ovate to orbicular, obtuse or nearly so, serrate, pubescent or becoming glabrous underneath: fis.

white to rose, $\frac{2}{3}$ in. across, before lvs.: fr. 1 in. more or less diam., red or yellow, edible. Calif., Ore. Var. Kélloggii, Sisson Plum, lvs. not cordate and glabrous, fr. larger.

subhirtélla. Rosebud Cherry. Small tree to 25 or 30 ft., sometimes bushy: lvs. lanceolate to ovate, short-pointed, double-serrate, hairy on veins underneath: fls. in profusion, pink to nearly white, about ¾ in. across, before the lvs., petals notched: fr. about ¼ in. diam., black. Japan; hardy N.; beautful species. Var. ascéndens. Tall tree, not weeping: lvs. elliptic-oblong, Var. autumnalis. Shrub or small tree bearing partly double fls. some of which may bloom in autumn. Var. péndula has crooked drooping branches.

sultana. Apparent hybrids between P. Simonii and P. saliona, as Wickson.

susquehanæ: P. pumila var.

tangtica (P. dehiscens). Glabrous bush of the dwarf almond group with more or less spiny branches: lvs. small and narrow, not much exceeding 1 in. long, finely crenate: fis. 1 in. across, solitary and sessile: fr. nearly 1 in. diam., very tomentose, splitting. China; hardy in some of the northern states.

tose, splitting. China; hardy in some of the normern states. tenélla (P. nana). Dwarfs Russian Almond. Haidy bush to 5 ft., glabrous: lvs. stiffish and narrow, 3 in. or less long, obtuse or nearly so, serrate: fls. about ½ in. across, with the lvs., pink to white: fr. about ½ in. long, pubescent. Eurasia.—Sometimes grown for ornament. The name P. nana is applied by some writers to the choke-cherry (P. virginiana).

tomentosa. Bush cherry or very small tree: lvs. broadoval to-obovate, 2½ in. or less long, short-pointed or obtuse, serrate, tomentose underneath and on young growths: fis. nearly sessile, just before the lvs., ¾ in. across, usually tinted fr. about ¾ in. diam., reddish, edible. China; hardy N. Var. endôtricha has shorter lvs., fis. white and abundant.

trichóstyla: a form of P. glandulosa.

triflòra: P. salicina.

triloba. One of the plants known as flowering almond: bush, but sometimes tree-like and 10 ft. or more: lvs. broadovate to obovate, sometimes 3-lobed on shoots, doubleserrate, hairy both sides: fls. 1½ in. or less across, pink or white, before the lvs., usually double in cult.: fr. about ½ in. diam., red, pubescent. China.—Cult. mostly in double-fld forms, worked on plum stocks. P. Arnoldiana is a hybrid between this species and P. cerasifera: differs from P. triloba in its white fls. that appear with the lvs. and on longer pedicels.

umbellāta. Plum, bush or small tree, the branchlets glabrous or becoming so: lvs. narrowly elliptic-acuminate, 1½-3 in. long, closely serrate, more or less pubescent underneath: fls. white, few together in advance of lvs.: fr. ½-¾ in. across, yellow to purple. S. C. to Fla. Var. injucúnda (P. injucunda), N. C. to Miss., has pubescent twigs and stone more pointed at either end.

Veitchii: see P. cerasifera; also applied to a form of P. serrulata.

virginâna. CHOKE-CHERRY. Shrub, sometimes tree-like: lvs. elliptic to obovate, short-acuminate, finely serrate, glabrous or nearly so underneath: fls. about ½ in. across, white and somewhat fragrant, in racemes with the lvs.: fr. ½ or ¼ in. diam., red sometimes yellow. Newf. to Sask., N. C. and Kans. Var. demissa (P. demissa). Wash. to Calif., has lvs. pubescent underneath. Var. melanocârpa (P. melanocarpa), N. D. to B. C. and New Mex., lvs. mostly smaller, fr. nearly black, petioles glandless.

Watereri: P. Sieboldin.

Wátsonii: P. angustifolia var.

xanthocárpa: yellow-fruited state of P. virginiana.

yedoénsis. Like P. serrulata, but lvs. hairy or pubescent at least on veins underneath: fis. single, white or pink, pedicels and perhaps calyx pubescent, calyx-lobes sharpserrate. Japan.

PSAMMÓPHORA. Aizoaceæ. Low woody succulents from S. Afr., having short thick gummy lvs. and solitary terminal violet or white fls. with linear petals.

Pfilansii. To 6 in.: lvs. to 1 in. long and 1/4 in. wide and thick: fls. pink, 1 in. across.

PSEDERA: Parthenocissus.

PSEUDERÁNTHEMUM. Acanthaceæ. Herbs and shrubs of world-wide tropics with opposite lvs. and tubular 5-lobed fls. subtended by linear bracts, in spikes or racemes; grown in the greenhouse, and in the open in warm countries. Propagated by cuttings.

atropurpureum (Eranthemum atropurpureum). Shrub to

4 ft.: lvs. ovate or oval, obtuse or nearly so, to 6 in. long, entire, purple or sometimes green spotted with yellow: fis. white with purple center or purplish, \(\frac{1}{2} \) in. long and to 1 in. across, in narrow clusters, corolla-lobes broad and mostly blunt. Polynesia.—Now commonly planted in the American tropics.

bicolor (*Eranthemum bicolor*). Shrub to 3 ft.: lvs. ovate, to 8 in. long, entire, dark given: fls. white spotted purple, salverform, to 1½ in. long and 1 in. across. Polynesia.

kewense. Another plant described and figured as atropurpureum but differing in narrower and acummate lvs., terminal spikes rather dense and broad, corolla-lobes narrow, cilate, white with rose at base. Solomon Isls.—Probably not planted within our area.

reticulatum (Eranthemum reticulatum). Shruh to 3 ft.: lvs. ovate-lanceolate, to 10 in. long, wavy-margined, dark green veined with yellow: fls. white spotted purple, ½ in. long and 1½ in. across. Polynesia.

tuberculatum (Eranthemum tuberculatum). Small shrub, branches with many small rough elevations: lvs. elliptic, to 1 in. long: fls. white, to 1½ in. long and 1 in. across, solitary. Polynesia.

PSEUDOBULB: the thickened or bulb-form stems of certain orchids, the part being solid and borne above ground.

PSEUDOCASSIA: Cassia speciabilis.

PSEUDOCYCAS. A genus of fossil plants. For the living plant known as *P. Mucholitzu*, see *Cycas*.

PSEUDOCYDONIA: Chanomeles sinensis.

PSEUDOCYMÓPTERIS. Umbelliferæ. Shortstemmed or stemless W. American plants having bipinnate lvs., and a non-involuerate infl. of white, yellow or purple fls.: fr. an oblong glabrous schizocarp with prominent dorsal and intermediate ribs and no stylopodium.

anisatus. To 1 ft., stemless tufted per, from much branched rootstock: lvs. long-petioled, with segms, slender, linear and sharply acute: fls. white or yellow. fr. to ½ in. long. N. W. U. S.

montànus. St. to 2 ft. high: Ivs. few, segms. ovate to lanceolate: fis. pale yellow, in 6-12-rayed umbels. Colo. to Ariz. and New Mex.

PSEUDOESPOSTOA: Haageocereus chosicensis.

PSEUDOLÀRIX. Pinacex. One deciduous tree native in China, P. amábilis (P. Fortunei. P. Kaempferi). Golden-Larch. To 130 ft.: lvs. in dense clusters, linear, to 3 in. long, light green turning bright yellow in autumn: cones hanging, ovate, to 3 in. long, the scales deciduous and thus differing from Larix as well as in the clustered staminate fls. Var. nana is a dwarf form. For cult. see Conifers.

PSEUDOLOBIVIA: although this generic name appears in the trade for certain cacta, it has no known botanical standing. Plants so listed are probably referable to *Echinopsis*.

PSEUDÓPANAX. Araliaceæ. Shrubs or small trees in New Zeal. and S. Amer., with variable (dimorphous) simple or compound lys., diocious fls. in umbels, and drupaceous frs.; grown under glass or out-of-doors in mild climates, as Calif. For cult. see *Polyscias*.

chathámicum. To 25 ft.: lvs. simple, of two forms, the mature lvs. linear-obovate, to 8 in. long, slightly wavy-toothed: fr. globose. New Zeal.

crassifòlium (Aralia crassifolia, Panar crassifolium). Tree to 50 ft.: lvs. of young unbranched plants very narrow-linear and rigid, toothed, to 3 ft. long, those of mature plants often of 3 or 5 broader lfts.: fls. in terminal compound umbels: fr. globose, New Zeal. Var. trifoliolàtum has 3-5 lfts.

discolor. To 15 ft., much branched; lvs. of 3-5 obovate lfts. to 3 in. long, sharp-toothed, yellowish-green or bronzy, leathery: fr. oblong. New Zeal.

fèrox (Panax ferox); To 20 ft.: lvs. simple but variable, very thick and stiff, from narrow-linear to obovate, on young plants 12-18 in. long and 1 in. or less broad and strongly toothed, those on old plants shorter and entire except perhaps near tip: fr. oblong. New Zeal.

Léssonii (Panaz Lessonii). To 20 ft., much branched: lvs. of 3-5 obovate lfts. to 4 in. long, entire or wavy-toothed. shining and leathery: fr. oblong. New Zeal.

PSEUDOPHŒNIX. CHERRY PALMS. Palmacex. Unarmed feather-palms, with staminate and hermaphrodite fls. in the same infl., spadices among the lvs. and branching, 1 species on certain of the Fla. Keys, the Bahamas, and southward: and there are a few other species: fls. on slender pedicels; stamens 6, the expanded filaments somewhat united at base: fr. a globose 2-or 3-lobed orange-scarlet drupe. See *Palm*.

Sargentii. Slow-growing palm to 25 ft., but in open ground hkely to be lower and not straight, top of the bole narrow and tapering: lvs. long and regularly pinnate: fr-clusters declined from the axis, nearly or quite as broad as long, or even broader, the branchlets wide-spreading; fr. cherry-red to orange-scarlet, pyriform, sometimes double or triple, nearly or quite \(\frac{1}{2} \) in. long. Sparingly planted in S. Fla. from the Keys.—The related \(P.\) unifera from History and the related \(P.\) unifera from History and the related \(P.\) and the related in the triple in the related \(P.\) and \(P.\) and \(P.\) in the related \(P.\) and \(P.\) a paniola is apparently not planted in our area; it is a taller tree with much larger fr. in elongated clusters and branches not divaricate.

PSEUDOSÁSA. Graminex. Shrub having creeping rootstocks, hollow round sts. and the branches usually solitary at the nodes. genus is now segregated from Sasa, differing in the st.-nodes scarcely raised, lf.-sheaths with flexuous bristles or glabrous, and the fls. with usually 3 stamens; 3 species have been described, all E. Asiatic. See Bamboo.

japónica (Arundinaria, Bambusa and Sasa japonica. A. and B. Metake). To 15 ft., the st.-sheaths bristly-hairy: lvs. to 10 in. long and 1½ in. wide, finely toothed, shining above, glaucous beneath. Japan.

PSEUDOTSÙGA. Pinacex. Several tall evergreen coniferous trees with flat linear lys. having 2 white bands below, and drooping cones with deciduous scales and conspicuous exserted bracts; native in W. N. Amer. and E. Asia. For cult. see Conifers.

Douglasii: P. taxifolia.

glauca: P. taxifolia var.

japónica. Lvs. notched at apex, glossy: cones to 2 in. long. Japan.

macrocárpa. Bigcone-Spruce. Branches usually drooping: lvs. acute, bluish-green: cones to 7 in. long. S. Calif. mucronata: P. taxifolia.

sinénsis. Lvs. to $1\frac{1}{4}$ in. long, notched at apex: cones to $2\frac{1}{4}$ in. long. W. China.

sinensis. Lvs. to 1/2, in. long, notened at apex: cones to 2½ in. long. W. China.

taxifòlia (P. Douglasii. P. mucronata. Picca Douglasii. Abies laxifolia). Douglas-Fir. Lvs. obtuse, dark or blush-green: cones to 4½ in. long. B. C. to Mex. and Tex.—A major timber tree in the regions of its best development. The Rocky Mt. form, which is sometimes considered a separate species, is hardy and adaptable for ornament in N. Y. and Cent. New England. Some of the hort. vars. are: argéntea, lvs. silvery-white; brevibracteàta, smaller tree with bracts of cone shorter; càsia, lvs. bluish-green; compácta, compact form with shorter lvs.; dénsa, dwarf and flat-topped; fastigilata, pyramidal form; Frétsii, lvs. shorter and broader; glaûca (P. glauca), with smaller lvs. and cones, the Rocky Mt. form, and glaûca péndula with drooping branchlets and bluish lvs.; globòsa, dwarf and globose; péndula, branches drooping, lvs. dark green; pyramidàta, of conical habit but partially dwarf; viridis, lvs. green, cones larger.—Recent investigations have revealed new evidence indicating the correctness of the name P. taxifolia and not its synomym P. Douglassi.

PSÍDIUM. GUAVA. Myrtaceæ. Trees and shrubs of trop. Amer. with opposite simple lvs., large white fls. with many stamens, and berry-like fr. crowned with the persistent calyx-lobes; grown in Fla. and tropics for the edible frs., from which iellies and conserves are also made.

Guavas require tropical temperatures, although they withstand a few degrees of frost. The strawberry guava grows wherever the orange thrives, and the requirements are simple. Any soil is satisfactory. Trees should be set 10 to 15 feet apart. Propagated by seeds sown in flats or pans of light sandy loam; seedlings should be kept in pots until transplanted permanently. Shield- and patch-budding should be employed for choice varieties. Cuttings may also be taken.

Araca: P. guineense.

Cattleianum. Strawberry G. To 25 ft., the bark smooth: lvs. to 3 in. long, glabrous: fls. 1 in. across, solitary: fr. purplish-red, to 1½ in. long, with white flesh. Brazil. Var. lùcidum has sulfur-yellow frs.

chinénse: an unidentified hort, name,

Friedrichsthalianum. Costa Rican G. To 25 ft., the branchlets 4-angled: lvs. to 3 in. long, glossy above, pubescent below: fls. 1 in. across, solitary: fr. sulfur-yellow, to 2½ in. long, with white flesh. Cent. Amer.

Guajàva. Common G. To 30 ft., with scaly bark and 4-angled branchlets: lvs. to 6 in. long, pubescent beneath, the veins prominent: fis. 1 in. across, solitary or few together: fr. yellow, to 4 in. long, with white, yellow or pink flesh. Trop. Amer.

guinéense (P. Araca). Brazilian G. Shrub: lvs. to 5 in. long, pubescent below: fis. 2-3 together: fr. greenish-yellow, 1½ in. long, with white flesh. S. Amer. but once supposed to be Guinean (African).—The plants known to the trade under this name are usually forms of P. Guajava.

PSILOCAULON. Aizoacex. Shrubs with small cylindrical lvs., differing from Mesembryanthemum in petals united at base into short tube, and technical fr. characters.

granulicaule (M. granulicaule). To 16 in., much branched, sts. rough-harry: lvs. to ½ in. long, soon deciduous: fls. whitish, ¼ in. across, 1-2 at tips of branches; styles 5. S. Afr.

PSILOSTEMON: Trachystemon.

PSOPHOCÁRPUS. Leguminos x.herbs making tuberous roots, lvs. of 3 lfts. papilionaceous fls. in racemes, and 4-angled winged pods; one species grown in warm regions for the edible roots and pods.

tetragonólobus. Goa Bean. Asparagus-Pea. Ann.: lfts. ovate, to 6 in. long: fls. bright blue, 1½ in. long: pods to 9 in. long, with jagged wings. India.

PSORÀLEA. Scurfy-Pea. Leguminosæ. Scented herbs or shrubs with pellucid dots, usually pinnate lvs., papilionaceous fls. in racemes or spikes, and short 1-seeded pods: one species has an edible root and others may be grown for ornament. Propagated by division.

aphfila. Tall shrub with rod-like branches usually leafless and bearing subulate scales: lfts. (when present) 1-3, narrow-linear: fls. pale blue. S. Afr.

bituminosa. Per. to 3 ft.: lfts. 3, ovate: fls. in dense heads, in spring and early summer. Arabia.

cuspidata. To 2 ft, with tuberous roots: lfts. 5, oval: fls. blush, in dense oblong spikes. May-June. S. D. to Tex.

esculenta (Pediomelum esculentum). Pomme Blanche. INDIAN BREADROOT. Per. to 1½ ft., with edible tuberous root: lfts. 5, obovate: fls. bluish, in dense head-like spikes. May-June. Sask. to Mont.

glandulòsa. Shrubby, to 5 ft.: lfts. 3, ovate-lanceolate: fls. blue and white, in racemes. Chile, Peru.

hypogæa. Nearly stemless, with tuberous roots: lfts. 5, linear or oblanceolate: fls. blue, in dense spikes. May-June. Neb. to New Mex.

macrostàchya. Leather-Root. Per. to 10 ft.: lfts. ovate: fls. purple, in broad spikes. Calif.

Onforychis (Orberilum Onobrychis). Per. to 4½ ft.: lfts. 3, lanceolate, to 4 in. long, glabrous above, pubescent beneath: fis. pale purple, in narrow spike-like racemes to 6 in. long; pod ½ in. long, rugose. Ohio to Ia. south to Tenn. and Mo.

pinnata. Shrub to 12 ft.: lfts. 7-11, linear or linear-lanceolate: fis. blue and white, solitary or clustered. S. Afr.

PSÝCHOTRIA. WILD-COFFEE. Many shrubs or trees in the tropics with mostly opposite lvs., white, yellow or rose somewhat Ixora-like fls. in corymbs, having short tube and 4-6-lobed limb, and fr. a drupe; a few of them rarely planted in extreme S. U.S., and sometimes seen under glass.

bacteriôphila. Shrub to 10 ft.: lvs. elliptic or ovate-oblong, to 3 in. long, shining above, fleshy: fls. greenish-white, about ½ in. long, stamens exserted: fr. reddish, ½ in. across. Comoro Isls.

capénsis. Evergreen: lvs. obovate, to 5 in. long, shining: fls. yellow, 1/2 in. long: fr. black, shining. S. Afr.

jasminiflora. Evergreen shrub with white bark: lvs. oblong-ovate, to 3 in. long, pale beneath: fls. white, to 1½ in. long, stamens exserted. Brazil.

Súlzneri. Shrub: lvs. oblong to elliptic-lanceolate, to & in. long, pubescent beneath: fis. white. Fla.

undata. Similar to P. Sulzneri but glabrous and corollalobes shorter rather than as long as tube. Fla., W. Indies.

PTÈLEA. Hop-Tree. Rutacex. Small trees and shrubs of N. Amer., with usually alternate trifoliolate lvs., small greenish-white polygamous fls. in short dense clusters, and fr. an orbicular or oblong or cordate samara.

Hop-trees thrive in somewhat shady positions in porous soil and are hardy North. Propagated by seeds sown in autumn, budding in summer, layering or grafting in spring under glass. They are ornamental tree-like shrubs of secondary importance. The species are confused, and several kinds are native in United States.

isophylla. Shrub or small tree: Its. 5, terminal one rhombic-ovate, to 2½ in. long, blue-green, glabrous or nearly so: fr. suborbicular, to 1 in. across. Mo.—Perhaps not distinct from the following species.

trifoliàta. Shrub or tree to 25 ft.: lfts. to 5 in. long: fr. circular, about 1 in. across, dry, winged all around. N. Y. to Fla. and west. Var. aùrea has yellow lvs.

PTERÈTIS (Matteuccia). OSTRICH-FERN. Polypodiaceæ. Large ferns of N. Amer., Eu. and Asia, 3 species, the sterile fronds deeply 2-pinnatifid and borne in a circle surrounding the fertile fronds which have segms, contracted into pod-like bodies around the sori. The American and European plants have been regarded until recently as a single species, and the synonyms properly belonging to *P. Struthiopteris* may be applied in lists to *P. nodulosa*. They are bold strong subjects for outdoor planting. See Ferns.

nodulosa (Onoclea nodulosa). Fronds 6-10 ft. long, margins of pinnæ often revolute, on stipes to 14 in. long. N. S. to Va. and Ia.

Struthiopteris (Matteuccia and Onoclea Struthiopteris. Struthiopteris germanica). Differs from P. nodulosa in less erect habit, shorter fronds 3-5 ft. long, on stipes to 5 in.

PTERÍDIUM. BRACKEN. BRAKE. Polypodiaceæ. Coarse ferns with triangular 3-4-pinnate fronds; sori borne in a marginal line, with double indus-ium. Useful as background in the rock-garden or wherever large masses of ferns are desired; hardy and durable.

aquilinum (Pteris aquilina). Fronds to 4 ft. long and 3 ft. wide, 3-pinnate into oblong or lanceolate segms., densely pubescent below, on stalks to 3 ft. long, the indusium chate. Cosmopolitan. Var. lanuginosum has the fronds with the segms. linear-oblong, strongly pubescent beneath and sometimes hairy above. W. N. Amer., Mich., Ont., E. Que. Var. lattifsculum (P. latusculum), the common form in E. N. Amer., has segms. thinly pubescent along veins beneath and indusium not ciliate.

latiúsculum: P. aquilinum var

PTERIDOPHÝLLUM. Papaveraceæ. Monotypic genus from the mts. of Cent. Japan, distinguished from other cult. genera of Papaveraceæ and Fumariaceæ by its pinnatisect fernlike lvs. which form a basal rosette from which arise the taller and naked peduncles. P. race-mosum. Stemless per to 10 in.: lys. to 6 in. long and 1 in. wide: fis. white, to ½ in. across: fr. a 2-valved silicoid caps. about ¾ in. long. Prefers moist soil in shade, not hardy far N.

PTERIS. Brake. Polypodiaceæ. Large genus of mostly trop. ferns (omitting Pteridium), a few of which are used for table decoration in ferndishes, in the window-garden and in conservatories: fronds 1-4-pinnate; sori in a marginal line with indusia formed of the revolute edge of frond. P. cretica and P. serrulata and their many forms are well-known subjects for pans and ferndishes, used in table decorations, and of easy management. See Ferns.

adiantoides: Pellea miridas

Alexándræ: hort, form of P. cretica. aquilina: Pteridium aquilinum.

argyræa: P. quadriaurita var.

Charlesworthii: hort, var. of P. serrulata.

Childsii: a modified form of P. cretica.

crenata: P. ensiformis.

crética. Fronds to 1 ft. long, on slender straw-colored stipes, 1-pinnate, pinnæ to \mathcal{H} in. across, the lower often pinnatifid. Tropics and subtropics. Var. álbo-lineata has lvs. white along center. Cristate, divided or larger forms are vars. cristata, magnifica, major, nobits.

Drinkwateri: hort, form of P. cretica.

Dútrei: modified form of P. cretica.

ensiformis (P. crenata). Sword B. Very slender: fertile fronds erect, to 20 in. long, 1-pinnate, pinna to ½ in. across; sterile fronds shorter, segms. broader, to ¾ in. long and to ½ in. wide. E. Asia, Malaya, Australia Var. Victòriæ (P. Victoriæ) has segms. banded with white.

Gautheri: hort, form of P. cretica.

hastata: Pellea mridis.

heterophýlla: Anopteris hexagona.

longifòlia. Fronds to 2½ ft. long and 1 ft. wide, 1-pinnate, pinnæ to 6 in. long and ½ in. wide, the fertile narrower. Tropics. Var. Marièsii has shorter lvs.

marginàta: P. tripartita.

Mayii: hort, form of P. cretica.

multiceps: hort, form with striking variegation.

multifida: P. serrulata.

nodulòsa: see Pteretis nodulosa.

Oùvardii: hort, form of P. serrulata.

Párkeri: a robust form with broad green fronds.

quadriaurita. Rather coarse: fronds to 3 ft. long and 1½ ft. wide, 2-pinnate or lower 3-pinnate, segms. ¼ in. across, entire. Tropics. Usually grown in the var. argyræa with segms. banded with whitish. Var. trícolor has whitish and reddish bands.

Rivertoniana: a modified form of P. cretica.

serrulata (P. multifida). Slender: fronds to 1½ ft. long and 10 in. wide, 1-punnate into very narrow long segms, lower segms. 2-3-forked, rachis winged. China, Japan. There are many crested and other vars. as angustata, corym bifera, cristata, nana, variegata, voluta.

Sièboldii: hort. form of P. ensiformis.

trémula. Australian B. Fronds bright green, to 3 ft. long and 2 ft. wide, 2-4-pinnate, segms. linear, to 1½ in. long, wavy-toothed. New Zeal, Australia.

tripartita (P. marginata). Fronds 3-parted, each branch pinnate, segms. oblong, to 1 in. long, rachis winged. Trop. Asia, Afr., Australia, Pacific Isls.

umbròsa. Fronds to 3 ft. long, 1-pinnate or lower 2-pinnate, segms. linear-lanceolate, to 6 in. long, entire or sterile toothed. Australia.

Victòriæ: P. ensiformis var.

Wilsonii: hort, form of P. cretica.

Wimsettii: a cristate form of P. cretica.

PTEROCARYA. WING-NUT. Juglandacex. Deciduous monocious trees of Asia with alternate pinnate lvs., unisexual fls. in drooping catkins, and fr. a winged nutlet. Of rapid growth, but some of them require protection in the N. when young. Propagated by seeds, layers or suckers.

caucásica: P. fraxinifolia.

fraxinifolia (P. caucasica). CAUCASIAN W. To 100 ft.: lvs. of 11-20 ovate-oblong or oblong-lanceolate lfts. to 5 in. long: fr. with nearly orbicular wings, in racemes to 1½ ft. long. Caucasus to Persia.

japônica: P. stenoptera.

Rehderiana. Hybrid between P. fraxinifolia and P. stenoptera.

rhoifdlia. To 100 ft.: lvs. of 11-21 ovate-oblong lfts. to 5 in. long: fr. with wing broader than long, in racemes to 1 ft. long. Japan.

sinénsis: P. stenoptera.

stenoptera (P. japonica. P. sinensis). To 100 ft.: lvs. with a winged rachis, of 11-23 oblong lfts. to 4 in. or more long: fr. with oblong wings, in racemes to 1 ft. long. China.

PTEROCASSIA: Cassia polyantha.

PTEROCÉPHALUS. Dipsacex. Ann. and per. herbs, sometimes subshrubs, in the Medit. region and eastward, differing from Scabiosa in the calyx being represented in fr. by pappus-like awns.

parnássi (Scabiosa pterocephala). Spreading deep-rooted per. 3 or 4 in. high but making broad patches: lvs. more or less lyrate-pinnatifid, to 1½ in. long, scalloped, densely pubescent. fls. purplish-pink, in composite-like heads about 1 in. across standing above foliage. Mts. of Greece.

PTEROSPÉRMUM. Sterculiaceæ. Trees or shrubs of trop. Asia, the growing parts scaly or tomentose, having alternate leathery lvs., large fls., and large leathery or woody capsular frs. One species is planted sparingly in Fla. and probably elsewhere. Propagated by cuttings of the side shoots

acerifolium. Large tree: lvs. peltate, palmately nerved and usually lobed, to 1 ft. across, thick rusty-pubescent beneath: fls. white, fragrant, to 6 in. across: caps. to 6 in. long. India to layar.

PTERÓSTYRAX. EPAULETTE-TREE. Styracacex. Deciduous trees or shrubs native in Asia, with alternate toothed lvs., white fls. in panicles, and fr. a small ribbed or winged drupe. These plants thrive in rather moist sandy loam. Propagated by seeds, layers, and cuttings of young wood under glass.

corymbòsa. Shrub or tree: lvs. oval or ovate, to 5 in. long: fls. in corymbose panicles to 5 in. long: fr. 5-winged, tomentose. Japan, China.

hispida (Halesia hispida). To 50 ft.: lvs. oblong, to 7 in. long: fis. fragiant, in drooping panicles to 10 in. long: fr. 10-ribbed, densely bristly. China, Japan; hardy N.

PTERYGÒTA. Sterculiaceæ. E. Indian trees differing from Sterculia and Brachychiton chiefly in the winged seeds; one species intro. in Calif. and Fla.

alata (Sterculia alata). Large tree with ash-colored bark: lvs. clustered at ends of branches, cordate-ovate, to 10 in. long and 7 in. wide: fls. unisexual or bisexual, 1 in. across, rusty-tomentose, in few-fld racemes: fr a woody pubescent globose follicle to 5 in. across; seed with large corky wing.

PTYCHORAPHIS. Palmaceæ. Malayan and Philippine unarmed monœcious feather-palms, none of which is regularly planted in our territory. Trunks ringed, usually slender: spadix below the lvs., branched; fls. spirally arranged, pistillate between 2 staminate and all staminate toward the top of the branches; stamens 6: fr. small, ovoid, drupe-like, 1 in. or less long. See Palm.

PTÝCHOSPÉRMA. Palmaceæ. About 12 or 15 species of ringed unarmed monocious featherpalms in New Guinea and other isls., Australia: lvs. mostly gracefully curved; pinnæ usually broadened at the apex and toothed or jagged: spadices below the lvs., branched; fls. spirally disposed in 3's, the outer ones staminate; stamens 20–30: fr. small, ovoid or ellipsoid, sometimes beaked, 1-seeded, stigmatic point terminal; seed sulcate or furrowed; albumen ruminate. See Palm for cult.

Alexandræ: Archontophænix Alexandræ.

Cunninghamiana: Archontophanix Cunninghamiana.

élegans. Slender palm with solitary trunk to 20 ft., and relatively few lvs. 3 ft. and more long, bright green and paler underneath; pinnæ to 2 ft. long and 1½-3 in. broad, contracted at base, oblique or truncate and toothed or jagged at apex: spadix about 20 in. long, on a very short peduncle; staminate fl-buds oblong: fr. about ¾ in. long. E. Australia (Queensland); common in S. Fia.—This plant is the true Seaforthia elegans, but the palm known to planters

under that name is Archontophænix Alexandræ; Seaforthia is not the oldest name.

Macárthuri: Actinophlæus Macarthuri. Nórmanbyi: Normanbya Normanbyi.

PUBERULENT: somewhat or minutely pubescent.

PUBESCENT: covered with short soft hairs; downy.

PUCCOON: Lithospermum canescens.

PUDDING-PIPE-TREE: Cassia Fistula.

PUERÀRIA. Leguminosæ. Herbaceous or woody twiners with trifoliolate lvs., blue or purple papilionaceous fls. in axillary racemes, and linear more or less flattened pods; native in Asia and Pacific Isls.

The roots of many species yield economic and medicinal products. One species is grown for ornament and is hardy in mid-northern United States, although the vine may be killed back to the ground each winter and may not reach blooming stage. Propagated by root-division, seeds, or cuttings.

hirsùta: P. Thunbergiana.

Thunbergiana (P. hirsuta. Doluchos japonicus). Kudzu-VINE. Harry vine to 60 ft.: lits. broadly ovate, entire or with shallow lobes: fis. purple, fragrant, in late summer: pods harry. China, Japan.

PUKA: Meryta Sinclairi.

PULICARIA. Composite. Herbs of the Old World with alternate lvs. and yellow heads of ray- and disk-fls. solitary or clustered; pappus of scales and bristles. Plants of somewhat weedy aspect, sometimes planted for ornament and interest.

dysentérica (Inula dysenterica). Per. to 2 ft , gray-tomentose: lvs. oblong-cordate, wavy-margined, clasping: heads 1 m. across. Medit. region.

odòra (Inula odora). Per. to 2 ft., gray-hairy to hoary: lvs. oval or oblong, entire, the upper clasping: heads 2-4, to 1 in. across. Medit. region.

PULMONÀRIA. LUNGWORT. Boraginaceæ. Per. more or less pubescent herbs with long-stalked basal sometimes mottled lvs., few alternate st.-lvs. and blue or purplish fls. in terminal cymes; corolla funnelform, the throat hairy or naked, stamens included; allied to Myosotis; European. Suitable for the flower-garden and border. Of easy cult. Propagated by division.

angustifòlia. To 1 ft.: lvs. oblong to linear-lanccolate: fls. blue. Eu. Vars. aùrea, azùrea, cærùlea and rùbra are listed.

arvernénsis is a hort. form with purple-blue fls.

azûrea: probably P. angustifolia var.

Lággeri: listed name of unknown botanical standing.

maculàta: P. officinalis.

móllis: P. montana.

montana (P. mollis. P. rubra). To 1½ ft.: lvs. broadly elliptic-lanceolate; fls. violet. Cent. Eu.

officinalis (P. maculata). To 1 ft.: lvs. ovate-oblong to linear, spotted with white: fis. red fading to violet. Eu.

rubra: P. montana.

saccharata. Bethlehem-Sage. To 1½ ft.: lvs. oval to ovate-oblong, spotted with white: fls. whittish or reddishviolet. Eu. Vars. maculata and picta are listed.

PULSATILLA: Anemone.

PULTENÆA. Leguminosæ. Shrubs in Australia with simple prevailingly alternate lvs., yellow, orange or tinged purple papilionaceous fls. solitary or in terminal heads, and ovate pods; intro. in Calif. Propagated by seeds or cuttings of the tips of shoots.

daphnoides. To 6 ft.: lvs. oblong, to 1½ in. long, pale beneath: fis. in dense sessile heads surrounded by an involucre of lvs.: pods flat, ¼ in. long.

PUMMELO: Citrus maxima; see Citrus Fruits (page 183).

PUMPKIN and SOUASH are terms employed popularly to designate the edible fruits of Cucurbita Pepo, C. moschata, C. maxima. See Cucurbita, Squash. The words are not applied with precision, and it is important to accord them more definite meaning. The term *Pumpkin* is sometimes applied, in a classificatory way, to the fruits and plants of both C. Pepo and C. moschata, and Squash reserved to C. maxima. Of C. Pepo. there are three well-marked classes: the common running field or pie and stock-feed pumpkins, and the vegetable marrows; the summer and early autumn bush varieties, as the various scallops, pattypans and cymlins, the crooknecks, and certain other forms as the Cocozelle, all of which are commonly known as squashes; the hardshelled yellow-flowered gourds grown for ornament. Cucurbita moschata yields the winter (not warty) crooknecks, the Cushaws, Japanese Pie, Tennessee Sweet Potato, Cheese, and many forms grown in the tropics. Examples of squashes, C. maxima, are Marblehead, Plymouth Rock, Bay State, Warren, Delicious, Essex, Mammoth, Hubbard, and the turbans. The three species remain distinct in the field. See Gourd.

All the pumpkins and squashes are similar in their cultural requirements. They are sappy rapid-growing frost-tender annuals. Seeds are commonly planted directly where the plants are to stand, although they may be started indoors, if desired, in pots, berry-boxes or knock-down boxes or on inverted sods, for they may not transplant very readily otherwise. The running kinds need plenty of room, the hills or stands 8–12 feet apart either way if possible. The bush squashes should be 4 or 5 feet apart if land is available. If the land is not in good heart, well-rotted manure may be forked into the hills, and chemical fertilizer added. The plants should make good headway early, in the northern states, to insure a crop before frost.

In garden operations, the squash-bugs or stinkbugs may be killed by trapping them under boards laid about the vines. Aphis is controlled by spraying or dusting with nicotine preparations. Striped cucumber beetles are driven away or poisoned by bordeaux mixture with arsenate of lead as well as by nicotine dust; this beetle is the carrier of bacterial wilt.

The fruits of the summer bush varieties, as the scallops and warty crooknecks, are eaten when immature, but other kinds are used when ripe. The squashes and some of the pumpkins can be kept in winter if mature and not injured in handling, in a fairly warm and dryish store-

PUNCTATE: with translucent or colored dots or depressions or pits, as in leaves.

PUNCTILLARIA: Pleiospilos.

PUNCTURE VINE: Tribulus terrestris.

PUNGENT: ending in a stiff sharp point or tip; also acrid (to the taste).

PÙNICA. Punicaceæ. Trees or shrubs in S. Eu. and Asia, one widely grown for the edible frs. and as an ornamental. P. Granatum. Pomegranate. To 20 ft. and more: lvs. lanceolate to oblong, to 3 in. long, shining: fls. orange-red, to $1\frac{1}{2}$ in. across, solitary or clustered toward ends of branchlets: fr. brownish-yellow to red, about size of orange, with hard rind and many seeds and reddish juicy pulp and persistent calyx. S. Asia, widely nat. Var. nana is a dwarf form

grown in greenhouses and about yards far S. There are double-fld. races and color variations, as vars. Alba, rabra, variegata, and Legréllei with double fls. striped with red and yellow outside.—The pomegranate is adapted to trop. and subtrop. climates and succeeds on deep rather heavy loam. For orchards, bushes should be set 12–18 ft. apart and for hedges 6–8 ft. Propagated mostly by hardwood cuttings in spring, also by seeds and layers.

PUNICACEÆ. Pomegranate Family. Only 1 genus, Punica, and two species, characterized by mostly opposite simple lvs., bisexual fls. having 5-7 sepals and petals, numerous stamens, inferior and many-celled ovary, and fr. a hardshelled berry.

PUNK-TREE: Melaleuca Leucadendra.
PURPLE WREATH: Petreg

PÚRSHIA (Kunzia). ANTELOPE-BRUSH. Rosacex. W. American cragged bushes of 1 or 2 species, sometimes transferred to grounds: lvs. small, stiff and clustered, simple: fls. small, yellowish, not showy. P. tridentàta is a gray or silvery deciduous shrub to 6 ft. or more: lvs. ½4-¾ in. long, linear toward base but broadened and 3-toothed at apex: petals thin, less than ½ in. long. Arid lands, Rocky Mts., Ore., Calif. Var. glandulòsa, separated as a species by some authors, is more or less evergreen and the lvs. punctate-glandular.

PURSLANE: Portulaca. Winter: Montia perfoliata.

PUSCHKÍNIA. Liliaceæ. Two spring-blooming bulbous herbs from Asia Minor, one sometimes grown in rock-gardens or borders. For cult. see Scilla.

libanótica: P. scilloides var.

scilloides. To 1 ft.: lvs. basal, to 1 ft. long and 1 in. wide: fls. bluish, $\frac{1}{2}$ in. long, in racemes terminating the scape, the perianth-segms. partially united. Var. libanótica (*P. libanotica*) has longer perianth-lobes.

PUSLEY: Portulaca oleracea.

PUSSYS-PAWS: Spragnea multiceps. Toes: Antennaria.

PUTÒRIA. Rubiaceæ. A small genus in the Medit region, of low much branched shrubs. P. calábrica is cult. To 8 in. or less, branches velvety-hairy: lvs. linear-oblong, to ½ in. long or more, somewhat fleshy, opposite, short-petioled, with scabrous margins: fls. red to reddish-purple, tubular, to 1 in. long, 4-lobed, in terminal few-fld. corymbs, calyx tubular and 4-toothed: fr. a small drupe. Propagated by seeds or division; does well in full sun in sandy soil; perhaps not hardy N.

PUTTY-ROOT: Aplectrum.

PÙYA. Bromeliaceæ. Terrestrial stiff mostly giant herbs native in dry parts of S. Amer., having spiny-margined lvs. in dense rosettes and blue, purple or yellow fls. in spikes or racemes; planted occasionally in the hothouse. Cult. as for Bromelia; out-of-doors in Calif. They thrive without special treatment.

alpestris. Sts. short: lvs. to 2 ft. long and 1 in. wide, pale beneath: fls. dull metallic blue, 1½ in. long, anthers bright orange, the infl. much branched. Chile.

cærùlea. To 4 ft.: lvs. 2 ft. long, narrow: fis. blue, the infl. somewhat branched. Chile.

chilénsis (Pourretia chilensis). To 5 ft.: lvs to 4 ft. long, very narrow, glaucous: fls. greenish-yellow, in a branching infl. Chile.

PYCNÁNTHEMUM (Koellia). MOUNTAIN-MINT. Labiatæ. N. American per. herbs with opposite entire lvs. and small white or purplish fls. in heads or cymes in late summer or fall; sometimes transplanted. Of easy cult.

flexuosum. To $2\frac{1}{2}$ ft.: lvs. to 2 in. long and $\frac{1}{2}$ in. wide: fls. in dense heads $\frac{1}{2}$ in. across. Me. to Fla. and Tex.

incanum. To 3 ft.: lvs. to 3 in. long and 1½ in. wide, white-pubescent beneath: fls. in loose clusters to 1½ in. across. Me. to Fla. and Mo.

lanceolatum: P. virginianum.

mîticum. To 3½ ft., finely pubescent: lvs. ovate to lanceolate, to 1½ in. long, serrate: fis. in dense heads, calyx-lobes short and mucronate. Me. to Fla. and Mo.

virginianum (P. lanceolatum). To 3 ft.: lvs. to 2 in. long and 1/2 in. wide, fragrant: fis. in dense heads 1/2 in. across, calyx-lobes triangular. Que. to Ga. and Ala.

PYCNÓSTACHYS. Labiatæ. African per. herbs with opposite lvs. and blue or violet 2-lipped fls. in whorls in dense terminal spikes; grown under glass, and in the open far S.

Dawei. To 6 ft.: lvs. lanceolate, to 1 ft. long, toothed, pubescent: fis. cobalt-blue, ¾ in. long, spikes to 5 in. long, calyx-teeth becoming spinescent. Trop. Afr.

thyrsiflora: listed name of form said to have spikes of blue fis. to 3 ft.

urticifòlia. To 7 ft.: lvs. ovate, to 4 in. long, acute, long-petioled, deeply incised-crenate and densely pubescent: fls. bright blue, in dense spikes to 3 in. long. Trop. Afr.

PYRACÁNTHA. FIRETHORN. Rosacex. Evergreen usually thorny shrubs with alternate simple lvs., white fls. in corymbs, and fr. a small red or orange pome; native in S. Eu. and Asia; related to Cratægus.

Firethorns are planted for ornament and hedges. The fruit is showy. P. coccinea is fairly hardy in middle states but the other species can be grown only in the South and California. Propagated by seeds, by cuttings of ripe wood under glass, by layers, and rare kinds by grafting on crategue or cotoneaster.

angustifòlia (Cotoneaster angustifolia). To 12 ft., the branches often prostrate: lvs. narrow-oblong, to 2 in. long, nearly entire, gray-tomentose beneath; corymbs tomentose. China

atalantioldes (P. discolor). To 10 ft.: lvs. ovate-elliptic to oblong, to 21% in. long, entire or nearly so, glabrous, indistinctly veined beneath: fls. white, many in corymbs to 11% in. across: fr. reddish. China.

chamelioldes: hort. name of no botanical standing.

coccinea (Cotoneaster and Cratægus Pyracantha). To 20 ft.: lvs. oval to oblanceolate, to 1½ in. long, finely toothed, becoming glabrous: corymbs pubescent. S. Eu., W. Asia. Var. Lalándii is a more vigorous form with orangered fr. Var. pauciflòra is said to have smaller corymbs.

crenato-serrata (P. crenulata var. yunnanensis. P. Gibbsu var. yunnanensis. P. yunnanensis. Photinia crenato-serrata). Differs from P. atalantioides in lvs. crenate-serrate and broadest above middle. China. Vars. Graberi, macrocarpa and prostrata are listed.

crenulata (Coloneaster and Cratægus crenulata). To 20 ft.:
lvs. oblong to oblanceolate, to 2 in. long, wavy-toothed, glabrous, shining above: corymbs glabrous. Himalayas.
Var. flava (var. aurantiaca), a form of var. Rogersiana with yellow fr. Var. kansuénsis (P. kansuensis) has narrower lvs. to 1 in. long and smaller fr. N. W. China. Var. Rogersiana is lower, with oblanceolate lvs.

discolor: P. atalantioides.

Duvàlii: a hort, form listed as of spreading habit to 10 ft. tall and fr. bright red; perhaps of hybrid origin.

formosana: P. Koidzumii.

Gibbsii: may be either P. crenato-serrata or P. atalantioides.

kansuénsis: P. crenulata var.

Koidzūmii (P. formosana). Lvs. clustered at tips of branchlets, oblong-obovate, 1 in. long, entire, pale and pubescent beneath: corymbs nearly glabrous. Formosa. Varietal names listed under P. formosana include Milleri and splendéns.

Rogersiàna: P. crenulata var. spléndens: hort. name. yunnanénsis: P. crenato-serrata.

PYRÈTHRUM. Compositæ. An old genus modernly combined with Chrysanthemum. The florists' pyrethrum is Chrysanthemum coccineum (C. roseum); it is a spring- or early summerblooming per. with long erect sts. bearing a large brilliant crimson, lilac or white head and finely cut lvs. Another plant still known in gardens as pyrethrum is the feverfew, C. Parthenium; and C. uliginosum is also sometimes named in that genus. P. inodorum is Matricaria inodora; P. Tchihatchewii is a Matricaria. For other names see Chrusanthemum.

PYRIFORM: pear-formed or -shaped.

PÝROLA. SHINLEAF. *Pyrolaceæ*. Per. herbs having rootstocks, clusters of evergreen lvs. and white, greenish or purplish fls. in racemes terminating a scape, in summer: sometimes transplanted to the wild-garden or colonized in woods but they do not thrive in usual garden soil. Sometimes called wintergreen: see *Gaultheria*.

americana: P. rotundifolia var.

asarifòlia. To 1 ft.: lvs. kidney-shaped or orbicular, to 2 in. long, blade about as long as petrole, rather thick, shining; fls. pink or purplish. N. B. to B. C. and New Mex. Var. incarnàta, fls. pink or rose, lvs. subcordate to obovate.

bracteata: P. rotundifolia.

chlorantha. To 8 in.: lvs. orbicular, to 1½ in. long, shorter than petiole, thick, glossy: fis. greenish-white, calyx-lobes ovate-triangular. N. Amer., Eu.

elliptica. To 10 in.: lvs. oval or oblong-elliptic, to 3 in. long, thin, dull: fis. white, calyx-lobes ovate-triangular. N. Amer.

incarnata: plants so listed are referable to P. rotundifolia or P. uluginosa.

minor (Erxlebenia minor). To 8 in.: lvs. oval or orbicular, to 1½ in. long: fls. white or pinkish. N. Amer., Eu., Asia.

picta. Lvs. ovate to rhombic, to 2½ in. long, acute, blotched white above and purple beneath, dentaculate: fis. green to purplish, about ¼ in. long. B. C. to Mont. south to Calif. and Ariz. Var. dentata is listed as having more dentate lvs. The true P. dentata is not known in cult. and does not have mottled lvs.

rotundifòlia (P. bracteata). To 10 in.: lvs. nearly round, to 2 in. long, thick, glossy: fls. white, calyx-lobes oblong. Eu. Var. americàna (P. americana) differs only in being slightly larger in all respects. N. S. to N. C. and Ky.

secunda. To 10 in::lvs. ovate to nearly orbicular, to 2 in. long: fls white or greenish-white. N. Amer.—Differs from other species here enumerated in having the style straight rather than declined, petals not spreading and fls. in a secund raceme.

uliginòsa. To 1 ft.: lvs. broadly ovate to orbicular, to 3 in. long, obtuse, finely crenulate, glossy: fis. pink to purplish, about ¼ in. long. N. S. to Minn., B. C. to Calif. and Colo.

uniflora: Moneses uniflora.

PYROLÀCEÆ (sometimes written Pirolaceæ). Shinleaf Family. Low mostly evergreen herbaceous or scarcely woody plants of northern regions, sometimes included in Ericaceæ. Three genera are characteristic of the family, Pyrola, Chimaphila, Moneses; these are plants with small nearly regular bisexual fls. in which the corolla is comprised of separate petals. Some authors include the saprophytic genera, like Monotropa, Pterospora and Sarcodes in this family, others separate them in the family Monotropaceæ and still others retain them in Ericaceæ; they are not cultivated plants but Monotropa and Sarcodes are sometimes planted.

PYROLÍRION. FIRE-LILY. Amaryllidaceæ. Bulbous herbs with linear lvs., scape single-fld., spathe tubular below, equilaterally bifid above; fl. erect, funnelform, yellow to deep orange with cylindrical tube expanded upward, stigmas trifid, spatulate; Bolivia-Peru.

aureum (Zephyranthes aurea). Lvs linear, green, somewhat falcate: scape stout at base, tapering upward; fis. deep orange, erect, opening flat 1½-2 in. diam.; stigmas markedly spatulate. Peru.

PYROSTÈGIA. Bignoniaceæ. S. American woody evergreen climbers with lvs. of 2-3 lfts. and 3-parted tendrils, tubular fls. in terminal panicles, the stamens exserted, and long linear frs.; commonly planted as an arbor and roof vine in S. U. S., making a brilliant display when in bloom; sometimes grown in conservatories. Propagated by cuttings.

Ignea (P. and Biynonia venusta). Lits. ovate, to 3 in. long: fis. reddish-orange, to 3 in. long, with reflexed lobes margined with white hairs: fr. to 1 ft. long. Brazil.

indica: Oroxylon indicum.

venústa: P. ianea.

PYRRHOCÁCTUS. Cactaceæ. A small genus combined by some authors with Malacocarpus but separated by its scaly ovary in the axils of whose scales are bristles and a white-woolly tomentum: fls. reddish-yellow.

centetèrius (Echinocactus centeterius and mammillarioides. Malocacarpus mammillarioides). Nearly globose; ribs 14-16 and strongly tubercled with large felted areoles; spines about 7: fls. yellowish-red. Chile.

curvispinus (Echinocactus curvispinus). Solitary, globose to subcylindric, to 7 in. diam., gray-green; ribs 16, to 1½ in high, rounded, somewhat tubercled; spines similar, usually 14–18, lowest to 1½ in. long, middle ones curved upwards and shorter, yellow to gray: fls. reddishyellow. Chile.

Froehlichianus (Echinocactus Froehlichianus. Gymnocalycium Froehlichianum). Globose to subcylindrical, to 7½ in. high and 6 in. dism., usually spineless on top; ribs 16, to 1½ in. high, obtuse, straight or spiralled, tubercled; spines to 17, the lowest to 1½ in long, others shorter, yellow to gray: fis. yellow. Chile.—By some authors believed to represent a variant of P. curvispinus.

horridus: probably P. tuberisulcatus.

mammillarioides: P. centeterius.

Soehrénsii: P. tuberisulcatus.

Strausianus (Echrocactus and Malacocarpus Strausianus). Solitary, globose to ovoid, gray-green, to 6 in. tall and 3½ in. dnam; ribs 13, somewhat spiralled, rounded, thick, tubercled; spines all similar, usually 9-20, the 4 inner ones larger and to 1½ in. long, others stout and awl-shaped: fls salmon-pink, to 5% in. long. W. Argentina.

tuberisulcatus (Echinocacus Soehrensii and tuberisulcatus. P. Soehrensi). Solitary, depressed-globose but not concave on top, covered with spines, to 6 in. diam. or more; ribs 16-20, about 34 in. high, straight, prominently tubercled; spines brown to gray, radials 10-12 or less when young, to about 45 in. long, centrals 4-5, to 1 in. long, stiff: fis. brownish-yellow, striped red, to nearly 2 in. long. Chile.

umadeave (Echinocactus and Friesia umadeave). To 4 in. high and broad; ribs about 18, areoles large and whitewoolly; spines 30-35, to 1 in. and more long, curved upwards, white or brownish: fis. pale yellow, 1½ in. long. Argentina.

PYRUS. Pear. Rosaceæ. About a score of trees and large shrubs in the northern hemisphere, commonly deciduous, a few species grown for the edible frs. and others somewhat for ornament and interest: fls. showy, bisexual, in umbel-like clusters in advance of foliage or with it, white or nearly so; petals 5, on rim of calyx-cup; stamens many; styles 3-5, free to base: fr. a pome, with core of 5 carpels, the flesh of the edible kinds containing hard or grit cells. See Malus.

The species and their varieties of Pyrus are hardy plants of simple culture in any ordinary soil and garden location. Like the species of Malus they propagate readily from seeds sown or preferably stratified in autumn, and kinds not yet producing fruit may be grafted or budded on closely related stocks. See Pear.

adstringens: Malus adstringens. aldenhaménsis: Malus sylvestris var.

americana: Sorbus americana.

amvgdalifórmis. Almond Pear. Shrub or tree, in

several vars., to 20 ft. or more, grown for ornament in differing forms: lvs. thick, oblong to narrow-obovate, entire or nearly so, glaucescent and becoming nearly or quite glabrous underneath: fis. about 1 in. across, white: fr. 1 in. more or less diam., yellowish-green and hard. France to Asia Minor. Var. pérsica (P. persica, P. sinaica). Lvs. oblong and fr. depressed endwise.

angustifòlia: Malus angustifolia. arbutifòlia: Aronia arbutifòlia.

Aria: Sorbus Aria.

Arnoldiàna: Malus floribunda var. astracánica: Malus sylvestris var. atropurpurea: Aroma atropurpurea. atrosanguínea: Malus Halliana. Aucupària: Sorbus Aucuparia. auriculàris: Sorbopurus auricularis.

baccata: Malus baccata.

betulæfðlia. Tree to 20 ft. or more, branchlets tomentose: lvs. mostly ovate-acuminate, sharp-serrate, shining above and tomentose or becoming nearly glabrous underneath: fls. ¾ in. across, white: fr. about ½ m. diam., brown and dotted, calyx-lobes falling. N. Chine; hardy N.—Free-flowering and suggested as experimental stock for the pear.

Bollwylleriana: Sorbopyrus auricularis.

Bretschneideri. One of the oriental pears, distinguished by ovate or elliptic-ovate lvs. with a mostly acuminate base, yellow subglobose fr. about 1 in. long, ealyx falling. N. China; hardy N.

brévipes: Malus brevipes.

Calleryana. Glabrous tree: lvs. ovate or broader, short-pointed, crenate (not sharp-serrate): fls 1 m. or less across, white, styles 2 or 3: fr. about ½ in. or less dam, globular, dotted brown. China: hardy N.—Attracts attention as a peur stock. Var. graciliflora, fls. smaller and pedicels more slender. Var. tomentélla has young branchlets and young lvs. tomentose or floccose, pedicels villous.

cerasifera: see Malus baccata.

communis. Pear. Large long-lived tree: lvs. oval to oblong-ovate, hard in texture, short-pointed, crenate-serrulate to nearly entire, glabrous or becoming so: fls. I in. or more across, white sometimes tinged pink, appearing with first foliage: fr. mostly pyriform, variable, with gritty cells. Eu. and W. Asia.—Cult. as an orchard fr. in many

coronària: Malus coronaria. cratægifòlia: Malus florentina. Cydònia: Cydonia oblonga. Dawsoniàna: Malus Dawsoniana.

Delavàyi: Docynia Delavayi. doméstica: Sorbus domestica.

elæagrifòlia. Small commonly thorny tree tomentose on twigs and both sides or under side of lvs., the latter lanceolate to very narrow-oboyate and entire: fis. about 1 in. across, white, on tomentose pedicels: fr. about 1 in. diam., green, short-pedicelled. Asia Minor.

Èleyi: Malus sylvestris var. florentina: Malus florentina. floribúnda: Malus floribunda. formosána: Malus formosana.

fúsca: Malus fusca. germánica: Mespilus germanica.

glabràta: Malus glubrata. glaucéscens: Malus glaucescens. Halliàna: Malus Halliana.

heterophýlla: see Malus heterophylla. Hòpa: see Malus adstringens.

hupehénsis: Malus hupehensis. ioénsis: Malus ioensis. japónica: Chænomeles japonica. Kàido: Malus micromalus.

kansuénsis: Malus kansuensis. lancifòlia: Malus lancifolia.

Lecontei. Hybrid race between *P. communis* and *P. pyrifolia*, represented by LeConte, Kieffer and other pomological vars. frs. more firm or hard in substance as a rule than those of *P. communis*, calyx persistent.

Lemdinei: Malus sylvestris var.

16ngipes (P. communis var. longipes). Small tree: Ivs. ovate or broader, acute or nearly obtuse, rounded or subcordate at base, becoming glabrous underneath, petiole long: fis. about 1 in. across, white: fr. about ½ in. diam., globose, calyx deciduous. Algeria.

Malus: Malus sylvestris.

Maulei: Chænomeles japonica. melanocárpa: Aronia melanocarpa. micromàlus: Malus micromalus. Niedzwetzkyàna: Malus sylvestris var.

nigra: Aronia melanocarpa.

nivalis. Snow Pear. Small tree, white-tomentose on many parts, thornless: lvs. oval to obovate, acute, narrowed to base, entire or essentially so, tomentum remaining on under surface: fls. about 1½ in. across, white: fr. 1–2 in. diam., globose. E. Eu.—Useful for ornament, and fr. for perry (pear cider).

ovoídea: P. ussuriensis var. Párkmanii: Malus Halliana var.

Páshia. Tree to 30 ft. or more, usually spiny: lvs. ovate to ovate-lanceolate, acuminate, crenate, becoming nearly or quite glabrous, often lobed and sharp-serrate on shoots: fts. 1 in. across, white: fr. about \$4\$ in. across, subglobose, brown. Himalayas to China; hardy N.

pérsica: P. amugdaliformis var.

phæocárpa. Tree of medium size, most parts becoming glabrous: Ivs. elliptic to ovate, long-attenuate, base mostly broad-cuneate, open-serrate: fls. about 1 in. across, white: fr. about 1 in. long, pyriform, brown. N. China; hardy N.

pinnatífida: Sorbus hybrida. platycárpa: Malus platycarpa. Pollvèria: Sorbopyrus auricularis. Práttii: Malus Prattii. prunifòlia: Malus prunifolia. pulchérrima: Malus floribunda. purpùrea: Malus purpurea.

pyrifolia (P. serotina). Sand Pear. Tree to 50 ft., glabrous or becoming so: Ivs. ovate or somewhat longer, long-acuminate, setose-serrate: fls. 1½ in. across, white, with Ivs. or just in advance of them, styles 5: fr. mostly apple-shaped, very hard, brown, calvx-lobes falling. China.—Cult. (in var. culta) for its fr. LeConte, Kieffer and other orchard vars. are hybrids with the common pear: see P. Lecontei.

Ríngo, Rínkii: Malus prunifolia var. Rinkii.

Ríversii: Malus spectabilis var.

rivulàris: Malus fusca.
robústa: see Malus baccata.

salicifòlia. Often spiny tree to 30 ft.: lvs. willow-like, ¾ in. or less broad, tapering at both ends, entire, tomentose when young but becoming glabrous: fls. ¾ in. across, white: fr. about 1 in. long, pyriform, yellowish, calyx persistent. S. E. Eu., Caucasus, Armenia; hardy N.

Sárgentii: Malus Sargentii.

Scheideckeri: Malus floribunda var.

serôtina: P. pyrifolia.

serrulata. Small tree differing from P. pyrifolia by shorter lvs. without setose serratures, smaller fis. with styles 3 or 4, subglobose fr. about ¾ in. long, and calyx persistent or often so. China; hardy N.

Sièboldii: Malus Sieboldii.

sinàica: P. amygdaliformis var. persica.

sinénsis (Decne.): P. ussuriensis. Sórbus: Sorbus domestica.

Soulárdii: Malus Soulardii. spectábilis: Malus spectabilis. sublobăta: Malus sublobata. theffera: Malus hupehensis. Toringo: Malus Sieboldii.

torminalis: Sorbus torminalis. transcendens: Malus transcendens.

transitòria: Malus transitoria. trilobàta: Malus trilobata.

Tschonóskii: Malus Tschonoskii.

ussuriénsis. Tree: lvs. nearly orbicular to ovate, broad or subcordate at base, acuminate, strongly setose-serrate, nearly or quite glabrous: fls. 1 in. and more across, white, on short pedicels: fr. to 1½ in. diam., nearly globose, greenish-yellow, calyx persistent. N. E. Asia; hardy N., and has been tried experimentally as pear stock. Var. ovoidea (P. ovoidea) has ovate to oblong-ovate lvs. and more ovoid long-stemmed frs. N. E. Asia.—P. sinensis, in part, belongs here.

Veitchii: Malus yunnanensis var. yunnanénsis: Malus yunnanensis.

Zùmi: Malus Zumi.

PYXIDANTHÈRA. Diapensiacex. Creeping evergreen shrublets forming cushion-like masses, native in pine-barrens from N. J. to N. C., and sometimes transplanted to the rock-garden and similar places.

barbulata. Pyxie. Flowering Moss. Pine-Barren Beauty. Branches to 1 ft. long, covered with very small lys.: fls. white, about 1/8 in. across, solitary but many at ends of branches. Mar.—May.

brevifòlia. Separated from $P.\ barbulata$ by smaller hoary lvs., ciliate calyx-lobes, and lobes of corolla cuneate rather than nearly orbicular. N. C.

PYXIE: Pyxidanthera barbulata.

OUAIL-BUSH: Atriplex lentiformis.

OUAMASIA: Camassia.

OUAMOCLIDION: Mirabilis multiflora.

QUÁMOCLIT. STAR-GLORY. Convolvulaceæ. Trop. herbaceous vines with alternate, simple or compound lvs. and salverform red or yellow fls. in long-stalked axillary clusters, the stamens and style exserted; cult. as for Ipomæa, from which it is distinguished by the small slender fls. and protruding stamens and style. Often grown from seed as summer-flowering vines.

coccinea (Ipomaa coccinea). STAR IPOMGEA. Ann. to 10 ft.: lvs. cordate-ovate, to 6 in. long, entire or angular-lobed: fls scarlet with yellow throat, to 1½ in. long. Trop. Amer.; nat. in N. Amer Var. hederifolia (Ipomaa hederifolia) has 3-5-lobed or -parted lvs. Var. luteola has yellow or orange fls. 1 in. long.

lobata (Mina lobata). Per. to 20 ft.: lvs. cordate, 3 in. across, deeply 3-lobed: fls crimson becoming pale yellow, with short tube and cylindrical limb ¾ in. long, the stamens long-exserted. Mex.

pennata (Ipomara Quamoclit). Cypress-Vine. Ann. to 20 ft: lvs. pinnately cut into thread-like segms.: fis scarlet, to 1½ in. long Trop. Amer., S. U. S. Var. álba has white fis

Slôteri (Ipomæa cardinalis). Cardinal-Climber. Hybrid between Q coccinca and Q pennata: ann: lvs. to $4\frac{1}{2}$ in across, palmately lobed nearly to base into 7-15 segms. to $\frac{1}{2}$ in across: fls. crimson with white throat, to $\frac{1}{2}$ in logs.

QUÁSSIA. Simarubaceæ. Trees with bitter white wood having medicinal properties, and sometimes grown for ornament in the tropics: lvs. pinnate: fls. diœcious, in terminal racemes or panieles: fr. of 5 spreading drupes. One species is sometimes planted in the warmest parts of the country for interest, it being a medicinal plant with a bitter principle; also worth growing for ornament.

amara. To 10 ft. and more: lvs. of 5 elliptic-oblong lfts., the petioles winged: fls. crimson, to 1½ in. long, in racemes. Trop. Amer

QUEEN-CUP: Clintonia uniflora. -of-the-Meadow: Filipendulu Ulmaria. -of-the-Prairie: Filipendula rubra.

QUEENS DELIGHT: Stillingia sylvatica.

QUEENSLAND NUT: Macadamia ternifolia.

QUÉRCUS. OAK. Fagaceæ. Hardwood trees and bushes mostly of the northern hemisphere with alternate lvs., staminate fls. in slender drooping catkins, pistillate in 1-many-fld. spikes, and nut or acorn inclosed or surrounded at base by a cuplike involucre; grown for ornament and timber, commonly with striking colors in autumn. The acorns are employed as feed for hogs and the bark of some species yields medicinal products, cork and tanning materials; major trees in hort. literature.

Oaks thrive on rich rather moist soil for the most part, although the scrub oaks inhabit dry barren lands. Most of the deciduous species are hardy North, while the evergreen kinds are adapted only to the southern and warmer parts of the country. Propagated by seeds sown in autumn or stratified and the evergreen species also by cuttings and layers; protect the seed-acorns from vermin. Varieties may be grafted on seedling stocks under glass in early spring or sometimes in August.

acùta. Japanese Evergreen O. Small tree: lvs. persistent, oblong, to 5 in. long, entire and wavy-margined: cup pubescent, about ½ length of nut. Japan.

acutíssima. To 50 ft.: lvs. deciduous, oblong, to 7 in. long, with bristle-like teeth, shining above: cup with spreading scales, 3 length of nut. Asia.—Formerly known as Q. serrata but this name is properly a synonym of Q. glandulfera.

Ægilops (Q. ventricosa). To 80 ft.: lvs. deciduous, elliptic

to oblong, to 4 in. long, with 9-13 entire bristle-tipped lobes, yellowish-tomentose beneath: cup 1/4-1/4 length of nut. S. Eu., W. Asia.

nut. S. Eu., W. Asia.

agrifòlia. Coast Live O. To 100 ft.: lvs. persistent,
elliptic, to 3 in long, spiny-toothed, light green and glossy
beneath: cup pubescent, 14-13 length of nut. Calif.

álba (Q. ramosa). White O. To 100 ft.: lvs. deciduous, obovate, to 9 in. long, with 5-9 entire obtuse lobes, glaucescent beneath: cup about ½ length of nut. Me. to Fla. and Tex. Var. repánda has lvs. with shallow sinuses.

alièna. Oriental White O. To 70 ft.: lvs. deciduous, oblong-obovate, to 8 in. long, coarsely toothed, gray-tomentose beneath: cup gray-tomentose, about ½ length of nut. Japan, Korea, China.

ambígua: Q. borealis.

aquática: Q. nigra.

arkansana. Like Q. marilandica but Ivs. pale underneath, and the scales on cup of acorn erect and in a single row: Ivs. deciduous, broad-obovate, broad at apex, little if at all lobed, to 4 or 5 in. long: cup shallow and flat. Ark.

Ballòta: Q. Ilex var. rotundifolia.

bicolor. SWAMP WHITE O. To 70 ft.: lvs. deciduous, obovate, to 6 in long, coarsely toothed or lobed, dark green above, whitish-tomentose beneath: cup about 1/2 length of nut. Oue to Ga. and Ark.

borealis (Q. ambigua. Q. rubra var ambigua) Northern Red O To 80 ft 'lvs. deciduous, oblong, to 9 in. long, 7-11-lobed halfway to middle, pale beneath: cup about ½ length of nut N. S. to Pa and Ia. Var māxima is a taller tree with larger acorns N. S. to Fla. and Tex.

brùtia: Q. Robur.

camàta péndula: Q. pyrenaica var.

canariénsis (Q Mirbeckii). Tree to 100 ft.: lvs. deciduous, ovate-oblong, to 5 in. long, coarsely toothed, shining above: cup about ½ length of nut. Spain, N. Afr.

castànea: Q. Muhlenbergii.

Cátesbæi: Q. lævis.

Cérris. Turkey O. To 100 ft.: lvs deciduous, oblong, to 5 in. long, with 3-8 pairs of entire or toothed lobes, grayish-pubescent beneath when young: cup mossy, about ½ length of nut S. Eu, W. Asia. Var austriaca, Austrian Turkey Oak, has shallowly lobed lvs. Var laciniata has punnatifid lvs. Var. péndula has drooping branches and pinnatifid lvs.

chrysólepis. Cañon or Maul O. To 90 ft.: lvs. persistent, elliptic, to 4 m. long, spiny-toothed or with entire revolute margins, glaucous and tomentose beneath: cup tomentose, about ½ length of nut. Ore. to Lower Calif.

cleistocárpa: see Lithocarpus cleistocarpa.

coccifera. Kermes O. Shrub: Ivs. persistent, broadelliptic, to 1% in long, with few spiny teeth, shining: cup about ½ length of nut. S. Eu., N. Afr, W. Asia.

coccinea. Scarlet O. To 80 ft: lvs deciduous, oblong or ellipte, to 6 in long, with 7-9 very deep lobes, bright green: cup ½-½ length of nut. Me. to Fla. and Mo.

conférta: Q. Frainetto.

córnea: Lithocarpus cornea.

crispula: Q. mongolica var. grosseserrata.

cupressoides: Q. Robur.

cuspidata: Castanopsis cuspidata.

Darlingtònia: Q. laurifolia var.

densiflòra: Lithocarpus densiflora.

dentata (Q Dunno). To 80 ft.: lvs. deciduous, obovate, to 1 ft long, with 4-9 pairs of rounded lobes or teeth, pubescent beneath: cup with spreading scales, ½ or more length of nut. Japan, Korea, China. Var. pinnatifida has lvs. divided almost to midrib.

Diàmio: Q. dentata.

dumbas. California Scrub O. Shrub to 8 ft.: lvs. persistent, oblong to elliptic, to 1 in. long, spiny-toothed or entire, glossy dark green above, pale and pubescent beneath: cup about ½ length of nut. Calif.

durâta. Leather O. Spreading shrub to 5 ft., branchlets densely tomentose: lvs. oval, to 1 in. long, dark green above, coriaceous, margins with sharp dentate teeth, persistent: cup to 3/4 in. across and nearly 1/2 in. deep. Calif

ellipsoidalis. To 80 ft. or more: lvs. deciduous, elliptic to 4 or 5 in. long, with deep narrow lobes bearing pointed teeth, becoming glabrous underneath except in axils of veins: cup 1/3 or 1/2 length of nut. Man. to Mich. and Ia.

Éngelmannii. To 60 ft.: lvs. persistent, oblong, about 2 in. long, entire or sometimes toothed, pale beneath: cup ½ length of nut. S. Calif.

falcata (Q. rubra). Spanish Red O. To 80 ft. or more:

lvs. deciduous, obovate, to 8 in. long, with 3-7 deep acute lobes, pubescent beneath: cup $\frac{1}{N}$ - $\frac{1}{N}$ length of nut. N. J. to Fla. and Tex.—Formerly the name Q. falcata was considered a synonym of Q. rubra, and both were mistakenly applied to the tree now known as Q. borealis.

Frainétto (Q. conferta. Q. pannonica). ITALIAN O. To 120 ft.: Ivs. deciduous, obovate, to 7 in. long, with usually 7 very deep lobes, dark green above, pale and pubescent beneath; cup ½-½ longth of nut. S. Eu.

Gámbelii. Shrub to 15 ft.: lvs. deciduous, broad-obovate, divided about half way into rounded lobes, glossy above, slightly pubescent beneath: cup about ½ length of nut. Colo. to New Mex.

Garryana. Oregon O. To 100 ft.: lvs. deciduous, oblong-obovate, to 6 in. long, divided about half way into 3-5 pairs of entire or toothed lobes: cup pubescent, about 1/2 length of nut. B. C. to Calif.

georgiana. Shrub or tree to 40 ft.: lvs. deciduous, obovate, 2½ in. long, lobed halfway to midrib or sometimes pinnatifid, shining above, pale beneath: cup ½-½ length of nut. Ga.

glàbra: Lithocarpus glabra.

glandulifera (Q. serrata). To 50 ft.: lvs. deciduous, oblong-obovate, to 6 in. long, sharply toothed, shining above, grayish-pubescent beneath: cup about ½ length of nut. Japan, Korea, China.—Some of the material known as Q. serrata is Q. acutissima.

gladca. To 50 ft.: lvs. persistent, oblong, to 5 in. long, toothed above middle, silky and glaucous beneath when young: cup pubescent, about ½ length of nut. Asia.

Havárdii. Shinnery O. Low shrub to 2½ ft.: lvs. deciduous, oblong, to 2½ in. long, coarsely lobed or toothed, bright green, pubescent beneath: acorns to 1 in. long. Tex., New Mex.

heterophylla. Hybrid between Q. Phellos and either Q. borealis var. maxima or Q. velutina. N. J. to Tex.

llex. Holly of Holm O. To 60 ft. lvs. persistent, ovate to lanceolate, to 3 in. long, toothed or entire, shining dark green above, yellowish or whitish-tomentose beneath: cup about ½ length of nut. S. Eu. Var. rotundifòlia (L. Ballota) has smaller ovate lvs. Var. Fórdii is of pyramidal

ilicifòlia. Scrub O. Much branched shrub to 10 ft. or more: lvs. deciduous, obovate, to 4½ in. long, with 2 pairs of broad entire or bristly-toothed lobes, whitish-tomentose beneath: cup ½ length of nut. Mc. to Va. and Ky.

imbricaria. Shingle O. To 60 ft.: lvs. deciduous, oblong, to 6 in. long, entire, pale and pubescent beneath: cup 1/2-1/2 length of nut. Pa. to Ga. and Ark.

Kélloggii. California Black O. To 80 ft. or more: lvs. deciduous, oblong, to 6 in. long, with narrow sharp-dentate lobes half way to middle, pubescent or sometimes becoming glabrous underneath: cup ½ or more as long as nut. Calif.,

lævigata. Lvs. thick and glabrous, oblong-lanceolate, to 7 in. long, entire or slightly toothed. Japan.

làvis (Q. Cateshari). To 50 ft and more: related to Q. falcata, with lvs. glabrous and shiming underneath and petioles very short, deciduous: cup deeper, with scales over edge and down inside. N. C. to Fla. and west.

lanugindsa: Q. pubescens.

laurifòlia. LAUREL O. To 60 ft.: lvs. deciduous or somehat persistent, oblong, to 6 in. long, entire or sometimes slightly lobed, shining dark green above, light green beneath: cup ½ length of nut. Va. to Fla. and La. Var. Darlingtonia (Q. Darlingtonia), Darlingtonia, Darlingtonia of more compact habit and lvs. more persistent.

lobata. Valley O. To 100 ft.: lvs. deciduous, obovate, to 3 in. long, with 7-11 obtuse lobes, grayish-tomentose beneath: cup 1/4-1/3 length of nut. Calif.

longifòlia: Q. Robur var. holophylla.

Louéttei: Q. petræa var. mespilifolia.

lyrata. Overcup O. To 100 ft.: lvs. deciduous, obovate oblong, to 8 m. long, deeply pinnatifid with a large terminal lobe, white-tomentose beneath or green and pubescent: cup usually inclosing the nut. N. J. to Fla. and Tex.

macranthèra. To 60 ft.: lvs. deciduous, obovate, to 7 in. long, with 8-10 pairs of broad lobes, grayish-tomentose beneath: cup about ½ length of nut. W. Asia.

macrocarpa. Burn or Mossy-Cup O. To 80 ft. or more: macrocarpa. DURG Of MOSSY-CUP O. To 80 ft. or more: lvs. deciduous, obovate, to 10 in. long, pinnatifid with large terminal lobe, grayish-pubescent beneath: cup with fringe-like border, about ½ length of nut. N. S. to Pa. and Tex. Var. olivesformis has smaller and more deeply lobed lvs., nut smaller and usually ½ or more inclosed by cup.

marilándica. Blackjack O. To 50 ft. but mostly less: lvs. deciduous, broader upward or toward apex, to 6 or 8 in. long, shallowly lobed at top, tomentose underneath: cup ½ or more length of nut, the rim scales recurving. N. Y. south and west.

máxima: Q. borealis var.

Michauxii: O. Prinus

Mirbeckii: Q. canariensis.

mongólica. Mongollan O. To 100 ft.: lvs. deciduous, short-stalked and clustered at ends of branches, obovate, to 8 in. long, with 7-10 broad teeth: cup with short fringe, about ½ length of cup. China, Korea, Japan. Var. grosseserràta (Q. crispula) has smaller lvs. with acute teeth.

montana. Chestnut O. Often confused with Q. Prinus, but Ivs. yellow-green above and only slightly pubescent beneath when young, turning dull orange instead of crimson in autumn. Me. to S. C. and Ala.

Muhlenbérgii (Q. castanea of cult). Yellow Chestnut O. To 100 ft. and more: lvs. deciduous, oblong to lance-oblong, to 6 in. long, with incurved coarse teeth along sides, pulbescent underneath: cup nearly half length of nut. New England west and south.

myrsinæfòlia (Q. Vibreyana). To 60 ft.: lvs. persistent, lanceolate, to 5 in. long, acuminate, toothed, shining above, glaucous beneath: cup about ½ length of nut. Japan, E. China.

nigra (Q. aquatica). WATER O. To 80 ft.: lvs. mostly deciduous or in some regions reported persistent, obovate, to 3 in. long, 3-lobed at apex or entire, bluish-green above: cut \frac{1}{4} - \frac{1}{3} \text{ length of nut. Del. to Fla. and Tex.}

olivæfórmis: Q. macrocarpa var.

palústris. Pin O. To 80 ft. or more: lvs. deciduous, elliptic, to 5 in. long, with 5-7 oblong toothed lobes, bright green: cup about ½ length of nut. Mass. to Del. and Ark. Var. aùrea is listed.—Planted as a street or avenue tree.

pannónica: Q. Frainetto.

pectinata: Q. Robur var.

pedunculàta: Q. Robur.

petræa (Q. sessulflora). Durmast O. Very similar to Q. Robur, differing chiefly in the longer petioles and almost sessile frs. Eu., W. Asia. Var. mespilifòlia (Q. Louettei) has narrow nearly entire lvs.

Phéllos. Willow O. To 60 ft.: lvs. deciduous, linear-oblong, to 4 in. long, entire, light green and shining above: cup about ¼ length of nut. N. Y. to Fla. and Tex.

phillyræoides. To 30 ft.: lvs. persistent, elliptic or obovate, to 2½ in. long, wavy-toothed: cup tomentose. Japan, China.

princides. Chinquapin O. Shrub to 6 ft. or rarely small tree: lvs. deciduous, oblong, to 5 in long, toothed, grayish-pubescent beneath: cup about ½ length of nut. Me. to Ala. and Tex.

Prinus (Q. Michaurii). BASKET O. To 100 ft.: lvs. deciduous, obovate, to 7 in. long, coarsely toothed, shining bright green above, grayish-pubescent beneath: cup 1/3-1/2 length of nut. Del. to Fla. and Tex.

pubéscens (Q. lanuginosa of cult). Pubescent O. Shrub or tree to 45 ft.: Ivs deciduous, obovate, to 4 in. long, with 4-8 pairs of rounded lobes, grayish-pubescent beneath: cup tomentose, ½-½ length of nut. S. Eu., W. Asia.

pyrenàica (Q. Toza). To 60 ft., suckering: lvs deciduous, obovate, to 6 in. long, with 5-6 pairs of acute deep lobes, yellowish-tomentose beneath: cup tomentose, ½-½ length of nut. S. Eu. Var. péndula (Q. camata pendula) has drooping branches

ramòsa: Q. alba.

repánda: Q. alba var.

repanda: Q. alba var.

Rôbur (Q. pedunculata. Q. brutia. Q. cupressoides).

ENGLISH O. To 80 ft. or more: lvs. deciduous, obovate, to 5 m. long, with 3-7 pairs of rounded lobes: cup about ½ length of nut. Eu., N. Afr., W. Asia. Some of the hort. vars. are: atropurparea, lvs. purple; Concordia, lvs. bright yellow; fastigiata, of columnar habit; flicifòlia, lvs. deeply cut into linear crisped lobes; holophýla (Q. pedunculata var. longifolia), lvs. entire; pectinata, lvs. deeply cut into narrow lobes; péndula (var. Dauvesset), branches drooping; variegata, lvs. margined or variegated white.

rùbra: a confused name; the Northern Red O. to which this name has been referred is Q. borealis while the Southern or Spanish Red O. is Q. falcata; the var. ambigua is Q.

sempérvirens: Q. virginiana.

serrata: Q. glandulifera; see also Q. acutissima.

sessiliflòra: Q. petræa.

Shumardii. Tree to 130 ft.: lvs. deciduous, elliptical to obovate, to 7 in. long, with 7-9 coarse sharp-pointed lobes, under surface green and glabrous except in axils of larger veins: nut to 1½ in. long in wide saucer-shaped cup. N. C. to Fla., Kans. and S. Mich.

stellata. Post O. To 100 ft. but usually much less: lvs. deciduous, obovate, lyrate-lobed, 6-8 in. long, lobes obtuse, grayish or whitish underneath: cup 1/2 or more length of nut. Mass. south and west. Suber. CORK O. To 60 ft., with thick bark yielding the cork of commerce: lys. ovate, to 3 in. long, toothed, shining dark green above, grayish-tomentose beneath: cup 1/2-1/2 length of nut. S. Eu., N. Afr.

texana. Tree to 35 ft.: Ivs. elliptical to obovate, to 3½ in. long, with 5 sharp-pointed lobes, infrequently with minute axillary tufts of hair on lower surface: nut to ¾ in. long. Tex.—Similar to Q. Shumardı: but of questionable hardiness in the N.

tinctòria: Q. velutina.

Tòza: Q. pyrenaica.

Turneri. Hybrid between Q. Robur and probably Q. Ilex, half-evergreen tree to 50 ft. with toothed lvs.

undulata. To 30 ft.: lvs. deciduous, elliptic-oblong, to 3 in. long, coarsely toothed or lobed, blush-green and pubescent: cup about ½ length of nut. Colo. to Mex. and Tex.

utahénsis. To 50 ft.: lvs. deciduous, oblong, to 5 in. long, with 3-5 pairs of deep broad lobes, shining dark green, pale and pubescent beneath: cup pubescent, about ½ length of nut. Colo. to New Mex. and Tex.

variábilis. To 80 ft.: lvs. deciduous, oblong, to 6 in. long, with bristle-like teeth, white-tomentose beneath: cup with curved scales, ½ or more length of nut. China, Korea, Japan.

velùtina (Q tinctoria). BLACK O. To 100 ft. or more: lvs deciduous, ovate to oblong, to 10 in. long, with 7-9 broad toothed lobes, shining dark green above: cup pubescent, with fringe-like border, about ½ length of nut. Me. to Fla. and Tex.

ventricòsa: Q. Ægilops.

Vibrevana: Q. myrsinæfolia.

virens: Q. virginiana.

virginiana (Q sempervirens. Q. virens). LIVE O. To 60 ft.: lvs. persistent, elliptic to oblong, to 5 in. long, usually entire, shining dark green above, whitish-tomentose beneath: cup tomentose, about 1/4 length of nut. Va. to Fla. and Mex.

Wilsonii: Lithocarpus cleistocarpa.

Wislizenii. To 75 ft.: lvs. persistent, usually oblong, to 4 in. long, glossy above, yellowish beneath, margins entire or spiny-toothed: nut cylindrical and tapering to apex or conical, to 1% in. long, cup inclosing 14-12 of nut. Calif

QUILLÀJA. Rosaceæ. Evergreen trees of S. Amer., the bark often with soap-like and medicinal properties, having alternate simple lvs., unisexual fls. in clusters, and fr. of 5 leathery follicles united at base; grown out-of-doors in the S. and Calif. Propagated by cuttings under glass.

Saponaria. SOAP-BARK TREE. To 60 ft.: lvs. ovate, to 2 in. long, sparingly toothed, shining: fis. white, about ½ in. across. Chile.

OUINCE. The pomological quinces are two. the common or true quince, Cydonia oblonga, and the Chinese quince. Chænomeles sinensis. The the Chinese quince, Chænomeles sinensis. latter is little known in North America although long ago introduced. It will stand on the seaboard as far north as Long Island, but is not generally hardy north of Philadelphia in the East. The fruits become 6 inches or more long, and have been recommended for culinary purposes. Several related plants are known as quince, grown for the ornamental early spring bloom and for the edible fruit. The ornamental bloom and for the edible fruit. The ornamental or "flowering" quinces may be found under the entry Chanomeles.

The common orchard quince, Cydonia oblonga, is a small crooked-branched tree native in Asia, grown in temperate climates for its fruit which is used in preserves and cookery. It is a slowgrowing shallow-rooted tree, requiring a rather heavy moist deep soil for best results, but very heavy lands are likely to produce green fruit of poor quality. The trees may be set one rod apart both ways which is greater than the usual full height of large specimens. The quince propagates readily from long hardwood cuttings. Nursery practice is to bud named varieties on rooted Angers quince cuttings or more rarely on seedlings. Plants are set when one or two years old; the second or third year thereafter a few fruits should be produced and then the crop should be steady for any number of years. The quince is but little hardier than the peach in its wood and may be severely injured at temperatures of 15° to 20° below zero. In the warmer parts of the country where the humidity is high, fire-blight is the limiting factor. Commercial quince culture is therefore largely restricted to the favored fruit regions of California, Ohio, Pennsylvania, New York and Ontario. In home planting it is worth attention over a much wider area.

The fruit is hand-picked when mature and well colored. Although a hard fruit, the quince shows bruises very readily and must, therefore, be handled with great care. In the East, quinces go to the general market in bushels. Fancy grades may be packed in smaller baskets. The fruit may be kept for a relatively short time as compared with the apple at 30° to 32°. Usually however, the crop is used at once. In some parts of the world quinces of much higher quality have been developed than any grown in North America. Here the one variety is the Orange, outstanding for its earliness, quality and color. Other varieties sometimes grown are the Champion, Meech,

Fuller and Smyrna.

Fire-blight, the worst disease of the quince, can be kept in check by avoiding over-stimulation of the trees and by cutting out the diseased twigs as with the pear. Borers, often a serious pest, can be dug out as in the case of the apple. The codlin-moth and quince curculio may be combatted with powdered arsenate of lead, 2 pounds to 50 gallons of water, applied when the petals fall and again three weeks later. There are other insects and diseases of lesser although often great importance.

QUÍNCULA. Solanacex. Spreading or prostrate per. herb suitable for dry sunny places in the rock-garden. Q. lobata (Physalis lobata). Lvs. spatulate to oblong, sinuate or pinnatifid: fls. purplish, to 11/4 in. across, wheel-shaped, usually in pairs. Kans. to Mex.

QUININE: see Cinchona. QUINOA: Chenopodium Quinoa.

QUINTINIA. Saxifragacex. Shrubs or trees native in Australia and New Zeal., having alternate leathery lvs. and small fls. in many-fld. racemes; intro. in Calif.

serrata. Tree to 30 ft., covered with minute scales: lvs. linear-lanceolate to oblong, to 6 in. long, toothed: fls. pale lilac, ¼ in. across, in erect axillary racemes to 4 in. long. New Zeal.

QUISQUALIS. Combretaceæ. Climbing or clambering shrubs with opposite simple lvs., showy fls. in spikes, and 5-angled or -winged fr.; grown out-of-doors far S. and sometimes under glass. Propagated by softwood cuttings over heat.

indica. Rangoon-Creeper. More or less climbing or lopping, without tendrils: lvs. to 5 in. long, deciduous: fls. fragrant, with slender green calyx-tube to 3 in. long and petals white changing to pink and red, in terminal drooping spikes. Burma, Malaya, Philippines.

RABIÈA. Aizoacex. Stemless succulents from S. Afr., of the Mesembryanthemum group: lvs. in dense rosettes, united at base, 3-angled: fls. solitary, with numerous petals in several series and stamens in a cylindric mass.

albinota (M. albinotum. Nananthus albinotus). Lvs. about 1 in long and $\frac{1}{3}$ in. broad, covered with whitish dots: fls. yellow, $\frac{1}{3}$ in. across.

albipúncta (M. albipunctum). Lvs. 1 in. long and ½ in. broud, covered with whitish dots: fls. yellow, 1 in. across.

Jamesii. Lvs. to 2 in. long and ½ in. broad and thick, glaucous, with conspicuous warts; fls. yellow.—First named in the genus Nananthus.

RACEME: a simple, elongated, indeterminate cluster with stalked flowers.

RACHIS: axis bearing flowers or leaflets; petiole of a fern frond.

RADERMÁCHIA. Bignoniaceæ. Trees in Asia with opposite pinnate lvs., large bell-shaped fls. in terminal panicles, and linear capsular frs.; grown in subtrop. climates. Propagated by seeds, cuttings and air-layering.

pentándra (Oroxylon flavum). To 20 ft, evergreen lvs. bipinnate into oblong entire lfts. to 7 in. long: fls. yellow, 2 in. long and 3 in. across, in panieles 1 ft. long: frs. to 3 ft. long. China.

RADIATE: standing on and spreading from a common center; also, with ray-flowers, as in the Compositæ.

RADICAL: belonging or pertaining to the root Radical leaves are those that arise from the root or crown, i. e., basal.

RADICULA ARMORACIA: Armoracia rusticana. Nasturtium-aquaticum: see Cress.

RADISH (Raphanus sativus and varieties). The small tuber-like roots of radish are eaten with us as a relish and an accessory, but the harder larger summer and autumn varieties are used freely in Europe, and in the Far East the durable winter radishes are important articles of food. These various races, with roots of many sizes, shapes and colors, are accounted as forms of one species, Raphanus sativus; and this species is unknown as an indigenous plant and is supposed to be a development from the weedy charlock, R. Raphanistrum. Another very different race is the rat-tailed radish, in which the seed-pods are highly developed and the root spindling and hard; these pods are often 1 foot or more long, soft and thick, and are eaten either raw as are radishes or used in pickles; this plant is R. satīvus var. caudatus; it has been called "aërial radish." See Raphanus.

The small radishes so much used as table delicacies should be grown quickly in order to develop crispness; seeds may be sown as early in the spring as the ground is fit. Of quick-growing varieties in good soil and the best conditions, edible roots may be had in four to six weeks. Seeds may be sown every week up to midspring for succession. If the small seeds are sifted out and only the large ones planted, better results are to be expected. Radishes also force readily, for which certain varieties are specially adapted. They may be grown in hotbeds and in frames. The seeds germinate quickly. They are sown in drills 6-12 inches apart, and the plants are thinned to 1-3 inches as they grow.

For main summer use, another set of varieties is adapted, requiring a longer time, although the spring kinds may be grown on ground sufficiently cool and moist.

The common spring radishes run to seed the same season, but the oriental winter kinds make deep hard roots, sometimes 2 feet long, and bloom the following year.

The most serious radish pest is the root-maggot. Rotation is to be practiced if the maggot is abundant. In frames, the plants may be screened with cheeseloth to keep the parent fly away. Aphis may be combated by a spray of Black-Leaf 40.

RAFFIA: Raphia Ruffia.

RAGGED ROBIN: Lychnis Flos-cuculi.

RAGWORT: Senecio.

RAIMANNIA: (Enothera.

RAINIÈRA. Compositæ. A milky-juiced herb to 2 ft., R. stricta, native on Mt. Rainier, Wash.: lvs. oblong-lanceolate, to 10 in. long, tapering to winged petiole: heads in dense racemes to 6 in. long, of 4-6 tubular fls.; pappus of pale brownish bristles. The genus is much like Luina.

RAIN-TREE: Samanea Saman.

RAISIN: see Grape. -Tree, Japanese: Hovenia dulcis.

RAJÀNIA. Dioscoreaceæ. Twining per. vines of W. Indies with alternate lvs. and small greenish diœcious fls. in racemes; one species sometimes grown for ornament; it has a winged 1-carpelled fr.; tubers of some species said to be eatable.

pleioneura. Cockscomb Yam. Aerial tubers large and very irregular: lvs ovate, 6 in. across, heart-shaped at base and sharply pointed at tip. Cuba.

RAMBUTAN, SMOOTH: Alectryon subcinereum.

RAMIE: Bahmeria nivea.

RAMONA: Salvia.

RAMÓNDA. Gesneriacex. Small herbs with basal lvs. and broad-campanulate fls. borne in few-fld. clusters on leafless scapes: native in mts. of Eu. and grown in rock-gardens. Hardy in the N. with winter protection. Propagated by seeds or old plants by division.—The original spelling is followed here, although the name is often misspelled Ramondia.

Heldreichii (Jankæa Heldreichii). Lvs. oval, entire, white-hairy above and hairs reddish-brown beneath: fls. violet, on 1-2-fld. scapes, corolla 4-lobed, more concave than in R. pyrenaica. Thessaly.

Natháliæ (R. serbica var. Nathaliæ). Lvs. oval, wavytoothed, hairy: fls. lavender-blue with golden center, 4-parted. Serbia, Bulgaria.

pyrenàica. Per. to 3 in.: lvs. ovate, deeply toothed, hary: fls. purple or white in var. álba, 1 in. across, 5-parted, in spring. Pyrenees. Var. ròsea is listed.

sérbica. Per.: lvs. in basal rosettes, obovate, coarsely toothed, rusty-hairy: fls. violet, ¾ in. across, 5-parted. Rocks, S. E. Eu.

RAMONTCHI: Flacourtia indica.

RAMPION: Campanula Rapunculus. Horned: Phyteuma.

RANGOON-CREEPER: Quisqualis indica.

RANUNCULÀCEÆ. Crowfoot or Buttercup Family. Herbs or sometimes shrubs of about 50 genera in the north temp. zone, with alternate or opposite lys., mostly bisexual fis. with 2-many sepals and petals or sometimes petals wanting, numerous stamens, few or many superior pistils, and fr. an achene, follicle or berry. The family contains many ornamental and flower-garden subjects as well as medicinal plants. Most of the species are hardy in the northern states and Canada. Many of the kinds are alpine or boreal and are prized in rock-gardens. Genera cult. are Aconitum, Actaa, Adonis, Anemone, Anemonella, Anemonopsis, Aquilegia, Caltha, Cimicifuga, Clematis, Coptis, Delphinium, Eranthis, Glaucidium, Helleborus, Hepatica, Hydrastis, Isopyrum, Leptopyrum, Nigella, Pæonia, Ranunculus, Thalictrum, Trautvetteria, Trollius, Xanthor-

RANÚNCULUS, BUTTERCUP, CROWFOOT, Ranunculaceæ. Many herbs of wide distribution, having alternate simple or compound lvs., yellow, white or red fls. with mostly 5 sepals and petals and many stamens, and fr. a head of achenes; grown in the flower-garden and borders.

achenes; grown in the flower-garden and borders. The florists' ranunculus is R. assaticus (and sometimes R. acontitofus), and is propagated by the tuberous roots which should be taken up and stored over winter. It may be grown out-of-doors in the summer and in the greenhouse. Other buttercups are propagated by seeds or division of the plants in spring. Most of the crowfoots are yellow-flowered, but there are a number of white kinds particularly in the section (or genus) Batrachium which includes aquatic and bog plants useful for colonizing in ponds and about the margins. Many of the crowfoots are alpine and boreal and well adapted to rock-gardens. Only two or three species have been much modified under domestication into color forms and doubles. The following species are perennial unless otherwise stated.

abortivus. Bien., to 2 ft.: basal lvs. broad-ovate and toothed, st.-lvs. divided into linear or oblong lobes: fis. yellow, ¼ in. across. N. Amer.

Acer: R. acris.

acerifòlia: listed name.

acontifôlius (R. plulanifolius). To 3 ft., much branched, the roots tuberous: lvs. palmately 3-5-parted into broad toothed segms . fls. several to many, white, \$4-1 in. across, sepals glabrous Fu Var. flore-pleno has double fls. and lùteo-plènus double golden-yellow fis.

acrifórmis. Erect to 20 in.: lvs. 2-3-ternately cleft, segms. lanccolate to linear, strigose: fls. yellow, to ½ in. long, petals broadly obovate, sepals slightly shorter, elliptic, strigose. Bogs, Mont., Ida. to Colo.

acris. To 3 ft., much branched, the roots fibrous: lvs. palmately 3-7-parted into narrow toothed or lobed segms.: fls. many, golden-yellow, 34-1 in. across, sepals hairy. Eu.; nat. in N. Amer. Var. flore-pleno has double fls.

adonèus. To 8 in.: lvs. 2-3-ternately parted into linear lobes: fls. 1-2, golden-yellow, 1 in. across, sepals hairy. Mts., Colo, Wyo.

alismæfòlius. Per. to 1 ft.: lvs. oval to lanceolate, entire or toothed: fis. yellow, ½ in. across. Wash. to Colo.

alpéstris. To 6 in.: lvs. palmately 3-lobed: fls. usually

appestris. 10 6 in.: ivs. paimately 3-lobed: fis. usually solitary, white, 34 in. across; sepals glabrous. Mts. of Eu. amplexicaulis. To 1 ft.: lvs. simple, oval-lanceolate, st.-clasping, glaucous: fis. 2-3, white, 1 in. or more across, sepals glabrous Mts. of Eu.

anemonoides. To 6 in.: lvs. 3-pinnate into finely divided segms., glaucous: fls. white or pinkish, to 1½ in. across. Alps.

assisticus. Turban and Persian B. To 1½ ft., simple or slightly branched, the roots tuberous: lvs ternate or biternate into narrow toothed segms.: fls. 1-4, long-stalked, bright yellow, to 1½ in. across, in the hort. forms very double, sepals hairy. S. E. Eu., S. W. Asia. Var. Ragionièri is listed as a strain having large double fls. of mixed colors. Var. superbissimus is taller with larger fls.

Bròteri. To 2 ft., branching, the roots slightly bulbous: lvs. deeply 3-parted into roundsh toothed segms.: fls. several, yellow, about 1 in. across, sepals hairy. Spain.

bulbosus. To 1 ft., the roots bulbous: lvs. 3-5-parted into lobed or cut segms., the terminal stalked, the lateral sessile: fls. solitary or few, bright yellow, about 1 in. across, sepals reflexed, hairy. Eu.; nat. in E. U. S. Var. florepleno has double fls.

californicus. Per. to 2 ft.: lvs. ternate into lobed or divided linear or lanceolate segms.: fls. yellow, ¾ in. across, sepals reflexed. Calif., Ore.

caucásicus. To 2 ft.: lvs. broadly-ovate, 2-3-pinnatisect, segms laciniate or dentate: fis. yellow, usually 3-5, to 1 in. across, sepals hairy. S. E. Russia to Caucasus.

chinénsis: R. pensylvanicus.

crenatus. Per. to 4 in.: basal lvs. round-cordate, wavy-toothed: fls. white, 1 in. across. Eu.

créticus. Per. to 2 in., soft-hairy: basal lvs. orbicular, to 4 in. across, obtusely palmately lobed: fls. golden-yellow, in spikes ½ in. long. Crete.

Cymbalaria (Haler pestes Cymbalaria). To 8 in, with rooting stolons: Ivs. mostly basal, oval to remform, cordate, crenate, to 34 in. long: fis. 1-3, yellow, to 12 in. across, sepals glabrous. N. Amer., S. Amer., Asia.

delphinifòlius (R. multifidus). Plant of variable habit: delphinifòlius (R. multifdus). Plant of variable habit; when growing submerged in water the immersed lys. are finely dissected into capillary or filiform segmis, the floating and aerial lys. narrower with longer petioles and linear segmis, and lys. of plants not submerged but growing in mud are shorter with segms, lanceolate to ovate: fis of all forms yellow, to 34 in. aeross: fr-head globose to somewhat oblong. Shallow water or mud, preferring at least partial shade, Me. to N. C. west to B. C. and Utah.

Eschschóltzii. Tufted per. to 6 in.: lvs. unequally 3-lobed or -parted, broader than long: fls. golden-yellow, ¾ in. across. Mts., Alaska to Calif. and Nev.

eximius. To 10 in.: basal lvs. few or solitary, cauline lvs.

fascicularis. Tufted per. to 1 ft.: lvs. 3-5-parted into oblong or linear lobes; fis. yellow, 1 in. across. Ont. to Tex.

Ficaria (Ficaria Ficaria). Sts. decumbent, roots fleshy: lvs ovate-cordate, to 2 m. long: fls. solitary on scapes to 5 m. high, golden-yellow, 1 in. across, petals 8 or 9, sepals 3. Eu.; nat. in E. N. Amer.

gargánicus: R. millefoliatus.

glabérrimus. Per. to 7 in.: lvs. oval, 3-lobed at apex or entire: fls. 1-3, golden-yellow, to 1½ in. across. B. C. to Calif. and Colo.

glacialis. To 6 in.: kys. palmately 3-5-parted into lobed segms.: fls. 1-3, white or reddish, to 1 in. across; sepals very hairy. Mts. of Eu., Greenland.

gramineus (R. gramunifolius). To 1 ft.: lvs. linear, entire, grass-like: fts. 1-7, yellow, to 1 in. across, sepals glabrous. Eu., Morocco.

graminifòlius: R. gramineus.

Haastii. Leathery glaucous per. to 6 in., rootstock milky: basal lvs with long fleshy petioles, reniform to orbicular, to 4 in. across, with 5-7 palmate lobes; st.-lvs. sessile, linear-lobed, few; fls. yellow, to 1½ in. across, mostly solitary on fleshy scupes, sepals oblong, glabrous. New Zeal.

hispidus: probably R. repens.

illýricus. To 1½ ft, white-silky-hairy: lvs. deeply 2-3-parted into linear-lanceolate segms.; fls. 1-3, yellow. S. E.

laxicaulis: R. obtusiusculus.

Lingua. To 3 ft. and more, the roots fibrous: lvs. lanceolate, to 10 in. long, sessile, entire or slightly toothed; fls. in loose panicles, yellow, $1\frac{1}{2}$ in. across, sepals hairy. Eu.,

Lyallii. Erect showy plant 1-4 ft.: lower lvs. large, peltate, simple, crenate; st-lvs. few: fis. white or cream-color, 2-3 in across, sepals hairy. New Zeal., and there sometimes called "Mountain bly."

Macauleyi. Lvs. mostly entire, tongue-shaped, apex truncute, 3-toothed; basal lvs. long-petioled, st.-lvs. sessile; fls. light yellow. July. Colo.

macrophyllus: listed name whose botanical standing, as used in the trade, is unknown.

millefoliatus (R. gargameus). Per. to 1 ft., crect, somewhat branched: lvs. tripinnatisect, segms. acute mostly basal: fls. yellow, to 1 in. across, sepals glabrous: fr. carpels hooked at apex. Medit. region.

monspeliacus. To 16 in.: lvs. mostly basal, petioled, ternate or 3-lobed, segms. more or less deeply toothed: fls. yellow, to 1½ in. across, not solitary: achenes tipped with long beak. Apr.-June. Eu.

montanus. Per. to 6 in., with creeping rootstocks: lvs. 3-5-parted into linear-oblong segms.: fls. usually solitary, bright yellow, 1 in. across. Mts., Eu.

multifidus: R. delphinifolius.

Nélsonii. To 2 ft.: lvs. all petioled, deeply 3-cleft, divisions broad, acute, toothed: fls. light yellow: achenes tipped with recurved beak, pilose. Spring. Ore. to Alaska.

nemoròsus. To 1 ft.: lvs. palmately 3-parted into lobed gms.: fls. several, yellow, 34-1 in. across, sepals hairy. Mts. of Eu.

nissanus. To 1½ ft.: lower lvs. 3-lobed, upper lvs. linear: fls. bright yellow, 2 in. across, abundant. May. Jugoslavia.

obtusiúsculus (R. laxicaulis). Per. to 3 ft.: lvs. lanceo-late, denticulate or entire, lower ones on broad petioles which clasp the st.: fis. yellow, petals much longer than sepals. June-Aug. Swamps, E. U. S.

occidentalis. Per. to 1 ft.: lvs. deeply 3-parted into ovate toothed or cut segms.; fls. bright yellow, 1 in. across. Alaska to Ore.

ophioglossifòlius (R. ophioglossoides). Ann. with hollow st.: lvs. undivided, the lower cordate-ovate and upper oblong-lanceolate: fis. small, pale yellow, sepals glabrous: achene slightly tuberculate. Medit. region.

orthorhýnchus. Lvs. bipinnatifid, lfts. deeply cleft, linear-acute: fls. yellow, ½ in. across, solitary on branched scapes. Wyo. to B. C. and Ore.

ovalis. To 1½ ft.: basal lvs. oval to ovate-oblong, 1 in. or more long, toothed; st.-lvs. divided into narrow lobes: fls. yellow, 1 in. across. Lab. to Alta. and Colo.

parnassifòlius. To 8 in.: basal lvs. long-stalked, ovate or cordate, shiny above, white-hairy below: fls. 1-6, white or rarely purplish, about 1 in. across; sepals hairy. Alps, Pyrenees.

parviflorus. Ann. to 1 ft.: lvs. 3-parted into oval toothed or cut lobes: fls. yellow, 1/4 in. across. Medit. region; nat. in N. Amer.

pensylvánicus (R. chinensis). Bristly B. Pilose-hispid per. to 2 ft.: lvs. trifoliolate, lfts. 3-fid, lobes lanceolate, incised: fls. yellow, to ½ in. across, sepals lanceolate, reflexed, about as long as petals. N. S. to Ga. west to B. C. and Calif. platanifolius: R. acontifolius.

Pumílio: considered to be synonymous with R. parviflorus.

pyrenæus. To 1 ft.: lvs. basal, linear or lanceolate, entire: fls. 1-4, white, to 1 in. across, sepals glabrous. S. Eu.

Ragionièri: R. asiaticus var.

rèpens. Creeping B. To 2 ft., with runners rooting at joints: lvs. long-stalked, 3-parted into broad toothed or lobed segms.: fis. yellow, 3/2-1 in. across, sepals slightly hairy. Eu., N. Amer. The common form in gardens is var. pleniflòrus (var. flore-pleno, R. speciosus) with double fis.

rutæfòlius. To 6 in.: lvs. all basal, bipinnate, segms. 3-lobed: fls. white, reddish on outside, solitary. June-July. Mts. of Eu. and Asia.

Seguièri. Very similar to R. glacialis but distinguished by the glabrous sepals. Mts. of Eu.

septentionalis. To 3 ft., some of the sts. procumbent: lvs. 3-parted into lobed segms.: fls. bright yellow, 1 in. across. Swamps, N. B. to Ga. and Kans.

specidsus: R. repens var. plenistorus.

Sáksdorfii. Per. to 4 in.: lvs. deeply 3-5-parted: fls. yellow, 1 in. across. Wash. to Mont.

triternatus. Per. to 6 in.: lvs. 3-ternate into linear segms.: fls. bright yellow, to 1 in. across, the peduncles recurved. Wash.

RAOÙLIA. Compositx. Small tufted or creeping per. herbs of New Zeal. and Australia, having alternate entire lvs. and small solitary heads of disk-fls.; pappus of hairs; adapted to the sunny rockery and grown in Calif.

australis. Sts. prostrate and matted, to 6 in. long: lvs. imbricated, to ½ in. long, white- or yellowish-tomentose: heads to ½ in. long, the inner bracts of involucre pale yellow and shning. New Zeal.

eximia. Sts. as above, to 2 ft. high and 4 ft. long: lvs. linear-spatulate, to ½ in. long, imbricated, 1-nerved, densely tufted-hairy on distal end; heads numerous, small, at distal ends of sts. New Zeal.

glabra. Prostrate: lvs. loosely imbricated, to ½ in. long, pale yellow-green, glabrous or nearly so: heads to ½ in. across, the inner bracts of involucre with white radiating tips. New Zeal.

subsericea. Prostrate, sts. stout, closely branched: lvs. linear-oblong, to ¼ in. long, laxly imbricated, usually silvery-tomentose: heads to ⅓ in. across. New Zeal.

tenuicaulis. Sts. prostrate, to 10 in. long: lvs. loosely imbricated, to $\frac{1}{10}$ in. long, grayish-tomentose or nearly glabrous: heads to $\frac{1}{6}$ in. long, the inner bracts of involucre dry and brown-tipped. New Zeal.

RAPE (Brassica Napus). In North America, primarily a forage crop for late autumn and early spring pasturing; the seed is sown late, as for rutabagas, sometimes following a grain crop; if the land is good and rains are sufficient, excellent late forage is secured, and as the plants withstand the winter they also give good spring pasturage if not previously grazed too close; it soon runs to seed. Hogs and lambs, as well as other animals, are sometimes pastured or soiled on rape. Dwarf Essex is the prevailing variety. It is sown either broadcast or in drills in June or July or sometimes even in May in the North;

better results are to be expected in drills far enough apart to allow of tillage; about 3 pounds of seed are required for an acre of drills.

Annual or summer races of rape, presumably of the same species, are grown in some countries for the seed, used for oil and as birdseed.

RÁPHANUS. Cruciferæ. Ann., bien. and per. branching tall herbs of Eurasia, of a few species, interesting to hort. because it includes the radish: lvs. mostly lyrate-lobed or pinnatifid: fls. white to purplish to yellowish, in racemes: fr. a terete spongy indehiscent long-beaked pod or silique, commonly constricted between the seeds. See Radish.

caudàtus: R. sativus var.

sativus. Radish. Root developed into an edible short or long tuber-like body: st. produced first or second year from seeds, bearing white or line veined fis. Var. caudatus (R. caudatus). RAT-TAILED RADISH. Root not tuberous: pods 8-12 in. long, thick, used for pickles. Var. longipinnatus. Lvs. to 2 ft. long, deeply pinnatifid: root usually long and durable: known mostly as Chinese radish; much grown in the Orient.

RAPHIA. Palmaceæ. About a score of moncecious feather-palms, all but one native in Afr., with gigantic erect and arching lvs., unarmed except perhaps on the sheaths, monocarpic (dying after the first fruiting): trunk short and stout, sometimes branched: spadices among the lvs., 3-4 ft. long, much branched, pendulous, the short ultimate branchlets thick and arranged comb-fashion on the branches, bearing many cup-shaped bracts covering the fls. which are pistillate at apex of branchlet and staminate at base, very heavy in fr.; stamens 6-16: fr. oblong or ellipsoid or turbinate, beaked, covered with imbricated scales. For cult. see Palm.

Rúffia. Raffia, yielding a familiar fiber from the lvs. Trunk to 25 or 30 ft.: lvs. to 65 ft. long, standing nearly erect; pinnæ very numerous, 2-5 ft. long, broad-linear and long-pointed, rather rigid, green above and whitish-powdery underneath: fr. 1-2 in. long. British E. Afr. to Madagascar; once planted in S. Fla.

RAPHIÓLEPIS. Rosaceæ. Evergreen oriental shrubs with alternate, leathery and shining lvs., white or pink fls. in racemes or panicles, and fr. a small purple or black drupe-like pome.

Raphiolopis is grown out-of-doors in warm climates, as southern states and California. Propagated by seeds, by cuttings under glass late in summer of ripe wood, by layers, and rare sorts sometimes by grafting on crategus.

Delacoùri. Hybrid between R. indica and R. umbellata, with toothed lvs. and pink fis.

hýbrida: hort. name.

indica. India-Hawthorn. To 5 ft.: lvs. oblong-lanceolate, to 3 in. long, bluntly toothed: fis. pinkish, about ½ in. across, in loose glabrous panicles. S. China. Var. rôsea is listed.

japónica: R. umbellata.

ovata: R. umbellata var.

umbellåta (R. japonica). Yeddo-Hawthorn. To 12 ft., but often low and spreading: lvs. obovate, to 3 in. long, slightly toothed, very thick and with revolute margins: fls. white, ¾ in. across, fragrant, in dense pubescent panicles. Japan. Var. ovåta (var. integerrima, R. ovata) has broad nearly entire lvs.

RAPHIONÁCME. Asclepiadaceæ. Low or twining per. tuberous- or fleshy-rooted herbs of trop. and S. Afr., having milky juice, opposite lvs. and rather small greenish, white or purple campanulate fls. in subaxillary or terminal cymose clusters: fr. a follicle containing comose seeds. Propagated by seeds or division and may be grown under glass or in warm climates.

divaricata. Much branched, to 8 in. high, tuber to 15 in. diam., sts. hairy: lvs. elliptic to obovate or orbicular, to 1½ in. long, pubescent beneath: fls. purple, to ½ in. long, in cymes of 5-25: fr. solitary, to 2½ in. long, puberulous.

RASPBERRY. The cultivated raspberries of North America are of three groups: (1) red raspberries, Rubus idxus, native in Europe, Asia and America, and var. strigosus which is the commonst form of the species in the fields and woodsides of the United States; (2) black raspberries or blackcaps, Rubus occidentalis, native in North America; (3) purple-canes, a range of probable hybrids between the two. All of them have biennial canes: the shoots that bear fruit this year arose from the root last year. The canes bear but once, their second year, and are then cut away at the ground, the new shoots or canes in the meantime coming on to take their places. A few strong shoots or canes should be allowed to remain each year after the plant is established, and the superfluous and weak ones removed.

The red raspberry is one of the hardiest of fruits, growing well in most of the northern United States, in a large part of Canada and in parts of Alaska. The black raspberry is not as hardy, its range extending little north of the Great Lakes. The purple-cane raspberry is scarcely more hardy than the black. None of these fruits is tolerant of heat or drought and hence they cannot be grown to advantage south of northern Virginia and Tennessee. Deep and well-drained lands of good moisture-holding capacity are favorable. Black raspberries thrive on light soils better than the red sorts.

The black and most of the purple-cane raspberries propagate by means of "tips," which are the young plants formed when the ends of firstyear canes strike the ground and take root. To insure a good stock of new plants, the tips may be laid in the ground and covered in midsummer; that autumn roots will have formed and the tip or layer may be separated, in fall or spring, for planting. Red raspberries are increased from the suckers that naturally arise from the crown or

root. In the North raspberries are commonly planted in spring. The blackcap raspberries should be set 3 to 4 feet apart, the rows 6 or 7 feet; the red varieties 3 feet apart, the rows 5 feet apart. For extra quality and yield, plants may be set in "hills" 5 by 5 feet, or 6 by 6 feet. The first year after the plants are set the blacks may be pinched back when they reach the height of 30 inches. If a very vigorous growth has been made the first season two canes may be left for fruiting, but in the case of weak growth only one cane should be allowed to fruit; the third season from setting, a good crop should be produced. In case of low-growing plants—those that have been pinched back short—a cover of straw or grass around the plants at fruiting time will help to hold the moisture, and also serve to keep the fruits clean in case of heavy rains. In the case of red raspberries, it is well to cut the cane back to within 6 inches of the ground when it is set to force new canes from the crown.

Thorough but shallow tillage is necessary to keep down weeds and to conserve moisture. Heavy mulching with straw or other litter may be of value especially in the home planting where cultivation is impossible. Manure has proved to be the best fertilizer. A blackcap plantation should remain in good bearing condition three to five years if not diseased. Red raspberries should last considerably longer.

Pruning, in the case of the red sorts, consists in cutting out the fruiting canes immediately

after picking and thinning out the weaker canes of the new growth the following spring. The new canes of the black- and purple-cane varieties are topped in the early summer at the height of about 30 inches to force branching. These branches are cut back to stubs 4–6 inches long early the next spring. Old canes are removed soon after picking the fruit, as with the red raspberry.

Fruits are picked when ripe but still firm, into pint or quart berry boxes in which they are to be marketed. For drying, the black sorts are knocked from the bushes with a bat into a large container. All raspberries are very perishable and must be rushed to market. Yields of 1,200 to 2,500 quarts to the acre may be expected.

Varieties are many. In this list the most desirable kinds are starred.

Hardy red varieties: *Herbert, Sunbeam, King,

Loudon, Ohta, *Latham.

General list of red varieties: *Cuthbert, *June, *Latham, Indian Summer (everbearing), Ontario,

Newburgh, Viking, Marcy, Taylor.

Purple-cane varieties: *Columbian, Royal

Purple, Sodus.

Black varieties: *Cumberland, Naples, Bristol,

Dundee, Ohio, *Plum Farmer.

Pests and diseases are likely to take heavy toll. Planting disease-free stock helps to prevent damage from anthracnose, orange-rust, mosaic and crown-gall, four of the most serious diseases. Plants having any of these maladies might better be destroyed immediately. Raspberries can usually be grown for home use without spraying, but commercial plantations may be sprayed with lime-sulfur or bordeaux mixture for anthracnose. There is no remedy for orange-rust. Short rotations—fruiting the plants only two or three years—and burning the old canes and trimmings, will do much to keep raspberry plantations healthy.

RATA: Metrosideros robusta.

RATAMA: Parkinsonia aculeata.

RATHBÙNIA. Cactaceæ. Simple or bushy and rather slender, the sts. weak and often clambering, ribs 4–8 and prominent, spines awl-like: fls. solitary and mostly at upper areoles, narrowly tubular and the tube bearing long scales more or less united with it. Two species of W. Mex. See Cacti.

alamosénsis (Cereus alamosensis. C. sonorensis. R. sonorensis). Columnar to 10 ft. and 3 in. diam., erect at first but becoming bent and rooting at tips; radial spines 11-18; centrals 1-4 and stouter: fis. scarlet, to 4 in. long, diurnal

sonorénsis: R. alamosensis.

RATIBIDA: Lepachys.

RATTLE-BOX: Crotalaria, Ludwigia alternifolia, Rhinanthus Crista-gallii.

RATTLESNAKE MASTER: Eryngium aquaticum. Root: Prenanthes.

RAVENALA. Musaceæ. Large and tree-like plants with palm-like trunks and large lvs. which are two-ranked toward top of st. resulting in a fan-shaped aspect: fls. bisexual, with elongated sepals, petals and stamens, borne in stiff boat-like bracts on spikes shorter than lvs. Only two species, the one commonly cult. in the tropics being R. madagascariénsis, Travelers-Tree, from Madagascar, to 30 ft. in clumps, and bearing Musa-like lvs.; the great fl-bracts and lf-sheaths hold rainwater; a striking object when mature.

RAY: outer modified florets of some composites, with an extended or strap-like part to the corolla; also the branches of an umbel or umbel-like cluster.

RAZOUMOFSKYA, see Loranthaceæ.

REBÙTIA. Cactaceæ. About 40 species of S. American caeti, small and globose or shortcylindric, simple or cespitose, tubercled but not ribbed: fis. small, from old tubercles at base or side of plant. See Cacti.

aureiflòra: Mediolobivia aureiflora.

auréscens: R. senilis var.

chrysacántha. Usually solitary, subcylindrical, to 234 in. high and 2 m. dam., glossy, green; tubercles spiralled; spines 25-30, white becoming yellow, bristly, the centrals to 14 in. long, base somewhat swollen; fls. yellowish-orange, to 2 m long. Argentina.

citracárpa: R. xanthocarpa var. deminùta: Aulostera deminuta.

Duursmaiana: Mediolobiria Duursmaiana.

Einsteinii: listed name.

élegans: Mediolobivia elegans. Fièbrigii: Aylostera Ficbrigii.

grandiflora. Globose to depressed-globose, to 2 in. high and to 3 in. diam.; tubercles in about 26 rows, spiralled; radial spines about 25, short, bristly, white to yellowish; centrals about 4: fis. carmine to brick-red, to 2½ in long.

Haagei. Cespitose, globose to subcylindrical, to 1% in diam; tubercles in 10 rows, spiralled; spines 4-12, about 14 in. long, all radial, bristly, spreading; fis. rose-pink, to 1½ in long. N. Argentina.

Knuthiàna. Depressed-globose, to 1¾ in. diam., areoles brown-hairy; fis. carmine-red, to 2 in long. Argentina.

Kupperiana: Aylostera Kupperiana.

minúscula (Echinocactus minusculus). Globular, to 2 in. diam; tubercles in many spirals; spines in clusters of 25-30; fls. funnelform and slightly bent near base, bright crimson, about 1 in. long, diurnal. N. W. Argentina. Vars. cristata and setosa are listed.

orurénsis: perhaps Lobivia orurensis.

pseudodeminùta: Aylostera pseudodeminuta.

pseudominúscula. Cespitose, subcylindric, to 1½ in. diam; tubercles in 12-16 rows, dark green flushed red; spines yellowish tipped brown, about ½ in. long, radials 7-10, bristly, centrals 1-4: fis. brilliant red, to 1½ in. long, stamens and pistil white. N. Argentina.

pygmèa. Usually solitary and occasionally branched, ovoid to subcylindric, to \$4 in. diam.; tubercles in 8-12 rows, spiralled; spines 9-11, all radial, to ½ in. long, appressed, base swollen: fls. rose-purple, to 1 in. long. Bolivia and N. W. Argentina.

salmònea: R. xanthocarpa var.

samilis. Depressed-globose, to 10 in. high but usually only to 3 in. and 3½ in. diam.; tubercles spiralled,; spines 35 40, to 1½ in. long, bristly, similar: fls. bright carmine, to 2 in. long. Argentina. Var auréscens, spines long bristly and dense, the central ones yellow. Var. brevisèta has more compressed sides, stiffer, more compressed, and shorter bristles, some of which are yellowish. Var. Steumeriàna, fls. bright yellowish-orange, throat yellow. Listed vars include chan, élegans and luteirosea.

Spegazziniana: Aylostera Spegazziniana.

spinosíssima: Aulostera spinosissima.

Steinmannii: Lobivia Steinmannii.

violaciflora. Solitary, depressed-globose, to ¾ in. diam.; spines about 20, amber-colored, the centrals darker: fis. rose-violet, to 1¼ in. across, stamens and stigma white. N. Argentina.

xanthocárpa. Globose to 2 in diam.; spines to ¼ in. long, dull straw-colored, slender: fis. red, to ¾ in. long, cam-panulate. Argentina. Listed vars. are cæruléscens, citracárpa, luteiròsea and salmònea.

RECEPTACLE: torus; the more or less enlarged or elongated end of the stem or flower-axis on which some or all of the flower-parts are borne; sometimes the receptacle is greatly expanded, as in the Compositæ; sometimes it assumes capsule-like forms, as in the hypanthium of the rose; at other times it is fleshy, as in the edible part of the strawberry strawberry.

RECURVED: bent or curved downward or backward.

RED-BERRY: Rhamnus crocea. Maids: Calandrinia ciluata var. Menziessi. Ribbons: Clarkia concinna. Robins: Geranium Robertanum. Root: Amaranthus retroflexus, Lachnanthes tinctoria. REDBUD: Cercis.

REDTOP: Agrostis alba.

REDWOOD: Sequoia sempervirens.

REED, CANE: Arundinaria gigantea. Giant: Arundo Donax. Sand: Ammonhila arenaria.

REFLEXED: abruptly recurved or bent downward or backward.

REGÈLIA. Myrtacex. Stiff Australian shrubs of the Calothamnus relationship, with small opposite lys. and sessile fls. forming terminal heads; one species somewhat planted in S. Calif.

ciliàta. Straggling shrub to 5 ft., white-hairy: lvs. overlapping and densely clothing st., orbicular, 1/4 in. across: fis. rose-purple, in globose heads 3/4 in. across.

pileata: catalogue name.

REGULAR FLOWER: the parts in each series or set alike; as stamens all like each other, petals all like each

REHDERODÉNDRON, Styracacex. Chinese trees having alternate exstipulate serrulate lvs. and solitary or paired woody indehiscent frs. R. macrocárpum. To 40 ft., branchlets reddishbrown: lvs. elliptic to nearly ovate, to 4 in. long, acute to acuminate, reddish-green with red midrib and lateral veins which are stellate-pilose beneath. fr. oblong, to 3 in. long and half as thick, crowned with persistent calyx, outer shell about % in. thick. Szechuan, China.

REHMÁNNIA. Scrophulariaceæ. Per. usually sticky-hairy herbs suitable for a cool greenhouse or outdoors in Calif. and the S., the large tubular 2-lipped fls. axillary or borne in terminal racemes: lvs. alternate and coarsely toothed or lobed; native in China and Japan. The name Rehmannia is retained by the International Lists as against Sparmannia.

Rehmannias are propagated by cuttings of growing wood or by seeds which produce blooming plants by the second year.

álba: listed name.

angulata. To 3 ft.: lvs. deeply toothed: fis. 2 in. long, red with band of scarlet at margin of upper lip and orange dots inside the lower lip. China. Var. tigrina, fis. spotted. Var. tricolor, fis. bright purple at first, then violet-rose, throat whitish.

elàta. To 6 ft.: lvs. lobed, the lobes entire: fls. bright rosy purple on the lips, throat yellow dotted with red, to 3 in. long. China.

glutinòsa. To 1 ft., sts. weak: lvs. coarsely toothed: ffs. yellowish or purplish with purple throat and veins, about 1 in. long. China.

REICHÁRDIA. Compositæ. Ann. or per. herbs of the Medit. region with alternate or basal lvs. and long-stalked yellow heads of ligulate fls.; pappus of white bristles. Somewhat like Sonchus; sometimes planted for ornament.

picroides (Picridium vulgare). Per. to 2 ft., glabrous: lvs. spatulate, clasping, toothed, the lower often pinnate: heads ½ in. long, bracts of involucre margined with white.

REINÉCKIA. Liliacex. Per. herb of China and Japan with creeping underground sts. R. carnea. Lvs. basal, to 1½ ft. long and ½ in. across: fls. flesh-colored, about ½ in. long, sessile, in racemes on scapes only few in. high, the perianth-segms. partially united. Var. variegāta is listed as having lvs. striped pale yellow.— Sometimes grown as a pot-plant, and in the open in mild climates. Propagated by division. Likely to be confused with the Ophiopogons.

REINWÁRDTIA. Linaceæ. Subshrubs bearing alternate lvs., yellow fls. with fugacious petals, 3-4-celled ovary with 2 ovules in each cell, and 3-4 styles; 2 Indian species.

Grown under glass; they require a temperature of 55–80°. Propagated by cuttings from strong growths in spring in sandy loam. Frequent pinching back to induce compact habit should be practiced. Adapted to outdoor culture far South and in California.

findica (R. trigyna. Linum trigynum). Yellow Flax. To 4 ft.: lvs. obovate, entire: fls. 1-2 in across, styles 3.—Sometimes grown erroneously as Linum flavum.

tetrágyna. Lys. serrulate: styles mostly or often 4. trígyna: R. indica.

RENANTHÈRA. Orchidaceæ. Old World epiphytes with leafy non-pseudobulbous sts. and fls. in many-fld. racemes or panicles, the sepals and petals spreading, lateral sepals usually much larger, the lip very small, spurred. Grown in a warm greenhouse; see Orchids.

coccinea. Sts. stout, to 10 ft. long: lvs. to 5 in. long and 1¼ in. wide: fls. to 3 in. long, in many-fld. loose panicles to 3 ft. high; dorsal sepals and petuls orange spotted with scarlet; lateral sepals scarlet or crimson; lp yellow striped with red. Apr—Sept. Cochin-China, Hainan.

Imschootiana. Sts. to 1 ft. long: lvs. to 4 in long and ins. wide; infl. loosely paniculate, many-fid., to about 2 ft. long; fls to about 2½ in. long; dorsal sepals and petals dull yellow spotted with scarlet; lateral sepals scarlet; lip light yellow spotted and barred with red. May-June. Assam, Burma, Indo-China.

Lòwii: Arachnis Lowii.

Maingayi. Seider Orchid Sts. to 6 ft. long: lvs. linear-oblong, to 5 m. long, tapering, apex notched: fls. to 2 m across, in racemes or short-branched panieles to 3 ft. long; sepals and petals white, thickly barred with dark pink, lip white closely striped with crimson or entirely crimson with buff-colored spot on each lateral lobe. Malacca Islu

Stòriei. St. to 12 ft long: lvs. distichous, oblong, fleshy, to 10 m. long: mfl. about 2 ft. long, loosely many-fld.; fls. to 3 m. long; dorsal sepal and petals linear-spatulate, orange-red mottled with crimson; lateral sepals spatulate-obovate, crimson with red blotches; lip red with yellow at base of lobes. Mar.-June, Sept.-Oct. Philippines.

RENEALMIA NUTANS: Alpinia speciosa.

RENIFORM: kidney-shaped.

RESEDA. MIGNONETTE. Reseduceæ. Herbs grown under glass and out-of-doors for the small fls. in terminal spikes, ornamental or fragrant.

The species mostly grown is known for its very fragrant The species mostly grown is known for its very fragrant bloom; the plant thrives in cool moderately nech soil in partially shaded positions. In the greenhouse the night temperature should be about 48°. Seeds should be sown where the plants are to grow, or else handled in pots, as they do not transplant well. Often seen in the flower-

álba. White Upright M. Ann. or bien. to 3 ft.: lvs. pinnate or deeply cut: fis. greenish-white, not fragrant. S. Eu.; nat. in N. Amer.

crystállina. Ann.: lvs. 3-parted or entire near base: fis. deep yellow. Canary Isls.

odorata. Common M. Ann., becoming decumbent: lvs. entire or only notched: fls. yellowish-white, very fragrant. N. Afr. Var. grandiflora arborea is a large garden form.

RESEDACEÆ. MIGNONETTE FAMILY. Six herbaceous genera native in Medit. region, characterized by bisexual irregular fls. with 4-7 sepals and petals, 3-40 stamens, ovary of 2-6 free or united carpels, and fr. a caps. or berry. Reseda is grown for ornament.

REST-HARROW: Ononis.

RESTRÈPIA. Orchidaceæ. Small trop. American epiphytic orchids with tufted sts. each bearing a solitary lf. and 1-fld. axillary peduncles; lateral sepals united, dorsal sepal and petals prolonged into filiform tails. See Orchids.

antennifera (R. maculata). Sts. to 8 in high, covered by loose membranaceous sheaths: If. elliptic or oval, erect, to 3½ in. long: peduncles 1-3; dorsal sepal and petals white or pale yellow with purple veins; lateral sepals ochraceous-yellow densely spotted with brown-purple; lip similar to lateral sepals but much shorter with an emarginate tip. Venezuela, Colombia, Ecuador.

maculata: R. antennifera.

RESURRECTION PLANT: Anastatica hierochuntica Selaginella lepidophylla.

RETINISPORA, RETINOSPORA: Chamecuparis. Thuia.

REVOLUTE: rolled backwards, margin rolled toward

RHABDOTHÁMNUS. Gesneriacex. branched shrub to 5 ft., native in New Zeal. R. Solándri. Lvs. opposite, ovate or orbicular, 1/2-2 in. long, coarsely toothed, rough: fls. orange striped with red, to 1 in. long, solitary in the axils: caps. 1/3 in. long. Listed in Calif.

RHAGÒDIA. Chenopodiaceæ. Australian shrubs or rarely herbs, one planted for ornament in Calif.: lvs. alternate or opposite, entire: fls. polygamous, small, in terminal spikes or panicles: fr. a small berry.

nitans. Herb to 2 ft., prostrate or procumbent: lvs. hastate to lanceolate, 1 in. or less long: mfl. to 1 in. long, often nodding.

RHAMNACEÆ. BUCKTHORN FAMILY. Widely distributed temp, and trop, trees and shrubs, climbing plants, rarely herbs, some 45-50 genera, with mainly alternate simple lvs., small, regular, bisexual or polygamous whitish or greenish fls. of 4-5 sepals, petals and stamens or sometimes without petals, 2-4-celled ovary, and fr. a drupe or caps., sometimes winged. The following genera are grown for ornament and two (Hovenia, Zizyphus) also for edible frs.: Alphitonia, Berchemia, Ceanothus, Colletia, Condalia, Dis-Hovenia, Noltea, Paliurus, Phylica, Pomaderris, Rhamnus, Sageretia, Spyridium, Trevoa, Zizyphus.

RHÁMNUS. BUCKTHORN. Rhamnacex. Many shrubs and small trees, mostly deciduous, with commonly alternate simple lvs., small greenish fls. in axillary clusters, umbels and racemes followed by berry-like frs.

Rhamnus furnishes considerable ornamental material suitable for shrubberies. Several species have medicinal properties. Propagated by seeds sown in autumn or stratified, by cuttings and grafting; the evergreen kinds by cuttings of mature wood under glass.

Alatérnus. To 20 ft., evergreen or partially so: lvs. ovate, to 2 in long, toothed; fls. in short racemes; fr. bluish-black. S. Eu; adaptable south of Washington. Var. argénteovariegata (var. var.equta), lvs. margined with creamy-white.

alnifòlia. To 3 ft., deciduous: lvs. ovate, to 4 in. long, toothed: fls. 2-3 together: fr. black. N. Amer.

alpina. To 10 ft, deciduous: lvs. elliptic, to 4 in. long, toothed; fls. in clusters: fr. black. S. W. Eu.

californica (R. Purshiana var. californica). Coffee-Berry. To 6 ft., evergreen: Ivs. oblong, to 21/2 in. long, finely toothed: fls. in umbels: fr. red turning black when ripe. Calif.; not to be grown in the N. Var. crassifolia is

caroliniana. Indian-Cherry. To 30 ft., deciduous: lvs. elliptic or oblong, to 6 in long, finely toothed or entire: fis in umbels: fr. red turning black when ripe. Va. to Tex.; hardy to New England.

cathártica (R. Wicklia). Common B. To 12 ft, deciduous, often with spines at ends of branchlets: Ivs. ovate, to 3 in. long, toothed: fls. diœcious, in clusters: fr. black. Eu., Asia; escaped in E. U. S.; hardy far N.

Chádwickii: listed name of form said to have glossy lvs. chlorophora: probably referable to R. utilis.

corymbosa: name of uncertain application.

crenata. To 10 ft., deciduous: lvs. oblong, to 4 in. long, finely toothed: fls. in umbels: fr. from red to purplish-black. Japan, China; hardy to New England.

cròcea. Red-Berry To 3 ft, evergreen: lvs. elliptic, about ½ in. long, finely toothed: fls. polygamous, without petals, in clusters: fr. bright red. Calif. Var. ilicifòlia (R. ihafolia) is a tree to 20 ft. with larger spiny-toothed lvs.

davàrica. To 30 ft., deciduous: lvs. oblong, to 4 in. long,

finely toothed: fls. dioccious, in clusters: fr. black. Siberia to N. Chma; hardy in S. New England. Var. nippónica has narrower longer lvs.

dumetorum. To 6 ft., deciduous, with spiny branchlets: lvs. obovate, \(\frac{3}{4}-1\frac{1}{2}\) in. long, remotely toothed: fls. without petals. China; hardy N. Var. crenoserrata has lvs. to \(2\frac{3}{4}\) in long, wavy-toothed.

fállax. Carniolian B. To 10 ft., deciduous: lvs. oblong, to 5½ in. long, finely toothed: fls. in clusters: fr. black. Mts. of S. and Cent. Eu.; hardy to New England.

Frângula. Alder B. To 12 ft., deciduous: lvs. obovate, to 2½ m. long, entire: fls. in umbels: fr. red turning black when ripe. Eu., N. Afr., Asia; escaped in E. U. S.; hardy far N. Var. aspleniifòlia is a feathery form with linear wayv lvs.

ilicifòlia: R crocea var.

imeretina. To 10 ft., deciduous: lvs. oblong to oval, to 8 in long, finely toothed, turning bronzy in autumn: fls. in clusters: fr. black. Caucasus; hardy to New England.

infectòria. Avignon Berry. To 6 ft., spiny, deciduous: lvs. elliptic, to 1½ in. long, toothed: fr. black. S. Eu.

koraiénsis. Tree with fine thorns: lvs. oval, finely toothed, pubescent on both sides: fls. in clusters. Korea.

lanceolata. To 6 ft., deciduous: lvs. ovate-lanceolate, to 3 in long, finely toothed: fr. black. Pa. to Tex.

Purshiàna. Cascara Sagrada. To 20 ft., deciduous: lvs. oblong, to 8 m. long, finely toothed; fis. in umbels: fr. black. Wash. to Calif.; adaptable south of Philadelphia.

speciòsa: listed name of unknown botanical application. tinctòria. To 5 ft , deciduous: lvs. elliptic, to 2 in. long, toothed, pubescent beneath. S. E. Eu.

tomentélla. Similar to R. californica but lvs. yellow- or gray-tomentose beneath. Calif. to Ariz.

utilis. To 10 ft., deciduous: lvs. oblong, to 5 in. long, finely toothed, yellowish-green: fr. black. China; probably adaptable south of N. Y.

Wicklia: R. cathartica.

Wflsonii. To 6 ft., somewhat spiny: lvs. opposite, ovate-lanceolate, to 4 in. long, acuminate, glabrous, serrate-dentate: fr. probably black. China.

RHAPHITHÁMNUS. Verbenaceæ. Spiny trees of Chile, one sometimes planted in S. U. S.: lvs. opposite, entire: fls. lilac, tubular, solitary or paired in the axils: drupes bright blue, fleshy.

cyanocárpus. To 20 ft., with slender spines to 1 in. long; lvs. ovate, to ½ in. long; fts. ½ in. long; fr. globose, to ½ in. across.

RHAPIDOPHÝLLUM. NEEDLE PALM. Palmacex. One low fan-palm on the coastal plain S. C. to Fla. and Miss., mostly in low grounds, remarkable for the long sharp erect needles of the lf.-sheaths: polygamo-diaccious or hermaphrodite: spadices short and condensed, head-like, buried in the lf.-sheaths and needles at the base of the plant; stamens 5–7: fr. ovoid, 1 in. or less long, drupe-like, red.

Hystrix. Cespitose or stoloniferous, crown or caudex rising a few im., the spines 6-16 in. long: petioles long and slender, unarmed; if.-blade 1½-2½ ft. cross, parted nearly to base into 5 to a dozen or more spreading narrow strongly ribbed stifflish segms. 1½ in. or less broad that are bifld or toothed at apex, glaucous and finely pubescent underneath.

RHAPIS. Lady Palms. Palmaceæ. Low reedlike or bamboo-like direious or polygamous cespitose fan-palms, of 9 described species in S. China; two of them long grown as tub specimens and for clumps in the open in regions as mild as S. Calif. and S. Fla.: lvs. 1–2 ft. across, divided nearly to the base; sheaths fibrous: spadices among the lvs., long-stalked, branched; fls. yellowish; stamens 6: fr. a small 1-seeded berry with a soft exterior, seldom produced outside the tropics. For cult. see Palm.

excélsa (R. flabelliformis). Sts. several to many, 5-10 ft., covered with coarse fiber: some or many of the lvs. only 3-7-parted, others to 10-parted, green both sides, the segms. uniformly curving or drooping, broad and notched at the end, 1½-3 in. broad at middle, cross-wrinkled or puckered.

flabellifórmis. R. excelsa.

hùmilis. Sts. more slender with finely-fibrous sheaths: segms. narrow, mostly 9 or more, the rear ones usually spreading or directed somewhat backward, usually not exceeding 1 m. broad and surface not puckered, apex very narrow.

RHAPONTICUM: Centaurea cunaroides.

RHÀZYA. Apocynaceæ. Shrubs of the Medit. region, akin to Amsonia, with alternate lvs. and white or blue fls. in terminal cymes.

orientàlis. Lvs. ovate-lanceolate, 2 in. long: fls. white, ½ in. long. S. E. Eu., Asia Minor.

RHEKTOPHÝLLUM. Aracex. One or two tall-climbing herbs rooting at the nodes, native in W. Afr., of which one is sometimes grown in hothouses.

mirábile (Nephthytis picturata). Lvs. arrow-shaped, to 6 ft. long and 2 ft. broad, green variegated with pale green between the nerves, the margins deeply wavy, the petioles to 3 ft. long; spathes to 4 in. long, green outside, reddishpurple inside.

RHÈUM. RHUBARB. Polygonaceæ. Stout per. herbs of Asia, with clumps of large basal lvs., small greenish, whitish or reddish fls. in panicled clusters or racemes on tall hollow sts., and fr. a winged achene; one species grown for the edible lf.-stalks and others for bold foliage effects. See Rhubarb.

acuminatum. Similar to R. emodi but only to 3 ft. high and fis. larger: sts. and infl. red-purple. Himalayas.

australe. Lvs. almost orbicular, 5-9-veined, with broad cordate bases: infl. without foliaceous blacts; fis. small, greenish-white, to dark red in fr. Cent. Asia.

Collinianum. Perhaps a hybrid: lvs. with broad much cut lobes: fis. red. China.

compactum. Lvs. broad-ovate, cordate, undulate and obscurely lobed: infl. with drooping branches. Siberia.

emòdi. Lvs. cordate-ovate, wavy-margined, somewhat copper-colored: fls. dark purple, stalks to 10 ft. high. Himalayas.

nóbile. To 4 ft., sts. densely covered with straw-colored bracts 6 in. across which conceal the short axillary panicles: lvs. ovate-oblong, 1 ft. across, leathery, entire. Himalayas.

officinalis. Lvs. round-oval, 3-7-lobed, the lobes notched, to 3 ft. across: fl.-stalks to 10 ft. high. W. China.

palmatum. Lvs. nearly orbicular, heart-shaped at base, deeply palmately lobed, the lobes sometimes again divided: fl.-stalks to 6 ft. high. N. E. Asia. Var. atrosanguíneum has dark red panicles and var. tangûticum longer lvs. not so deeply lobed. Vars. coccíneum and rûbrum are also hsted.

Rhapónticum. Garden R. Pie-Plant. Wine-Plant. Lvs. ovate, heart-shaped at base, the margins entire but wavy, to 1½ ft. long. fl.-stalk to 6 ft. high. Siberia.

Ribes. To 5 ft.: lvs. thick, almost leathery, cordate to reniform, with the margins crisped or undulate and the blades puckered or blistered: infl. with foliaceous bracts; fls. green, drooping; frs. about 1 in. long, blood-red, showy. Asia Minor to Persia.

 ${\bf spicif\acute{o}rme}.$ Lvs. orbicular or cordate, very leathery, reticulated beneath: fl.-stalk to 2 ft. high. Himalayas.

tatáricum. Lvs. roundish, 3-veined, weakly cordate: infl. without foliaceous bracts. W. Asia.

undulate: infl. with foliaceous bracts; fls. with the pedicels jointed near the base. Asia.

RHÉXIA. Meadow-Beauty. Melastomaceæ. Per. herbs native in N. Amer., with opposite simple 3-5-nerved lvs., terminal fls. solitary or in cymes, and capsular frs.; cult. in borders and wild-gardens in moist situations. Propagated by tubers and seeds.

lanceolàta. To 18 in., hairy, sts. terete: lvs. oblanceolate to linear-lanceolate, to 1 in. long: fls. white to pale purple, to $1\frac{1}{2}$ in. across. Blue Ridge Mts., Ga.

lùtea. To 1 ft., sts. angled, much branched: lvs. obovate to lanceolate, serrulate, glabrous: fls. yellow, small, in cymes N. C. to Fla. and west.

mariana. To 2 ft., sts. cylindric, very hairy-pubescent: ls. narrow, oblong or linear-oblong, to 1½ in. long: fis. pale purple, about 1 in. across, in loose cymes. L. I. to Fla. and Tex.

Náshii. To 2 ft., sts. densely yellow-hairy: lvs. narrowly ellptic-lanceolate, to 2 in. long: fls. purple, to 1½ in. across. Swamps of Fla to Ls.

virgínica. To 1½ ft., the roots bearing tubers, sts. square, somewhat pubescent: lvs. ovate, to 2 in. long: fls. rosypurple, 1½ in. across, in cymes. Me. to Fla. west to Ia. and Ia.

RHINANTHUS. Scrophulariaceæ. Ann. herbs of the northern hemisphere, with opposite lvs., yellow, blue or violet 2-lipped tubular fls., sometimes parti-colored, and capsular frs.; sometimes placed in the rock-garden or elsewhere.

Crista-gailli. RATTLE-Box. To 1½ ft.: lvs. lanceolate, to 2 in. long, toothed: fls. yellow with purple spots on lips, about ½ in. long. Mts., Eu., Asia, northern part of N. Amer.

RHINEPHYLLUM. Aizoaceæ. Stemless succulent perennials with opposite lvs. and solitary terminal fls., the petals in one row; stigmas 5. S. Afr., allied to Mesembryanthemum.

Cómptonii. Lvs. several, thick, keeled, expanded at end, toothed. petals comparatively broad, filaments papillate, stigmas slender.

macradenium (M. macradenium. Peersia macradenia). Branches decumbent: lvs. to 2 in. long and 1/4 in. thick, united at base, bright green: fls. yellow, 1 in. across.

RHIPÓGONUM (or Ripogonum). Liliaceæ. Climbing shrubs of Australia and New Zeal., with mostly opposite lvs., small fls. with deciduous perianth borne in racemes, and fr. a berry; one species intro. into Calif.

scándens. Lvs. ovate-oblong to oblong-lanceolate, to 5 in. long, leathery: fls. greenish, ½ in. across, in axillary racemes to 6 in. long: berries bright red, ½ in. across. New Zeal.

RHÍPSALIS. Cactaceæ. Epiphytic cacti for the most part, a number of them grown as pot subjects in greenhouses, hanging or clambering or sometimes erect and more or less rooting or emitting aërial roots, the sts. branched, terete, angled, or flattened and leaf-like, sometimes as slender as strings, the areoles on the edges or angles and bearing hairs, wool and bristles: fls. small, with few segms., opening night or day: fr. often resembling that of the mistletoe. Fla. to Argentina, some 60 species. See Cacti.

The species of Rhipsalis are interesting pot subjects and are easily grown, propagated by cuttings, and by seeds when available.

capillifórmis. Very slender and weak, the main branches very long and lateral ones short, all cylindrical: fis. many along sides, cream-color, ½ in. or less across. Brazil.

cassutha (commonly but not originally spelled cassytha). MISTLETOE CACTUS. Growing on trees or rocks hanging in many strands to 30 ft., the branches terete and very slender, somewhat bristly when young but becoming naked: fls. cream-color, solitary, about ¼ in. across. Fla. to Brazil and Peru, also Ceylon and trop. Afr.

cavernosa: Lepismium cruciforme.

cereiformis: Pfeiffera ianothele.

cereuscula (R. Saglionis). Parts terete, slender and mostly long, sometimes to 2 ft. high and terminated by cluster of short branches: fls. pinkish to white with yellowish midrib, about ½ in. or more across. Cent. Brazil to Uruguay.

chrysocárpa: R. puniceo-discus.

commûnis: see R. squamulosa.

cribrata (R. penduliflora). Sts. becoming hanging, terminal branches in whorls and 1 in. long: fls. white or cream-colored, 1/3 in. long, pendulous. Brazil.

crispata (Epiphyllum crispatum). Joints elongate to ovate, to 4 in. long, somewhat crenate: fis. pale yellow, 1-4 at an areole, but usually solitary: fr. white. Brazil.

dissimilis. Sts. erect or hanging, naked or hairy, the latter with 9 low obtuse ribs and areoles white-bristled: fl.-buds red, fls. pink with numerous white stamens: fr. white. Brazil.

funalis: probably R. grandiflora.

grandiflora. Branches cylindrical and rather stout, to

3 ft. high and nearly $\frac{1}{2}$ in. diam.: fls. scattered, rose or cream-color, about $\frac{3}{2}$ in. across. Brazil.

heteroclada. Sts. erect, dark green with purple zones around areoles and branch tips, slender, areoles often only 1-bristled; fis. greenish-white, to ½ in, across. Brazil.

Houlletians. Much branched, to 6 ft., branches leaflike, flat and thin, to 2 in. broad, serrate or notched. fls. cream-color turning yellowish, with red center, about ¾ in. long. Brazil.

lumbricoides. Sts. much branched, to 12 ft. long and 1/2 in. thick, rooting freely, areoles with 5-10 white bristles when young: fls. white or cream-colored, 1/2 in. long. Uruguav. Paraguay.

mesembryanthoides (often but not originally spelled mesembryanthemoides). Upright with drooping ends, branches of two kinds, some 4-8 in. long and very slender, frutting branches ½-nearly ½ in. long and thicker. fls. white or light pink, solitary, ½ in. or more across. Brazil.

pachyptera. Sts. more or less pendent and much jointed, joints to 2 ft. long and nearly 3 m. broad, but sometimes nearly orbicular, crenate: fis. yellowish, solitary, about 35 in. long. Brazil.

paradóxa. Hanging in clusters to 3 ft. or more, with many aérial roots, branches 3-winged and zigzag: fls. white, about ½ in. long. Brazil.

penduliflòra: R. cribrata.

pentaptera. Branches stiff and to ½ in. or more diam., strongly 5- or 6-ribbed to almost winged: fis. scattered, cream-color and petals reddish on back, about ½-½ in. long. S. Brazil, Uruguay.

pigmática zanzibària is probably referable to R. cassutha. prismática (R. Suareziana. R. tetragona). Much branched, prostrute, upper branches somewhat angled: fis. white. Brazil.

puniceo-discus (R. chrysocarpa). Branches filiform and hanging, rooting freely: fls. white, ½ in. long. Brazil.

rhómbea. Branches flat and thin or sometimes 3-angled, the joints to 1 in. broad and crenate: fls. solitary or in 2's, cream-color with red spot inside. Brazil.

Saglidnis: R. cereuscula.

salicornioides: Hatiora salicornioides.

Schottmuelleri: a form of Hatiora salicornioides.

squamulosa (Lepismium commune). Creeping, rooting freely, bianches 3-angled, to 1 ft. long and 1 in. wide, green tinged with red, areoles with white wool and bristles: fis. white, to ½ in. long. Brazil, Argentina.

Suareziàna: R. prismatica.

tetragòna: R. prismatica.

Tonduzii. Sts. to ½ in. diam., usually 4-5-angled, rooting freely, branches 4 in. long and in clusters of 2-6 and hanging, areoles forming notches in branches: fis. white, ½ in. long. Costa Rica.

trigona. Much branched, sts. ½ in. diam. and 3-angled: fls. solitary, white or pinkish, to ¾ in. across. Biazil.

tucumanénsis. Much branched, the sts. pendent, often whorled, to nearly ½ in. diam., becoming angled with age: fls. solitary, pale rose to cream-colored, about ½ in. across: fr. white to reddish. Argentina.

RHIZOME: underground stem: rootstock.

RHIZÓPHORA. MANGROVE. The only representative in the U.S. of Rhizophoracea, a family of 17 genera of trees and shrubs in trop, and semi-trop, regions about the world; the plants of this family bear thick leathery mostly opposite entire lvs., bisexual and regular polypetalous fls. in axillary clusters, and indehiscent or tardily splitting leathery fr. R. Mangle, American M., is native on tidal shores and shoals and in marshes under sea influence and along streams from the Everglades, S. Fla. to W. Indies, Cent. Amer., S. Amer.: tree commonly to 40 ft. high but sometimes twice or more this height, with thick round and bushy top, forming dense and difficult tangles by the many arching aërial roots that become attached in the mud and form stilts or trunks as well as by the seedlings that arise from the seeds that begin to germinate before the frs. fall from the tree. In regions of its nativity the mangrove protects shores and aids in building land, and affords acceptable background for the development of personal properties; it is one of the most interesting of trees.

RHODANTHE: Helipterum Manglesii.

PHODIOI A. Sadum

RHODÓCHITON. Scrophulariaceæ. Graceful vine of free-flowering habit, similar to Maurandia but more vigorous and differing in technical characters; 1 species. It blooms the first season if the seed is sown in early spring, and should be treated as a tender ann. R. volubile. Purple Bell-Vine. Lvs. alternate, heart-shaped, to 3 in. long, toothed: fls. purplish-red, over 2 in. long, on red sts., solitary, drooping. Mex.

RHODODÉNDRON (incl. Azalea and Rhodora). Rose Bay. Azalea. Ericacex. Shrubs and small trees with alternate entire often leathery lvs., bell-shaped or funnelform fls. mostly in terminal umbel-like racemes, and capsular frs., making prominent autumnal buds. The botanical differences between azaleas and rhododendrons are not constant, but the azaleas are largely deciduous with funnelform fls. and the rhododendrons mostly evergreen with bellshaped fls.

Rhododendrons do not thrive in clay or limestone soils. Rhododendrons do not thrive in clay or limestone soils, but stand best un a maxture of leaf-mold, peat and sandy loam. They should be protected from strong winds and continuous hot sun, and the soil kept moist. Transplanting is easily effected in spring or fall if a good ball of earth is kept around the roots. Most of the species require a mulch as protection from frost. They usually need protection from early spring sun and winds, and are therefore placed where conscibled exercised by other but transplant.

from early spring sun and winds, and are therefore placed where somewhat screened by other plantings.
Rhododendrons and azaleas are propagated by seeds sown in pans or boxes of sandy peat and only slightly covered with sand or sphagnum. Seedlings should be transplanted as soon as they can be handled. The second year they may be taken out. Propagated also by layers which cannot be separated until the second year and slowly by cuttings of half-ripe wood taken with a heel. Named varieties are increased by grafting, particularly veneer-crafting.

grating
Rhodolendrons are often forced under glass for the
florists' trade. They should be grown in pots and can be
brought into bloom in about six weeks with a night temperature of 50-55°.

The varieties and hybrids of *R. catawhrense* are the standard and dependable rhododendrons for planting in the North Some of the unmodified species also endure the North Some of the unmodified species also endure northern conditions, particularly if given some protection, as R arbutifolium, bruchycarpum, campanulatum, carolinianum, caucasicum, dauricum, ferriquieum, hirsulum, Meternichi, micrainhium, minus, myntifolium, Prevudskii, Smirnoni. The few high northern species are of course very hardy, as R. lupponicum, maximum, partifolium. As here understood, Rhododendron includes all the azaleas, even though the latter are habitually kept separate by gardeners. The azaleas are commonly assumed to be deciduous, and this is true of the native North American species; but the Indian azaleas and others are evergreen.

species; but the Indian azaleas and others are evergreen, and some of the rhododendrons are deciduous. Nor is the and some of the rhododendrons are deciduous. Nor is the shape of the corolla or other character a constant mark of separation when the plants of the world are considered. Those who wish to name their plants under Azalea will find the Asynonym, in the following account, to be the tenable name under that genus. The much-modified garden azaleas are of three main groups: (1) the Indian azaleas (R. indican), evergreen, much grown under glass for florists trade and in the open along the seaboard and in the South and California; (2) the Ghent azaleas (hybrid derivatives from R. luteum, known as R. gandavense), deciduous, abounding in yellows, forced and also hardy on the seaboard; (3) the kurume and similar classes (forms of R. obtusum), evergreen, not hardy North but popular under glass. Some of the dwarf kinds, or taller species that bloom when small, are useful in rock-gardening.

The genus has been divided variously by different authors. The treatment usually accepted by botanists and horticulturists of Europe divides the genus into forty-four series and about as many sub-series. Because these 'series' do not represent clearly defined groups and are not each distinct from the other, they are not accepted here. The genus separates rather naturally into four subgenera, each with its respective subsections: Eurhododendron, Azaleastrum, Anthodendron and Therorhodon.

The subgenus Eurhododendron contains the true rhododendrons. It is characterized by leaves usually persistent, smooth, hairy or glandular spotted (lepidote) beneath, and rarely ciliate, with ovary usually glabrous. Sections of Eurhododendron are: Leiorhodon, Lepipherum, Pogonanshape of the corolla or other character a constant mark of

thum and Rhodorastrum. The first three usually have persistent leaves and the flowers arise from terminal buds. Section Leiorhodion has non-lepidote leaves and ovary, Section Leibrnouton has non-lepinote leaves and ovary, the leaves may be glabrous or tomentose beneath. Sections Lepipherum and Pogomanthum each have lepidote lvs. and ovary. Lepipherum has a rotate to funnel-shaped corolla. Pogomanthum has a salverform corolla. The section Rhodo-rastrum differs in its leaves usually deciduous and lepidote, flowers solitary or few from lateral buds and 10 stamens.

The remaining three subgenera have leaves usually deciduous, never lepidote, and rarely glabrous; the ovary usually setose. The subgenus Therorhoduon is characterized by flowers borne on a leafy-bracted peduncle. The flowers of the subgenera Azaleastrum and Anthodendron arise from leafless buds whose bracts are deciduous. Azaleastrum has

teaness bluds whose bracts are deciduous. Acateastrum has its flowers solitary or in two's with only 5 stamens, and the flowers of Anthodendron are usually many in terminal clusters with 5-10 stamens.

Sections of Anthodendron are: Tsutsutsi, Sciadorhodion, Rhodora and Pentanthera. The flowers and leafy branches of the first two sections arise from the same terminal bud Section Tsutsutsi is characterized by leaves persistent or Section Tsulsulsi is characterized by leaves persistent or deciduous, non-lepidote, and the branchlets vestured with appressed setose hairs; stamens 5-10. Section Sciadorhodon has leaves deciduous, non-lepidote, usually clustered at branchlet ends, branchlets glabrous or villous and stamens 8-10. In the sections Khodora and Pentanthera the flowers arise from terminal buds and the leaves from distinct lateral buds beneath Section Rhodora with a rotate-campanulate corolla has 8-10 stamens, and section Pantanthem with a function would be 5 stamens.

Pentanthera with a funnelform corolla has 5 staniens.

To economize space in the following brief diagnoses of species, or of plants under Latin names, letters are employed o distinguish the subgenus and section into which the plant falls according to the delimitations given above: E. Eurhododendron; Az, Azaleastrum; An, Anthodendron; Th, Therorhodion; Li, Leiorhodion; Le, Lepipherum; Po, Pogonanthum; Rh, Rhodorastrum; Ts, Tsutsutsi; Se, Seadorhodion; Rho, Rhodora; Pe, Pentathera and H, hybrids.

adenógynum. E, Le: to 8 ft: lvs. lanceolate-ovate, to $3\frac{1}{2}$ in long and $1\frac{1}{4}$ in. across, reddish-brown-pubescent beneath: fis. white tanged pink or erimson, to $2\frac{1}{2}$ in. across, fragrant. China.

adenóphorum. E, Le: to 8 ft.: lvs. lanceolate to oblong, to 5 m long, acute, thick, tawny beneath: fls. rose, to ¾ m across, corolla-tube cylindric and longer than limb, style as long as corolla. Yunnan.

adenópodum. E, Le: to 10 ft., branchlets gray-tomenacenopodum. E. Le: to 10 lt., branchlets gray-tomentose-glandular: lvs. oblong-lanceolate to oblanceolate, to 8 m. long, acute, base cuncate, densely tomentose beneath: fls. pale rose, to 1½ in. long, on pedicels nearly as long, lobes 5, stamens 10, ovary pubescent, style glabrous, calyx about ½ m. long. S. W. China.

æchmophýllum. E, Rh: to 3 ft.: lvs. lanceolate, to 2 in. long, acuminate to mucronate, not strongly pubescent: fls. rose, stamens puberulous, of unequal length. S. W. Szechuan.

æruginðsum. E, Li: to 8 ft.: differs from R. campanulatum in its more dwarf habit, lvs. glabrous above with a metallic luster when young and usually stiffer. Himalayas. -Probably ments only a varietal rank and is so considered by some authors.

agástum. E, Li: to 20 ft.: lvs. elliptic-oblong, to 5½ in. long, red-tomentose beneath, mucronate-tipped: fls. rose with crumson blotch within, unspotted without, campanulate, to 2 in. long, ovary glandular. W. Yunnan.

alabaménse (A. alabamensıs). An, Rho: low shrub, branches irregular, whorled, strigose when young, winterbuds glabrous: lvs. obovate to elliptic, to 2½ in. long, usually short-villous beneath and above on midrib: fis. white, about 1 in. long, appearing with the lvs., fragrant, in clusters of 6-10, funnelform, tube hairy outside and longer than lobes. Ala.

álbicans (A. albicans). An, Pe: hybrid between R. molle and R. occidentale: fls. white tinged yellow with orange blotch.

albiflorum (A. albiflora). Az: to 6 ft., deciduous: lvs. to 2½ in. long: fis. white, broad bell-shaped, ¾ in. across, solitary and nodding. June-July. B. C. to Ore. and Colo.

Albrechti (A. Albrechti). An, Rho: allied to R. pentaphyllum from which it differs in growing only to 6 ft. high, the lvs. obovate to oblong-lanceolate, pubescent beneath: fis. magenta in clusters of 3-6 and fr. bristly-glandular. N. Japan.—Distinguished from R. canadense in corolla not

album. E, Le: evergreen: lvs. to 4 in. long, rusty beneath: fis. yellowish-white, bell-shaped. Java.

álbum élegans. Hybrid with R. catawbiense as one parent: fls. pale pink changing to white.

álbum grandiflòrum. Hybrid with large pale pink fls. changing to white.

álbum nòvum. Hybrid differing from album elegans in fls. clear white and lower habit.

altaclarénse. A catawhiense hybrid with R. arboreum: fla. crimson.

ambiguum. E, Le: to 7 ft.: lvs. elliptic-lanceolate, to 3 in. long, lepidote beneath: fis. pale yellow spotted green, to 2 in. across, corolla lepidote without. W. Szechuan.

Amesiæ. E. Le: to 14 ft.: Ivs. elliptic to nearly oblong, to 3 in. long, acute, somewhat villous beneath on midrib, petioles setose: fls. dark purple, corolla funnelform, glabrous. W. Szechuan.

Anneliesis. An, Pe, H: hybrid of R. arborescens and R. calendulaceum: differs from R. arborescens in the midrib pubescent beneath and in the yellow blotch on upper lobe of the pale pink fls.; and from the latter parent in the glabrous character of the lvs., and almost glabrous branchlets.

Anthopogon. E, Po: to 2 ft.: lvs. oval or ovate, to 1½ in. long: fls. white or pink, fading to yellow but not yellow when opening, stamens glabrous. W. China.—True yellow-fld. forms ascribed to this species are probably R. hypenanthum

anwhéinse. E, Li: 1vs. ovate-lanceolate, to 2½ in. long, glabrous: fis. not seen. W. China.

aperántum. An, Rh: to 8 in.: lvs. ovate to obovate, to 1½ in. long, pale to purplish-green above, lighter and glabrous beneath: fis. rose to bright crimson, unspotted, stamens 10, about ½ as long as corolla. N. E. Burma.

aralioides: catalogue name, probably intended for R. azaleoides.

arboréscens (A. arborescens. Azaleastrum arborescens). anorescens, (A. aroorescens. Azaleasrum aroorescens). An, Pe: to 10 ft. or more, branchlets glabrous: Ivs. to 3 in. long: fis. white or pinkish, fragrant, funnelform, 2 in. long, June–July, stamens much exserted, style glabrous. Pa. to Ga. and Ala.

arboreum. E, Li: to 40 ft.: lvs. to 8 in. long, silvery beneath, base cuneate: fls. red, pink or white and often spotted, bell-shaped, to 1½ in. across. Mar.-May. Himalayas. Var. Câmpbelliæ (R. Campbelliæ), differs from var. nilagiricum in its more purplish fls. Var. nilagiricum has rose or crimson spotted fls., and lvs. reddish-brown-pubescent beneath, with obtuse to cordate base. Var. zeylânicum (R. zeylancum) has rich pink fls., lvs. bullate above and fullewy beneath. and fulvous beneath.

arbutifolium (R. daphnoides). Hybrid between R. ferrugineum and R. minus: to 4 ft., evergreen: lvs. to 3 in. long, scaly beneath: fls. pink, bell-shaped, to ¾ in. across. June-July.

argénteum: R. grande.

argyrophfilum. E. Li: to 20 ft., branchlets becoming glabrous: lvs. oblong-lanceolate, to 5 in. long, acuminate, white-felted beneath. fls. white often suffused rose, spotted on upper part, about 1½ in. long and narrowed toward base, lobes usually 6-10, ovary white-floccose. S. W. China. Var. culpare has corolla base wider and not funnelform.

Arnoldianum: R. obtusum var.

atlanticum (A. atlantica). An, Pe: to 2 ft.: lvs. to 2½ in. long: fls. white or pinkish, funnelform, 1 in. long, appearing before the lvs., fl. bud-scales with stipitate glands, stamens much exserted. Del. to S. C.

atrosanguíneum. A catawbiense hybrid with rich bloodred fis.

Aùcklandii: R. Griffithianum var.

Augustinii. E, Le: to 20 ft.: lvs. to 3 in. long, scaly beneath, petioles glabrous: fls. pink spotted with yellow, broad bell-shaped, to 2 in across. Apr.-May. China.

aureum: R. chrysanthum.

auriculatum. E, Li: to 20 ft., auriculate at base: lvs. to 1 ft. long, rusty-tomentose beneath: fls. white or pinkish spotted with green or rose, broad-funnelform, to 3½ in. across, Aug., corolla 7-lobed. China.

austrinum (A. austrina). An Pe: to 10 ft.: lvs. to 3½ in. long, pubescent: fls. yellow or orange, funnelform, to 1½ in. long, early spring, stamens much exserted. Fla.

azaleoides (R. odoratum). Hybrid between R. ponticum and probably R. nudiflorum: fis. pale purple, to 2 in. across.

Baileyi. E, Le: lvs. oblong-oval, to 3½ in. long, dark green above, buff beneath: fls. deep red-purple, to nearly ¼ in. across, usually 10-16 fls. in raceme, style shorter than corolla-tube, stamens 10 as long as tube. S. Tibet.

Balfourianum. E. Li: to 8 ft.: lvs. ovate to oblong-elliptic, to 3½ in. long, acute, base rounded to cordate, hairy beneath: fls. pale rose with crimson markings, funnel-campanulate, to 1½ in. long, on glandular pedicels to 1 in. long, lobes 5, stamens 10, ovary glandular and style glandular on basal third, glabrous above, calyx deeply 5-cleft, to ½ in. long. W. Yunnan.

balsaminæflörum: R. indicum var.

barbatum. E, Li: tree to 60 ft.: lvs. elliptical-lanceolate, to 7 in. long, glabrous beneath, petioles bristly: fls. deep red, bell-shaped, $1\frac{1}{2}$ in. across, Apr., ovary strongly glandular, stamens glabrous. Himalayas.

basflicum. E, Li: tree or shrub to 30 ft., young sts. red-tomentose: lvs. obovate, to 10 in. long, pubescent beneath, base cuneate to obtuse: fls. pale yellow spotted red, to 1½ in. long, stamens 16, ovary tomentose. Yunnan.

bauhinifforum. E, Le: perhaps not distinct from R. trylorum, reported to differ in 11st. 2-fld. and not 3-fld. and in scales of lower surface of lvs. unequal in size and of uniform color. Assam.

Benigiri: a form of R. obtusum.

Blandianum. A hybrid with R. catawbiense as one parent: fls. rosy-crimson.

Bodinièri. E, Le: small shrub: lvs. oblong-lanceolate, to 3 in. long, apex acuminate, glabrous beneath, rarely lepidote above: fls. rose spotted purple, to 1¼ in. long, usually 6-7 in infl., corolla glabrous without. Yunnan.

Bobthii. E, Le: a straggling epiphytic shrub to 10 ft.: lvs. ovate to elliptic, to 5 in. long, apex briefly acuminate, hairy above on margins and midrib: fis pale yellow, unspotted, to 1½ in. long, lepidote without, style shorter than stamens, lepidote at base, pedicels to 34 in. long. Bhutan.

brachyánthum. E, Le: to 5 ft.: lvs. oblong-elliptic, to 1½ in., lepidote beneath: fls. pule yellow to greenish-yellow, to 3½ in. long, corolla-tube broad bell-shaped, longer than limb, pedicels 1 in. long or more, calyx green to 3½ in. long. Yunnan.

brachycárpum. E. Li: to 12 ft.: lvs. to 8 in long, gravtomentose beneath, base rounded to auniculate: fls. cream-white flushed with pink, spotted brownish-yellow, to 2 in. across, ovary hairy, style glabrous, calyx minute. Japan, Korea. Var. rosæflörum has pink fls.

braceatum. E, Le: shrub to 6 ft., twigs not scaly: lvs. ovate-elliptic, to 2 in. long, obtusely mucronate, base rounded, lavly scaly above and densely so beneath: fts. white spotted red, campanulate, tube hairy within and scaly outside, s amens 10, hairy basally. W. Szechuan.

brevistylum. E. Le: to 10 ft: lvs. glabrous, to 4 in. long: fls. rose with crunson markings, to 134 in across, in terminal clusters, style pubescent on lower half, shorter than stamens, corolla-lobes longer than tube, pedicels to 1 in. long. Yunnan.

bullatum. E, probably Le: to 8 ft., branchlets densely woolly: lvs. to 4 in. long, brown-tomentose beneath, wrinkled above: fls. white with yellowish-green blotch at base, fragrant, bell-shaped, to 2½ in. across, margins wavy. Yunnan.

Bureavii. E. Li: to 6 ft.: lvs. to 4½ in. long, rusty-tomentose beneath mixed with glands, base obtuse or rounded: fls. rose marked crimson, ovary red-tomentose and glandular, calyx to 38 in. long. Yunnan.

Bylsianum. A reputed hybrid.

Calendulaceum (A. calendulacea. A. lutea, in part).
FLAME AZALEA. An, Pe: to 10 ft. or more, deciduous: lvs. to 3 in. long, pubescent when young: fis orange-yellow to scarlet, funnelform, glandular without, 2 in. across, May-June, stamens much exserted. Pa. to Ga. and Ky.

californicum: R. macrophyllum.

callimorphum. E, L: to 10 ft.: lvs. broadly elliptic, to 2% in. long, apex rounded, glaucous beneath: fls. rose, to 2 in. long, broadly bell-shaped, ovary glandular, stamens 10, glabrous. W. Yunnan.

calophyllum. E, Le: to 3 ft.: lvs. to 5 in. long, scaly and glaucous beneath: fls. white tinged yellowish-green, tubular-bell-shaped, 3 in. across, stamens about 15, not exserted. Himalayas.—Not known to be in cult.; plants under this name are probably R. Maddensi.

calophytum. E, Li: tree to 40 ft.: lvs. oblong, to 1 ft. long: fis, white to rose, broad bell-shaped, 2 in. across. China.

calostròtum. E, Le: to 1 ft., suitable for rock-garden: lvs. oval or elliptical, to 1 in. long, reddish and scaly beneath: fls. pink, solitary or in pairs, to ½ in. long, corolla pubescent without, calyx densely scaly, to ½ in. long. N. E. Burma.

caloxánthum. E, Li: to 5 ft.: lvs. nearly orbicular, to 2½ in. long, glabrous beneath: fls. yellow, to ¾ in. across, ovary densely glandular, stamens 10, glabrous. N. E.

camellæflörum. E, Le: weak often epiphytic shrub to 6 ft.: lvs. narrowly oblong-lanceolate, densely scaly beneath: fls. white tinged pink, to 1½ in. across, terminal in 2's, bell-shaped, style shorter than the 12-16 stamens. Himalayas.

campanulatum. E, Li: to 16 ft.: lvs. oblong, to 6 ir. long, rusty-tomentose beneath: fls. rosy-purple and spotted, broad bell-shaped, 2 in across, June, ovary glabrous. Himalayas.

Cámpbellise: R. arboreum var.

campylocárpum. E, Li: to 8 ft.: lvs. ovate to elliptic,

to 3 in. long, glabrous beneath: fls. yellow, sometimes with pale crimson blotches, fragrant, to 11/4 in across, ovary glandular, pedicels about 1 in. long. Himalayas.

campylógynum. E, Le: to 6 ft., less than 1 ft. tall in native habitat at 12,000 ft. altitude: lvs. obovate, to 1 in. long, glabrous beneath, petioles not scaly: fls. rose to dark purple, to 3/4 in. across, pedicels 11/4 in. long, corolla-tube longer than lobes. W. Yunnan.

camtschâticum (R. kamtschaticum. Therorhodion camt-schaticum). Thi to 1 ft, decidious: Ivs. to 2½ in. long, ciliate: fls. rose-purple, rotate-bell-shaped, to 1½ in. across. July-Aug. Alaska to B. C.

canadense (Rhodora canadensis). Rhodora. An, Rhot to 3 ft., much branched: lvs. about 2 in. long, gray-pubescent beneath: fls. rose-purple, 2-lipped, to 34 in. long, Apr.-May, corolla divided to base. Newf. to Pa.

candidíssimum. A reputed hybrid.

canéscens (A. canescens). An, Pc: to 15 ft., deciduous: lvs. to 4 in. long, gray-tomentose beneath: fls. pink or white, funnelform, 1½ in. across, Apr., stamens much exserted, corolla-tube much longer than lobes. N. C. to Fla and Tex. Var. rôseum is listed but the plant may be R. nudiflorum var. roseum.

cantábile. E. Le: to 3 ft.: lvs. oblong to nearly elliptic, to 1 in. long, densely scaly on both sides: fls. dark violet, to ¾ in. across, stamens 10, longer than tube, style basally pilose. Yunnan.

cardinale: listed name, probably a form of R. gandavense or R. Mortieri

carminata spléndens: hort, name.

carolinianum. E, Le: to 6 ft.: lvs. to 3 in. long, rusty-scaly beneath: fls. pale rose-purple to white, narrow bell-shaped, to 1½ in. across, Mny-June, stamens 10, style glabrous. N. C. Var. album has white fls.

Cartonianum. Reputed hybrid: fls. violet, white toward hase

catapástum: R. desquamatum.

catawbiénse. Mountain Rose Bay. E, Li: to 20 ft. catawoiense. Mountain Robe Bay. E. Li: to 20 ft., evergreen: lvs. to 5 in. long, shining above, pale beneath: fls. litac-purple, broad bell-shaped, to 23/g in. across, May-June, ovary tomentose, stamens 10. Mts., Va. to Ga. Var. album has white fls. Listed varietal names are comfetum and grand grand. páctum and grandiflòrum.

caucásicum. E. Li: to 2 ft.: lvs. to 4 in. long, brown-tomentose beneath, base cuneate, petioles glabrous, lateral vens visible through tomentum: fls. pink or yellowish-white spotted with green, narrow bell-shaped, 2 in. across. May. Caucasus.

cephalantholdes. E. Po: to 4 ft.: lvs. oblong-elliptic, to $\frac{3}{4}$ in. long, glabrous above, petiole $\frac{1}{2}$ 6 in. long, bud-scales deciduous: fls. white, tube yellow, to $\frac{3}{2}$ 6 in. long, not scaly, stamens 5-8, glabrous. Yunnan.

cephalánthum. E, Po: differs from R. cephalanthoides in persistent bud-scales, fls. white, and stamens basally pubescent. W. China.

Chamæcistus: Rhodothamnus Chamæcistus.

chamæunum. F. Le. to 1 ft.: lvs. oblong-elliptic, to ½ in. long: fls. deep rose-purple marked crimson, to 1 in. long, broadly funnel-shaped, ovary briefly tomentose, stamens 10. W. Yunnan.

charianthum. E, Le: to 15 ft.: lvs. oblanceolate, to 2 in. long, scaly on both surfaces, glabrous: fis. rose spotted red, to 3½ in. across, not scaly outside, style pubescent at base, longer than stamens. W. China.

chartophyllum. E, Le: to 8 ft. or more: lvs. persistent or deciduous, slightly scaly beneath, to 2½ in. long, glabrous: fls. pale purple, broadly funnel-shaped, to 2 in across, glabrous outside, in terminal and axillary clusters. Yunnan.

chasmantholdes. E. Le: to 5 ft.: lvs. oblong-triangular, to 4 m. long, midrib pubescent beneath, petiole glabrous: fls. rose to lavender with olive-green markings, scaly outside, calyx rim-like, unlobed. S. E. Tibet.

chrysanthum (R. aureum). E. Li: typically to 1 ft., occasionally to 3 ft., much branched: lvs. to 3 in. long, glabrous beneath: fls. pale yellow, narrow bell-shaped, 1 in. across, May-June, ovary rusty-tomentose. Siberia to Japan.

chryseum. E, Le: to 2½ ft.: lvs. ovate-elliptic, to ½ in, long, densely scaly above and below: fis. yellow, to ¾ in. across, scaly, tube much shorter than lobes, style longer than stamens. W. China.

ciliatum. E, Le: to 6 ft · lvs. to 4 in. long, hairy above, scaly beneath: fis. white to reddish-purple, bell-shaped, 1½ in. across, not scaly, early spring. Himalayas.

cinnabarinum. E, Le: to 10 ft.: lvs. to 4 in. long, scaly beneath fis. brick-red, tubular-bell-shaped, to 2 in. long, not scaly. May-June. Himalayas.

citriniflorum. E, Li: to 4 ft.: lvs. oblong-obovate to

obovate, to $2\frac{1}{4}$ in. long, obtuse at ends, densely tomentose beneath, petiole to $\frac{1}{4}$ in. long; fls. lemon-yellow, to $1\frac{3}{4}$ in. long, on pedicels to $1\frac{1}{4}$ in. long in umbels of 4-6, lobes 5, stamens 10, ovary glandular-hairy, style glabrous. W. Yunnan.

Clementings. E. Li: to 10 ft.: lvs. oval to oblong, to 5½ in. long, pubescent beneath: fls. yellowish-white to rose with crimson markings, to 1½ in. across, corolla 6-7-lobed, stamens pubescent at base. W. China.

coccinea speciòsa: hort, name for form of R. gandavense or R. Mortieri.

concinnum (R. yanthinum). E, Le: to 10 ft.: lvs. to 2½ in. long and scarcely 1 in. wide, scaly, glabrous beneath: fls. purple, 1½ in. across. May. China. Var. lepidánthum is R. pseudoyanthinum.

crássum. E. Le: to 20 ft.: lvs. to 5 in. long. rustv beneath: fis. white, funnelform, to 4 in. across, corolla and style scaly. Himalayas.

crinigerum. E. Li: to 12 ft.: lvs. to 7 in. long, pubescent beneath: fis. white to pink spotted purple or with large basal blotch, to 2 in. across, pedicels to 1½ in. long, ovary glandular. W. China.

croceum. E. Li: to 20 ft.: lvs. oblong. to 516 in. long. sparsely pubescent or glabrous beneath; fis. yellow, with or without crimson blotch, somewhat red-glandular without, to 1¼ in. long, ovary and style glandular. N. W. Yunnan.

cucullàtum. E. Li: to 8 ft.: lvs. oboyate to oblanceolate, to 3 m. long, tomentose beneath: fts. white spotted crumson, funnelform, to 1½ in. long, pedicels to ½ in. long, ovary glandular, style glabrous. W. China.

cuneatum. E, Le: to 4 ft.: lvs. elliptic, to 1 in. long, scaly on both sides: fls. dark rose, to 1 in. across, funnelform, glabrous, style glabrous, longer than stamens. Yunnan.

Cunninghamii. E. Li: hybrid of R. maximum and R. arboreum: lvs. brown-tomentose beneath and fis. white spotted purple. Not to be confused with "Cunningham's White," a hybrid of R. caucasicum and R. ponticum album.

cyanocárpum. E, Li: tree to 20 ft.: lvs. elliptic to orbicular, to 4½ in. long, glabrous beneath: fls. white to rose, to 3½ in. across, in umbels of 8-10, ovary and style glabrous. W. Yunnan.

dahùricum: R. dauricum.

Dalhoùsiæ. E, Le: to 8 ft., often epiphytic: lvs. to 5 in. long, rusty-scaly beneath: fis. yellow to white, fragrant, bell-shaped, 4½ in. across; style scaly, longer than stamens. Himalayas.

daphnoides: R. arbutifolium.

dauricum (R. dahuricum). E, Rh: to 6 ft., deciduous or semi-evergreen: Ivs. to 2 in. long, scaly beneath: fls. rosypurple, broad hell-shaped, to 1½ in. across, solitary. Mar.-Apr. Siberia to Japan. Var. mucronulatum is R. mucronulatum. Var. sempérvirens (var. atrovirens) has dark green evergreen Ivs.

Davidsonianum. E, I.e: to 10 ft.: lvs. to 2½ in. long, scaly and glaucous beneath: fls. pink, narrow bell-shaped, to 1½ in. across, May, infl. axillary and terminal, stamens slightly exserted. China.

decorum. E, Li: lvs. to 5 in, long, glaucous beneath: fls. white or pink, broad bell-shaped, 6-8-lobed, 2 in. across, stamens 12-16. China. Var. mājus is listed.—The plant known as R. verncosum differs only in the glands on the style being dark red and R. rhantum is not distinct from it.

Delavayi. E, Li: tree to 40 ft.: lvs. rusty-tomentose beneath, petioles and twigs reddish-tomentose: fis. deep red, broad bell-shaped, 1 in. across, on pedicels to ½ in. long, ovary pubescent. China.

deleiénse. E, Le: shrub to 3 ft., branches spreading: lvs. oblong, to 5 in. long and 1½ in. wide, mucronate, densely black-scaly beneath: fis. deep purple-magenta with tube darker within, tubular-campanulate; stamens 10, exserted, shorter than scaly style, stigma crimson, calyx large, deeply lobed, segms. rounded. Assam.

delicatíssimum. A catawbiense hybrid with pale pink fls. changing to white.

desquamatum (R. stenoplastum. R. catapastum). E, Le: shrub or small tree to 30 ft.: lvs. to 3½ in. long, scaly below, glabrous above: fls. pale pinkish-purple, to 1½ in. across, scaly outside, style glabrous, longer than stamens. W. China, N. Burma.

detonsum. E, Li: to 12 ft.: lvs. oblong-elliptic, to 5 in. long, densely or remotely reddish-tomentose beneath: fls. rose-pnik, crimson-spotted, to 2 in. across, pedicels 1½ in. long, corolla 5-7-lobed, ovary glandular. Yunnan.

diacritum (R. pycnocladum). E. Le: procumbent shrub to 2 ft.: lvs. broadly elliptical, to ½ in. long, densely scaly on both sides: fis. dark rose-purple with white throat, broadly funnelform, to ½ in. long, scaly, style glabrous, longer than stamens. Yunnan.

dichroanthum. E. Li: to 7 ft. or less, blooming when small: lvs. oblong to oblanceolate or obovate, to 4 in. long, whitish underneath, petiole to 3% in. long: fls. 2-8 together, yellowish-rose to orange, corolla fleshy and to 1 in. across. Yunnan.

dídymum. E. Le: to 1 ft. or more: lvs. obovate, to 2 in. long, in short whorls, dark green and rugulose above, gray-hairy beneath, apex rounded, base wedge-shaped: fls. dark crimson, tubular-campanulate, about 1 in. long, in umbels of 3-5, stamens 10, filaments red and glabrous, shorter than style. S. E. Tibet.

dilatatum: R. reticulatum.

distatum: *k. reticulatum*.

diphrócalyx. E. Li: to 15 ft.: lvs. oblong-ovate to obovate, to 6 in. long, obtuse or cuspidate, base rounded,
essentially glabrous beneath, petiole to ¾ in. long: fis.
light crimson to bright red, usually spotted or with basal
blotch, to 1¾ in. long, in umbels of 16-22, pedicels to ¼ in.
long and densely hairy, ovary pubescent and shorter than
the calyx-lobes. W. Yunnan.

discolor. E. Li: to 15 ft.: lvs. to 8 in. long, pale beneath, base cuneate: fls. white or pale pink, narrow bell-shaped, to 3½ in. across, June, stamens 14-16, glabrous, ovary glandular. China.

drumônium. E. Le: to 1 ft.: lvs. oblong, to ½ in. long and ½ in. wide, scaly on both sides: fls. pale bluish-purple, nearly ½ in. long, funnelform, solitary, stamens 10, style glabrous. Yunnan.

Edgarianum (R. oresbium). E, Le: to 3 ft.: lvs. broadly elliptic, to \(\frac{1}{3}\) in. long, scaly on both sides: fls. rose-purple, to \(\frac{3}{4}\) in. across, not scaly, style longer than stamens. W. China.

Édgeworthii. E, Li: to 6 ft., often epiphytic: lvs. to 4 in. long, rusty-tomentose beneath, dark green and bullate above: fls. white tinged with rose, broad bell-shaped, to 41/2 in. across, ovary and style tomentose. Himalayas.

elæagnoldes (R. sinolepidotum). E. Le: to 9 in, branchlets warty: lvs obovate-elliptic, to ½ in. long, scaly on both sides: fls. pale yellow or reddish-purple, to 1½ in. across, solitary, ovary scaly, stamens 8. Himalayas.

euchaltes. F, Le: currently considered a variant of R. neruflorum, differing only in its height of usually 15-20 ft. and tree-like in habit, not shrubby. Border of Yunnan and Burma.

Everestianum: see R. Morelianum.

eximium: R. Falconeri var.

Faberi. E, Li: to 18 ft.: lvs. to 6 in. long, rusty-tomentose beneath, base rounded: fls. white or pink spotted with red, broad bell-shaped, 1½ in. across, calyx to ¾ in. long, style glabrous. China.

Fáiconeri. E. In: to 30 ft.: lvs. to 10 in. long, rusty-tomentose beneath: fls. white spotted with purple, fragrant, bell-shaped, 2 in. across, in spring, corolla 8-lobed. Himalayss. Var. eximium (R. eximium), fls. rose, not spotted.

Fargèsii. E, Li: to 15 ft.: lvs. to 3 in. long, glaucous beneath: fls. white or pink, broad bell-shaped, to 2 in. across, May, calyx rim-like, stigma ¼ in. across. China.

fastigiatum. E. Li: very dwarf, evergreen: lvs. to ½ in. long, rusty-scaly: fis. lilac-rose, to 1 in across, glabrous, style glabrous, longer than stamens. China.—See R. impeditum.

fastudsum flore-plèno: see R. Morelianum.

Faurei. E. Li: shrub to 10 ft.: lvs. oblong-elliptic to obovate, to 5 in. long, upper surface glabrous, grooved along midrib, lower surface paler, apex and base rounded: fls. white or cream-colored, flushed pink along center of petals and green spotted, funnelform-campanulate, about 1 in. long, in racemes of 12-15, stamens 10, filaments glabrous and swollen at base, hairy above, stigma orange. Japan.

ferrugineum. E, Le: to 3 ft.: lvs. to 2 in. long, shining above, rusty-scaly beneath: fls. pink to carmine, funnel-form, ½ in. across. July-Aug. Mts. of Cent. Eu.

fictolacteum. E. Li: to 20 ft.: lvs. to 8 in. long, rusty-tomentose beneath: fls. white spotted with red, bell-shaped, 2 in. across, lobes 7-8, ovary glandular. China.

fimbriàtum. E, Le: low shrub with erect sts.: lvs. lanceolate to oblong-lanceolate, to 1 ¾ in. long, mucronate, scaly on both sides, petiole scaly: fis. deep mauve-purple fading to purple, about ¾ in. long, corolla campanulate, glabrous outside, stamens 10, over scaly, style pink and glabrous. N. E. Yunnan.

flávidum (R. primulinum). E, Le: to 3 ft.: lvs. oblong-ovate, to about ½ in. long, scaly, darker above: fls. few together, yellow, about 1 in. across, corolla glabrous, sta-mens 10, exserted. W. China.

flavum: R. luteum.

floribundum. E, Li: to 15 ft.: lvs. to 6 in. long, gray-tomentose beneath: fls. rose, 1½ in. across, pedicels to ½ in. long, ovary white-tomentose. China.

formosum. E, Le: to 8 ft.: lvs. to 2½ in. long, scaly and glaucous beneath: fis. white or pinkish, narrow bell-shaped,

to 2 in. across, scaly outside, style scaly, stamens 10, shorter than style. Himalayas.

Forsterianum. Hybrid between R. Edgeworthii and R. Veitchianum: fls. white.

Fortune. E, Li: to 12 ft., evergreen: lvs. to 8 in. long, glabrous beneath: fls. hlac or pink, fragrant, broad bell-shaped, to 3 in. across, May-June, calyx rim-like, style scaly. China. Var. cyanocarpum is R. cyanocarpum. Var. Houlstônii is R. Houlstonii.

fragrantissimum. Hybrid probably between R. ciliatum and R. Edgeworthni: fis. white or pinkish, fragrant.

Fraseri. Hybrid between R. japonicum and R. canadense: fls. rose-lilac, 2-lipped, to 1 ½ in. across.

fülgens. E, Li: to 8 ft.: lvs. to 4 in. long, rusty-tomentose beneath: fis. blood-red, bell-shaped, to 11/2 in. across, in spring, pedicels less than 1/2 in. long, ovary glabrous. spring, ped Himalayas.

galactinum. E, Li: tree to 20 ft.: lvs. to 8 in. long, tan-pubescent beneath: fis. rose with basal crimson blotches, to 1¾ in. across, 7-lobed, ovary glabrous, stamens 14. Szechuan

gandavénse. Ghent Azaleas. A series of hybrids between R. luteum and other species, probably R. calendulaceum, R. nudiflorum and R. Mortieri.

gigantèum. A catawbiense hybrid with bright rose fls.

gladcum. E, Le: to 3 ft., evergreen: lvs. to 3 in. long, scaly, glaucous beneath: fis. rose, bell-shaped, 1½ in. across or less, in spring, corolla and style not scaly. Himalayas.

globuligerum. E, Li: to 6 ft.: lvs. oblong to oboval, to 3 in. long, pubescent beneath, petioles tomentose: fls. white, marked crimson, about I in. long, bell-shaped, pedicels less than 1 in. long. W. China.

glomerulātum. E, Le: to 2 ft. or less, twigs densely brown-scaly: lvs. ovate to ovate-elliptic, about % in. long, densely scaly on both sides, apex emarginate, base rounded: fls. pale purple-mauve, about 6 in terminal clusters, narrowly campanulate, about ¾ in. long, glabrous outside, harry within. W. China(?)—Differs from R. russatum in glabrous style and smaller calyx.

grande (R. argenteum). E, Li: tree to 40 ft.: lvs. to 1 ft. long, white beneath: fls. rosy to white, bell-shaped, to 3 in. across, calyx minute, style glabrous with large disc-like stigma. Himalayas—Distinguished from R. calophytum by its shorter and glandular fl-pedicels.

grandiflorum. A catawbiense hybrid with clear rose fls.

Griersonianum. E, Li: to 6 ft.: lvs. to 7 in. long, acute, with a red horny tip, rusty-tomentose beneath, petioles tomentose: fls. rose with darker spots, 2½ in. long, style glandular at base. China.

Griffithianum. E, Li: to 8 ft.: lvs. to 1 ft. long, glabrous beneath: fis. white, fragrant, 3 in. across, bell-shaped, calyx to ½ in. long, stamens 12–18, glabrous, style glandular. Hima ayas. Var. Aùcklandii has fis. to 7 in. across.

hæmåleum. E, Li: to 4 ft.: lvs. to 3 in. ong, apex rounded, base cuncate, pubescent beneath, petiole less than 1 in. long: fis. dark crimson with white stamens, to 1½ in. long, tubular-bell-shaped. S. E. Tibet.

hæmatochilum: R. oreodoxa.

hæmatòdes. E, Li: dwarf shrub, sometimes to 10 ft.: lvs. oblong-obovate, to 3 in. long, pubescent beneath, petiole pubescent: fs. crimson, to 2 in. long, in umbels of 6-8, stamens usually 12, glabrous. Yunnan.

Hanceanum. E, Le: to 3 ft.: lvs. to 3 in. long, scaly: fls. pale yellow to nearly white, narrow bell-shaped, % in. across, in spring, stamens exserted, style glabrous. China.

Hatsu-giri: R. obtusum var. amænum.

hedy6smum: R. ledoides.

heliôlepis. E, Le: to 10 ft.: lys. oblong-elliptic, to 4 in. long, glabrous beneath, petiole $\frac{1}{2}$ in. long: fls. red to rose, broadly funnelform, to $\frac{1}{2}$ in. across, scaly outside, style longer than stamens, pubescent at base. Yunnand.

hemitrichotum. E, Le: to 3 ft.: lvs. oblanceolate, to 1 in. long, acute: fls. pale rose, less than 1 in. across, broadly funnel-shaped, short-lobed, stamens 8, pubescent, style very long. W. China.

Hinodegiri. One of the Kurume azaleas, R. obtusum var. Hinomòyo. A Japanese azalea, evergreen: fls. clear pink, produced profusely.

hippophaeoides. E, Le: to 5 ft., much branched: lvs. to 1½ in. long, scaly on both sides: fls. lavender-blue, bell-shaped, ½ in. long, tube villous within, style glabrous. China.

hirsutum. E. Le: to 3 ft.: lvs. to 1¼ in. long, scaly beneath, ciliate: fls. pink to carmine, funnelform, ½ in. across. June. Mts. of Eu.

Hódgsonii. E, Li: to 20 ft.: lvs. to 1 ft. or more long, rusty-tomentose beneath, petiole tomentose: fis. pale

purple, broad bell-shaped, 2 in. across, corolla usually 7-8-lobed, stamens 15-18, glabrous, ovary hairy. Himalayas.

horæum. E, L1: procumbent, to 1 ft. or less: lvs. obovate, to 2 m. long, densely tomentose beneath, petiole whitehairy, to ½ m. long: fls. deep crumson, bell-shaped, to 2 in. across, style glabrous, longer than stamens. S. E. Tibet.

hormóphorum. E. Le: to 3 ft.: lvs. lanccolate, to 2 in. long, ciliate, scaly on both sides: fis. rose marked with brown, funnelform, scaly, to $1\frac{1}{4}$ in. long, style glabrous, longer than stamens. W. China.

Houlstônii (R. Fortunei var. Houlstonii). E, Li: differs from R. Fortunei in smaller lvs., more glandular pedicels, and glandular-pubescent ovary, fls. pink. China.

hybridum. Hybrid between R. viscosum and R. maximum: fls. whitish tinged pink or purple and spotted with yellow, fragrant.

hypolepidotum. E. Le: to 4½ ft., branchlets scaly: lvs. oblanceolate, to 2 in. long, abruptly mucronate, scaly on both sides, petioles to ½ in. long: fls. yellow, broadly campanulate, to ¾ in. long, ovary scaly, style short and thick, stamens exserted. S. E. Tibet.

illuminătum: hort, name.

impéditum. E. I.e: to 20 in.: lvs. elliptic and obtuse, less than ½ in. long, scaly on both sides: fls. light purphish-blue, funnelform, to ½ in. long, not scaly, style glabrous, longer than stamens, stigma lobed. Yunnan.—Sometimes misnamed R. fastignatum which differs in its hoary rather dull green appearance, slightly shorter corolla, purple rather than brown anthers, and non-lobulate stigma.

Indicum (A. indica. R. macranthum. R. lateritrum).

An, Ts. to 6 ft., evergreen: Ivs. to 1½ m. long, pale beneath, margins crenulate: fls. red or pink, broad-funnelform, to 3 in. across, usually solitary. June-July. Japan. Var. balsaminæflorum (var. rosæflorum), fls. salmon-red, double. Var. laciniátum, fls. deeply 5-parted. Varietal names listed under Azalea are álbum, Cávendishii, coccíneum màjor is R. speciosum, concinnum élegans, Iveryànum is not distinct from var. variegatum, lilácinum, Miltonii, præstantíssimum, rôseum is R. mucronatum Sekudera, sublanceolátum, violàceum, vittàtum is R. Simsii var.—The A. indica of the trade is R. Simsii or hybrids of it and other species.

inopinum. E. Li: shrub, perhaps to 2½ ft.: lvs. ovate-oblong, to 5 in. long, apex acute to acuminate, base rounded: fls. cream-colored with crimson basal blotch and smaller spots, funnelform-campanulate, about 1 in. long, in race-mose umbels of about 10. Szechuan.

intermédium. Hybrid of R. maximum and R. ponticum with pink fls., to 3 ft.

intricatum. E, Le: to 1½ ft.: lvs. ½ in. long, scaly: fls. violet-purple, broad-funnelform, ½ in. across. June. China.

irroratum. E, Li: shrub or tree to 25 ft.: lvs. to 4 in. long, pale and glabrous beneath: fls. white or pinkish, narrow bell-shaped, 1½ in. long, ovary and style glandular. China.

japónicum (A. japonica). An, Pet to 6 ft., deciduous: lvs. to 4 in. long, ciliate: fls. orange-red to scarlet, narrow bell-shaped, to 2½ in. across. Apr.-June. Japan. Vars. álbum and rôseum are listed.

javánicum. E, Le: epiphytic shrub to 4 ft.: lvs. nearly obovate, to 5½ in. long, glabrous and scaly: fls. red, bell-shaped, 1½ in. long. Mts., Malaya.

Kaémpferi: R. obtusum var.

kamtscháticum: R. camtschaticum.

Keiskei. E. Le: low sometimes procumbent shrub to 10 ft.: lvs. lanceolate, to $2\frac{1}{2}$ in. long, scaly beneath: fls. lemon-yellow, unspotted, to $1\frac{1}{2}$ in. across, scaly outside, style glabrous, longer than the 10 stamens. Japan.

keléticum. E, I.e: semi-prostrate shrub to 6 in.: lvs. ovate to elliptical, to ½ in. long, mucronate, ciliate, scaly below: fls. purplish-crimson, darker marked, to 1 in. across, funnelform, calyx nearly ½ in. long, style longer than stamens. S. E. Tibet.

Kimnazdi. An evergreen azalea with deep rose fls. 11/4 in. across, and narrow lvs.

Kirishima. A Japanese evergreen azalea with large white fis having scarlet center: a form of R. obtusum.

kiusianum: R. obtusum var. japonicum.

Kosteriànum. Hybrid between R. japonicum and R. molle: fis. white to red.

Kőtschyi. F. Le: to 3 ft., usually less: lvs. oblanceolate, to ½ in. long, mucronate, crenulate, scaly below: fis. pink, rarely white, less than ¾ in. across, corolla-tube longer than lobes, style shorter than ovary. Cent. Eu.

Kurume azaleas: R. obtusum var. amanum.

istévii ens (R. Wilsonii. R. olesfolium). Hybrid between R. carolinianum and R. ferrugineum: fls. rose, 11/4 in. across.

lanatum. E, Li: large shrub or tree, but rarely exceeding 8 ft. in cult.: lvs. to 5 in. long, densely tomentose beneath, petioles pubescent: fis yellow spotted with red, bell-shaped, to 2½ in. across, pedicels less than 1 in. long. Himalayas.

lapponicum. E, Le: to 1½ ft. or prostrate, evergreen: lvs. to ¾ in. long, rusty-scaly beneath: fls. purple, broad bell-shaped, ½ in. across. June-July. Mts. of N. Eu., N. Asia, N. Amer.

lateritium: R. indicum.

Leachianum: Kalmiopsis Leachiana.

ledifòlium: R. mucronatum.

ledoides (R. hedyosmum). E, Le: to 2½ ft.: lvs. linear-lanceolate, to 1½ in. long, scaly beneath: fls. pale rose, to 3½ in. across, corolla-tube not scaly, longer than lobes, stamens 5, glabrous. Yunnan.

lepidòtum. E, Le: to 4 ft.: lvs. to 1½ in. long, scaly: fls. purple, broad bell-shaped, ½ in. across, ovary scaly, style shorter than the 8 stannens. Himalayas.

leucáspis. E. Le: shrub 1-2 ft high, twigs scaly and pilose: lvs. elliptic to obovate, to 2 in. long, pilose above, scaly beneath, apex rounded or nucronate, base tapering: fis. white, rotate, to 2 in. across, in infl. of 1-3, stamens 10, pubescent basally. Tibet.

levistratum. E, Li: to 10 ft: lvs to 3½ in. long, hairy beneath, base rounded to obtuse: fls white or pale pink, crimson spotted, about ¾ in. across, pedicels ¾ in. long, callyx minute. N. W. Yunnan.

lilácinum: R. indicum var.

linearifòlium (A. linearifòlia). An, Ts: to 4 ft., evergreen: lvs. linear-lanceolate, to 3 m. long: fls. rose-lilae, deeply divided into linear segms, stamens 5. Japan. Var. macrosépalium (R. macrosepalium). To 3 ft., often deciduous: lvs. elliptical-ovate to oblanceolate, acute or obtuse: fls. rose-purple. Var. dianthifòrum is a double-fd. form.

litangénse. E, Le: to 2 ft.: lvs oblong-elliptic, to $\frac{1}{2}$ in. long, scaly on both sides: fis. dull purple, to $\frac{1}{2}$ in. across, style glabrous, longer than stamens. W. China.

litiénse. E. Li: to 8 ft: lvs. oblong, to 3 in. long, glabrous beneath: fls. yellow, unspotted, broadly bell-shaped, to 1/4 in. long, style and ovary glandular, stamens glabrous. Yunnan.—Differs from R. croccum in its smaller fls. and lvs. waxy beneath.

16chmium. E, Le: spreading shrub, twigs densely scaly: lvs oblanceolate, to $2\frac{1}{2}$ in. long, recurved above from the midrib, glabrous above, densely scaly beneath, upex accumunate to mucronate, base narrowly wedge-shaped: fls. pink with red spots, to $1\frac{1}{2}$ in. long, glabrous outside. Probably W. Szechuan, described from cult. material passing as R. Dandsonianum.

Lòderi. Hybrid between R. Fortunei and R. Griffithianum: fls. white to rose, fragrant, to 6 in. across.

longistylum. E, Le: to 6 ft.: lvs. to 2 in. long, scaly beneath: fls. white, narrow bell-shaped, ½ in. across, style exserted, glabrous. China.

Luscombianum. Hybrid of R. Fortunei and R. Thompson, with pink fls.

lutéscens. E. Rh: to 6 ft., evergreen: lvs. to 3 in. long, scaly beneath: fls. yellow, broad funnelform, 1 in. across, in spring, stamens exserted. China.

lùteum (R. flavum. A. pontica). An, Pe: to 12 ft., deciduous: lvs. to 5 in. long, hairy when young: fls. yellow, very fragrant, funnelform, 2 in. across, May, stamens much exserted. Caucasus.—Parent of the race of Ghent azaleas; see R. gandavense.

lysólepis. E, Po: dwarf subshrub, branchlets erect and scaly: lvs. oblong-elliptic, to $\frac{3}{4}$ in. long, mucronate, glossy glandular-scaly above, scaly beneath: fls. pinkish-to dark-violet, to 1 in. across, corolla-limb at right angles to short the, infl. of 3 fls., stamens 10, long-exserted, ovary scaly. Nativity not known.

macránthum: R. indicum.

macrophfilum (R. californicum. R. washingtonianum). E, Li: to 10 ft. or more: lvs. to 6 in. long, glabrous beneath, apex acute: fls. rosy-purple spotted with brown, bell-shaped, to 2½ in. across, May-June, pedicels glabrous, ovary rusty-tomentose. B. C. to Calif.

macrosépalum: R. linearifolium var.

macrostemon. A Japanese azalea with large salmonpink fls.; a form of R. obtusum with smaller corolla and longexserted stamens.

Måddenii. E, Le: to 8 ft.: lvs. to 5 in. long, densely scaly beneath: fls. white, broadly tubular, to 3½ in. across, scaly outside, style scaly, stamens 20, glabrous, shorter than style. Himalayas.

malváticum: hort. name.

Mánglesii. Hybrid between R. Griffithianum and R. album elegans: fis. white, spotted.

Marièsii. An, Sc: to 10 ft.: lvs. deciduous, ovate-lanceolate, to 3 in. long, glabrous: fls. rose spotted reddish-purple, rotate-funnelform, to 2½ in. across, style glabrous, longer than stamens. S. E. and Cent. China.

maximum. E, Li: tree or shrub to 35 ft.: lvs. to 10 in.

long, tomentose beneath; fls. rose spotted with green, bellshaped, to 1½ in. across. June–July. N. S. to Ga. and Ala. Color forms are vars. album, purpurcum, roseum.

Máxwellii: hort, material under this name is probably of the R. indicum group.

Métternichii. E, Li: to 12 ft.: lvs. to 5 in. long, densely tomentose beneath: ffs. rose, bell-shaped, to 3 in. across. Apr.-May. Japan.

micranthum. E, Le: to 8 ft.: lvs. to 1½ in. long, rusty-scaly beneath: fls. white, bell-shaped, ½ in. across, June-July, stamens exserted. China.

minus (R. punctatum). E, Le: to 10 ft.: lvs. to 4 in. long, scaly beneath: fls. pink spotted with green, funnelform, 1½ in. across, June-July, style glabrous, shorter than stamens. S. C. to Ga. and Ala.

môlle (R. sinense. A. mollis). An, Pe: to 5 ft., deciduous: Ivs. to 6 m. long, gray-pubescent beneath: fis. golden-yellow, broad funnelform, 2 in. across. Apr.-May. China.

mollicomum. E. Le: to 6 ft.: lvs. narrowly lanceolate, to 1½ in. long, pubescent on both sides, scaly beneath: fis. crimson, to 1 in. across, in axillary clusters. Yunnan.

Morelianum. Hybrid between R. catawbiense and R. ponticum: fls. lilac-violet. R. Everestianum and fastuosum flore-pleno belong here.

Morii. E. Li: shrub or tree to 25 ft.: lvs. oblong-lancco-late, to 5 in. long, base rounded or truncate, glabrous or glandular-pubescent on midrib: fls. white or very pale rose spotted or blotched crimson, broadly bell-shaped, to 1% in. long, stamens 10-14. Formosa.

Mortièri. Hybrid between R. calendulaceum and R. nudiflorum: fis. pinkish spotted with orange.

Mossieanum: an orchid-lavender colored form of R. obtusum var. Arnoldianum.

moupinénse. E, Le: small shrub, sometimes epiphytic, to 2½ ft.: lvs. elliptic, to 1½ in long, scaly beneath: fis. white, to 1½ in. long, broadly funnelform, fragrant, glabrous, style glabrous, longer than stamens. E. Tibet.

mucronatum (R. ledsfolum and var. album. A. mucronata). An, Ts: to 6 ft., evergreen: lvs. to 3 m. long, tomentose: fls. white, fragrant, broad funnelform, 2 m. across. May. China. Var. narcissiforum, fls. white, double. A form having pure white fls. spotted with rose is Sekidèra.

mucronulatum (R. dauricum var. mucronulatum). E, Rh: to 7 ft.: Ivs. elliptic-lanceolate to lanceolate, to 3 m. long, acute, both sides somewhat scaly: fis. pale rose-purple, to 134 in across, before the lvs., style longer than stamens, glabrous. N. China.

muliense. E, Le: to 2½ ft.: lvs. oblong, to ½ in. long, densely scaly on both sides: fls. bright yellow, to ¾ in. across, corolla scaly, lobes shorter than tube, style pubescent, much longer than ovary. W. China.

myrtifolium. Hybrid between R. hirsutum and R. minus: to 5 ft., evergreen: lvs. to $2\frac{1}{2}$ in. long, rusty-scaly beneath: fls. pink, funnelform, 1 in. aeross. June July.—The name is sometimes confused in the trade with R. Kotschys.

myrtilloides. E, Le: low shrub to 6 in. with decumbent branches: Ivs. to ¾ in. long, gray-white and scaly beneath: fls. plum-colored, red inside, ¼ in. long, funnelform, glabrous Burma.

neriifòlium. E, Le: epiphytic shrub 3-9 ft. high: lvs. linear-lanceolate, to 3 in. long, scaly: fls. rose or purple, funnelform, 1½ in. long, usually solitary. New Guinca.

nikoénse: R. pentaphyllum.

níveum. E, Li: shrub or small tree to 15 ft.: lvs. obovate-lanceolate, to 6 in. long, thinly tomentose beneath with lateral veins visible: fls. magenta to purplish-lilac, narrowly bell-shaped, to 11/2 in. long, calyx rim-like, ovary pubescent. Himalayas.

norbitonense. Hybrid with R. molle as one parent: fls. yellow. beneath. Var. aureum (R. Smithii aureum) has lvs. glaucous

nudiflorum (A. nudiflora). PINXTER-FLOWER. numbroum (A. manipora). FINATEM-FLOWER. An, Fet to 6 ft. or more, deciduous: Ivs. to 3 in. long, glabrous and green underneath or hary on the midrib: fls. pink to nearly white, funnelform, 1½ in. across, Apr.-May, stamens exserted. Me. to Fla and T.x. Var. röseum (R. roseum, A. roseu) has under side of Ivs. and also shoots grayishpubescent; similar range but more inland.

obtasum (A. obtusa). An, Ts.: to 3 ft., much branched, evergreen: lvs. to 1 in. long, shining above: fls. red, funnelform, to 1½ in. across. Apr.-May. Japan. Var. álbum (R. ramentaceum) has white fls. and rather larger lvs. Var. amænum (R. amænum. R. Hatsu-giri), fls. purple or magenta, about 1 in. across, hose-in-hose; here belong most of the "Kurume" azaleas. Var. Arnoldianum is a hybrid between vars. amænum and Kaempferi with rose to red fls. Var. japônicum (R. kusianum) has two forms of lvs. at different seasons, fls. 2-5, the wild or spontaneous form. Var. Kaémpferi (R. Kaempferi) is often deciduous, sum-

mer lvs. somewhat different: fls. red to pink, 2-4, 2 in. across.—The Kurume and Hinodegiri azaleas are products of R. obtusum, the former particularly of var. amanum and the latter of var. apponeum.

occidentale (A. occidentalis). An, Po: to 10 ft., deciduous: lvs. to 4 in. long, cliate: fis. white or pink with yellow blotch, funnelform, to 2 in. across, June-July, stamens blotch, funnelform, exserted. Ore., Calif.

occulissimum: hort, hybrid of unknown parentage.

ochraceum. E. Le: to 9 ft.: Ivs. narrowly oblanceolate, to 3 m. long, pubescent beneath, pettole pubescent: fis. crimson, unspotted, open bell-shaped, to 1½ in. long, ovary harry, style and stamens glabrous. W. China.

odoratum. R azalemdes

Oldhamii (A. Oldhamii). An, Ts: much branched evergreen to 10 ft., very glandular and harry: lvs. elliptic or lanceolate to nearly ovate, to 3 m. long: fls. red, to 2 in, across the spreading rounded lobes. Japan.

olesefòlium: R lateurens.

oleifòlium: R. racemosum var.

Comurasaki: referable to R. pulchrum var. phaniceum.

orbiculare. E. Li: compact cushion-like shrub to 6 ft. high and 12 ft. across: lvs. broadly ovate to orbicular, to 4 m. long, glabrous beneath: fls. rose, bell-shaped, to 2½ in. across, 7-lobed, calyx mmute, style glabrous, stamens 14. W. China.

oreodóxa (R. hæmatochilum). E. Li: shrub: lvs. to 4 in. long, glabrous beneath, base obtuse or rounded: fls. pale rose, sometimes purple spotted, broadly bell-shaped, to 2½ in. across, usually 7-8-lobed, stamens usually 14. W. China.

oreotrephes. E, Le: to 7 ft.: lvs. to 2 in. long, rounded at each end, densely scaly beneath: fls. rose-lavender, broad funnelform, to 1½ in. long, not scaly, in tusses of 5-8, stamens exserted, style glabrous, shorter than stamens. China.

orésbium: R. Edgarianum.

orthoclàdum. E. Le: to 4 ft.: lvs. oblanceolate, to ½ in. long, scaly on both sides: fls. mauve, to ¾ in. across, funnel-form, not scaly, style glabrous, shorter than stamens. N. Yunnan.

ósmerum: R. russatum.

ovatum. Az: evergreen: lvs. to 2½ in. long, shining above: fls. pale purple to pink, spotted, 1 in. across. May-June. China.

pachýtrichum. E, Li: shrub 6-18 ft. high: lvs. oblong to oblanceolate or obovate, to 5 in. long, glabrous above and beneath except on lower side of mudrib which is brownshaggy-harry, apex cuspidate, base cordulate-rounded or cuneate: fls. white to pale rose with dark purple basal blotch, campanulate, to 1½ in. long, in racemose umbels of 7-10. W. Szechuan.

paradóxum. E, Li: shrub to 7 ft., terminal lf.-buds clongate with outer basal scales twice as long as inner: lvs. oblong, to 5 in. long, glabrous above with patches of loose indumentum beneath, apex obtuse and beaked, base rounded fis. white with dark crimson basal blotch with smaller spots above, to $\frac{3}{4}$ in, long, in racemose umbels of about 7–9 fls. Szechuan.—Similar to R. mopnum, the latter best distinguished by its ovate terminal If.-buds whose outer scales scarcely exceed the inner.

parvifòlium. E, Le: to 1½ ft.: lvs. to ¾ in. long, scaly on both sides: fls. rose-purple, broad bell-shaped, to ¾ in. across, glabrous within, Apr.-May. Siberia, Korea.

péndulum. E, Le: low shrub with trailing branches, often epiphytic: lvs. elliptic-oblong, to 2 in. long, woolly beneath: fls. white, sometimes yellowish within, broadly tubular, to 1½ in. wide, scaly outside. Himalayas.

pennsylvánicum. Listed as a natural hybrid of R. atlanticum and R. nudiflorum: fis. white, fragrant, early.

pentaphýllum (R. nikoense). An Rho: to 25 ft., deciduous: lvs. elliptic, glabrescent, to 2½ in. long: fls. rose, broad bell-shaped, 2 in. across, in clusters of 1-3. Apr.-May. Japan.

peregrinum. E, Li: shrub or small tree: lvs. elliptic, to 7 in. long, pubescent beneath: fis. white spotted and blotched bright red. to 2 in. across, bell-shaped, 6-7-lobed, on hairy pedicels to 1½ in. long, ovary glabrous. W. China.

phœniceum: R. pulchrum var.

planetum. E. Li: to 12 ft.: lvs. to 8 in. long, pale green beneath: fls. pink, narrow bell-shaped, to 2 in. long, calyx small, stamens 12-14, style glabrous with large flat stigma to 14 in. across. W. Chma.

pleistanthum. E. Le: differs from R. yunnanense in its violet to pale purple fis., non-bristly lvs. and non-scaly calyx. Yunnan.

polylèpis. E. Le: to 10 ft.: lvs. to 3 in. long, scaly beneath: fls. purple spotted with yellow, to 2 in. across, stamens exserted, longer than style. China.

pónticum. E, Li: to 10 ft.: lvs. to 6 in. long, pale be-

neath: fis. purple spotted with brown, narrow bell-shaped, 2 in. across. May-June. Spain, Portugal, Asia Minor. Vars. compactum and Daviesise are listed.

poukhanénse: R. vedoense var.

præcox. E, Rh: hybrid between R. dauricum and R. cilialum: lvs. to 2 in. long, rusty-scaly beneath: fis. rose-purple, broad funnelform, 1½ in. across. Mar.-Apr.

primulinum: R. flavidum.

pròbum. E, Li: shrub 4-6 ft. high: lvs. oblong to obovate, to 2 in. long, dark green and glabrous above, glaucousgray beneath, apex and base rounded: fls. white without markings, to 1½ in. long, in umbels of 4-5. W. Yunnan.—Currently treated as a variant of R. selense, a species not known to be in cult. in N. Amer.

procumbens: see Loiseleuria procumbens.

prunifibrum. E. Le: compact subshrub to 2 ft., branch-lets scaly: lvs. obovate-elliptic, to 1¼ in. long, obtusely mucronate, glabrous above, scaly beneath: fis crimson to plum-purple, to ½ in. long, broadly tubular-campanu-late, glabrous outside, ovary scaly, style short. N. E. Burma.

prunifòlium. An, Pe: to 10 ft., deciduous: lvs. to 5 in. long, pale beneath: fis. crimson, funnelform, 1 in. long, stamens much exserted. Ga. to Ala.

Przewalskii. E, Li: lvs. to 4 in. long, brown-tomentose beneath: fls. white or pink spotted with purple, bell-shaped, to 1½ in. across, ovary glabrous, grooved. China.

pseudoyanthinum (R. concinnum var. lepidanthum). E. Le: similar to and often confused with R. concinnum, differing in the larger lvs. 2½-3 in. long and 1-1¼ in. wide, and larger dark purple fis. W. Szechuan.

pubescens. E. Le: to 4 ft.: Ivs. narrowly lanceolate, to 34 in. long, scaly beneath and densely villous on both sides: fls. bright rose, to 34 in. long, lobes ciliate, style glabrous, longer than stamens. W. China.

palchrum. An, Ts: to 6 ft.: lvs. persistent, elliptic to oblong-oblanceolate, to 2½ in. long, glabrescent above, somewhat harry beneath: fls. rose-purple spotted darker, broadly funnelform, to 2½ in. across, sepals lanceolate, stamens 10. Intro. from cult. in China; possibly of bybrid origin. Var. calýcinum (R. ledifolium var. purpureum), fls. bright rose-purple, large, sepals usually acuminate. Var. phænfceum (R. puniceum), fls. magenta.

pumilum. E, Le: to 6 in., semi-prostrate: lvs. obovate-elliptic, to 4 in. long, scaly beneath: fls. pink, broadly tubular, to 4 in. long, pubescent and sometimes scaly outside. S. Thet, N. Burma, W. China.

punctatum: R. minus: also applied to R. læterirens and by some authors to R. carolinianum.

puniceum: R. pulchrum var. phæniceum.

purálbum. E, Li: shrub 12-15 ft. high: lvs. oblong-ovate, puralbum. E. Li: shrub 12-15 it. high: Ivs. colong-ovate, to 5 in. long, both surfaces glabrous at maturity, apex obtuse or subacute, base rounded to truncate or subcordate, petiole about 1 in. long: fis. white, saucer-shaped, to 1¾ in. long, about 8 in terminal umbels, stamens 10-12, style and ovary glandular. Yunnan.

purpureum crispum. A catawbiense hybrid with lilac-purple fls. spotted with green. purpureum élegans and grandiflorum have rich purple fls.

pvcnocladum: R. diacritum.

quinquefòlium. An, Sc: to 25 ft., deciduous: lvs. to 2 in. long, ciliate: fls. white spotted with green, broad bell-shaped, 1½ in. across. May. Japan. Var. ròseum is a synonym of R. pentaphyllum.

racembaum. E. Rh: to 6 ft., evergreen: lvs. to 1½ in. long, scaly and glaucous beneath: fls. pink, broad bell-shaped, ¾ in. across, Apr.-May, scaly but not pubescent, stamens exserted. China. Var. álbum, fls. white. Var. eleifolium (R. eleifolium) has pink to white fls. which are pubescent and scaly outside.

radians. E, Le: shrub: lvs. in whorls of 5-12, cordate-ovate or oval, to 2 in. long, slightly scaly beneath: fls. white, salverform, to 3 in. long, slightly scaly outside. Celebes.

radicans. E, Le: prostrate and matted, to 8 in. high, mentioned in rock-gardening: lvs. thick, narrow-oblong to somewhat obovate, about ½ in. long, shining above, grayish underneath: fis. solitary and terminal, dark purple, corolla about ½ in. long. Tibet.

radhum. E. Po: to 4 ft., branchlets bristly and scaly: lvs. narrowly oblanceolate, to 34 in. long, mucronate, scaly on both sides: fis. white flushed with rose, narrowly tubular, to 34 in. long, scaly outside, stamens 5, glabrous, ovary scaly, style short and glabrous. Yunnan.

ramentàceum: R. obtusum var. album.

ramosissimum. E, Le: to 3 ft.: lvs. broadly elliptic, to 1/4 in. long, scaly on both sides, reddish beneath: fis. dark purple, to 1/4 in. long, broadly funnelform, style glabrous, shorter than stamens. W. China.

ravum. E, Le: to 4 ft.: lvs. oblanceolate, to nearly 1/2 in. long, scaly on both sides: fis. rose, to 1/2 in. long, narrowly funnelform, style hairy at base, longer than stamens. Vunnan

rèpens. E, Li: creeping shrub to 1 ft. high: lvs. obovate to elliptic, to 1½ in. long, somewhat bullate above, glandular-hairy below: fis. crimson, to 1½ in. long, narrowly bell-shaped. W. China.—Vars. having larger lvs. or of taller habit are known.

reticulatum (R. rhombicum. R. dilatatum. A. reticulata). An, Sci to 25 ft., deciduous: lvs. ovate, to 2½ in, long: fls. rose-purple, broad bell-shaped, to 2 in. across. Apr.-May. Japan.

rhaibocárpum. E. Li: to 7 ft.: lvs. elliptic-oval, to 234 in. long, munutely pubescent beneath: fls. white or pinkish, sometimes with crimson basal blotch, funnelform, to 1½ in. long. N. W. Yunnan.

rhántum: see R. decorum.

rhômbicum: R. reticulatum.

rigidum. E. Le: shrub to 7 ft., twigs laxly scaly: lvs. oblanceolate, to 2 in. long, scaly on both sides, apex mucronate, base tapering: fls. very pale rose with crimson-brown markings, to 3/4 in. long, about 4 in terminal clusters. Yunnan.

riparium. E, Le: to 1½ ft.: lvs. elliptic, to ¾ in. long, scaly both sides: fls. purple with darker spots, to 1 in. long, lobes scaly outside. S. Tibet.

Ririei. E, Li: to 18 ft.: lvs. to 6 in. long, pale beneath: fis. purple with black spots, broad bell-shaped, 2 in, across.

rosæflorum: R. indicum var. balsaminæflorum.

Rósamundii: catalogue name for form said to have pink Ae Ì

roseum: R. nudiflorum var.: sometimes considered to be

roseum elegans and roseum superbum are catawbiense hybrids with lilac and rose-purple fis.

rubiginosum. E, Le: shrub or tree to 30 ft.: lvs. elliptic-lanceolate, to 2½ in. long, scaly beneath: fls. pinkish-blue, brown spotted, funnelform, to 2 in. across, style glabrous.

rupicola. E. Le: to 2 ft.: lvs. broadly elliptic, to 1/2 in. long, scaly on both sides: fls. dark crumson, to 1 in. across, scaly, style glabrous, longer than stamens. Yunnan.

russåtum (R. osmerum). E, Le: to 3 ft.: lvs. oblong to oval, to 1 in. long, scaly and russet-brown underneath: fls. in head-like umbels, deep purple-blue with white center, to 1/2 in. long, not scaly, style harry at base. Yunnan.

rústicum. Hybrid.

Rutherfordianum. Hort, hybrid having many forms from white through crimson, one parent of which is said to be R. pulchrum var. phæniceum.

Sakuragiri. A Japanese azalea having white fis. edged

saluenénse. E, Le: to 2 ft.: lvs. oblong-elliptic, to 1 in. long, scaly on both sides: fls. dark purple-crimson, to 1½ in. across, scaly and pubescent outside. N. W. Yunnan.

Sánderi. Hybrid between R. obtusum and R. Simsii.

sanguineum. E, Li: to 3 ft.: lvs. obovate to narrowly oblong, to 2½ in. long, minutely pubescent beneath: fls. crimson, narrowly bell-shaped, to 1½ in. long, ovary hairy, style glabrous. W. Yunnan.

scabrum (R. sublanceolatum). An, Ts: to 6 ft., evergreen: lvs. to 4 in. long; fls. rose to scarlet, funnelform, 2½ in. across. Japan.

Schlippenbachii (A. Schlippenbachii). An, Sc: to 15 ft., deciduous: lvs. to 5 in. long, pale beneath: fls. pink spotted with brown, fragrant, broad funnelform, to 3 m. across. May. Korea, Manchuria, Japan.

scintillans. E, Le: to 3 ft.: lvs. oblance olate, to $\frac{1}{2}$ in. long, scaly on both sides: fls. lavender, to nearly 1 in. across, broadly funnelform, not scaly outside. Yunnan.

Sèarsii. E, Le: to 15 ft.: lvs. oblanceolate-acuminate, to 3 in. long, scaly beneath: fls. white to mauve, to 2½ in. across, not scaly, style glabrous, longer than stamens. W. China.

serpylifòlium (A. serpyllifolium). An, Ts: low much branched shrub, branchlets appressed-hairy: lvs. deciduous, obovate to elliptic, to ½ in. long, base wedge-shaped, remotely hairy beneath: fls. rose-pink, funnelform, to 1 in. across, stamens 5, glandular on basal half, style glabrous, ovary hairy. Japan.

serrulatum (A. serrulata). An, Pe: to 25 ft., deciduous: lvs. to 3 in. long, ciliate: fls. white, fragrant, funnelform, 1½ in. long, stamens exserted. Ga. to Fla. and La.

setosum. E, Le: low spreading shrub to 15 in. high, branchlets densely setose: lvs. oblong-elliptic, to ½ in. long, glandular-scaly above and setose-scaly beneath: fls. bright purple-pink, funnelform, to 1 in. long, in 3-fld. terminal clusters, stamens 10, ovary scaly, style glabrous. Himalayas to S. Tibet.

Shérwoodii: catalogue name.

shweliénse. E, Le: to 3 ft.: lvs. to 2 in. long, scaly on both sides, grayish-white below: fis. greenish-yellow, bell-shaped, ¾ in. long. China.

siderophfilum. E, Le: to 9 ft.: lvs. to 3½ in. long, scaly beneath: fls. white to violet, to 1 in. across, lobes slightly scaly outside. S. W. Yunnan.

sigillatum. E, Li: shrub 6-12 ft.: lvs. oblong-elliptic to ovate or obovate, to 4 in. long, glossy above, ends rounded, densely short-hairy beneath: fls. white with crimson markings on lower side, in umbels of about 10, funnel-campanulate, to 1½ in. long, stamens 10, ovary and style glabrous. N. W. Yunnan

Símsii. An, Ts: to 10 ft., semi-evergreen: lvs. to 2 in. long, hairy: fls. rose to red, broad funnelform, to 2 in. across. May-June. China, Formosa. Var. vittàtum (R. nitatum), fls. white striped with hlae-purple.

sinénse: R. molle

sino-gránde. E. Li: to 30 ft.: lvs. to 1½ ft. long and 1 ft across, white-pubescent beneath: fis. white with crimson blotches, bell-shaped, 2½ in. long, stamens 18–20, puberulous at base. Mts., China.

sinolepidòtum: R. elæagnordes.

sinonuttállii. E. Le: to 10 ft: lvs. elliptic, to 8 in. long, scaly beneath, midrib raised on upper surface: fls. whitishpink tinged with yellow, fragrant, bell-shaped, to 5 in. across. China.

Smirnòwii. E, Li: to 18 ft.: lvs. to 6 in. long, browntomentose beneath: fls. rose, narrow bell-shaped, to 3 in. across. May. Caucasus.

Smithii. Hybrid between R, ponticum and R, arboreum: fls. rose-purple.

Souliei. E. Li: to 10 ft.: lvs. to 3 in. long, glabrous beneath; fls. pink or white, cup-shaped, to 3 in. across, May—June, ovary glandular, style glandular to tip, stamens glabrous. China.

speciosum (A. speciosa). An, Pe: to 6 ft., deciduous: lvs. to $2\frac{1}{2}$ in. long, pubescent beneath: fls. red with yellow spot, funnelform, to 2 in. across, May, stamens much exserted. S. C. to Ga.

sperabile. F., Li: to 6 ft.: lvs. elliptic-lanceolate, to 4 in. long, tawny-pubescent beneath, petiole 1/2 in. long: fls. scarlet, to 11/2 in. long, narrowly bell-shaped, style glandular and harry. N. E. Burma.

sphæránthum. E. Le: to 4 ft.: lvs. narrowly oblong-lanceolate, to 1 in. long, scaly beneath: fls. pink, to 3\% in. long, tubular, stamens 5, included, longer than style.

spinuliferum. E, Li: to 8 ft.: lvs. to $1\frac{3}{4}$ in. long, pubescent and glandular-scaly beneath: fis. red, tubular, 1 in. long, stamens exserted. China.

stenoplástum: R. desquamatum.

sterophyllum. To 6 ft., branchlets resinous-glandular: lvs. obovate, to 2 in. long, mucronate, densely scaly on both sides, petioles scaly, to ½ in. long: fls. rose-pink, very small, in 3-4-fid. clusters, stamens 10, hairy below, ovary scaly, style glabrous. Yunnan.

Stewartianum. E. Li: to 7 ft.: lvs. elliptical, to 5 in. long, pubescent beneath: fls. white, yellow to rose, to 2 in. long. N. E. Burma.

strigillosum. E. Li: to 8 ft., twigs strongly strigose: lvs. to 5½ in long, brown-hairy beneath: fis. red or white, bell-shaped, 1½ in. across, filaments and style glabrous. China

sublanceolàtum: R. scabrum.

sutchuenense. E. Li: to 10 ft.: lvs. to 10 in. long: fls. pink or hlac spotted with purple, narrow bell-shaped, to 2½ in. across, ovary and style glabrous. China.

taliénse. E, Li: to 10 ft.: lvs. to 5 in. long, rusty-tomentose beneath: fls. white to pink, narrow bell-shaped, 1 in. across. China.

tapetiforme. E, Le: slow-growing mat-forming shrub to 8 in high or less: Ivs. broadly elliptic, to ½ in. long, scaly on both sides: fls. pink, funnelform, to ½ in. long, not scaly, style glabrous, longer than stamens. Tibet-Yunnan border.

telmatèium. E, Le: to 3 ft.: lvs. narrowly oblanceolate, to ½ in. long, scaly on both sides: fls. deep rose-purple with white center, broadly funnelform, scaly outside, to nearly 1 in. across, style glabrous, longer than stamens. Yunnan.

tephropéplum. F, Le: lvs. to 2½ in. long, scaly beneath: fls. rose, broad funnelform, 1 in. long, style somewhat scaly and longer than stamens. S. E. Tibet.

Thayerianum. E, Li: shrub 9-13 ft. high: lvs. narrowly oblanceolate, to 5½ in. long, acute to acuminate, base cuneate: fls. white flushed pink, funnelform-campanulate, to 1½ in. long, usually 10-20 in compact racemose corymbs. W. Szechuan.

Thómsonii. E, Li: to 12 ft.: lvs. to 4 in. long, glaucous

beneath: fls. blood-red, bell-shaped, to 3 in. across, in early spring, stamens and pistil glabrous. Himalayas.

timetèum. E. Le: differs from R. oreotrephes in lvs. less glaucous beneath and scales more remote and fewer, the infl. usually only 3-4-fld., and corollas purplish-rose with a few darker markings. S. W. China.

Traillianum. E, Li: shrub or small tree to 30 ft.: lvs. to 4½ in. long, spex and base rounded, tomentose beneath: fls. white or pale rose spotted crimson, funnelform-bell-shaped, 1 in. across, infl. of 10-15 fls. N. W. Yunnan.

trichocladum. E. Le: to 3 ft., branches hairy: lvs. deciduous, oblong-lanceolate, to 1½ lm. long, pubescent above, minutely scaly beneath: fis. greenish-yellow spotted dark green, broadly funnelform, to 1½ lm. across, ovary scaly, style glabrous, sharply bent. W. Yunnan.

triflorum. E, Le: to 8 ft.: lvs. lanceolate, to 2½ in. long, scaly beneath: fis. light yellow, green spotted, to 1½ in. long, scaly outside, style glabrous, not sharply bent. Hımalayas.—Differs from R. Keiskei in its non-hairy petioles and green spotted fis.

tsangpoense. E, Le: weak much branched shrub to 2 ft.: lvs. obovate, to 1½ in. long, remotely scaly beneath: fis. pink, to 1½ in. across, usually 3-5 in infl., glabrous outside, style glabrous, abruptly bent downward, stamens hairy to top. Tibet.

tsarongénse. E, Po: to 2 ft.: Ivs. oblong to oblongelliptic, to ¾ in. long, sealy beneath: fls. white with yellow center, narrowly tubular, to nearly ¾ in. long, tube hairy within, scaly outside, stamens 5. S. E. Tibet.

Tschonóskii (A. Tschonosku). An, Ts: to 8 ft., much branched, deciduous: lvs. to 1 in. long, pubescent: fls. white, funnelform, ½ in. across, June, stamens exserted. Japan, Korea.

Ungernii. E, Li: to 20 ft.: lvs. to 6 in. long, brownt mentose beneath: fls. pink to white, broad bell-shaped, 2 in. across. Caucasus.—Differs from R. Smirnowii in its glabrous ovary and minutely apiculate If. apex.

vaccinioldes. Small shrub, usually epiphytic: lvs. oblanceolate, about % in. long, scaly beneath: fls. pink or white, to ½ in. long, somewhat scaly outside, style shorter than stamens. Himalayas.

Vaseyi (A. Vaseyi, Bıltia Vaseyi). An, Rho: to 15 ft., deciduous: lvs. to 5 in. long: fls. rose spotted with brown, 2-lipped, 1½ in. across, Apr.-May, stamens 5-7, exserted. N. C.

Veitchianum. E, Le: to 6 ft.: lvs. to 4 in. long, scaly and glaucous beneath: fts. white, broad funnelform, 5 in. across, scaly, style scaly at base, longer than stamens. Himalayas. vernicosum: see R. decorum.

verruculdsum. E, Le: to 3 ft.: lvs. broadly elliptic, to ½ in. long, scaly on both sides: fls. purple, to ¾ in. across, scaly, stamens 7-8, shorter than style. W. China.

Vervæneanum. A hybrid Indian azalea with rose fls. bordered with white. Var. album has white fls.

villòsum. E, Le: to 5 ft., rarely to 20 ft.: lvs. oblonglanceolate, to 4 in. long, scaly beneath, midrib pubescent: fls. rose, more than 1 in. across, scaly outside and bristly on lower half, ovary bristly and scaly. W. China.

virgatum. E, Le: to 4 ft.: lvs. to 2½ in. long, scaly beneath: fis. rose, funnelform, 1½ in. across, style longer than stamens, hairy and scaly on basal half. Himalayas.

viscôsum (A. viscosa). White Swamp Honersuckle.
An, P: to 10 ft. or more, deciduous: lvs. to 2½ in. long: fls.
white or pink, fragrant, funnelform, to 2 in. long, June-July,
stamens exserted. Swamps Me. to S. C. Var. glaucum, lvs.
glaucous beneath. Var. montanum, a dwarf form from
N. C.

vittatum: R. Simsii var.

Wallichii. E. Li: to 10 ft., branchlets glabrous: lvs. elliptic, to 4 in. long, obtuse, somewhat cordate at base, under surface with scattered tutts of hair: fs. lilac with dark rose-colored dots, broadly campanulate, to 2 in. long, in racemes of 6-10, pedicels 1½ in. long, corolla 5-lobed, stamens 10, pistil to 1¾ in. long, ovary glabrous. Himalayas.

Wardii. E. Li: to 20 ft.: lvs. broadly elliptic to semiorbicular, usually glabrous beneath: fls. bright yellow, to 3½ in. across, ovary and style glandular. W. Yunnan.

washingtonianum: R. macrophyllum.

Websterianum. E. Le: to 3 ft.: lvs. narrowly elliptic, to ½ in. long or less, densely scaly on both sides: fls. rose-purple, to 1 in. across, not scaly outside. W. China.

wellesleyanum. Hybrid between R. catawhiense and R. maximum: fls. white or pinkish.

Wéyrichii. An, Sc: to 17 ft., deciduous: lvs. suborbicular to rhombic-ovate, to 3 in. long, becoming glabrous beneath with age: fls. red, funnelform, to 2½ in. across. S. Japan and Korea.

Wightii. E, Li: to 14 ft.: lvs. to 8 in. long, rusty-tomentose beneath: fis. yellow spotted with red, bell-shaped, 2½ in. across. Himalayas.

Williamsjanum. E. Li: slender-branched, to 3 ft.: lvs. winamsianum. B, D. Stender-branched, to 3 lt.: vs. ovate or broader, mostly subcordate, to nearly 2 in. long, glabrous: fls. 3-5 together, pale rose, pedicels nearly glabrous, stamens glabrous. W. China.

Wilsonii: R. lætevrens.

Wiltonii. E. Li: to 15 ft., twigs greenish-white-pubescent, becoming glabrous with age: Ivs. to 5 in. long, cinnamontomentose beneath: fls. white to pink with red spots or blotches, to 2½ in. across, stamens harry at base. W. China.

yanthinum: R. concunnum.

Yavegiri. A Kurume azalea with double salmon-red fls. yedoénse (A. yodogava). An, Ts: deciduous or semi-evergreen: lvs. to 3 in. long, pale and harry beneath: fls. rose-lilae spotted with purple, double. May. Korea, Japan, Var. poukhanénse (R. poukhanense). To 6 ft.: fls. fragrant, 2 in across.

yodogàva or yodogàwa: R. yedoense.

yunnanense. E, Le: to 6 ft., semi-evergreen: lvs. to 3 in. long, scally, bustly on upper surface and margins: fls. white or pinkish spotted with red, broad funnelform, 2 in. across, May, mfl. axillary and terminal, stamens exserted. China. Var. præcox is listed.

zaleùcum. E, Le: tree to 30 ft.: lvs. to 3 in. long, gray-scaly and glaucous beneath; fls. white or pinkish, funnelform, 1): in long, scaly, style glabrous, longer than stamens. China.

zevlánicum: R. arborcum var.

RHODOHYPÓXIS. Amaryllidaceæ. A small genus of S. African bulbous plants allied to Hypoxis, differing in having a short perianth-tube and sessile anthers. They are adapted to the environment of a well-drained rock-garden when planted in a sandy soil in full sun; propagated by offsets or seed.

Baueri. To 2½ in: lvs. linear, acute, to 2 in. long, hairy and glaucous: fis. rose-red, to 1 in. across, solitary on erect slender sts.

hygrométrica: Hypoxis hygrometrica.

platypétala. Similar to R. Baueri and by some considered only a variant of that species, differing in fls. white or flushed pale pink and lvs. much more densely pubescent.

RHODOMÝRTUS. Murtaceæ. Trees and shrubs trop. Asia to Australia, with opposite simple lvs., rather large pink or white fls., and fr. a berry; grown for the edible fr.

The following species will withstand several degrees of frost and is not particular as to soil. Propagated by seeds which should be sown in flats.

tomentosa. Downy-Myrrle. Hill-Gooseberry. To 5 ft: lvs. to 2½ in long, densely tomentose beneath, 3-nerved from base: fls. rose-pink, ¾ in. across: fr. ½ in. across, purple. Japan, China, Philippines.

RHODORA: Rhododendron canadense.

RHODORHIZA: Convolvulus floridus.

RHODÓSTACHYS. Bromeliacex. Short-stemmed S. American herbs with stiff spinytoothed lvs. and sessile fls. in heads; suitable for cult. in a warm greenhouse.

andina. Lvs linear, to 1 ft long and 1 in. wide: fls. rose, 1 in. long, petals linear-lanceolate, acummate, the bracts about the length of fls. Chile.

pitcairniifòlia. Lvs. ensiform, to 1 ft. long, margins short-spined, innermost ones bright red at base: fls. blue, to 2 in. diam., in dense central sessile head, petals oblong, obtuse. Chile.

RHODOTHÁMNUS. Ericacex. much branched shrub about 1 ft. high suitable for rock-gardens. It does best in peaty moist soil in partial shade. Propagated by seeds, layers and cuttings of ripe wood. R. Chamæcistus (Rhododendron Chamæcistus). Lvs. to ½ in. long, entire, ciliate: fls. purple, 1 in. across, usually solitary, May-June. Alps of Eu., E. Siberia.

RHODÓTYPOS. Rosaceæ. Deciduous shrub to 6 ft., native in Japan and China and now much planted for ornament. R. tetrapétala (R. kerrioides). Jetbead. Lvs. opposite, ovate or oblong-ovate, to 4 in. long, doubly toothed: fls.

white, to 2 in. across, solitary, May-June: fr. a shining black drupe about ¼ in. across.—Hardy in N. Y. and New England and of easy cult. Propagated by seeds and cuttings. The generic name has recently been written Rhodotypus, but the author of the name used the Greek form -os. By some authors the specific name scandens is brought over from Thunberg's Corchorus scandens, 1793, supposed to be identical with our plant: but Thunberg described, under that name, a climbing plant with yellow fls., perhaps an error, and the name may lead to confusion when applied to Rhodotypos.

RHŒO. Commelinacex. Per. herb from W. Indies and Mex., grown in greenhouses and in the open in S. Fla., where it is also naturalized. R. discolor (Tradescantia discolor and versicolor). Sts. to 8 in. long: lvs. to 1 ft. long and 3 in. wide. dark green above, purple below, making an attractive erect-spreading foliage clump: fls. white, in dense umbels nearly concealed by 2 boatshaped bracts. Var. vittata is striped above lengthwise with pale vellow.

RHOMBOPHÝLLUM. Aizoacex. Segregate from Mesembryanthemum (which see for cult.), marked by oblique-rhomboidal white-flecked lys. and thread-like stigmas. S. Afr.

dolabriforme (Hereroa dolabriformis. M. dolabriforme). St. at length to 6 or 8 in : lvs. hatchet-shaped (dolabriform), glaucous, to 1½ in. long and nearly or quite half as broad at apex: fls. golden-yellow, 1½ in. across, in 3's or

Nèlii. Differs from $R.\ dolabriforme$ in the 2-lobed, not hatchet-shaped, lvs.

rhomboideum (M. rhomboideum). Stemless: lvs. 8-10, to 2 in. long and 34 in broad: fis. yellow, 1 in across, in 3's on a scape, the petals little exceeding calyx.

RHOPALÓSTYLIS (Eora). Palmacex. Unarmed ringed monocious feather-palms bearing infl. at summit of trunk and base of lvs., and with sheathing petiole-base, native in the New Zeal. region, all the species being accounted for herewith: crown rather narrow because of the upward or feather-duster habit of the lvs.: pinnæ with 1 strong rib either side the midrib: spadix short, stout, much branched; fls. in 3's, pistillate one in middle; stamens 6: fr. ellipsoid, ovoid-oblong or globose, ½ in. or less long, with fleshy exterior, seed 1. For cult. see Palm.

Baûeri: see R. sapıda.

Cheèsemanii: see R. sapida.

Cheèsemanii: see R. sapida.

sápida (Areca, Kentia and Eora sapida). Nikau Palm.
Erect clean-looking tree to 20 or 25 ft., trunk 6-9 in. diam.:
lys. to 8 ft.; rachis scaly; pinnæ numerous, 2-3 ft. or more,
1-2 in. broad: spadix 12-16 in. or less long; fls. purphsh:
fr. ovoid or ovoid-ellipsoid, about ½ in. long and ¾ in or
less diam., red at maturity; seed ovoid, with light colored
polished surface and broad-linear hilum: fruiting perianth
cup-like. New Zeal.—Thrives and fruits in S. Calif., the
spadices sometimes appearing only 2 ft. above the ground;
probably the only species planted in the U. S. R. Baheri.
Tall palm, probably reaching twice or more the height of
R. sapida: spadix to 3 ft. long: fr. ovoid-ellipsoid, ¾ in.
long and ½ in. diam., seed with dull brown surface, and
hilum linear and slightly narrowing toward base: fruiting
perianth cup-like. Norfolk Isl. R. Cheèsemanii of the
Kermadec Isls. (north of New Zea.; proper), was formerly
confused with R. Baueri: tall, to 60 ft.: spadix in fr. about
1½ ft. diam: fr. globose, ½ in. or less diam.; seed with
light colored polished surface, the hilum broad and suborbicular above and narrowing toward base: fruiting perianth wide-spreading rather than cup-like.

RHUBARB (Rheum Rhaponticum). Strong hardy Old World perennial grown for the thick leaf-stalks that are cooked and caten in early spring for their agreeable acid; known also as pie-plant. See Rheum.

Rhubarb thrives on any good garden land. As large leaf-stalks in abundance are wanted, the

land should be rich and kept moist.

The plant is usually propagated by division of the fleshy roots, small pieces of which will grow if separated from the old established roots and planted in rich mellow soil, every piece having a good eye. Planting is usually in spring; roots are spaced 2–3 feet apart in rows 4–6 feet apart and covering 3–4 inches deep. Clean tillage should be maintained throughout the season. If given good care the plants will yield abundantly for many years. The stalks should not be harvested until the second year. In harvesting the stalks are pulled (not cut) and the expanded portion of the leaf is cut off.

Rhubarb may be forced for winter and very early spring, either by placing a temporary glass structure over rows in the field or by digging the roots in autumn and growing them in the cellar or under a greenhouse bench. For the latter kind of forcing strong roots are employed, allowed to freeze after digging, then planted in position with earth underneath them and over them in a room or space with diffused light and a temperature 50° to 75°. After forcing, the roots

are usually discarded.

RHUBARB. SPINACH -: Rumex abussinicus.

RHÚS. Sumac. Anacardiaceæ. Woody erect or root-climbing plants native to temp. and subtrop. regions, with milky or resinous juice, simple or compound lvs., small polygamous fis. borne in panicles, 5 stamens, and small 1-seeded drupaceous fr.; grown for ornament; some of them yield tannin; some are poisonous.

Cultivation is simple in any garden soil. Propagated by seeds and root-cuttings; some species by layers and by cuttings of mature wood. Planted mostly in shrubbery borders for the luxinous effect of the pinnate foliage, the bright red autumn color, and the dense fruit-heads.

americana: Cotinus americanus.

anomatica (R. canadensis. Schmaltzia crenata). Fragrant S. Shrub to 8 ft. lvs aromatic, of 3 ovute coarsely toothed lfts. to 3 in long: fis. yellowish, in clustered spikes before the lvs.: fr. red and hairy. Ont. to Minn., south to Fla. and La. Var. laciniata is listed as having lits. more narrowly and deeply lobed.

canadénsis: R. aromatica.

chinénsis (R. javanica of hort., R. Osbeckii. R. semialata) Shrub or tree to 25 ft.: lvs of 7-13 ovate commonly toothed lfts to 5 in. long, brownish-pubescent beneath, the stalk winged: fls. creamy-white, in large terminal panicles in Aug. and Sept.: fr red and hairy. China, Jupan, S. Asia.

cismontana. Shrub to 6 ft.: lvs. of 11-15 lanceolate sharply toothed lfts. to 4 in. long: fls. greensh-yellow: fr. red and hairy. S. D. to Wyo., south to Ariz. and N. Mex. Var. flavéscens has yellow fr. changing to russet and light green foliage.—Sometimes treated as a var. of R. glubra.

coccinea: R. glabra.

cognàta: R. trilobata.

copallina. Shining S. Shrub or tree to 20 ft.: lvs. of 9-21 oblong-lanceolate usually entire lfts. to 4 in. long, the stalk winged: fls. greenish, in dense terminal panicles in July and Aug.: fr. red and hairy. Me. to Minn., south to Fla. and Tex.

coriària. Shrub to 20 ft.: lvs. of 9-15 oval to oblong toothed lfts. to 2 in. long, pubescent beneath, the petiole winged: fls. greenish, in loose terminal panucles in July: fr. red, harry. Medit. region.

cotinoides: Cotinus americanus.

Cotinus: Cotinus Coggygria.

diversiloba. Poison-Oak. Shrub to 8 ft. or sometimes climbing: lvs. of 3 ovate variously toothed or lobed lits. to 3 in. long: fls. greenish, in panicles with the lvs.: fr. whitish. B. C. to Calif.

glàbra (R. coccinea). SMOOTH S. Glabrous shrub or tree to 20 ft.: lvs. of 11-31 oblong-lanceolate toothed lfts. to 5 in. long: fis. green, in dense panicles in June and July: fr. searlet and hairy. N. S. to Minn., south to Fla. and La. Var. laciniàta has deeply cut lfts.

hirta: R. typhina.

integrifolia. Sour-Berry. Evergreen shrub or tree to 30 ft.: Ivs. simple, oval, to 2 in. long, entire or toothed: fis. white or pinkish, in pubescent panicles: fr. dark red and hairy. S. Calif.

javánica: the true R. javanica of Linneus is not known in cult., the plants so named are referred to R. chinensis.

láncea. Small tree: lvs. compound, the lfts. lanceolatelinear, to 5 m. long: fis. in panicles shorter than lvs. S. Afr.

laurina. Laurel S. Evergreen glabrous shrub: lvs. simple, ovate to lance olate, to 3 in. long, entire: fls. greenish-white, in dense panicles: fr. whitish. S. and Lower Calif.

Ósbeckii: R. chinensis.

ovàta. Sugar-Bush. Evergreen shrub to 10 ft.: lvs. simple, ovate, to 3 in. long, usually entire: fis. light yellow, in short dense spikes: fr. dark red and hairy. S. Cahi, Ariz.

quercifòlia: R. Toxicodendron.

radicans (R. Torticodendron.
radicans). Poison Ivy. Poison-Oak. Vine or low shrub:
lits. 3, to 10 in. long, margins entire, toothed or lobed,
glossy or dull above, glabrous or somewhat pubescent
beneath: fis. greenish-white, early spring: frs. white, in
axillary clusters, berry-like, waxy, persisting into the
winter. B. C. to N. S. south to Fla., Tex. and Mex.

semialata: R. chinensis.

succedànea. Wax-Tree. Shrub or tree to 30 ft.: lvs. of 9-15 oblong lfts. to 4 in. long, shining above: fls. yellow-green, in panicles in May: fr. whitish. Asia.

sylvéstris. Tree to 30 ft : lvs. of 7–13 ovate lfts. to 4 in. long: fls brownish-pulbescent, in panicles in June: fr. brownish-yellow, glabrous. China, Japan, Korea.

terebinthifòlia. Evergreen shrub to 6 ft.: lvs. of 3-15 oblong to ovate lfts. to 2½ m. long: fr. red or orange, hairy. Mox., Guatemala.

Toxicodéndron (R. quercifolia). Shrub to 1½ ft.: lvs. of 3 lfts. which are 3-7-lobed; fls. greenish, in panicles; fr. whitish. N. J. to Tex.—The R. Toxicodendron of most authors, and more commonly known as poison ivy, is now considered to be the plant treated here as R. radicans.

trichocárpa. Tree to 25 ft. or more, branchlets hairy when young: lfts. 13-17, ovate to oblong, to 4 in. long, acuminate, pubescent beneath on veins, margins entire, base rounded: fls. in axillary panicles to 6 in. long; fr. whitish. Japan, China.—Foliage orange to scarlet in autumn, probably poisonous.

trilobàta (R. cognata. Schmaltzia trilobata). Lemonade S. Ill-smelling shrub to 6 ft.: lvs. of 3 ovate usually coarsely toothed lfts. to 1 m. long: fls. greenish, in clustered spikes before the lvs.: fr. red and hairy. Ill. to Calif.

typhina (*R hirta*). STAGHORN S. Shrub or tree to 30 ft. with densely pubescent twigs: Ivs. of 11-31 oblong-lanceolate toothed lfts. to 5 in long: fls. greenish, in dense terminal pameles, in June-July: fr. crimson and hairy. Que. to Ga. and Ia. Var. dissécta has flts. cut and var. laciniàta lfts. aut bracts laciniately toothed.

venenàta: R. vernix.

vernicifius. Vannish-Tree. Lacquer-Tree. Tree to 60 ft.: lvs. of 11-15 ovate-oblong entire lfts. to 8 in. long: fis. whitish, in loose axillary panicles, in June and July: fr. yellowish, glabrous. Japan, China.

vérnix (R. venenata.) Poison S. Swamp S. Poison Dogwood. Shrub or small tree to 20 ft.: lvs. pinnately compound, lfts. 7-13, glabrous, margins without teeth, lf.-stalks reddish: fis. greenish, axillary: frs. greenish-white, in pendent axillary clusters to nearly 8 in. long, the pedicels persistent through the winter. Swamps, Me. to Minn., south to Fla. and La.— Probably not in cult.

viminalis. Tree to 40 ft. or more: lvs. trifoholate, lfts, lanceolate, to $2\frac{1}{2}$ in. long: fls. whitish-green, to $\frac{1}{8}$ in across, in terminal panicles. Afr.

RHYNCHOSIA (Dolicholus). Leguminosæ. Per. herbs or subshrubs with pinnately trifoliolate lvs., usually yellow papilionaceous fls. in axillary racemes, and flattened pods; rarely grown for ornament in warm regions.

minima. Slender twiner or trailer: Ifts. rhombic-ovate: fls. ¼ in. long: pods to ¾ in. long. Tropics.

pubërula (Desmodium cılıatum). Prostrate or partially climbing, with many flexuose branches: lfts. oblong: fls. ½ in. long: pods to ½ in. long. Cape.

RHYNCHOSPERMUM: Trachelospermum.

RHYNCHÒSTYLIS. Orchidaceæ. Old World epiphytic orchids with leafy non-pseudobulbous sts. and densely many-fld. lateral racemes;

dorsal sepal and petals similar, the lateral sepals broader; lip entire and spurred. For cult. see Orchids

retusa (Saccolabium Blumei. S. præmorsum.). Lvs. to about 1 ft. long and 1 in. wide, ligulate, imbricated: infl. a densely many-fld. pendulous raceme longer than lvs.; fls. about ¾ in. across; sepals and petals white spotted with purple; lip purple. June-Sept. India, Burma, Indo-China, Malaya, Philippines.

violacea: Anota molacea.

RHYTICÒCOS. OVERTOP PALM. Palmaceæ. One large mono-cious unarmed ringed feather-palm of the French W. Indies and Dominica, a segregate from Cocos with the aspect of Arecastrum. R. amàra (Cocos amara. Syagrus amara). Tree to 50 or 60 ft. with relatively thick trunk: lvs. long and heavy, dark shining green; pinnæ numerous, aggregate or fascicled particularly toward base of lf., middle ones 1½-2 in. broad, conduplicate, with very strong midrib: spathe conspicuously plicate-sulcate on outside; pistillate ffs. ovate or ovate-conic when closed, petals valvate at apex: fr. very large, 2-2¾ in. long, heavily fibrous-coated, ovoid with blunt apex; nutlet 1-celled, the wall bony and very thick; albumen ruminate, with cavity in center when dry.—A handsome tree, probably intro. into the southern part of our territory.

RIB: in a leaf or similar organ, the primary vein; also any prominent vein or nerve.

RIBBON-BUSH: Homalocladium.

RIBES. CURRANTS. GOOSEBERRIES. Saxifragaceæ. Shrubs of temp. regions, mostly deciduous, sometimes prickly, with alternate usually palmately lobed lvs., bisexual or unisexual fls. in racemes or solitary, appearing in spring with the lvs., and fr. a berry. Certain Ribes are grown for edible frs. (as R. Grossularia, R. hirtellum, R. odoratum, R. nigrum, R. sativum) and others for ornamental habit and bloom. For cult. see Currant and Gooseberry. Propagated by cuttings and mound-layers as well as by means of seeds.—Ribes proper, including the currants, is without spines at the nodes and the fls. are mostly in racemes on jointed pedicels. The Grossularia section (by some authors held as a separate genus), comprising the gooseberries, is prevailingly prickly and the fls. are solitary or few and pedicels commonly not jointed; the synonymy indicates them.

alpestre. Hedde G. To 10 ft., armed with spines about 1 in. long: fls. greenish or reddish, 1-2 together: fr. purple, glandular-bristly. Himalayas, China.

alpinum. Mountain C. To 8 ft., unarmed: fls. diœcious, greenish-yellow, in erect racemes: fr. scarlet, glabrous. Eu. Hort. vars are adreum with yellowish foliage, lacinitum with deceply cut lvs., pùmilum dwarf.

americanum (R. floridum). American Black C. To 5 ft., unarmed: lvs. resinous-dotted beneath: fis. yellowishwhite, in many-fld. drooping racemes: fr. black, glabrous. N. S. to Va. and Colo.

ahreum (R. tenuisorum. Chrysobotrya aurea). Golden C. To 6 ft., unarmed: fls. yellow, in 5-15-fld. racemes: fr. black or purplish, glabrous. Wash. to Mont. and Calif. Var. chrysococcum has orange-yellow fls. Var. gracfilimum differs chiefly in calyx characters.—See R. odoratum.

bracteosum. To 10 ft., unarmed: lvs. resinous-glandular beneath: fis. greenish or purplish, in erect racemes to 10 in. long: fr. black with whitish bloom. Alaska to Calif.

californicum. To 4 ft., spiny: fis. white with greenish or purplish calyx, solitary: fr. bristly. Calif.

cèreum. To 3 ft., unarmed, glandular-pubescent: fis. white or greenish, in few-fid. drooping racemes: fr. bright red. B. C. to Mont. and Calif.

curvatum (Grossularia curvata). To 3 ft., with spines to 1/2 in. long: fls. white, 1-5 together: fr. greenish, glabrous. Ga. to La. and Tex.

Cynósbati (Grossularia Cynosbatii). To 5 ft., with spines to ½ in. long or lacking: fis. green, 1-3 together: fr. wine-red, prickly. N. B. to N. C. and Ala. Var. inérme is a native form without prickles.

Diacantha. To 6 ft., armed with small prickles: fls. dioecous, greenish-yellow, in erect racemes: fr. scarlet, glabrous. N. Asia.

echinéllum (Grossularia echinella). To 3 ft., with spines about ½ in. long: lvs. less than 1 in. long: fls. green or greenish-white, 1-2 together: fr. green, very prickly. Fla.

fasciculatum. To 5 ft., unarmed: fis. direcious, yellowish, fragrant, the staminate in 4-9-fid. umbels, the pistillate in 2's: fr. searlet, glabrous. Japan, Korea. Var. chinénse is larger. N. China.

flóridum: R. americanum.

glandulosum (R. prostratum). Fetid C. Low, with prostrate sts.: fls. white or pinkish, in 8-12- fld. racemes: fr. red, bristly. N. Amer.

glutinosum. To 12 ft., unarmed, glandular-pubescent: fls. red, in spreading or nodding racemes: fr. black, bloomy. Calif.

Gordonianum. Hybrid between R. sanguineum and R. odoratum with yellow fis. tinged red outside.

gracillimum: R. aureum var.

Grossulària (Grossularia reclinala). English G. To 3 ft., with spines to $\frac{1}{2}$ in. long. fls greenish, 1-2 together: fr. red, yellow, or green, pubescent. Eu., N. Afr., S. W. Asia—Original of the large European gooseberries. Var. **Üva-crispa** has smaller lvs. and yellowish fr.

hesperium (Grossularus hesperus). To 10 ft., with spines to ½ in. long: fis. greenish-red, 1-2 together: fr. very prickly. S. Calif.

hirtélium (Grossularia hirtella) To 3 ft., the branches bristly: fls. greenish or purplish, 1-3 together: fr. purple or black, commonly glabrous. Newf. to W. Va. and S. D.—Original either directly or through hybridization of the American pomological gooseberries.

inèbrians (R. pumilum). Branched erect shrub to 4 ft.: lvs. 3-5-lobed, glandular beneath: fls. pink, in few-fld. racemes: fr. red, often glandular. Mont., S. D., to N. Mex. and Cent. Calif.

inérme. To 6 ft., usually with few small spines: fls. green or purplish, 1-4 together: fr. purplish-red, smooth. B. C. to N. Mex.

japónicum. To 6 ft., unarmed: fls. greenish or brownish, in erect racemes: fr. black, smooth. Japan.

lacústre (Limnobotrys lacustris). To 3 ft., with clustered spines and bristles: fls. greenish or purplish, in 12-20-fld. drooping racemes: fr. purple, bristly. N. Amer.

lasianthum (R. leptanthum var. lasianthum. Grossularia lasiantha). To 3 ft., stiffly branched, with spines ½ in. long: fls. yellow, 2-4 together: fr. crimson, glabrous. Mts., Calif.

leptánthum (Grossularia leptantha). To 6 ft., with spines to ½ in. long: fis. greenish-white, 1-2 together; fr. black, shining. Colo. to New Mex.

Lóbbii (Grossularia Lobbia). To 6 ft., with spines to 34 in. long: fls. purple-red, 1-2 together: fr. purple, densely glandular. B. C. to Calif.

malvaceum. To 6 ft., unarmed: fls. pink or purple, in drooping racemes: fr. sticky-pubescent. Calif.

missouriénse (Grossularia missouriensis). To 6 ft., more or less bristly and the spines ¾ in. or less long: fls. greenish-white, 2-3 on slender peduncle: fr. purplish, glabrous. Tenn. west and northwest.—Like R. niveum but with smaller and greener fls.

nevadénse. Unarmed: fls. rose, in 12-20-fld. racemes: fr. blue, glaucous. Ore., Cahf., Nev.

nigrum. European Black C. To 6 ft., unarmed: fls. greenish-white, in 4-10-fld. drooping racemes: fr. black, glabrous. Eu., Asia. Some of the hort. vars. are: chlorocarpum, fr. green; heterophyllum (var. laciniatum), lvs. deeply cut; reticulatum, lvs. mottled with yellow; xanthocarpum, fr. yellow or whitish.—The black currants of fruit-gardens are of this species.

níveum. To 10 ft., with spines to ¾ in. long: fls. white, 1-4 together: fr. bluish-black, glabrous. Ida., Wash., Nev.

odoratum (Chrysobotrya odorata). Buffalo C. To 6 ft., unarmed: fls. yellow, fragrant, in 5-10-fld. racemes: fr. black, glabrous. S. D. to Tex. Grown foi fr. in the form known as Crandall.—Closely related to R. aureum and differing chiefly in having the sepals less than half the length of the calyx-tube; these species have been confused.

orientale $(R.\ resinosum)$. To 6 ft., unarmed: fls. diœcious, green tinged with red, in short racemes: fr scarlet, pubescent. Eu., Asia.

oxyacanthoides (Grossularia oxyacanthoides). Low, bristly, with spines ½ in. or less long; fis. greenish-white, 1-2 together: fr. red, smooth. N. Amer.

petræum. To 6 ft., unarmed: fls. red or pink, in racemes to 4 in. long; fr. dark red. Mts. of Eu.—A variable species of many botanical varieties.

pinetòrum (Grossularia pinetorum). To 6 ft., with spines 1 in. or less long: fls. orange-red, 1-2 together: fr. purple, prickly. Ariz., New Mex.

prostratum: R. glandulosum.

pilmilum: R. inebrians.

resindsum: R. orientale.

robústum. Hybrid between R. niveum and probably R. incrme: spines small: fls. white or pinkish.

Roézlii (Grossularia Roezlii). To 6 ft., branches spreading, tortuous, spines usually in 3's, to ½ in. long: lvs. rounded, to 1 in. across, 3-5-lobed, incised-crenate, more densely hairy beneath than above: fis. with white petals: fr. dark red to purplish, about ½ in. across, hairy and prickly. Calif.

rotundifolium. To 3 ft., with few small spines: fls. greenish-purple, 1-3 together: fr. purplish, smooth. Mass. to N. C.

rùbrum. Northern Red C. To 6 ft., unarmed: fls. greenish-brown. in racemes: fr. red. Eu., Asia.—Cult. in Eu. but rarely in Amer.

sanguineum. To 12 ft., unarmed: fls. red, in many-fld. racemes: fr. bluish-black, bloomy. B. C. to N. Calif. Vars. atrorubens and spléndens have dark red fls.

sativum (R. vulgare). Common or Garden C To 5 ft., narmed: fls. green or purplish, in many-fld. drooping racemes: fr. red or white, juoy. W. Eu. Var. macrocarpum, Cherny C., has large red frs. Var. variegatum has lvs. variegated with white or yellowish.—Here belong the common pomological currants.

setòsum ((frossularia setosa). To 3 ft, bristly, with spines to about 1 in. long: fis white, 1-3 together: fr. red or black, glabrous or slightly bristly. Ida. to S. D.

speciòsum (Grossularia speciosa). Fuchsia-flowered G. Evergreen, to 12 ft., bristly and spiny: fls. bright red, 2-4 together, drooping, the stamens long exserted: fr. red, glandular-bristly. Calif.

stenocárpum (Grossularia stenocarpa). To 6 ft., spiny: fls. reddish, 1-3 together: fr. greenish or reddish, mostly glabrous. China.

ténue. To 8 ft., unarmed: fls. diœcious, brownish-red, in racemes: fr. red. W. Asia.

tenuiflorum: R. aureum.

triste. Swamp Red C. Sts. decumbent: fls. purple, in drooping racemes: fr. red, smooth. N. N. Amer., N. Asia.

viburnifòlium. Evergreen, to 8 ft., unarmed: fls. rose, in erect racemes: fr. red. S. Calıf., Lower Calif.

vulgàre: R. sativum.

RÍCCIA. A genus of hepatics or liverworts (which are allied to mosses), one of which may be seen in aquaria or pools; it is R. fluitans, with little green radiating thalli on the surface of the water much like branching lemnas and which may be gathered with those plants on stagnant and roadside pools: thallus or plant-body forking and becoming an inch or two long, sometimes forming mats, without root-hairs when floating but developing them when stranded on mud, the branches or divisions \(\frac{1}{8} \) in. or less broad.

RICE: Oruza sativa. -Flower: Pimelea. Wild: Zizania.

RICHÁRDIA. Rubiacex. Pubescent or hairy herbs with opposite entire lvs. and white or pink fls. in terminal clusters subtended by an involucre, having funnelform corolla and 3-5-lobed limb. See Zantedeschia for calla-lily once known as Richardia.

One species is grown as a forage, green-manure and cover-crop in southern United States. It thrives on sandy soil. Propagated by seeds.

scabra (Richardsonia scabra). Mexican Clover. Ann. with erect or diffuse sts. to 4 ft. long: lvs. ovate to lanceolate, to 3 in. long, rough: fls. white, ¼ in. long. S. C. to S. Amer.

RICHARDSONIA: Richardia scabra.

RICINUS. Euphorbiaceæ. A single variable species widely nat. in the tropics and warm regions but originally from Afr., commonly planted for foliage effects; the seeds yield oil

which is extensively used for medicinal and other

Castor-beans thrive in sandy or clay loams with good drainage, although they grow on any land not too wet. Seeds may be sown where the plants are to stand or sown in pots under glass and transplanted about the middle of May.

communis. Castor-Bean. Castor-Oil-Plant. Palma Christi. Ann. to 15 ft., or in tropies a tree to 40 ft.: lvs. peltate, palmately divided into 5-11 lobes, to 3 ft. across: fls. monœcious, without petals, in panieles 2 ft. or more long: fr. to 1 in. long, covered with soft dark brown spines. Runs into numerous forms, the best known of which are: africanus with very large green lvs; borboniénsis arboreus africanus with very large green lvs; borboniénsis arbòreus with red sts. and glaucous lvs.; cambodgénsis with very dark foliage and sts.; coccíneus with dark red foliage; Gíbsonii, a small form with dark red foliage having a metallic luster; hýbridus panórmitans, a large form with dark, very glaucous foliage; laciniàtus, lobes deeply cut; macrocárpus, purple-red foliage; macrophyllus, purple-red; purpièreus, purple-red; sanguineus with red lvs.; zanzibarénsis, bright green lvs. with white veins.

RICÒTIA. Crucifera. Annuals of the Medit. region: glabrous and much branching: lvs. mostly pinnatisect: fr. a broad flat pod. R. Lunaria, of Egypt and Syria, is a diffuse quick-growing ann. sometimes raised for its lilac radish-like fls. and large flat thin odd pods.-Sow in the open in spring; fls. should appear in two months or less; plant 8-20 in. high, spreading: sometimes used in rock-work.

RIGIDÉLLA. Iridacex. A small genus of halfhardy bulbous plants from Mex., differing from Tigridia in the very small inconspicuous crect inner perianth-segms, and larger outer ones with a reflexed blade.

flámmea. To 5 ft.: lvs. broadly linear-lanceolate, plicate, equitant: fls. bright scarlet striped black at throat, in terminal fascicles: caps. 3-valved and papery. Var. guatemalénsis is listed.

RIMÀRIA. Aizoacex. Plants in the trade under this name may be found as follows:

Cómptonii: Gibbæum Comptonii.

Hèathii: Gibbæum Heathii.

Pole-Évansii: Dinteranthus Pole-Evansii.

Roddiæ: Vanheerdia Roodiæ.

RIMU: Dacrydium cupressinum.

RIVINA. Phytolaccacex. Herbs with alternate entire lvs., small bisexual fls. in many-fld. racemes, and fr. a red berry; grown out-of-doors and in the greenhouse for the ornamental little berry-like frs. Propagated by seeds or cuttings in spring over heat.

aurantiaca: R. humilis.

hùmilis (R. aurantuca). ROUGE-PLANT. To 3 ft.: lvs. ovate, to 4 in. long: fls. white or rosy. S. U. S. and trop.

ROBERTIELLA: Geranium Robertianum.

ROBÍNIA. Locust. Leguminosæ. American trees and shrubs with pinnate lvs., showy papilionaccous fis. in usually pendulous racemes, and flattened pods; planted for ornament.

Locusts are mostly hardy in the North and thrive in any usual soil. Propagated by seeds sown in spring, by suckers, root-cuttings and division, and special varieties by grafting.

Bessoniàna: P. Pseudo Acacia var.

Bóyntonii. Shrub to 10 ft.: lfts. 7–13, elliptic or oblong: fls. pink or rose-purple and white, May-June: pods glandular-hairy. N. C. to Ga. and Ala.

Decaisneana: R. Pseudo Acacia var.

Élliottii. Shrub to 4½ ft., branchlets glabrous or pubescent, not hispid: lfts. 11-15, to 1 in. long, elliptical: fls. rose-purple or white, racemes 5-10-fld., peduncle pubescent: pods hispid. N. C. to Ga.

fértilis: R. hispida var.

globòsa: listed name of plant resembling R. Pseudo-Acacia var. Rehderi

hispida. Rose Acacia. Shrub to 7 ft., with bristly hairs: hispida. ROSE ACACIA. Shrub to 7 ft., with bristly hairs: Ifts. 7–13, oval to suborbicular, obtuse: fls. rose or pale purple, May-June: pods bristly-hairy, to 2½ in. long. S. E. U. S. Var. Camusettii has deep red bristles. Var. fertilis, to 8 ft. high, with Ifts. oblong to oblong-elliptic, acute. Var. macrophylla has larger Ifts. and fls. and the branchlets and petoles are nearly destitute of bristles. Var. rosea may be either R. Boyntonn or R. Elliottin.

Hóldtii. Hybrid between R. luxurians and R. Pseudo-Acacua: fls. light pink or rose.

Kélseyi. Shrub to 10 ft.: lfts. 9-11, oblong-lanceolate: fls. rose, May-June: pods bristly-harry, 2 in. long. N. C.

luxurians. Shrub or tree to 30 ft.: lfts. 15-21, oblong: fls. pale rose or nearly white, June-Aug.: pods glandular-harry, to 4 in. long. Colo. to Utah and New Mex.

neo-mexicana. Shrub to 6 ft.: Ifts. 9-15, elliptic-lanceolate: fls. rose, June-Aug.: pods smooth, to 4 in. long. New Mex.

péndula: R. Pseudo Acacia var.

Robinia

péndula: R. Pseudo Acacia var.
Pseudo Acacia. Faler Acacia. Black Acacia. Yellow
L. Tree to 80 ft., nearly glabrous, the branches prickly: lfts.
7-9, oval: fls. white, fragrant, May-June: pods reddishbrown, glabrous, to 4 in. long, remaining on tree over winter. E. and Cent. U. S. Var. amorphifòlia has narrow oblong
lfts. Var. Bessoniàna, slender unarmed branches. Var. Decaisneàna, light rose-colored fls. Var. érecta has lvs. of 1
or few lfts., a tree of columnar habit. Var. inérmis (R. spectabils), unarmed branches. Var. monophília is var.
unifolial. Var. péndula, branchlets somewhat pendulous.
Var. pyramidàlis is of columnar habit with spineless branchlets. Var. rectíssima, Shipmast L., has more durable wood,
produces no root shoots, has fewer fls. with less hairy
calyces and is not known to produce fr. Var. Rèhderi
s a low subglobose form. Var. semperflòrens flowers
throughout the year. Var. tortuòsa has short twisted
branches Var. umbraculifera has a dense head and unarmed branches. Var. unifoliola (monophylla), lits. reduced armed branches. Var. unifoliola (monophylla), lfts. reduced to 1 to 3 or more.

spectábilis: R. Pseudo Acacia var. inermis.

umbraculifera: R. Pseudo Acacia var.

viscosa. Clammy L. Tree to 40 ft., young branches and other parts glandular-viscid: lfts. 13-25, ovate: fls. pink, May-June: pods with glandular hairs, to 3½ in. long. S. U. S.

ROBINSONÉLLA. Malvacex. Small trees or shrubs of Mex. and Cent. Amer., differing from Sida in their tree-like habit and the much inflated papery carpels with the calyx much smaller than fr. and sepals never connivent nor inclosing it. Grown for ornament in S. Fla.

edéntula. Small tree: lvs. ovate to ovate-lanceolate, 6 in. long, usually 3-lobed, somewhat scabrous: fls. white with violet center, about 3/4 in. across. Cent. Amer.

ROBLE: Platumiscium polystachyum.

ROCAMBOLE: Allium Scorodoprasum.

ROCHEA. Crassulacex. Succulent S. African subshrubs with opposite simple lvs. and white, vellow or red fls. in dense terminal clusters, the petals joined to about the middle; one sometimes grown in greenhouses for the bloom. For cult. see Succulents.

coccinea (Crassula and Kalosanthes coccinea). To 2 ft.: lvs. ovate, to $1\frac{1}{2}$ in. long, closely imbricated: fis. bright scarlet, fragrant, to 2 in. long, with long slender tube.

falcàta: Crassula falcata.

longifòlia: listed name without botanical standing. versicolor. Differs from R. coccinea in the long lanceolate lvs. and the pink or white fls.

ROCK-BRAKE: Cryptogramma. -Rose: Cistus. ROCKET: Diplotaxis, Hesperis. -Salad: Eruca sativa. ROCKFOIL: Saxifraga.

ROCK-GARDENING. A type of gardening in which special provision is made for rock-loving or saxicolous plants. It is likely to be confused with alpine-gardening, which may be only one phase of it: see Alpines.

A rock-garden is not primarily a pile of rocks:

the rocks and stones are employed for the purpose of providing proper conditions for the growing of plants. The plants, rather than the rocks, are the primary consideration; and the plants should be such as specially thrive in rock crevices and pockets or at least be comparable with them in size and form. A tumulus of rocks in which is grown a miscellaneous collection of plants that do not profit by such conditions is not a rockgarden: such plants may be grown with less trouble elsewhere, and are likely to be much more in keeping.

Much of the charm of a rock-garden depends on its setting. In a city or town lot a rock-garden may be established in the rear without particular relation to a landscape although it should have connection with boundaries, but in properties of any size such a garden should conform to contours and to the subdivision of the area. Not every park or pleasure-ground has an acceptable setting for a rock-garden. It is to be remembered, also, that not every so-called rock-garden is an object of interest and beauty. Unless under the hand of a specially skilled gardener who maintains a continued interest in it, such an area is likely soon to fall into neglect and disrespect, and it becomes an abundant lodgement for weeds and vagrants.

The special appeal of a rock-garden lies in the skilful growing of plants that in nature inhabit cliffs, moraines and mountains. Many such plants are tall and take much room in the wild. but those kinds most prized in the constructed rock-garden are the low, tufted and spreading species, for the most part perennial. They are likely to have a penetrating root system, often a pronounced tap-root, and are therefore able to establish themselves in deep cool moist chinks and depressions. The proper preparation for the rock-gardener is a keen knowledge of such plants: he then finds or makes conditions for them where they may come to perfection. Having provided a proper place for the plant, he will keep it in place, restricting it to its confines. He will be careful with his labels and his note-book records. He will provide inhabitants for all the pockets or spaces, and this may require a supply of extra plants, sometimes even of temporary annuals if they are conformable and not the usual horticultural subjects of flower-gardens and borders.

The exposure of the rock-garden must depend on the kinds of plants to be grown in it, and the climate. In general, it should occupy an open free space not over-shadowed with trees or buildings; yet in parts of North America it is well if the severity of midday and afternoon sun can be mitigated. The area should be protected from the roots of trees that may forage underneath it

Knowing the kinds of plants he may wish to grow, the rock-gardener will make his rock areas to suit them. The construction will be neat and trim, and have good lines and proportions. If there are rocky cliffs or outcrops on the property, he may utilize them rather than attempt to make a wholly artificial area. Stone walls and old foundations may sometimes be utilized to advantage. Old quarries often yield excellent results. The rock-garden will not be a mere display of rocks. The larger part of any structural rock or stone is below the surface of the ground. In placing the rocks one must always have in mind the providing of good roothold for plants.

All cavities should be firmly filled to avoid covered hollows that dry out. Every part of the construction should be easily accessible from paths and trails. The success or failure of the rock-garden may depend on the ability to hold moisture and thereby to carry the plants through dry times, although provision must be at hand for applying water when needed. On the other hand, good natural drainage is essential, for saxicoles are not bog-plants. The soil with which to fill the pockets and leads will be conditioned on the plants to be grown, but in general its main elements should be good garden earth, fine or sifted leaf-mold or peat, and gritty sand or fine gravel, all well mixed. Fertilizing is likely to be necessary.

The visible part of the rock construction should be attractive. Rocks from the neighborhood or region are commonly the most desirable. Generally speaking, only about one-third of the mass of any boulder should be exposed to view. There should be harmony in the work, the rocks, and the positions and directions in which they are laid, presenting a pleasing uniformness of character. Likewise it is necessary that the plants produce a harmonious picture. Much of this harmony will reside in vegetation, presented in tufts, mats, and growths lying close to stones. Many of the rock-garden mats are evergreen; and at appropriate places very dwarf compact forms of certain conifers may be utilized, as well as various kinds of shrublets.

The kinds of plants suited to rock-gardening are legion. Crassulaceous plants of this character are many (see Succulents); also ferns; some of the best of them in other families are in the genera athionema, allium, alyssum, androsace, anemone, aquilegia, arabis, arenaria, aster (dwarf), aubrietia, campanula, cassiope, corydalis, cotoneaster, daboecia, daphne, dianthus, draba, dryas, epigea, epimedium, erinus, gentiana, heuchera, iberis, iris (dwarf), leontopodium, lewisia, linaria, linnea, lithospermum, loiseleuria, lychnis, oxalis, papaver, petrocallis, phyllodoce, phlox, potentilla, primula, ranunculus, rhododendron, saxifraga, shortia, soldanella, thymus, viola, wahlenbergia. The attentive rock-gardener will observe the saxicolous plants native in his region and find satisfaction in growing them.

A rock-garden properly placed, constructed and maintained, and with a population of well chosen and skilfully grown plants, constitutes one of the choicest departments of horticulture.

RODGÉRSIA. Saxifragaceæ. Herbaceous perennials with thick rootstocks, showy terminal fl.-clusters: lvs. large, peltate or digitately or pinnately compound: native in China and Japan, variously hardy N. Multiplied by division of the plants, also by seeds when obtainable.

esculifòlia. To 6 ft.: lvs. resembling the horse-chestnut, finger-shaped, with usually 7 coarsely toothed lfts. to 10 in. long: fls. white, in flat clusters forming an infl. to 2 ft. long. China.

pinnata. To 4 ft.: lvs. pinnately compound, lfts. oblanceolate, 5-9, to 8 in. long: fls. red without, white within, in large branched panicles with reddish rachis and branches. China. Var. álba, fls. white, in larger and looser panicles.

podophýlla. To 5 ft., with thick scaly rootstock: lvs. finger-shaped, the 5 lobes angled and toothed, to 10 in. long and 6 in. wide, light green in spring, in summer metallic bronzy: fls. small, yellowish-white, in panicles to 1 ft. long, making a fluffy spray. China.

sambucifòlia. To 3 ft.: lvs. pinnately compound into 3-11 lfts.: fls. white, small, in terminal flat-topped panicles. China.

tabulàris. To 3 ft.: lvs. peltate, to 3 in. across, long-petioled, with many short lobes resembling teeth: fls. white, small, in many-fld. panicles. China.

RODRIGUÈZIA. Orchidacex. American epiphytes often with an elongate rhizome, small 1-2-lvd. pseudobulbs and lateral racemes; dorsal sepal and petals similar; lateral sepals deeply united and concave; lip with a short spur. Grown at intermediate temperatures; see Orchids.

secunda. Lvs. narrowly oblong, very leathery, to about 9 in. long: racemes usually one-sided, many-fid., to 15 in. long; fls. pale rose to red. Feb.-Oct. Panama, St. Vincent, Trınidad, N. S. Amer.

venústa (Burlingtonia fragrans). Lvs. linear-oblong, to about 9 in. long: racemes pendulous, to about 9 fld; fls. 1½ in. long, fragrant, white with yellow spot on lip. Jan.—May. Brazil.

ROEMÈRIA. Papaveraceæ. Ann. slender herbs of the Medit. region, with yellow juice, pinnately dissected lvs., and violet or blue solitary fls.; sometimes planted for the bloom.

refrácta. To 1 ft.: lvs with linear segms.: fls. blue, spotted with black at base, to 1 in. long. Asia Minor, Caucasus.

violacea. To 1½ ft.: lvs. 2-3-pinnatisect, segms. linear and terminated by a bristle: fls. hlac, on short peduncles. Medit. region.

ROGIERA: Rondeletia.

RÒHDEA. Liliaceæ. One Chinese and Japanese herb sometimes grown as a durable foliage plant in the house or out-of-doors in mild climates; much prized in the Far E. R. japónica. Lvs. basal, to 2 ft. long and 3 in. broad, leathery: fls. tightly packed in a thick short spike terminating the scape, resembling an aroid, concealed by the foliage: fr. a large berry with red pulp. There are many forms with striped, variegated, and otherwise modified lys.

ROLLINIA. Annonaceæ. Trop. American trees and shrubs with alternate simple lys., bisexual fls. with the 3 outer petals produced into wings or spurs, and fr. a fleshy syncarp resembling Annona. Cult. as for *Cherimoya*.

mucosa (R. Sieberi). Small tree: lvs. elliptic, to 8 in. long, pubescent beneath: fls. rusty-tomentose, about 1 in. long: fr. nearly globose, 3 in. across, covered with tubercles, edible W. Indies, Mex.

Sièberi: R. mucosa,

ROMANOVIA: Actinophlæus Nicolai.

ROMANZÓFFIA. Hydrophyllaceæ. Per. herbs of W. N. Amer., in habit resembling a delicate saxifrage: lvs. mostly basal, round-cordate and lobed, long-stalked: fls. pale pink, purple or white, in racemes on scape-like sts.

californica. Material so listed is probably not distinct from *R. sitchensis. R. californica* was originally described as differing from the following species in lacking scaly bulb-like tubers but this distinction has not been accepted in recent treatments.

sitchénsis. To 9 in., the rootstock bearing tubers: fis. white, on long stalks. Alaska to Calif.

unalaschkénsis. Differs from R. sitchensis in roots not bearing tubers, pedicels shorter instead of longer than fls., and very short-funnelform corolla. Unalaska.

ROMNÈYA. Papaveraceæ. Per. herb native in S. Calif. and Mex., striking as a flower-garden and border subject where hardy. Propagated by suckers and seeds but the latter require several years before blooming. It transplants with difficulty. R. Coulteri. MATILIJA-POPPY. To 8 ft.: lvs. pinnately cut, to 4 in. long: fls. white, fragrant, 6 in. across, solitary. Var. trichócalyx has a beakless bristly calyx.

ROMULEA. Iridacex. Crocus-like bulbous herbs with narrow basal lvs. overtopping the fls. and solitary funnelform fls. having short tube and long pedicels: cult. as for Crocus but not so hardy.

Hártungii: catalogue name.

hirsùta. Lvs. obscurely pilose, to 4 in. long: fis. golden-yellow below, reddish-purple above, segms, lanceolate, to 1 in. long, stigmatic branches reaching anther tips. S. Afr.

hirta: catalogue name.

rosea. Lvs. to 1 ft. long; ffs. red-lilae with yellow throat, segms. oblanceolate, acute, the outer ones with faint purple stripes, 1 in. across, stigmatic branches much exceeding anther tips. S Afr.

sabulòsa. To 4 in.: lvs. filiform, terete, to 3 in. long: fls. deep rose-pink with purple center, segms. obovate, obtuse, free to base and not forming tube, anthers exceeding style.

RONDELÈTIA (Rogiera), Rubiaceæ, Many trop. American evergreen shrubs and trees with mostly opposite lvs., tubular 4-5-lobed fls. in cymes in red, yellow or white, and capsular frs.

Rondeletias are grown out-of-doors in the South, and in the greenhouse North where the temperature should not be allowed to go below 50°. Propagated by cuttings of halfripened wood.

amcena (R. versicolor). Shrub or small tree: lvs. ovate. to 6 in long, densely pubescent beneath: fls. pink, pubescent, with yellow-bearded throat, ½ in long. Mex. to Panama.

cordata. Shrub to 7 ft.: lvs. ovate-oblong or ovate, to 5 in long, nearly glabrous: fis pink or red, pubescent, with yellow-bearded throat, 1/2 in across. Guatemala.

odorata (R. speciosa) Shrub to 6 ft.: lvs ovate to oblong. 2 in. long, nearly glabrous, margins often revolute: fls. orange-red with yellow throat, ½ in. across. Cuba, Panama.—The commonest species in cult.

speciòsa: R. odorata.

spléndens: listed name.

thyrsoidea. Shrub to 6 ft : lvs. ovate or oval, to 6 in. long, pubescent beneath: fls. yellow, 1/4 in. long, pubescent. Jamaica.

versicolor: R. amana.

ROODIA DIGITIFOLIA: Argyroderma brevipes. ROOTSTOCK: subterranean stem; rhizome.

ROQUETTE: Eruca sativa.

RORIPA ARMORACIA: Armoracia rusticana.

ROSA. Rose. Rosacex. Large genus of shrubs, mostly prickly, often more or less scandent, native mostly in the north temp. zone, and furnishing many ornamental subjects: lvs. alternate, commonly pinnate: fls. white, yellow or red, solitary or in corymbs, prevailingly in early summer: fr. a hip, achenes inclosed in a fleshy nearly closed hollow receptacle, usually red. The species of Rosa can be accurately determined only from full technical descriptions; at this place some of the main horticultural features may be indicated. For cult. see Rose.

aciculàris. To 3 ft.: líts. 3-7 to 2 in. long: fls. deep rose, fragrant, 2 in. across, solitary. N. Amer., N. Asia. Var. Bourgeauiana has obtuse doubly toothed lvs. Var. Engelmannii (R. Engelmannii) is more bristly and lvs. are glabrous beneath. Var. nipponénsis, líts. 7-9, to 1 in. long, petioles and pedicels bristly.

álba. Presumably a hybrid between R. corymbifera and R. walkea: to 6 ft.: Ifts. mostly 5, to 2½ in. long: fls. white or pinkish, fragrant, to 3 in. across, often double, in corymbs. Var. cárnea is said to have pale salmon-pink fls.—A source of attar of roses. Hardy N., and frequent in yards.

Albertii. To 3 ft.: lfts. 5-9, to $1\frac{1}{4}$ in. long: fls. white, $1\frac{1}{4}$ in. across. Turkestan.

alpina: R. pendulina.

altàica: R. spinosissima var.

Ándersonii: listed as a late-flowering rose-pink form. anemoneflora: R. triphylla.

anemonoides. Hybrid probably between R. lævigata and R. odorata: climbing: lfts. 3-5: fls. light pink, single.

arkansana. To 1½ ft: lfts. 9-11, to 2½ in. long: fls. pink, 1½ in. across, in corymbs. Wis. to Kans. and Colo.

Arnoldiana. Hybrid between R. rugosa and R. borbonana: lits, 5-7; fis. purplish, 2 in. across, semi-double, in corymba

arvénsis (R. repens). Branches trailing: Ifts. mostly 7, to 1½ in. long: fls. white, to 2 in. across, in corymbs or solutary. Eu; hardy N. Var. Ayreshirea, AYRESHIRE R., is more vigorous.—The double-fld. forms are probably hybrids.

Bánksiæ. Banksia R. Climbing to 20 ft., evergreen, with few prickles: lits. commonly 3-5, to 2½ in. long: fls. white or yellow, I in. across, slightly fragrant, in many-fid. umbels. China; not hardy N. Var. álbo-plèna, fls. double, white. Var. làtea, fls. double, yellow. Var. lutéscens, fls. single, yellow. Var. normàlis, fls. single, white.

banksiópsis. Lfts. 7-9, 1 in. long: fls. red, 1 in. across. in corymbs. China.

Barbierana. A series of hybrids between R. Wichuraiana and R. multiflora: lfts, 5-7; fls. red, 2 in. across, single.

Beggeriana. To nearly 10 ft., prickles hooked: lfts. 5-9, ovate to elliptic-obovate, to 1 in. long, serrate, blueto gray-green, usually pubescent beneath: fls. white, rarely pink, to 1½ in. across, usually in corymbs. N. Persia to pınk, Altaı.

bélla. To 10 ft.: lfts. 7–9, to 1 in. long: fls. rose, 2 in. across, in 1-3-fld. corymbs. China.

bengalénsis: R. chinensis var. semperflorens.

blanda. To 6 ft., often without prickles: lfts. 5-7, to 21/2 in. long: fls. pink, 2 in. across, solitary or in few-fid. corymbs. Newf. to Pa. and Mo.

borboniana (R. borbonica). BOURBON R. Hybrid between R chinensis and R. gallica: lits. mostly 7: fls. red or purple, to 3 in. across, double or partially so, solitary or in few-fld. corymbs in late summer. Hybrid Bourbons represent crosses between this hybrid and R. gallica, R. centifolia, and R. daimascena; these crossed with R. chinensis produced the group of Hybrid Perpetuals or Remontants, which are mostly hardy N.

borbónica: R. borboniana.

bracteata. M. Coronama.

bracteata. M. CARTNEY R. To 20 ft., half-climbing, evergreen: lfts. 5-9, to 2 in. long, shining above, rachis glabrous: fls. white, 3 in. across, solitary, subtended by large toothed bracts. China; nat. in S. U. S.—Some of the material so listed may be R. Wichuraiana.

Bruántii. A group of hybrids between R. rugosa and R. odorata or R. delecta.

Brundnii. Himalayan Musk R. Tall, with partially climbing branches: Ifts. 5-7, to 2½ in. long: fis. white, fragrant, to 2 in. across, in many-fid. corymbs. Himalayas; not hardy N.

burgundiaca: R. centifolia var. parvifolia.

californica. To 10 ft.: lfts. 5-7, to 1½ in. long: fis. pink, 1½ in. across, in corymbs. Ore. to Lower Calif. Var. plena has fls. double or partially so.

Caméllia: R. lævigata.

canina (R. Friedlanderiana. R. monticola). Dog R. To 10 ft.: lits. 5-7, to 1½ in. long: fls. white or pinkish, to 2 in. aeross, solitary or in few-fld. corymbs. Eu.

cantabrigiénsis: listed name of unknown botanical

carélica: the plant in the trade is a form of R. acicularis.

carolina (R. humilis). Pasture R. To 3 ft. or more, suckering: lfts. commonly 5, to 1½ in. long: fls. rose, 2 in. across, usually solitary. Me. to Fla. and Tex. Var. alba (R. Lyonii var. alba) has white fls. Var. grandiflora has fls. 2½ in. across. Var. villòsa (R. Lyonii) is somewhat larger with longer lfts. and larger fls. which are often in few-fld. racemes. B. C. to Tex.—See R. palustris.

cathayénsis: R. Gentiliana.

caudata. To 12 ft.: lfts. 7-9, to 2 in. long: fls. red, 2 in. across, in few-fld. corymbs: fr. orange to coral-red, about 1 in. long. China.

centifòlia. Cabbage R. To 6 ft.: lfts. mostly 5, to 2 in. or more long: fls. pink, fragrant, to 3 in. across, solitary, nodding, very double with the petals overlapping. Caucasus. nounng, very double with the petals overlapping. Caucasus. Var. cristâta has edges of serals mossy. Var. muscôsa (R. muscosa) Moss R., has mossy calyx and pedicels. Var. parvifolia (R. parvifolia, R. burgunduca), BURGUNDIE R., fits. to ¾ in. long, fis. 1 in. across.—Seen in old yards, and haidy N.

cerasocárpa. Allied to R. moschata: Ifts. 3-5, ovate to elliptic-ovate, glabrous: fis. white, about 1 in. across, pedicels and receptacles glandular. Cent. China. cerasocárpa.

cherokeénsis: R. lævigata.

chinénsis. China R. Low, evergreen or partially so: lfts. 3-5, to 2½ in. long, shining above: fis. red to nearly white, 2 in. across, in few-fid. corymbs. China; hardy only far S. Var. Manéttii is R. Novsettuana. Var. mínima (R. Lawranciana, R. Roulettii). Fairs or Pygmy R. To 1 fts. fis. rose-red, 1½ in. across, single or double. Var. semper-

florens (R. bengalensis). Fls. crimson, usually solitary. Var. viridiflora. GREEN R. Fls. green, the petals represented by green lys.

chrysophýlia: listed name.

cimamòmea. Cinnamon R. To 6 ft.: lfts. 5-7, to 134 in. long: fls. red, fragrant, 2 in. across, solitary or in few-fld. corymbs. Eu., Asia; escaped in E. U. S. Var. plèna has double fls.

clinophylla. Differs from R. bracteata in prickles straight, not hooked, and lfts. acute and pubescent beneath with rachis also pubescent. China.

coriifòlia. To 5 ft.: líts. 5-7: fls. rose, solitary or in corymbs. Eu., W. As a. Var. Froebèlii has small white fls.

corymbifera (R. canna var. dumetorum. R. dumetorum). Distinguished from R. canna by the lits. being pubescent rather than glabrous. Eu., W. Asia; hardy N.

corymbulosa. To 6 ft.: Ifts. 3-5, to 1½ in. long: fls. red, white in center, 1 in. across, in many-fld. corymbs. China. cymdsa. Differs from R. Banksiæ in having more

cymbsa. Differs from R. Banksiæ in having more slender sts. with hooked prickles, glabrous rachis and corymbs of smaller white fls. China.

damascèna. Damask R. To 8 ft.: Ifts. usually 5, to 2½ in. long: fls. pale pink to red, fragrant, double, in corymbs. Origin unknown; intro. from Asia Minor. Var. trigintapétala, fls. red, semi-double. Var. versícolor, York and Lancaster R., has partially double white fls. striped with pink.—A source of attar of roses. Hardy N., and persists in old vards.

Davidii. To 10 ft.: lfts. 7-9, to 2 in. long: fls. pink, to 2 in. across, in corymbs. China.

davùrica. Resembles R. cinnamomea but with straight instead of curved prickles and smaller lfts. N. Asia.

dilecta. A group of hybrids between R. odorata and R. borboniana, comprising the Hybrid Teas: fls. white, red, vellow, fragrant.

dumālis (R. glauca, R. Reuteri). To 6 ft.: lfts. 5-7, to 1½ in. long, bluish-green: fis. rose, about 1½ in. across, solitary or in corymbs. Eu., W. Asia.

dumetòrum: R. corymbifera.

dumifidra: error for R. dumetorum.

Dupôntii (R. moschata var. nivea). Hybrid between R. moschata and R. gallica: fis. white.

Ecæ. This species is not known to be in cult., material so listed being R. Primula.

Eglantèria (R. rubiginosa). Eglantine. Sweerbrier. To 8 ft., much branched: lfts. 5-7, to 1½ in. long, glandular and fragrant: fls. pink, 2 in. across, solitary or in few-fid. corymbs. Eu.; nat. in N. Amer., and common in pastures. Var. duplex has double fls.

Éngelmannii: R. acıcularıs var.

excélsa: a hybrid Wichuraiana.

Fedtschenkoana. Differs from R. Webbiana in branchlets bristly as well as prickly, lifts, oblong and somewhat longer and pubescent beneath, with white fis. Turkestan.

Féndleri: R. Woodsn var.

fèrox: R. horrida.

ferruginea: R. rubrifolia.

filipes. To 15 ft., the branches partially climbing: lfts. 5-7, to 3 m. long: fls. white, fragrant, about 1 in. across, m many-fld. corymbs. China.

fétida (R. lutea). Austrian Brier. To 10 ft.: Ifts. 5-9, to 1½ in. long: fls. deep yellow, with unpleasant odor, to 3 in. across, commonly solitary. Asia; hardy N. Var. bfcolor, Austrian Copper Brier, fls. coppery. Var. persiàna, Persian Yellow, £s. double.

foliolòsa. To 1½ ft.: lfts. 7-9, to 1¼ in. long, shining above: fls. rose or white, 1½ in. across, solitary or in few-fld. clusters. Ark. to Tex. Var. álba has white fls.

Fortuneana. Hybrid between R. Banksiæ and probably R. længata climbing: líts. 3-5: fls. white, double, solitary.

Friedlanderiàna: R. canina.

fujisanénsis. To 10 ft., sts. flexuose: lfts. 3-9, to ¾ in. long: fls. white, 1 in. across, in corymbs. Japan.

gállica. FRENCH R. To 4 ft.: Ifts. 3-5, thick, to 2½ in. long: fis. pink or crimson, to 3 in. across, solitary. Eu., W. Asia. Var. půmila is a dwarf form with single red fis. Var. versícolor has partially double fis. striped white and red. Other listed vars. are conditorium, marmorata and spléndens.—This rose is common in old gardens and often escapes or persists.

Gentiliana (R. cathayensis. R. multiflora var. cathayensis). Branches somewhat climbing: Ifts. usually 5-7, stipules fringed: fls. few, pink or rose, 1½ in across, fragrant, in corymbs. China.—Other material of this name is R. Henryi.

gigantèa: R. odorata var.

Giráldii. Lfts. usually 7, to $\frac{1}{2}$ in. long: fis. pink, 1 in. across. China.

glauca: R. dumalis or R. rubrifolia:

glutinosa. To 4 ft. or less, prickles to nearly ½ in. long, bristly and gland-tipped, abundant: lfts. elliptic to obovate, to ½ in. long, glandular: fls. pink, small. S. E. Eu., W. Asia.

gratissima. To 6 ft., much branched: lfts. 5-7, to 11/4 in. long: fls. pink, about 1 in. across, in corymbs. Calif.

gymnocárpa. To 10 ft.: lfts. 5-9, to 11/4 in. long: fls. rose, about 1 in. across, usually solitary. B. C. to Mont. and Calif.

hæmatòdes. To 4 ft., prickles stout and curved: Ifts. 3-5, ovate-oblong, obtuse, sharply toothed, nerves often minutely glandular-puberulous beneath: fis. crimson, large. E. Caucasus.

Hárisonii. HARISONS YELLOW R. Hybrid between R. fætuda and R. spinosissima: fis. pale yellow, double.

Héleniæ. To 15 ft., with partially climbing branches: lfts, 7-9, to 2 in. long: fls. white, fragrant, about 1 in. across, in many-fld. corymbs. China; hardy N.

heliophila: R. suffulta.

hemisphærica. Sulphur R. To 15 ft, prickles hooked: lfts. 5-9, obovate, to 1½ in. long, coarsely toothed, somewhat glandular, base wedge-shaped: fls. pale yellow, to 2 in. across, double, not fragrant. W. Asia.—A form with single fls. is not known to be cult.

Hénryi (R. Gentiliana, in part). To 12 ft., the branches partially climbing: Its, 5, to 2½ in. long: fls. white, fragrant, to 1½ in. across, in many-fld. corymbs. China.

hibérnica. Hybrid between R. spinosissima and R. canina. fls. pink, 1 in. across.

highdownénsis. Said to be a hybrid of which one parent is R. Moyesus lys. glaucous beneath: fis. crimson, on arching sts.; fr. bright colored.

Hillieri: R. pruhoniciana

himalàica: fis. white tinted blush; hort, name.

hispida: R. spinosissima var.

hórrida (R. ferox). Dwarf: lfts. 5-7, about ½ in. long: swhite, about 1 in. across, in few-fid. corymbs. S. Eu., Asia Minor.

Hugònis. Hugo R. To 8 ft., the branches drooping: lfts. 5-13, to ¾ m. long: fls. yellow, 2 in. across, solitary, May-June China; hardy N., early.

hùmilis: R. carolina.

illinoénsis: R. spinosissima.

indica: confused name, belonging mostly to R. chineneis and R. odorata.

inérmis Morléttii: a form of R. pendulna, with purplish fis., thornless.

Iwara. Hybrid between R. multiflora and R. rugosa: fls. white, single, small.

Jáckii: R. Maximowicziana var.

Jácksonii. Hybrid between R. Wichuraiana and R. rugosa: fls. bright crimson.

Jundzillii: R. marginata.

kamtchática: R. rugosa var.

Kukolínskii. A cross or sport of R. canina which has been recommended as an understock.

lævigåta (R. Camellus. R. cherokeensis). Cherokee R. Climbing to 15 ft., evergreen: lits. usually 3, to 2½ in. long, shining: fis. white, fragrant, to 3½ in. across, solitary. China; nat. in S. U. S.

Lawranciana: R. chinensis var. minima.

láxa. To 8 ft.: lfts. 7–9, to $1\frac{1}{2}$ in. long: fls. white, several. Turkestan.

Lheritieràna. Boursault R. Hybrid between R. pendulna and R. chinensis: elimbing to 20 ft.: lfts. 3-7: ffs. red, in corymbs.

longicúspis. Climbing: lfts. to 4 in. long, ovate to ovateoblong, acuminate, glabrous, glossy: fls. silky, in corymbs, pedicels pubescent. W. China.

lûcens érecta: hort. form with semi-double pink fis., perhaps of R. longicuspis or R. sempervirens.

lùcida: R. virginiana.

lùtea: R. fætida.

L'yonii: R. carolina var. villosa.

MacDoùgalii: R. nutkana var. hispida.

Macounii. To 6 ft., much branched: lfts. 5-7, to 1¼ in. long, glaucous beneath: fls. rose, 1½ in. across, solitary or in few-fld. corymbs. B. C. to Tex.

macrantha. Hybrid between R. canina and R. gallica: Ifts. 5-7: fls. light pink, 3 in. across.

macrophýlla. Large: líts. 9-11, to 2½ in. long: fis. red, 2 in. or more across, solitary or in few-fid. corymbs. Himalavas.

Manéttii: R. Noisettiana.

marginata (R. Jundzillii). Related to R. canina, differing in prickles nearly straight, ifts. doubly glandular-serrate and usually glandular beneath, pink fis. to 3 in. across on long glandular bristly pedicels. Eu., W. Asia. Var. amôna

Marrétii. Branchlets dark purple: lfts. mostly 7, to 1½ in. long: fis. pink, solitary or in few-fid. corymbs. Saghalin Isl.

Maximowicziana. Branches partially climbing: Ifts. 7-9, to 2½ in. long: fis. white, 1½ in. across, in many-fid. corymbs. N. Asia. Var. Jáckii (R. Jackii) has no bristles.

melina. To 3 ft., much branched: Ifts. usually 7, to 1 ¼ in. long: fls. rose, to 2 in. across, commonly solitary. Colo.,

micrántha. To 6 ft., much branched: lfts. 5-7, to 1¼ in. long: fls. pink or white, about 1 in. across, solitary or in few-fld. corymbs. Eu.; escaped in N. Amer.

microcarpa. The true R. microcarpa is not known to be in cult., the material so listed is referable to R. cymosa. microphylla: R. Roxburghii.

minutifòlia. To 4 ft.: líts. 5-7, ¼ in. or less long: fls. pink or white, 1 in. across. Lower Calif.

mirífica: R. stellata var.

mohavénsis. To 3 ft.: lfts. usually 5, to ½ in. long: fls. rose, about 1 in. across, mostly solitary. Calif.

móllis. To 4 ft.: líts. 5-7, to $1\frac{1}{2}$ in. long, silky-tomentose beneath: fls. deep pink or rarely white, to 2 in. across, solitary or few. Eu., W. Asia.

montícola: R. canina.

morica. Hybrid with R. canina as one parent: fls. light

moschāta. Musk R. Branches partially climbing or arching: Ifts. 5-7, to 2 in. long: fis. white, with odor of musk, to 2 in. across, in 7-fid. corymbs. Medit. region; not hardy N. Var abyssínica, a more prickly tender form from Abyssinia. Var. álba, a large-fid. hybrid between the species and R. canna. Var. floribúnda, large clusters of white fis. Var. grandiflora (R. polyantha var. grandiflora), probably hybrid. Var. japônica is listed. Var. nívea is R. Dupontu. Var. nastarāna (R. Pissardu) has more numerous pinkish fis. Var. plēna has double fis.—Now little known in gardens. known in gardens.

Moyèsii. To 10 ft.: líts. 7-13, to 1½ in. long: fls. deep red, to 2½ in. across, solitary or in 2's: fr. dark orange-red, about 2 in. long. China.

multibracteata. To 6 ft.: Ifts. 7-9, to 1/2 in. long: fls. pink, about 1 in. across, in corymbs. China.

multiflora. Branches climbing or trailing: Ifts. 5-11, to 1¼ in long, stipules fringed: fls. white, very fragrant, to 3¼ in. across, in many-fld. panicles. Japan. Var. platyphylla, Seven Sisters R., has larger Ivs. and deeper pink fls. Other listed vars. are japonica and nana.—Source of many garden roses, often double, together with its Chinese ally, R. Gentilana. Hardy N. Crimson Rambler is of this relationship. relationship.

muscòsa: R. centifolia var.

mutábilis: a confused name, plants so listed are probably referable to R. gallıca or R. setigera.

myriacántha: R. spinosissima var.

nipponénsis: R. acicularis var.

nítida. To 1½ ft.: lfts. 7-9, to 1¼ in. long, shining above: fls. rose, 2 in. across, solitary or in few-fld. corymbs. Newf. to Conn.

Noisettiàna. Noisette, Manetti or Champney R. Hybrid between R. chinensis and R. moschata to 10 ft.: lfts. 5-7: fls. white, pink, red, yellow, in many-fid. corymbs. Not hardy N. The Maréchal Niel is one of this group, as are also the Manetti roses (R. Manettn) used extensively controlly on which recent as stocks on which to grow greenhouse roses

nutkana. To 5 ft.: lfts. 5-9, to 2 in. long: fls. commonly rose, 2 in. across, solitary. Alaska to Calif. Var. hispida (R. MacDouguli). has the receptacle glandular-hispid. Var. Halliana is listed with large pink fls.

Nuttalliàna: probably R. palustris var.

odorata. Tea R. Evergreen or somewhat so, branches partially climbing: lfts. 5-7, to 3 in. long, shining above: fls. white, pale pink or yellow, to 3 in. across, solitary or in few-fld. corymbs. China; hardy only far S. Var. gigantea, fls. cream, to 6 in. across. Var. ochroledea, fls. pale yellow, double. Var. pseudfindica, fls. salmon-yellow, double, to 4 in. across.

omeiénsis. To 12 ft.: lfts. 9-17, to 1 in. long: fls. white, to 1½ in. across. China. Var. chrysocárpa, fr. bright yellow. Var. pteracántha has prickles much enlarged at base, forming wide rings.

oxýodon: R. pendulina var.

palústris. SWAMP R. To 6 ft.: lfts. commonly 7, to 2 in. long: fls. pink, 2 in. across, in corymbs. N. S. to Fla. and

Miss. Var. Nuttalliana has larger fls.—This is the rose to which the Linnæan name $R.\ carolina$ was long erroneously

parvifòlia: R. centifolia var.

Paulii (R. rugosa var. repens). Hybrid between R. rugosa and R. arvensıs: procumbent: fis. white, in corymbs.

pendulina (R. alpina). To 3 ft.: Ifts. 7-9, to 2½ in long: fls. rose, 1½ in. across, solitary or in few-fld. corymbs Eu. Var. oxfodon (R. oxyodon), Ifts. 5-9, ovate; pedicel and receptacle smooth, not glandular-bristly. Var. pyrenàica is of lower habit with glaucous branchlets and glandularbristly pedicels and receptacle.

Penzanceana. Lady Penzance R. Hybrid between fatida and R. Eglanteria: lfts. 7, fragrant; fls. pink with vellow center.

Pernetiàna: see R. fatida, page 640.

pérsica (R. simplicifolia). To 1½ ft: lvs. simple, to 1½ in. long: fls. yellow with red center, 1 in. across, solitary. W. Asia; little grown and not hardy N.

pimpinellifdlia: R. spinosissima.

pinetòrum. To 3 ft.: lfts. 5-7, to 1½ in. long: fls. deep rose, 1½ in. across, usually solitary. Calif.

pisocárpa. To 6 ft.: lfts. 5-7, to 1½ in. long: fls. pink, 1¼ in. across, in corymbs. B C. to Calif.

Pissardii: R. moschata var. nastarana.

polyántha. A group of roses of the R. multiflora type.

pomífera (R. villosa). To 6 ft., densely branched: líts. commonly 5-7, to 2 in. long: fls. pink, to 2 in. across, solitary or in few-fid. corymbs. Eu , Asia; hardy N.—Recent studies have shown the description accompanying the older Linnean name of R. villosa to be too ambiguous to ment its acceptance.

pratincola: R. suffulta.

Práttii. To 8 ft.: lfts. 7-15, to ½ in. long: fls. pink, to ¾ in. across, solitary or few-fld. China.

Primula (R. Ecw of cult.). To 6 ft.: lfts. 7-15, to 3/4 in. long: fls. pale yellow, 1 in. across, solitary. Asia.

pruhoniciàna (R. Hillieri). Hybrid between R. Will-mottiæ and R. Moyesi: fls. bright pink.

rèpens: R. arvensis.

Reuteri: R. dumalis.

revérsa (R. rubella). To 5 ft, creet bristly sts. with prickles: lfts. 5-9, orbicular to oblong-ovate, to ³4 in long: fls. red, to 2 in. across, solitary, pedicels glandular-bristly. Eu.—Believed to be a hybrid between R. spinosissima and R. pendulina.

Richardii. Allied to R. centifolia, differing in lits. rugose and pubescent on lower side only and sepals pinnately lobed, leafy at apex. Abyssinia.

Rouléttii: R. chinensis var. minima.

Rôxburghii (R. microphylla of cult). To 8 ft., much branched: Ifts. 7-15, to 34 in. long: fls. pale pink, to 234 in. across, solitary or in few-fid. corymbs. China, Japan. Var. hirtula has Ifts. pubescent beneath. Var. normalis has single fls. and var. plena double.

rubélla: R. reversa.

rubigindsa: R. Eylanteria.

rubrifòlia (R. ferruginea. R. glauca). To 6 ft., sts. purplish: lfts. 7-9, to 1½ in. long, somewhat purplish: fis. deep red, 11/2 in. across, in few-fld. corymbs. Eu.; hardy N.

rugòsa. To 6 ft.: Ifts. 5-9, to 2 in. long, thick and rugose, rugosa. To 6 ft.: Ifts. 5-9, to 2 in. long, thick and rugose, shining above: fis. red or white, to 4 in across, solitary or in few-fld. corymbs. China, Korea, Japan; hardy and durable Var. Alba, fis. white. Var. Albo-plena, fis. white, double. Var. Chamissoniana, less bristly, lvs smaller. Var. kamtchática, lvs. thinner, fis. smaller. Var. magnifica, said to be an improved form. Var. rèpens is R. Pauli. Var. ròsea, fis. rose. The typical form (var. rubra) has fis. purple.

rústica: R. stylosa.

sáncta. The true R. sancta is not known to be in cult.; the materials so listed are probably R. Richardii.

saturāta. To 8 ft., scarcely prickly: lfts. mostly 7, to 2½ in. long: fls. dark red, 2 in. across, solitary China.

sempérvirens. Evergreen, the branches decumbent or climbing: lfts. 5-7, to 2 in. long, shining: fis. white, slightly fragrant, to 2 in. across, in corymbs. Medit. region; to be grown S

Serafinii. Low shrub, prickles hooked, unequal: lfts. 5-7, ovate-orbicular, to ½ in. long, glandular beneath; fis. pink, solitary, pedicels short, glabrous. Medit. region.

serices. To 12 ft., prickly: ifts. 7-11, to 34 in. long, silky-pubescent beneath: fis white, to 2 in. across, solitary. Himalayas. Var. fructo-luteo has yellow hips. Var. nigra is listed.

sertata. To 6 ft.: lfts. 7-11, to ¾ in. long: fls. rose, 2½ in. across, solitary or in few-fld. corymbs. China.

setigera. Prairie R. To 15 ft., the branches climbing: lfts. 3-5, to 4 in. long: fls. rose fading to white, 2 in. across, in few-fld. corymbs. Ont. to Fla. and Tex.; hardy N., and represented in Baltimore Belle and others. Var. tomentosa has lys. tomentose beneath.

setipoda. To 10 ft.: lfts. 7-9, to 2½ in. long: fls. pink or rose, 2 in across, in corymbs. China.

simplicifòlia: R. persica.

sínica: synonym of R. lævigata and R. chinensis.

sonoménsis. To 1 ft.: lfts. 5, to ½ in. long: fls. rose, in many-fld. corymbs. Calif.

Soulieana. To 12 ft.: lfts. mostly 7, to 11/4 in. long: fls. white, 11/4 in. across, in many-fld. corymbs. China.

Spæthiana. Hybrid of R. rugosa and R. palustris, having corymbs of large purple fls.

spinosíssima (R. pimpinellifolia. R. illinoensis). Scotch or Burnett R To 4 ft., densely spiny: lits. 5-11, to ¾ in. long: fls. white, pink or yellow, to 2 in. across, solitary. Eu, Asia. Var. álba, fls. white. Var. altàica (R. altaica), fls. white. Var. cestiflòra is listed as a single rose. Var. fúlgens, fls. lilac-pink, semi-double, small. Var. hispida, ruigens, ns mac-pink, semi-double, small. Var. hispida, fis. sulfur-yellow, to 3 in. across. Var. hitea, fis. bright yellow. Var. lutèola, fis. pale yellow. Var. myriacántha (R. myriacantha), very prickly, fis. white tinged pink. Var. sulphirea, fis. pale yellow. Var. Vorbergii is R. Harisonii.

spinulifòlia. Hybrid between R. tomentosa and R. pendulina.

spithamea. To 1 ft.: lfts. 3-7, to 1½ in. long: fls. rose, to 1½ in. across, in few-fld. corymbs. Ore, Calif.

stellata. To 2 ft.: Ifts. usually 3, to ¼ in. long: fls. deep se, to 2 in. across, solitary. Tex., Ariz. Var. mirifica rose, to 2 in. across, solitary. (R. mirifica), to 4 ft., fls. larger.

stylòsa (R. rustica). Sts. green, arching, prickles stout, curved, scattered: lfts. 5-7, ovate to elliptic, mostly to ¾ in. long, serrate: fls. soft pink to nearly white at base, to 2 in. across, in corymbs of 3-6. Eu.

subserrulata. To $2\frac{1}{2}$ ft.: lfts. 3-7, sharp-toothed: fis. rose, about 2 in. across, solitary. Mo. to Tex.

suffúlta (R. heliophila. R. pratincola). To 1½ ft.: lfts. '-11, to 1½ in. long: fls. pink, 1½ in. across, in corymbs. Man. to Tex.

Sweginzòwii. To 15 ft.: lfts. 7-11, to 2 in. long: fls. rose, 1½ in across, solitary or in few-fld. corymbs. China.

tomentosa. To 6 ft.: lfts. 5-7, to 1½ in. long: fls. pale pink to white, 1½ in. across, solitary or in few-fld. corymbs. Eu.; escaped in M. Amer.

triphylla (R. anemoneflora). Climbing, partially evergreen: lfts. 3-5, to 3 in. long: fis. white, $1\frac{1}{2}$ in. across, double with the inner petals shorter, in corymbs. China. villòsa: R. pomifera.

virginiana (R. lucıda). To 6 ft.: lfts. 7-9, to 2½ in. long, shining above: fls pink or rose, to 2½ in. across, in few-fld. torymbs. Newf. to Va. and Mo. Var alba has white fls.

Watsoniana. Branches partially climbing: Ifts. 3-5, to 2½ in. long, very narrow and with entire wavy margins: fis. white or pink, ½ in. across, in many-fid. corymbs. Probably Japan; not hardy far N.

Webbiana. To 6 ft.: lfts. 5-9, to 34 in. long: fls. pale pink, 2 in. across, mostly solitary. Himalayas to Turkestan.

Wichuraiana. MEMORIAL R. Prostrate or trailing, evergreen: lfts. 7-9, to 1 m. long, shining above: fls. white, fragrant, to 2 m. across, in corymbs. Japan to China; hardy N.—Dorothy Perkins is a derivative of this species.

Willmottie. To 10 ft., densely branched: lfts. 7-9, to ½ in. long: fls. rose-purple, 1½ in. across, solitary. China. Woddsii. To 6 ft.: lfts. 5-7, to 1½ in. long: fls. pink or rarely white, 1½ in. across, solitary or in few-fld. corymbs. Sask. to Kans. and Utah. Var. Féndleri (R. Fendleri) is lower with straight prickles.

xanthina. To 10 ft.: lits. 7-13, to ¾ in long: fis. yellow, 1½ in. across, semi-double, solitary. N. China, Korea. Var. spontanea (var. normalis) is the wild single form.—Some of the material so listed may be R. Primula.

ROSACEÆ. Rose Family. About 100 widely distributed genera of herbs, shrubs and trees, with mostly alternate lvs., bisexual regular fls. having 4-5 sepals and petals or petals lacking, and 5-many stamens borne on edge of calyx-tube, and fr. an achene, follicle, hip, pome or drupe. The family contains many of the most important fruit plants and ornamentals in the north temp. zone, most of them grown out-of-doors. Genera herein treated are Acæna, Adenostoma, Agrimonia, Alchemilla, Amelanchier, Aronia, Aruncus, Cercocarpus, Chænomeles, Chamæbatia,

Chamæbatiaria. Chrysobalanus, Cotoneaster, Cowania, Cratægomespilus, Cratægus, Cydonia, Dalibarda, Dryas, Duchesnea, Eriobotrya, Exochorda, Fallugia, Filipendula, Fragaria, Geum, Gillenia, Heteromeles, Holodiscus, Horkelia, Kageneckia, Kelseya, Kerria, Luetkea, Lyono-thamnus, Maddenia, Margyricarpus, Mespilus, Neillia, Neviusia, Osmaronia, Ostcomeles, Petrophytum, Photinia, Physocarpus, Potentilla, Poterium, Prinsepia, Prunus, Purshia, Pyracan-tha, Pyrus, Quillaja, Raphiolepis, Rhodotypos, Rosa, Rubus, Sanguisorba, Sibbaldia, Sibiræa, Sorbaria, Sorbaronia, Sorbopyrus, Sorbus, Spenceria, Spiræa, Stephanandra, Stranvæsia, Waldsteinia.

ROSA DE MONTANA: Antigonon leptopus.

ROSCHÈRIA. Palmaceæ. Monœcious palm of the Sevchelles Isls., sometimes included in Verschaffeltia, but lvs. pinnate except in ver young trees, fls. in 2's, one of which is pistillate, spathes several and in technical characters. It is seldom seen in collections.

ROSCÒEA. Zingiberacex. Per. herbs with thick fleshy roots, of the Curcuma kind, lanceolate or oblong parallel-veined lvs. and purple or blue fls. in terminal spikes, the calyx split down one side.

Roscoeas are suitable for the greenhouse or for borders in mild climates. The roots should be planted in sandy loam 4-5 inches deep. Propagated by division.

alpina. To 6 in.: lvs. oblong-lanceolate, to 4 in. long, sessile, becoming fully developed after blossoming: fis. with dark purple limb and tube white, to 1 in. long. Himalayas

cautleoides. To 1 ft.: lvs. usually sessile, to 6 in. long and 1 in wide: fls. pale primrose-yellow, to 3 in. or more long. China.

purpurea. To 1 ft.: lvs. lanceolate, undulate, usually 5-6 on st.: fis. with white to purple lmb and tube, few in sessile spike. Himalayas to Burma and Assam. Var. capitàta is listed.

ROSE. The species of Rosa are probably 200, widely distributed in the northern hemisphere. A score of them have been much modified under cultivation or have contributed to important hybrids, but even in the crosses the parental resemblances are usually apparent to students of the genus. All members of the genus are important to the horticulturist, to be grown as ornamental shrubbery if not directly for bloom. The well-known horticultural classes, often much modified from the wild state, are the following:

Hybrid Perpetual or Remontant roses (H.P.) are of mixed ancestry, with R. borboniana probably prevailing (although few Bourbon roses as such are now in commerce); highly developed varieties of upright growth, producing in early summer and sparingly in autumn very large, double and fragrant flowers, from white through pink to deep crimson. Hardy for the most part in the northern states, they form the background of many rose gardens. Once dominant, their varieties, not seriously increased in the last twenty years, are now less than one-fourth of those in ordinary use

Hybrid Tea (H.T.) roses, broadly referred to R. dilecta, represent crosses between the Hybrid Perpetuals and virtually all other classes, beginning with Tea and China groups. They are less hardy than the Hybrid Perpetuals and the Polyanthas, but because of their recurrent blooming habit and the richness and color variation of their fragrant blooms, they by far predominate as garden roses. The Hybrid Teas are grown throughout America, sometimes with such protection as may be required, and also extensively for out-of-season flowering in greenhouses. Through the work of a French hybridizer, M. Pernet-Ducher, about 1900, there was introduced into the Hybrid Tea class the brilliant yellow and copper tones of the Austrian Brier (R. fatida), giving as a continuing result under many hybridizers colors not before available, and, at the same time, unfortunately beginning a disease liability now being slowly bred out.

To illustrate the relation of these Hybrid Teas to the general group of garden roses, it was noted that a recent comprehensive catalogue included 204 H.T., as compared with 120 H.P. and 85 of

the varied Polyantha varieties.

The Polyantha roses, sometimes attributed to R. multiflora nana, form a most important and largely used branch of the Multiflora family. It includes dwarf roses with characteristic flowers, sometimes called "baby ramblers." In more recent hybridizations, equally floriferous and hardy, and even better adaptable to garden use, the flowers are larger and brighter in color, including yellow and orange, and are of high value for masses of bloom. Certain desirable forms originating in Denmark and north Germany reach above 3 feet, being otherwise similar to the lower-growing Polyantha type. An indeterminate subclass in this general group, by reason of its blooming habit, has been commercially called the Floribunda without botanical support. All the colors of the rose, including vellow and even orange, as well as the pinks and crimsons and scarlets, are found in these important and rapidly enlarging groups.

Tea roses (T.), derived principally from R. odorata, are much less used in America than the Hybrid Tea group. In California and on the Gulf Coast great specimens of these roses, brought in with the old missions, yet remain in much beauty. Not dependably hardy north of the Mason and Dixon Line, they yet provide abundance of bloom, large flowers, and great beauty, though in general without the strong yellows and bright reds which characterize the H.T.'s. Once considerably grown under glass for forcing purposes, they are now rarely so used. About 25 horticultural varieties are found in

various parts of America.

China and Bengal roses, attributed both to R. chinensis and R. odorata and their hybrids, are used in the same way as are the Tea roses, though some of them prove hardy in the middle states. Both have horticultural varieties with small red blooms, and, being generally of lower growth, are valuable, with careful selection, in

ordinary rose gardens.

Noisette or Champneys, R. Noisettiana, resulting from a hybrid made in Charleston, South Carolina in 1810, form excellent bush roses where they are hardy, as in the same section mentioned for the larger Tea roses. Much grown in Europe, they have their horticultural varieties, including the famed Maréchal Niel and similar strong-growing climbing yellow roses.

The Multiflora roses, R. multiflora, include an important class of climbing roses sometimes called "ramblers," but diminishing in importance by reason of hybridization with R. Wichuraiana forms. The true Multiflora groups have cluster flowers in large panicles of white, blush pink, and dull crimson.

The Wichuraiana group, R. Wichuraiana, (also called the Memorial rose) arises from a more or less evergreen ground trailer, itself useful for covering banks with its white flowers and shining leaves, but more important because of the hybrids which have reached into all other forms of roses, producing pillar and climbing roses of high value with both large and small flowers and in varied and attractive colors. This is the dominant form of the Hardy Climbing rose in America, and not even a trained botanist can readily distinguish the Wichuraiana base from the Multiflora base. The initials L.C. are used to designate these varieties, referring to the larger flowers produced on these modern climbers.

The Sweetbriers, R. Eglanteria (rubiginosa), are exemplified in the so-called Penzance sweetbrier hybrids, which, with fragrant foliage, also include single flowers of great attractiveness.

The Rugosa roses, R. rugosa, from China and Japan, furnish hardy roses of strong growth, suitable for hedges and garden backgrounds. Hybridized with all other classes, many forms even including rich yellow and orange tones, have been combined with the Rugosa type to great garden advantage when the plants are used as backgrounds or for hedges, being unsuitable for the formal rose-garden. The class is generally designated as H.R.

The Austrian Brier rose, R. fatida, includes yellow roses of upright or half-climbing habit, also bringing in notable copper hues. An early American hybrid, Harisons Yellow, includes, apparently, a cross with R. spinosissima in a hardy spreading awkward bush of great bloom beauty. Another hybrid, the Persian Yellow, was the parent of the so-called Pernetiana group

previously discussed.

Banksia rose, R. Banksiæ or Lady Banks, is a climbing evergreen form from China abundantly used in California, the South, and other mild regions for its good foliage and seasonal abundance of small clustered yellowish or white flowers, sometimes fragrant.

The Cherokee rose, R. lævigata, from China and Japan, has been naturalized in the South, producing very large single fragrant white flowers, blooming once on strong shoots, sometimes evergreen. The Cherokee rose is rarely hardy north of the Mason and Dixon Line. Certain hybrids have been made in this class; one said to contain Cherokee blood, Dr. W. Van Fleet, is of importance as a hardy climber.

The Macartney rose, R. bracteata, also a garden escape from China in the South, is chiefly or value through its hybrid called Mermaid, which endures to the middle states.

Hugonis, R. Hugonis, from China, provides a yellow-flowered shrub of graceful form, blooming very early, with a covering of primrose single

flowers on a shapely hardy bush.

Primula, R. Primula, erroneously known as R. Ecæ, is of the same general form of bush, but more graceful and stronger, blooming earliest of all with primrose flowers in vast abundance.

Rosa setigera is the Prairie rose, which with its derivatives is usually of climbing or bush habit. Thoroughly hardy, of great vigor, it has been used in second-generation crosses for a series of most useful Hardy Climbing roses, in-

cluding American Pillar, Doubloons, Thor and many others. These hybrids are designated as

H.S. in rose terminology.

Groups long cultivated and found all over America as brought in by pioneers are the Musk roses, including R. moschata and R. Brunonii, the scentless white Ayrshire rose, R. arvensis, the French or Provence roses, including R. gallica, the Moss and Cabbage roses, derived from R. centifolia, the Damask roses, R. damuscena. All are included among the "old roses" listed as worth the attention of the discerning amateur.

The Dog rose, R. canina, little used in America, is important in Europe as an understock. In that connection R. blanda and several other species in northwestern America come into view because of their hardiness and understock adapt-

ability.

The Scotch or Burnet rose, R. spinosissima, is of very real garden importance for its pink, white and yellow flowers on a hardy, handsome and somewhat globular plant of much persistence.

The Cinnamon rose, R. cinnamomea, sometimes naturally develops flowers of many petals, and it belongs with the "old roses," being long-

persisting about old premises.

The dominant garden roses of America include the Hybrid Tea, Hybrid Perpetual, and Polyantha types, in that order as to importance. They are currently obtainable in hundreds of horticultural varieties as pleasing and important garden plants, rarely desirable as lawn subjects, though the use of certain taller-growing plants which can endure half shade is taking these roses into the edge of the shrubbery. One notable Rugosa hybrid, Max Graf, affords a thoroughly hardy bank, fence or stone-pile cover with enduring foliage and very beautiful large pink flowers in June.

Broadly speaking, these truly garden roses need to be composed by themselves, preferably in beds or borders, though in some cases, with skilful use, the Polyantha roses form an admirable adjunct in herbaceous borders, as well as serving excellently as low hedges. In some cases the Rugosa roses, either trained high as a protective hedge or pruned down to a definite height, as may be done with certain hybrids, serve admirably as backgrounds against which the lower-growing roses above mentioned may be displayed. Some few of the groups mentioned above may give similar service.

It is important that the separated rose garden, the chief feature of which is to be the recurring bloom of the Hybrid Teas and Polyanthas, should be so placed that it can be adequately cared for. This care, in addition to thorough cultivation, and sometimes mulching, also involves protection against the insects and diseases which bother garden roses. Research by the American Rose Society has resulted in control methods for both fungous and insect troubles, so that with reasonable care any thoughtful grower may have good flowers through a long season.

Some of the species of roses add an advantage to their pleasing single blooms in decorative "hips" which retain their color over winter.

Roses do well in any soil that will grow good vegetables, whether of light or heavy nature. Enough rotted manure to add fertility, the use of peat moss in many cases to lighten clay soils and to retain moisture, and good culture, will

generally produce many pleasing roses throughout the season. Roses seem to prosper best in soils neither strongly acid nor alkaline.

Planting methods vary according to location. Ordinarily, roses in beds in the North can be as close together as 15 inches, so that their foliage will shade the ground. Farther south, with larger growth, the distance must increase. The admirably useful Hardy Climbing roses may be planted in almost any location, and will flourish wherever the soil will produce a good burdock. In all cases thorough drainage is essential, as roses do not endure "wet feet." In general the observing rose grower varies his soil make-up and his cultural practice by his own experience or through reading the data constantly supplied by other amateurs through the American Rose Annual.

Roses are best planted in the North very early in the spring, though satisfactory results follow fall planting in well-prepared ground with at least a 6-inch hilling-up around the stem for winter protection. Plants are now sold in containers of various sorts so that they may be purchased in full leaf, and sometimes in full bloom, and successfully transplanted. The best practice is that of planting only fully dormant plants with adequate preparation and care.

Pruning is as desirable to secure good roses as it is for good apples or peaches. The average rose plant is not a beautiful object in itself. It is desirable, particularly with Hybrid Tea or Polyantha roses, to space and handle beds so as to give a flower mass as the blooms open. To obtain this effect pruning is requisite: if the plants are cut low, there will be more blooms not so large; if the plants are kept high and the buds are thinned, large representative and specimen

flowers may be obtained.

The Hybrid Perpetual roses bloom on shoots of the current season which arise from last year's wood, and that fact must be kept in mind when they are pruned. The Hybrid Tea roses bloom only on the wood of the current year, and that may arise from the base, above the bud. The Polyantha roses bloom on old wood and require little pruning. It is obvious that the frame of the plant, in the case of the Hybrid Perpetuals, is made up of older wood, whereas with Hybrid Teas the new shoots are of more importance for form and flowers.

Pruning may be simple and according to the ideal established, it being always good practice to cut away weak or diseased shoots and to prune toward the size and style of plant that is desirable.

In pruning the Hardy Climbing roses it is essential to know whether the variety is of the Multiflora type, in which case most or all of the current year's shoots are removed immediately after the bloom is over, the new shoots that arise from the base forming the plant for next year. The other type, of which Dr. W. Van Fleet is an example, blooms on short shoots arising from old wood, and this must not be pruned so sharply.

The Hybrid Perpetual roses may be induced to recur in bloom, in many cases, if carefully pruned after the bloom is spent, there being at the same time added fertility to promote new

growth.

Generally speaking, rose pruning should be done in the spring, though it is sometimes advisable to cut back long shoots to avoid whipping about by winds during the winter.

Winter protection depends on location. Throughout the middle states a mound from 6 inches to a foot of earth about the Hybrid Tea roses will preserve them so that even if the frost is heavy, Nature's pruning to the top of the mound will leave a good plant for next year. Pruning for special places and of special varieties is best learned by conferring with others who have succeeded, and in that respect the American Rose Society provides important available information.

The species and bush roses are usually pruned only by removing shoots that are in the way or are obviously diseased or worn out. It is not often desirable to cut them down as is the practice for Hybrid Tea roses.

Rose plants are easily propagated by one of two ordinary methods. For many years, as "own-root roses," there was large use of rooted cuttings of Hybrid Tea and Tea roses which were sold when the plants were in full leaf, and which, under proper care, would grow to usefulness in a year. As some varieties seemed to do better if given a stronger root system than naturally available, the practice arose of budding on an understock. Formerly the most important understock was known as Manetti, and that is still used for greenhouse roses. By far the largest number of the ordinary garden roses, including the Hybrid Teas and Polyanthas, are budded on one of several understocks, the more important being the Japanese Multiflora. Another much used understock is Ragged Robin, being the old Bourbon rose, Gloire des Rosomanes. In both of these cases the understocks may be raised from cuttings, or, with Multiflora, sometimes from seedlings.

The process of budding is not here described. Any standard method by which a bud of the desired variety is slipped when sap is moving under the slit stem of the proposed understock, with attention to protection until the bud has begun to grow, will give good results.

In general, the dependence in America is on budded roses grown in the open ground which have had the advantage of a full season's growth after the bud has taken hold, and before the plant, then known as a "maiden," is lifted to be sold or elsewhere set where it is to remain. Of these budded roses there are several qualities, and the nursery standards explain the difference between the No. 1 and No. $1\frac{1}{2}$ roses of commerce. These plants, if carefully budded on a suitable under-stock and carried through a full season under good nurture, afford the most desirable material for planting a rose garden. There are unscrupulous dealers who sell plants not fully matured, or who are careless about the labels, these plants usually being offered at lower prices. Obviously it is a waste of time to go to the trouble of planting roses that cannot be depended on as being what the purchaser desires and as having back of them the responsibility of a known grower who is willing to make good.

The culture of roses has tremendously increased in the United States, and annually fully twenty-five millions of outdoor-grown budded rose plants are sold. The greenhouse men who grow roses to bloom over winter probably do ten millions more. There is an increasing demand for the Hardy Climbers and for the bush

and species roses as desirable adjuncts for home

ROSE, BRIDAL-: Matricaria inodora var. plenissima. Brier-: Rubus coronarius. California-: Convolvulus japonicus. Christmas-: Helleborus nuger. Confederate-: Hibiscus mutabilis. Guelder-: Viburnum Opulus var. roseum. -Mallow: Hibiscus. -Moss: Portulaca grandiflora. -of-China-: Hibiscus Rosa-zinensis.-of-Heaven: Lychnis Cali-rosa. -of-Jericho: Anastatica hierochuntica. -of-Sharon: Hibiscus syriacus. Rock-: Cistus. Rush-: Crocanthemum scoparium. Sun-: Helianthemum.

ROSELLE. An annual hibiscus, H. Sabdariffa, sometimes grown in the warmest parts of the United States and in the tropics for the large thick acid calyx and bracts that are prized in the making of jams, sauces, jellies and acid drinks. It is grown like tomatoes or eggplants. Rows are ordinarily spaced for horse tillage, and plants may be set therein 18–24 inches apart. The plants reach 4 or 5 feet or more in height, making a continuous line or hedge. The bolls or heads are picked when immature, before becoming woody, and utilized either fresh or after being dried. There are yellowish forms of roselle, but in the usual kind the bolls are red. The plant is known also as Jamaica sorrel.

ROSEMARY: Rosmarinus. Bog-: Andromeda. Wild: Ledum palustre.

ROSENBERGIA: Cobra.

ROSEOCÁCTUS. Cactaceæ. Segregate from Ariocarpus, technically defined by the fls. arising from an arcole concealed in a longitudinal cleft in the tubercle: very succulent plants with a turnip-like root and flat or hemispherical body bearing thick spirally disposed tubercles: fls. from the center of the plant, opening in sun and of short duration. See Cachi.

fissuratus (Anhalonium fissuratum. Ariocarpus fissuratus. Mammillaria fissuratu). Living Rock. Plant-body flattish or somewhat rounded, mostly buried, to 5 or 6 in. across; tubercles grooved on upper side, the triangular surface showing a deep linear impression following the outer margins: fls. white to shell-pink, to 1½ in. across. W. Tex., Mex.

Kotschoubeyanus (Ariocarpus Kotschoubeyanus and A. sulcatus) Plant 2 in. or less across, only the flat top above ground; tubercles grooved on upper side, the triangular surface slightly rough: fls. about 1 in. long, rose-colored to light purple, arising near the top of the tubercle. Mex.

Llóydii (Ariocarpus Lloydii). Body with rounded top, 4 in. or more dam.; tubercles without a linear depression along the margin, exposed end broadly rhomboid rather than trangular: fls. purple, slightly above 1 in. long. Cent. Mex.

ROSEOCEREUS: Trichocereus tephracanthus.

ROSEROOT: Sedum Rosea.
ROSINWEED: Sulphium.

ROSMARÌNUS. ROSEMARY. Labiatæ. Hardy evergreen subshrub with small fls. in short axillary racemes, a well-known sweet herb grown for its aromatic lvs. which are used in seasoning while their volatile oil is common in drug-stores. Rosemary lasts for years if given well-drained soil and some winter protection. It is useful in S. Calif. for hedges, especially along the coast where it is dry and rocky. R. officinălis. To 6 ft.: lvs. linear, ¼ in. long, revolute, dark and shining above, white-tomentose beneath: fls. in short axillary racemes, light blue, ½ in. long, Apr.—May. Medit. region. Var. prostratus is prostrate.

ROSÚLARIA PALLIDA: Sedum chrysanthum.

ROTANTHA: Campanula floridana.

ROTATE: wheel-shaped; with short or obsolete tube and a flat and circular limb.

ROTENONE: see Derris.

ROTUND: nearly circular; orbicular inclining to be oblong.

ROUGE-PLANT: Riving humilis.

ROUPALA. Proteaceæ. Trop. American trees with alternate leathery lvs., bisexual fls. in pairs borne in racenes, and hard capsular frs.; differs from Hakea and Grevillea chiefly in seed characters. Sometimes grown under glass, and out-of-doors in S. Calif.

corcovadénsis: R. Pohlii.

Pohlii (R. corcovadensis). To 30 ft. or more, branches rusty-tomentose: Ivs. with 5-8 pairs of ovate or oblique toothed lfts. to 5 in. long: fls. white or yellowish, in racemes to 5 in. long. Brazil.

ROWAN: Sorbus Aucuparia.

ROYÈNA. Ebenaceæ. African evergreen trees or shrubs with entire lvs., small usually solitary fls., and fr. a leathery berry; one species grown out-of-doors in S. Calif. and sometimes under glass.

lùcida. To 12 ft. or more: lvs. alternate, oval, to 2 in. long, shining above: fls. white or yellowish, to ½ in. long: fr. red or purple, to 1 in. long. S. Afr.

ROYOC: Morinda Royoc.

ROYSTÒNEA. ROYAL PALMS. Palmaceæ. Monœious columnar unarmed feather-palms of American tropics of striking appearance and much planted in trop. countries around the world and in S. Fla.: trunk solitary, tall, cylindrical or variously bulged, more or less ringed: lvs. regularly pinnate, long and large, handsomely arching and drooping: spadices arising from top of trunk at base of sheath-column, much branched, shorter than lvs.: fls. in 3's, the middle one pistillate, or in 2's and staminate toward ends of branches; stamens mostly 6: fr. globose or oblong, 3% to 3/4 in. long, 1-seeded. See Palm for cult.

borinquena. Puerro Rico R. P. Trunk to 50 ft. and more, fusiform or swollen in the upper part and thence tapering to the infl: Ivs to 10 ft. long; pinnæ many, to 2½ ft. long, nearly 2 in. or less broad, long-tapering to the point; stamens covered in the bud: fr. ovoid, yellowishrown, about ½ in. long and ¾ in. thick. Puerto Rico; sometimes planted elsewhere.

floridàna: R. regia.

oleracea (Oreodoxa oleracea). Caribbee R. P. Noble slender tree reaching 100 ft. and more: trunk commonly swollen at base and then cylindrical: lvs ascending or horizontally spreading so that the crown is more or less flat on the bottom; pinnæ in a single row on either side the rachis: spadices far below the crown and therefore conspicuous; stamens protruding in the bud; fr. oblong, 1/2-5/8 in long and 3/8 in thick, often somewhat curved. Farther W. Indies; much and widely planted.

règia (R. floridana. Oreodora regua). Cuba R. P. To 70 ft. or perhaps more, the t unk swollen somewhat at or above the middle and then tapering: crown bushy and the lower lvs. drooping and covering the rather short spadies; pinnæ in 2 rows or directions on either side the rachis; stamens covered in the bud: fr. globose or globular-oblong, \(^3\frac{1}{2}\) in. long. Cuba, and reported on other isls.; S. Fla. on isls. in Everglades; much planted in S. Fla.

RUBACER: Rubus odoratus.

RUBBER, PARA: Hevea brasiliensis. -Plant: Ficus elastica. -Tree, Mexican: Castilla elastica. -Vine: Cryptostevia.

RÙBIA. Rubiaceæ. Per. herbs with mostly whorled lvs. and small wheel-shaped 5-lobed fls. in cymes; of wide distribution, one sometimes cult. for the root which yields a dye.

tinctòrum. Madder. To 4 ft., erect or decumbent: lvs. in 4's-6's, lanceolate, to 4 in. long, prickly on midribs and edges: fls. greenish-yellow, in branching cymes: fr. red turning black. S. Eu., Asia.

RUBIACEÆ. MADDER FAMILY. A large group of about 350 genera of herbs, shrubs and trees. sometimes climbing, abounding in ornamental subjects: lvs. simple, opposite or whorled: fls. usually bisexual with gamopetalous 4-5-lobed corolla, 4-5 stamens, inferior 1-10-celled ovary: fr. a caps., berry or drupe. The family furnishes many economic plants such as coffee and quinine. as well as dyes and medicines. The genera known to hort. are Asperula, Bouvardia, Catesbæa, Cephaelis, Cephalanthus, Chiococca, Cinchona, Coccocypselum, Coffea, Coprosma, Coutarea, Crucianella, Damnacanthus, Duggena, Emmenopterys, Galium, Gardenia, Genipa, Hamelia, Hoffmannia, Houstonia, Isertia, Ixora, Leptodermis, Luculia, Manettia, Mitchella, Morinda, Nertera, Palicourea, Pentas, Portlandia, Poso-queria, Psychotria, Putoria, Richardia, Rondeletia, Rubia, Serissa, Tricalysia, Vangueria, Warszewiczia.

RÙBUS. Brambles. Rosacex. Shrubs. seldom nearly herbaceous, the woody species with bien. canes (fruiting the second year and then perishing), most of them prickly, including the blackberries, dewberries, raspberries grown for fruit and also a good number of exotic species planted for the showy flowers and ornamental foliage: there are hundreds of species around the world, mostly in the northern hemisphere. Lvs. alternate, prevailingly compound but sometimes simple: fls. white or pinkish or rose, in the cult. species mostly in clusters: fr. an aggregate of small drupes; when the cone or thimble of cohering drupelets parts from the receptacle when picked, it is a raspberry, the receptacle remaining on the bush; when the drupelets adhere to the receptacle it is a blackberry or dewberry, the receptacle being eaten as part of the fruit. The receptacle being eaten as part of the fruit. dewberries differ from blackberries only in being vines, running over the ground or when planted needing support. The new cane, which usually does not flower and fruit that year, is a primocane; the second year it bears fls. and frs., may have different foliage, and is called a floricane. The characters of the cane in these different ages are important points in distinguishing the species botanically

The pomological blackberries and dewberries in North America are derived within a century from native species, yet these species are so little understood that the varieties cannot now be referred to their original sources. Probably the subject will be elucidated in the near future. The native species are many more than we have recognized, some of them not yet named and described.

The brambles are of simple culture. The canes of black-berries and raspberries should be removed at the ground after fruiting and opportunity given for the new ones to develop. An open exposure and average garden soil are suitable. They grow readily from seeds, but the usual method of propagation is by root-cuttings or by suckers; some of them increase by the new canes taking root either at the joints or at the recurving tip. See Blackberry, Boysenberry, Dewberry, Himalaya-Berry, Loganberry, Raspberry.

acuminatus. Ornamental scandent shrub: lvs. simple, ovate-oblong, caudate-acuminate, serrulate; fls. white, small, in fascicled racemes. Himalayas; probably adapted to parts of the S.

allegheniénsis (R. nigrobaccus). Glandular highbush blackberry, crect or at length somewhat arching, to 10 ft., with hooked prickles: Ifts. 3 or 5, ovate or oblong-ovate, long-pointed, soft-pubescent underneath: infl. elongated: fr. mostly long or oblong, sweet and aromatic. Common, N. S. to N. C. and Mo.—In dry open lands the wild plant may remain as low as 1 or 2 ft.

árcticus. The plant so listed is probably not the true

R. arcticus of N. Eurasia but R. stellatus native in northern R. archous of N. Eurasia but R. stellatus native in normern Amer, and which is an herbaceous unarmed glabrous more or less decumbent or mat-forming plant much resembling a strawberry lits. 3 or the lf. 3-lobed, close to the soil: fl.-sts. nising from the crown or at the ground, bearing 1 or 2 rose-colored fls.: fr. very small, globular.

argitus. Non-glandular highbush blackberry, erect or argitus. Non-glandular highbush blackberry, erect or becoming arching or in woods more or less decumbent, to 8 ft. or more, stiff and upright in the open: Its. 3 or 5, mostly oval to oblong or lance-ovate, commonly softpulsescent underneath, the petioles and infl. essentially glandless. infl. short: fr. rather small, short-oblong. Central eastern states and west to Miss. River.

aurantiacus: see R. ellipticus.

austraticus: see H. eutpucus.
austratis. Lofty tree climber, diocious; branches slender
and drooping, recurved-prickly: lfts. usually 3 or 5, variable,
narrow-ovate or narrower, to 5 in. long, glabrous or sometimes tomentose underneath, sharp-serrate: fis. white, to
½ in. diam. fr. reddish-orange, ¼ in. diam. New Zeal.
Var. glaber is the glabrous or smooth form.—Adapted only
to warmer parts and sometimes seen under glass.

bambusarum: R. Henryi var.

cæsius. European Dewberry. Weak plant with longcèsius. European Dewberry. Weak plant with long-prostrate slender rooting glaucous canes, making large colonies, prickles not stout and mostly or often straight, sts. and fl.-clusters with few or no glands: lfts. normally 3, broad-ovate. fls. white, few in open cluster. fr. of a few large glaucous drupclets and the sepals mostly erect. Eurasia.—Planted as ground-cover and sometimes spontaneous, also intro. for fr. because of its hardiness far N

canadénsis (R. Millspaughii). Glandless highbush essentially glabious blackberry, spineless or nearly so, to 8 or 12 ft., the canes at length somewhat arching: lfts. 3, 8 or 12 ft., the canes at length somewhat arching: lfts. 3, 5 or seldom 7, ovate to narrow-ovate and long-acuminate, sharp-serrate infl. elongated: fr. oblong to roundish, mostly sour. Abundant northward, ranging from Newf. to the mts. of Ga.—Probably not in cult. outside botanical collections except as a transplant; the thornless blackberries of cult. are spineless states of other species.

Chamemorus. CLOUDBERRY. Monoccious or dioccious: st. nearly or quite herbaccous, 3-10 in. high, from a creeping rootstock. Ivs. 2 or 3, rounded in outline and obtusely lobed: ft. solitary, white, to 1 in. across: fr. reddish or yellow. Arctic and subarctic regions around the world, south to Me.-Useful in rock-garden.

Cockburnianus (R. Giraldianus). Raspberry grown for ornament, sts. white-glaucous, somewhat prickly: lvs. white-tomentose underneath; lfts. 7-9, oblong-lanceolate and terminal one much broader, serrate: fis. purp small, in narrow terminal panicles 4-6 in. long. China. purplish.

Commersonii: R. rosafolius.

coronarius (R. rosæfolius var. coronarius). BRIER-ROSE. coronarius (R. rosæfolius var. coronarius). BRIER-ROSE, Smaller stature than R. rosæfolius, young parts and Ivs. glabrous and strongly resinous-dotted, prickles much more numerous and very stout, lits. relatively small, not prominently acuminate and mostly narrowed at base: fis. full double, white, 1 in. or more across. Probably Asian; cult, and more or less wild in Calif. and tropics; persists as far north as N. J.

crategifolius. Upright, to 10 ft., prickly: lvs. cordate-ovate to oblong-ovate, with 3 or 5 acute toothed lobes, mostly slightly harry underneath: fls. white, 1/2 1/3 in. across, in small clusters: fr. small, orange-red. China, Japan.—Sometimes planted to cover banks and for its good autumn foliage; hardy N.

cuneifolius. Sand Blackberry. Stiff and erect, 1-3 ft., branched, strongly armed: lvs. white-pubescent underneath; lts. 3 or 5, mostly obovate, dentate, obtuse or short-acute: fts. white or pinkish, few in a cluster: fr. blackish, oblong, good but small. Sands, Conn. to Fla.—Useful for cover on poor lands.

Dalibárda: Dalibarda repens.

deliciosus (Bossekia deliciosa. Oreobatus deliciosus).
BOULDER RASPBERRY. ROCKY MOUNTAIN FLOWERING
RASPBERRY. Upright, to 6 ft. or more, spreading and arching, unarmed: lvs. orbicular-ovate to reniform, with 3 or
5 broad shallow lobes: fls. white, mostly solitary, to 2 in.
across, in spring and early summer: fr. dark purple or winered. Canyons, Colo.—Grown for the rose-like fls.; hardy N.

elifpticus (R. flavus). Clambering semi-climbing strong evergreen to 10 or 15 ft., sts. densely reddish or brownish hairy and with stout prickles: lfts. 3, oval or elliptic or broader, obtuse or short-acute, serrate, gray-tomentose underneath: fls. white, in panicles: fr. yellow. India.— Grown in Calif. and similar climates for ornament and sometimes naturalized in tropics; has been planted as R. aurantiacus.

flagellàris (R. procumbens). American Dewberry. Trailing, rooting at tips, not glandular, with recurved prickles: lfts. 3 or 5, ovate to triangular-ovate, acute to acuminate, serrate-dentate: fls. few in a forking infl.: fr. spherical to oblong, black, edible. Canada to the Gulf

states, occasionally planted.—Sometimes known as R. villosus. Var. álmus. Without prickles: fi.-clusters arising usually from lateral buds on floricane rather than on leafy shoot: here belongs Foster Thornless dewberry. Var. geophilus (R. geophilus). Lvs. very large, cut-toothed. Probable origin of the Mayes or Austin and similar dewberries. Var. roribáccus. Robust; lfts. cuneate-obovate and doubly serrate, pedicels very long, to 6 in., fis. and fr. very large; Lucretia dewberry.

flavus: R. ellanticus.

Fraseri (R. robustus). Cross between R. parviforus and R. odoratus: to 8 ft., less glandular-hairy than R. odoratus: rose-color fading to pale purple. R. parviforus var. Fraserianus is a different plant.

frondòsus. Non-glandular highbush blackberry, at length over-arching, with short recurving prickles: Its. mostly 3, short-ovate, acute, dentate or serrate, soft-pubescent: fis. in a short leafy cluster: fr. spherical or nearly so, black, sweet. Mass. to Va.

fruticosus: an old name for shrubby blackberries of Eu., now mostly abandoned as a name for a particular species.

geóphilus: R. flagellaris var.

Giraldianus: R. Cockburnianus.

glaucus. Raspberry with glaucous somewhat prickly canes: Ifts. 3, lanccolate or ovate-lanceolate, long-acuminate, scirate, white-tomentose underneath: fls. white, in short terminal racemes. Costa Rica to Ecuador.

Hénryi. Climbing evergreen, with sts. tomentose when young and few pickles: Ivs. deeply 3-5-lobed, white-tomentose underneath, the segms. or lifts. long and narrow, to 6 in. long and 1 in. broad: fls. pink, 3/4 in. across, in glandular racemes. China. Var. bambusārum (R. bambusarum) has 3 narrow short-stalked lifts. to 4 in. long.

hispidus. Swamp Dewberry. Slender hispid and often glandular trailer, lying close on the ground, without prickles, foliage glossy and mostly evergreen: lits. mostly 3, obovate and obtuse: fis. small, few. fr. black at full maturity, sour. Swamps and low places, Canada to Ga. and Kans.—Sometimes grown as ground-cover.

Kans.—Sometimes grown as ground-cover.

idæus. European Rasperry. Erect, 3–5 ft. or more, prickles many, few or none, sometimes bristly but not glandular, propagating by suckers: Ifts. 3 or 5, ovate to broad-ovate, dentate, grayish- or whitish-pubescent underneath: fis. whitish, few and small: fr. oblong, conical or thimble-shaped, mostly dark red but sometimes yellow or whitish. Eurasia, seldom northward in N. Amer.—The pomological red raspberries belong to this species and its varieties. Var. strigosus (R. strigosus). Common or American Red Rasperry. More hardy: infl. and sometimes new canes bristly and glandular: fr. light red, hemispherical to conical, soft. Newf. to N. C., Wyo, and B. C., and E. Asia.—The purple-cane raspberries, frs. mostly purplish, are apparently hybrids of the R. idexus class and R. occudentalis; plants propagated either by suckers or tips. cidentalis; plants propagated either by suckers or tips.

illecebrosus. Strawberry-Raspberry. Canes glabrous, illecebròsus. Strawberry-Rasperry. Canes glabrous, woody or nearly herbaccous from spreading roots forming patches, with curved prickles, to 4 ft. long and more or less lopping: lfts. 5-9, narrow-lanceolate and acuminate, to 4 in. long: fls. white, fragrant, few or solitary, to 1½ in. long, with very long sepals: fr. large, scarlet, sour. Japan.—Root-hardy N.; planted for ornament, fr. pleasant when cooked. It has been known also as balloon-berry.

inérmis: R. ulmifolius var

innominatus. Canes densely glandular-hairy, erect, to 10 ft., prickly (in var. Kuntzeanus glandless): lfts. 3 or 5, oblong-ovate, serrate, white-tomentose underneath, to 4 in. long: fls. small, pink, in narrow panicles: fr. orangered, edible. China.—Sometimes grown for ornament and interest, root-hardy N. The Van Fleet raspberry, pomological variety for the S., is a hybrid of R. innominatus and the Cuthbert red raspberry.

invisus: R. flagellaris var.

irenæus. Prostrate more or less shrubby evergreen, st. tomentose and with or without prickles: lvs. simple, nearly orbicular, cordate, often acute, to 6 in. across, white- or rusty-tomentose underneath: fls. white, to ¾ in. across, solitary to few: fr. red. China; not hardy N.

laciniatus. Cutleaf or Evergreen Blackberry with tumbling or trailing prickly per. canes becoming glabrous: Ifts. 3 or 5, cut into very narrow acute toothed parts: fls. white or pink, in large panieles: fr. small to medium, spherical or nearly so, black. Eu., run wild in many parts of the world as on the Pacific Coast.—There are a few pomological vars., as Starr, Wonder.

lasiocóccus. Sts. creeping, slender, nearly herbaceous, to 12 in. or more, without prickles: Ivs. reniform or orbicular in outline, small, 3-lobed or 3-divided with rounded parts, finely serrate: fis. small, white, usually 1 or 2 on erect sts. 2-4 in. high. Mts., Ore. to B. C.

laudatus. Tall erect non-glandular blackberry with fur-

rowed canes becoming glabrous and straight or retrorse prickles: lfts. 3 or 5, obovate-oblong to oblanceolate to ovate, acuminate, serrate: fls. white, in a short leafy cluster: fr. oval, black, sweet, early. Mo., Kans.—Bundy and Kenoyer blackberries belong here.

leucodérmis (R. occidentalis var. leucodermis). Differs ieucodermis (R. occidentais var. teucodermis). Differs from R. occidentais in yellowish canes, more strongly re-curved and flatter prickles, lfts. yellowish-green above, less acuminate, more strongly and sharply toothed, fr. reddish or black, edible. B. C. to Calif., Mont., Utah.

BROADLEAF EVERGREEN BLACKBERRY. Stout and very prickly, more or less evergreen, with long arching or prostrate densely felted per. often glandular canes: Ifts. 5, broad-ovate to nearly orbicular, short-acuminate, sharply dentate, yellowish- or grayish-felted underneath: fls. white or pink, in large villous panicles: fr. rather large, globose, black, sweet but insipid. Eu.; sometimes planted, and escaped on Pacific Coast.

Linkianus. Bramble of uncertain identity, not N. American; the name has been applied to double-fld. forms of European blackberries grown for ornament.

loganobáccus. Loganberry, Phenomenal. Robust and vigorous blackberry, canes glaucous, with many straight prickles, long and vine-like: Ifts. 3 or 5, thick, large, broadovate, acute, dentate, gray-tomentose underneath: fis. bisexual, white, to 2 in. across (sometimes double), in short open clusters: fr. long, to 1½ in., red, acid. Cultigen; offshoot of R. ursinus.

louisianus. Erect non-glandular blackberry with scattered prickles, canes becoming glabrous with age; distinguished by the very narrow lits. (narrowly lanceolate and long-pointed), to 4 in. long, sharp-serrate: fls. white, in open leafy clusters: fr. cylindrical, white or nearly so. S. U. S.—Known in the pomological varieties Crystal White and Iceberg.

macrocárpus. Branches, infl. and petioles glandular and villous, with hooked prickles: lvs. simple, lobed or ternate; lfts. thick, ovate or broad-elliptic, serrate: fis. purple, large, somewhat panicled: fr. large, long. Mts., Ecuador.

macropétalus. Blackberry or dewberry, at first ascending, becoming procumbent or vine-like, plant not tomentose, canes slender and glaucous, with weak prickles: Ifte ? ing, becoming procumbent or vine-like, plant not tomentose, canes slender and glaucous, with weak prickles: Ifts. 3, green both sides, thin, most of them acuminate or pointed, very sharply toothed: fls. unsexual or imperfect, white, variable in size, in short clusters, pedicels and large calyx with stalked glands: fr. glabrous, black. N. Calif. to B. C.—Has given rise to pomological vars.; often confused with

Mîllspaughii: R. canadensis.

mirus. Decumbent or clambering, with stout prickles mirus. Decument or clambering, with stout prickles but no bristles or glands, the pedicel prickles also long and prominent. Ifts on new shoots ovate or elliptic, more than half as broad as long; fils, white, very large, commonly more than 1 in. across: fr. 1 in. or more long, black, of good quality. Cultigen.—The Marvel dewberry belongs here.

moluccànus. Robust, raspberry-like, tomentose and red-hairy, with curved prickles: lvs. simple, tomentose underneath, usually broad-ovate and deeply cordate, more or less 3-5-lobed: fis. white, in terminal clusters. India, Malaya.

negléctus: form of the native red raspberry, R. idæus var. strigosus, at one time interpreted as a hybrid. nigrobáccus: R. allegheniensis.

nivalis. Woody prickly vine to 3 ft. or more long: lvs. persistent, mostly simple, more or less 3-lobed, rounded, serrate: fls. red. Mts., Ida., Ore., B. C.—Grown for groundcover.

nutkànus: R. parviflorus.

occidentalis. Blackcap Raspberry. Blackcap. Thim-bleberry. Erect, 3-5-ft., with glaucous prickly canes that bend over and root at the tip: lfts. mostly 3, ovate-acumibend over and root at the tip: Its. mostly 5, ovate-acum-nate, doubly dentate, white-tomentose underneath: fls. small, whitish, in dense short prickly clusters: fr. hemi-spherical, black and glaucous, firm, seldom varying to amber. N. B. to Ga., westward.—The source of many pomological varieties of black raspberry.

odoratus (Rubacer odoratum). Flowering Raspberry. Unarmed, erect, with shredding bark, to 6 ft., forming colonies: lvs. simple, large, broad-ovate, cordate, 3-5-lobed, finely serrate, pubescent underneath: fls. to 2 in. across, rose-purple (varying to whitish), many in loose clusters: fr. red, flat, dry, not eaten. N. S. to Mich. and Ga.—Sometimes planted for ornament.

palmatus. MAYBERRY. Diffuse and rather slender, to 7 ft., glabrous, with scattered prickles: lvs. simple, triangular-ovate to oblong-ovate, to 3½ in. long, deeply lobed toward base, sharply lobed-dentate, acuminate, somewhat pubescent on veins underneath: fls. white, to 1 in. across, solitary: fr. yellow. China, Japan.—Has been intro. for fr. in mild climates; sometimes planted for ornament and roothardy N. with protection.

paniculatus. Scandent, white-tomentose on branches and under side of lvs. which are simple but sometimes lightly lobed, cordate-ovate, to 6 in. long, acuminate, serrate: fls. medium size, in large panicles. Himalayas: useful S.

parviflorus (R. nutkanus). Much like R. odoratus, but fis, fewer and white. Mich. to Mex. and Alaska. Var. Fraserianus has lacmiate-toothed petals.

parvus. Prostrate, diocious, with creeping sts. to 18 in. long, glabrous: lvs. of a single lft. which is linear or linear-lanceolate, acute, dentate, 3 in. or less long. fls. solitary or paniculate, small, white: fr. ½-1 in. long. New Zeal.

pedåtus. More or less herbaceous very slender vine without prickles, to 3 ft. or more: lvs. of 5 small dentate-serrate lfts.: fs. solitary on slender pedicels, white. Mts., Ida., Ore. to Alaska.—Interesting ground-cover.

phenicollasius. Wineberry. Canes long, recurving and rooting at tip, with weak nearly straight prickles and covered with red-brown glandular hairs. Ifts. usually 3, broadly cordate-ovate, dentate, purplish-vened and white-tomentose underneath: fis. small and whitish or pink, in close clusters, the large callys bristly; fr. bright red, small, edible. China, Japan; escaped in U. S.—Ornamental.

probus. QUEENSLAND RASPBERRY. Erect or somewhat drooping at maturity, 6-8 ft., producing suckers, canes glabrous and with few short spines: lvs. pinnate, glabrous; lits. 3-9, ovate-lanceolate and gradually acuminate, sharply double-serrate, terminal one to 4 in. long: fls. white, solitary decreased endwise. Known only as a cultigen, said to be a hybrid from Queensland, R. rosæfolius being one parent.— Prized for fr. in Puerto Rico and has been grown in Fla.

procèrus. Himalaya-Berry. Very vigorous and thorny, the woody per. canes 20-40 ft. long and trailing or clamberthe woody per canes 20-40 ft. long and training or clambering, young growths white-tomentose: Ivs. thick, persistent, white-tomentose underneath; lfts. 3 or 5, broadly ellipticovate, sharply double-serrate: fls. white, in tomentose panicles: fr. a thimble-shaped blackberry, black, midsummer to autumn. Eu.; now run wild in many parts of

procumbens: R. flagellaris.

pubescens (R. triflorus). Soft little unarmed plant, the sts. herbaceous or somewhat woody: Ifts. 3 or 5, rhombicovate, acute, serrate, thin and nearly or quite glabrous: fis. white, to ½ in. broad, 1-3 on the peduncle: fr. 1ed-purple. Newf. to Alaska to N. J. and Neb., in swamps; sometimes colonized in most places.

refléxus. Creeping or scandent, sts., petioles and under renexus. Creeping or scandent, sts., petioles and under side of lvs. rusty-tomentose: lvs. simple, triangular-ovate in outline, 3-5-lobed, middle lobe long, dark green above, brown-tomentose and prominently veined underneath: fs. about ½ in. across, white, in close clusters: fr. globose, dark purple. Hongkong.—Sometimes grown under glass and in warm countries; offered as R. reflexus pictus.

robústus: R. Fraseri; another R. robustus is European and another Andean, probably neither in cult. here.

and another Andean, probably netter in cult. here.

rossefolius (R. Commersonii). More or less trailing, canes 5-8 ft. long, pubescent at least on younger parts, with few recurved prickles: 1vs. pinnate, thinly hairy, sharply double-serrate; lits. 5 or 7, lanceolate, long-acummate, broad at base: fls. white, solitary or in small clusters, long-pedicelled, calyx-lobes long-caudate fr. globose to oblong-thimble-shaped, red, edible. E. Asia; extensively nat. in American tropics and the fr. collected; often planted. Var. coronarius. see R. caronarius. coronarius, see R. coronarius.

schmidelioides (R. australis var. schmidelioides). Scramschmidenoides (R. custratis var. schmidenoides). Scrambling or climbing, forming a dense diocious bush with usually unarmed branchlets: Ifts. 3 or 5, orbicular-ovate to ovate-lanceolate, mostly tomentose or pubescent underneath, petioles and midribs prickly: fis. whitish: fr. small, pale yellowish. New Zeal.; adapted to parts of Calif.

spectabilis. Salmonberry. Sts. per., upright, becoming spectabilis. Salmonberry. Sts. per., upright, becoming long and prostrate, with few or weak spines, bark shredding, spreading by underground roots: Ifts. 3, thin, ovate to oblong-ovate, acuminate, doubly dentate and somewhat lobed, nearly glabrous: fis. 1-4, rose-colored or purplish, about 1 in. across: fr. more or less conical, salmon-color, edible. Ida. and Calif. to Alaska.—Sometimes planted for ornament and hardy N.

stellatus: see under R. arcticus.

strigòsus: R. idæus var.

thibetanus (R. Veitchii). Raspberry with pinnately compound lvs., sts. erect, with slender prickles: Ifts. 7–13, elliptic or ovate, coarsely toothed, white underneath, the terminal lft. larger and lobed or pinnatifid: fis. rose-purple: fr. nearly globose, blue-black. W. China.—Sometimes planted for ornament. A very different plant has been grown as R. Veitchii.

titanus. Enormous grower, to 40 ft., the canes vine-like and bearing many stiff prickles as also on the petioles and midribs: lfts. 3 or 5, ovate-attenuate, only thinly pubescent underneath, jagged-toothed and sometimes somewhat lobed: fls. white, bisexual, in short leafy clusters: fr. oblong, to

2½ in. long, black, sweet. Pacific coast; the Mammoth blackberry, cult. in Calif. Var. espinatus, without prickles, is represented in the Cory (Cory Thornless). Both are probably developments from R. vitifolius.

triflorus: R. pubescens.

triviàlis. Southern Dewberry. Variable long trailer, very prickly and commonly bristly-glandular, partially evergreen: Ifts. 3 or 5, stiffish and glabrous, narrow-oblong to lanceolate, pointed, sharp-serrate: fls. white varying to pinkish, solitary or few: fr. oblong, black. Va. to Fla. and Tex.—Several named pomological forms have been intro.

ulmifòlius. A name of doubtful application, in Eu., where native, a very thorny plant and probably not in cult. here, but known in the accepted var. inérmis (R. inermis), the Evergreen ThornNless Blackbern; canes per., very long and clambering, destitute of prickles: Its. 3 or 5, thick, gray-pubescent underneath, oval to elliptic-ovate, serrate, acute: fls. mostly pinkish, in long panicles: fr. nearly globose, black. Grown somewhat in mild climates, particularly Calif. often as Burbank Thornless.

ursinus. Pacific Dewberry or Blackberry. Mostly strongly ascending at first but becoming decumbent or vine-like, plant dull green and foliage felted or tomentose at least when young and underneath; primocanes with hairs among the prickles; lvs. usually 3-foliolate unless those in the fl.-clusters; fls. often functionally imperfect, white, pedicels and callyx usually glandless. Ore. to Lower Calif.—See R. loyanobiccus.

Veitchii: R. thibetanus.

vèlox. Robust, glandless blackberry, canes arching or finally trailing to several ft., with hooked prickles: lfts. 3 or 5, ovate or elliptic-ovate, terminal one to 4 in. long, sharpdentate, soft-pubescent underneath: fls. white, about 1 in. across, few in forking infl.: fr. 1 in. or more long, black, very early. Tex.—Sorsby, Hogo, Spalding, McDonald very early.

vitifòlius. Differs from R. ursinus in green color of herbage and thinner not tomentose foliage which may be only pubescent or even glabrous underneath; middle lvs. of flowering shoots mostly 3-lobed rather than 3-follolate. W. Cent. Calif.—Parent of pomological vars. See R. titanus.

xanthocárpus. Small plant with ann. shoots to 1 ft. tall, lightly hairy, prickles few and weak lvs. 3-foliolate, terminal lft. ovate-oblong, all obtuse and serrate: fls. 1 or 2 in upper axils: fr. large, ovoid, bright yellow, edible. W. China.—Once intro. for its fr.

RUDBÉCKIA. CONEFLOWER. Compositæ. Coarse summer-flowering ann. and per. herbs of N. Amer. with simple or compound alternate lvs., and usually showy terminal heads of yellow ray-fls. and hemispheric to columnar disk greenish or yellowish to purplish-black; pappus a crown or teeth or none.

The coneflowers thrive in almost any soil and situation. Propagated by seeds, cuttings or divisions. They are useful for yellow border effects in summer and autumn: some of the annuals are adapted to the flower-garden.

amplexicaulis (Dracopis amplexicaulis). Ann. to 2 ft., glabrous, somewhat glaucous: lvs. oblong or ovate, entire or slightly toothed: heads solitary, 2 in. across, rays yellow often with a brown-purple base, disk brownish, becoming 1 in. high. Mo. to Tex.

bicolor. Ann. to 2 ft., bristly: lvs. lanceolate or oblong, to 2 in. long, entire: rays to 1 in. long, wholly yellow or with lower part dark colored, dusk black, 34 in. high. Ark. and Tex. to Ga. Var. supérba, Erfurt C., has heads 2 in. across, rays yellow purplish-brown below.

californica. Per. to 51/2 ft., pubescent: lvs. ovate or lanceolate, to 1 ft. or more long, entire or lower toothed or lobed: heads solitary, rays to 2 in. long, disk 11/2 in. high. Calif., Ore.

columnàris: Lepachys columnifera.

flava: R. hirta.

fülgida. Per. to 2 ft, hairy: lvs. oblong to lanceolate, to 4 in. long, mostly entire: heads 1½ in. across, rays goldenyellow or with orange base, disk black-purple, ½ in. across. Pa. to Fla. and Tex. Var. variābilis is listed.

hirta (R. flaws). Black-Eyed Susan. Yellow Daisy. Bien. or sometimes ann., rough-hairy, to 3 ft.: lvs. oblong to lanceolate, to 5 in. long, mostly toothed: rays goldenyellow or sometimes deeper at base, to 2 in. long, disk purplebrown, 34 in. across. Ont. to Fla. and Tex.

laciniata. Per. to 12 ft.: lvs. pinnately divided into toothed or lobed segms.: heads 4 in. across, rays yellow, drooping, disk greenish-yellow. Que. to Fla. and Ariz. Var. hortensia, Golden-Glow, fis. double.

Mandaiana: hort. name for a pure yellow form.

máxima. Per. to 9 ft., glabrous and glaucous: lvs. ovate to 1 ft. long, nearly entire, clasping: rays yellow, to 2 in. long, drooping, disk brownish, to 2 in. long. Mo. to Tex.

móllis. Per. to 3½ ft., gray-hairy: lvs. elliptic-spatulate, to 2½ in. long, margins wavy or entire: heads to 3½ in. across. Coastal plain, E. Ga. to Fla.

montana. Per. to 6 ft., glabrous: Ivs. pinnately divided, the upper entire: heads of purplish-black disk-fls. to 2½ in. long. Mts., Colo.

moschata: an old name of doubtful application, some of the material so listed being R. lacingata.

Nèwmanii: R. speciosa.

nitida. Per. to 4 ft: lvs. ovate to lanceolate, to 6 in. long, entire or finely toothed: rays pure yellow, drooping, disk to 2 in. high. Ga. to Fla. and Tex.

occidentalis. Per. to 4 ft.: lvs. ovate, to 6½ in. long, toothed: rays none; disk to 1½ in. high. Wash. to Calif. and Nev.

pállida: Echinacea pallida.

purpurea: Echinacea purpurea.

scariòsa: hort. name.

speciosa (R. Newmanii). Per. to 3 ft.: lvs. lanceolate to ovate, to 6 in. long, toothed: rays yellow often orange at base, 11½ in long, disk brown-purple, to 3½ in high. Pa. to Mich. and Ark. Var. grandiflora is an improved form.

spectábilis: listed name.

subtomentòsa. Sweet C. Per. to 6 ft., gray-pubescent, rough: lvs toothed, ovate or 3-lobed, to 5 m. long: rays to 1½ in. long, yellow with sometimes dark base, disk dull brownsh, ½ m across. Ill. to Tex.

triloba. Brown-eyed Susan. Bien. blooming the first year, to 5 ft.: lower lvs 3-lobed or -parted, rough: rays to 1 in long, deep yellow or with orange or brown-purple base, disk black-purple, ½ in. across. N. J to Gia and La.

RUE: Ruta. -Anemone: Anemonella thalictroides. Meadow-: Thalictrum.

RUÉLLIA. Acanthaceæ. Herbs and shrubs with opposite entire lvs. and funnelform or salverform 5-lobed fls.; grown under glass and out-of-doors in the S. for the ornamental fls. Propagated by cuttings, seeds and division.

amœna (Stephanophysum longifolia). To 2 ft.: lvs. ovate to oblong-lanceolate, to 5 in. long, toothed or wavy: fls. bright red, 1 in. long, gibbous at base, long-stalked, in clusters. S. Amer.—Frequent in cult.

ciliòsa. To 2½ ft.: lvs. oblong to ovate, to 3 in. long, ciliate: fls. blue, 2 in. long, sessile, solitary or in clusters. N. J. to Fla. and Tex.

Devosiana. To 1½ ft.: Ivs. oval, to 2 m. long, entire, purple beneath, veined with white above: fls. white marked with lilac, 1¾ m. long, solitary Brazil.—Makes a good decumbent greenhouse plant; has been grown as a Pellonia.

floribunda: plant cult, under this name is probably R. amæna.

formòsa. Subshrub: lvs. ovate, to 3 in. long: fis. scarlet, 1½ in. long, long-stalked. Brazil.

longifòlia: R. amæna.

macrántha. To 6 ft.: lvs. ovate-lanceolate, to 6 in. long: fls. rosy-purple, 3 in. or more long, solitary. Brazil.

Makoyana. Similar to R. Devosiana but fls. bright carmine and larger. Brazil.

malacospérma. To 3 ft.: lvs. lanceolate, to 6 in. long: fls. blue-purple, 1½ in. long. Cult. in Mex. and Cent. Amer.—Has been confused with Strobilanthes isophyllus.

nudiflora. To 1 ft. or more: lvs. oval, to 2 in. long: fls. violet, 1% in. long. S. U. S., Mex.

occidentalis: a listed name.

pedunculata. To 2 ft. or more: lvs. ovate-oblong, to 3 in. long: fls. lilac or bluish, on slender peduncles with 2 leaf-like bracts at summit. Mo. and south.

Portéllæ. To 1 ft., velvety-pubescent: lvs. elliptic-ovate, to 3 in. long, acute, deep green above with primary veins nearly white, reddsh-purple beneath: fls. rose-pnk, to 1¾ in. long and 1 in. across, lobes bifid, tube slender. Brazil.

strèpens. To 4 ft.: lvs. oblong or ovate, to 6 in. long, entire: fls. blue, to 2 in. long, sessile, solitary or clustered in axils. Pa. to Fla. and Tex.

tuberòsa. To 2 ft., roots tuberous-thickened: lvs. ovate-oblong to elliptic, to 3 in. long, base narrowly wedge-shaped, margins undulate: fls. blue or white, to 1½ in. long, in open axillary cymes forming a terminal panicle-like infl. Tex. to S. Amer.

RUFACER: Acer rubrum.

RULAC: Acer Negundo.

RUMEX, Dock, Sorrel, Polygonacew, Herbs. many of them weeds but a few grown for greens, with basal or st.-lvs. and small green bisexual or unisexual fls. borne in panicles. Of easy cult. in any garden soil. Propagated by seeds which yield plants for cutting in one or two years. The old kitchen-garden species are R. Acctosa, R. Patientia, R. scutatus; R. abyssinicus has now been introduced for similar use.

abyssinicus. Spinach-Rhubarb. Per. to 9 ft.: lvs. broadly ovate to arrow-shaped or lanceolate, to 7 in long, entire or somewhat 3-lobed: fis. unisexual. Abyssinia.—The lvs. are eaten as spinach and the stalks as rhubarb.

Acetosa. Garden S. Per. to 3 ft.: lvs. oblong or oblong-oval, to 5 in. long, arrow-shaped at base: fls. unisexual. Eu, Asia; nat. in N Amer.—One of the principal cult. forms is Large Belleville.

alpinus. Per. to 3½ ft.: lower lvs. ovate-cordate, very large: panicles showy. Mts. of Eu.

aquáticus. Per. to 6 ft.: lower lvs. ovate-cordate: fls. bisexual Ponds, Eu., N. Asia.

conglomeratus. Per. to 3 ft.: lvs. ovate to lanceolate, to 5 in. long: fls. bisexual, in leafy racemes. Eu.; nat. in N. Amer

flexuosus. Per. to 18 in., sts. slender and flexuous, usually grooved: lvs linear to oblong, to 12 in long, base variable from cuneate to cordate: fls. bisexual or umsexual, margins of inner perianth-segms, with long curved spines. New Zeal.

Hydrolapáthum. Great Water-Dock. Per. to 6 ft.: lvs. oblong-lanceolate, to 2 ft. long, wavy-margined: fls. bisexual, in very large panieles. Eu —Planted along ponds

hymenosépalus. Canaigre. Per to 3 ft.: lvs. oblong to oblong-lanceolate, to 1 ft. long: fts. bisexual, the panicles to 1 ft. long. Okla. to Calif.—Tannin is produced from the tubers.

obtusifòlius. Bitter D. Per to 4 ft.: lvs. oblong-lanceolate, to 14 in. long, rounded or cordate at base: fls. bisexual Eu.; nat. in N. Amer.

occidentalis. Per. to 3 ft.: lvs. lanceolate or ovate-lanceolate, to 1 ft. long: fls. bisexual. N. Amer.

Patiéntia. Spinach-Dock. Herb-Patience. 6 ft: lvs elliptic-ovate to lanceolate, to 1 ft. long: fls. bisexual, the panicles to 2 ft. long. Eu.; nat. in N. Amer.

púlcher. Per to 3 ft : lvs. oblong or fiddle-shaped, cordate, to 6 in. long. fls. bisexual. Eu.; nat. in N Amer.

ròseus (R. vesicarius var. roseus). Ann. to 2 ft.: lvs. triangular-ovate, small: fls. umsexual, in short racemes, the valves veined with rose. Egypt to Persia.

scutatus. French S Low per, the sts prostrate or cending: lvs cordate-ovate, those on the st arrow- or ascending: lvs cordate-ovate, those or fiddle-shaped: fls. unisexual. Eu, Asia.

vendsus. Per. to $1\frac{1}{2}$ ft: lvs. ovate to oblong, to 5 in. long: calyx red, in fr. with large wings to $1\frac{1}{2}$ in. across. Sask. to Wash. and Nev.

RUNNER: a slender trailing shoot taking root at the

RUPTURE-WORT: Herniaria.

RÙSCHIA. Aizoacex. A segregate from Mesembryanthemum: S. African succulents with 3-angled lvs. usually with dark transparent dots: fls. rose, violet or white.

acuminata. Branches ascending or decumbent, to 8 in. long: lvs to 1 in. long and ¼ in. wide and thick, acute or acuminate: fis. white or pinkish, the petals filamentous.

Axthelmiàna (M. Arthelmianum). To 2 ft., much branched: lvs about 1 in. long and $\frac{1}{2}$ 8 in wide and thick, blue-green: fls solitary, violet, $\frac{8}{4}$ in. across.

crássa (M. crassum). Plant robust, white-pubescent: lvs. ¾ in. long, glaucous: fls. 1-2, white, 1 in. across. cymosa (M. cymosum). To 1½ ft., with stiff branches: lvs. ascending, to 2 in. long and ½ in. wide and thick, glaucous: fls in cymes, purple-rose, to ¾ in. across.

dichroa (M. dichroum). To 3½ ft.: lvs. 4-6, spreading, linear-oblong, to 2½ in. long and ½ in. wide, glaucous: fls. white with rose tips, 1¾ in. across, nearly sessile. Var. alba has snow-white fls. 2 in. across.

filamentòsa (M. filamentosum). Sts. prostrate, branched: lvs. to 2 in. long and $\frac{1}{2}$ in. wide: fls solitary, red, 2 in. across, the pedicels with 2 united bracts.

gibbòsa. To $1\frac{1}{4}$ in , branches erect or ascending: lvs. to $\frac{1}{2}$ in long and $\frac{1}{2}$ in. wide and thick, glaucous: fls. solitary, rose, $\frac{3}{4}$ in. across.

hamata (M. hamatum). Sts. thick, with stiff spreading branches: lvs. to ½ in. long and ½ in. wide: fls. solitary, purple or rose-purple, ½ in. across

hexamèra (M. hexamerum). Sts. to 4 in. long: lvs. to 1 in. long and ½ in. wide and thick, keeled on back, velvety-papillose, glaucous: fls. solitary, white or pink. Var. longipétala has pink petals ½ in. long.

impréssa. To 2½ in., branches spreading: lvs. about in. long and thick, with conspicuous impressed lines: fls. rose, 12 in. across.

karrodica (M. karrooicum). To 1 ft.: lvs. ascending, to 1 in. long and $\frac{1}{2}$ in. thick, glaucous: fis. solitary, rose-purple, 2 in, across.

multifldra (M. multiflorum). Erect, to 3 ft., with straight branches: lvs. separated, long-linear, glaucous-green, to 3 in long: fls. white, 1 in. across.

muricata. Branches decumbent, to 1 ft. long, toothed, rough, glaucous, suffused with rose; fis. solitary, pale rose, 16 in. across.

piscodora (M. piscodorum). To 10 in., with slight fishy odor: lvs. to $\frac{3}{2}$ in. long and $\frac{1}{2}$ in. wide and thick, glaucous: fls. solitary, rose, 1 in. across.

propinqua (M. propinquum). To 1 in.: lvs. ¼ in long, ½ in. wide and ½ in. thick, margins and keels ciliate, glaucous: fls. pale rose, ½ in. across.

pygmèa (M. pygmèum). To 3 in., tufted: lvs. united at base, to $\frac{1}{2}$ in. long and $\frac{1}{2}$ in. thick, inclosed in sheath, very small second pair of lvs. developing between first pair.

rigida (M. rigidum). Branches very stiff, erect, 1 ft. and more: lvs. less than 1/2 in. long: fls. white, petals about 1/4 in long.

sabulicola. To 1 ft., much branched: lvs. 1½ in. long, with 1 or 2 teeth, blue-green: fls. solitary, white, petals 1/4 in. long.

serrulata (M. serrulatum). Branches ascending: lvs. somewhat scinutar-shaped, thick, serrulate, more or less glaucous, to 1½ in. long: fls purplish, the 2-toothed petals a little exceeding the calyx-lobes.

sólida (M. soludum). Sts. short, with decumbent stiff branches to 10 in. long: lvs. ascending, to 1 in. long and ¼ in. wide, glaucous. fls. 2 or 3, rose-purple, to ¾ in. across.

Steingroèveri (M Steingroeveri). Lvs. to 1/2 in. long: fls. solitary, 12 in. across.

tumidula (M. tumidulum). To 2 ft., much branched; lvs. to 1 in. long and 1/6 in. wide: fls. in panicles, rose veined with darker, 1 in. across.

uncinata (M uncinatum). Sts. prostrate: lvs. to 14 in. long, with few teeth on keel, gray-green with darker dots: fls. solitary, rose, 34 in. across

uncinélla (M. uncinellum). Similar to R. uncinata but with lvs. 1/2 in. long with teeth on edges near tip: fls. rose, ½ in. across.

vaginata (M. vaginatum). To 3 ft., much branched: lvs. 1 in. or more long, united about half way: fls. in many-fld. cymes, white, 1 in. across.

RÚSCUS, Liliacex. Shrubs with minute bractlike lys., the apparent lys. being leaf-like branchlets or cladodes, small greenish unisexual fls. attached on the midrib of the cladodes, solitary or clustered, and berry-like frs.; grown out-of-doors in S. U. S. and the dried artificially colored sprays of R. aculeatus frequently used in florists' decorations.

aculeàtus. Butchers Broom. To 3 ft., evergreen: lvs. or cladodes to $1\frac{1}{2}$ in. long and 1 in. wide, spiny-pointed; berries red or yellow, to $\frac{1}{2}$ in. across. Eu.

Hypoglóssum. To $1\frac{1}{2}$ ft.: lvs. to 4 in. long and $1\frac{1}{2}$ in. wide: berries red, $\frac{2}{5}$ in. across. S. Eu.

Hypophyllum. To 1 ft.: lvs. to 3 in. long and 1½ in. wide: berries red, ½ in. across. Canary Isls. to Caucasus.

racemòsus: Danae racemosa.

RUSH: Juncus. Flowering-: Butomus umbellutus. Wood:

RUSSELIA. Coral-Blow. Scrophulariaceæ. Shrubs in trop. Amer. with opposite or whorled lvs. often reduced to scales on the branches and red 2-lipped tubular fls.

Russelias are often grown in greenhouses and in the open far South, also good as basket-plants as the bloom is nearly continuous. Of easy culture. Propagated by cuttings.

elegantíssima. Supposed hybrid between R. equisetiformis and R. sarmentosa.

equisetifórmis (R. juncea. R. scoparia). CORAL-PLANT.

FOUNTAIN-PLANT. To 4 ft., much branched, branches rushlike, nodding or drooping, sts. sharply 4-angled: lvs. mostly reduced to bracts on the branches, but lanceolate to ovate and dentate when produced: fis. in 1-3-fid. clusters. Mex.; nat. in Fla. and W. Indies.

júncea: R. equisetiformis.

Lemdinei. Reputed hybrid between R. equisetiformis and R. surmentosa.

aultiflora: R. sarmentosa.

sarmentòsa (R. multiflora). Similar to R. equisetiformis but with ovate toothed lvs. to 2 in. long, never reduced to scales, and fls. in many-fld. clusters. Mex.

scopària: R. equiscuformis.

RÙTA. Rue. Rutaceæ. Very aromatic or pungent per. herbs and substrubs from the Medit. region castward, with alternate simple or compound lvs., small yellow or greenish fls. in terminal clusters, perfect with 4-6 petals, 8-10 stamens and ovary sessile, and capsular fr.; grown for the medicinal properties and for general interest in herb gardens; hardy. Propagated by division and seeds.

albiflora: Boenninghausenia albiflora.

chalapensis. Differs from R. graveolens in the fringed petuls and the carpels of the fr. pointed. Medit. region.

graveolens (R. officinalis). Common R. Evergreen subshrub to 3 ft.: lvs. 2-3-pinnate: fls. yellowish, about ½ in. across: carpels of fr. obtuse. S. Eu.—An old inhabitant of herb gardens; lvs. sometimes variegated.

officinalis: R. graveolens.

patavina. Herb to 6 in.: Ivs. simple, the lower ones oblong-spatulate, the upper Ivs. 3-parted: fis. golden-yellow. S. Eu.—The plant grown under this name is sometimes R. graveolens.

RUTABAGA (Brassica Napobrassica). A hardier plant than the turnip (which see) and requiring a longer season of growth. The edible root has a long leafy neck, and the foliage is

glaucous blue-green, smooth, very different from that of the turnip. Roots left in the ground may survive the winter and go to seed the following year, becoming more or less spontaneous.

Seeds of rutabagas are sown in the northern parts of the country in June or very early July, usually in drills about 18 inches apart; 1 to 2 pounds of seed are required to the acre. Bagas are not grown as an early summer vegetable.

RUTÀCEÆ. Rue Family. Trees and shrubs of more than 100 genera widely distributed in warm regions, with simple or compound lys. (sometimes reduced to a single lft.), bisexual, polygamous or dioecious fls. with 3–5 sepals and petals, the same or twice the number of stamens, and fr. of various forms, often pulpy and edible. The family is commonly known in cult. by the citrus fruits; most of the genera yield essential oils and many have medicinal properties. The genera here treated are Acronychia, Ægle, Æglopsis, Agathosma, Atalantia, Balsamocitrus, Barosma, Boenninghausenia, Boronia, Calodendrum, Casimiroa, Chalcas or Murræa, Choisya, Citropsis, Citrus, Clausena, Cneoridium, Coleonema, Correa, Dictamnus, Diosma, Eremocitrus, Eriostemon, Evodia, Feronia, Feroniella, Fortunella, Glycosmis, Hesperethusa, Lavanga, Melicope, Microcitrus, Murræa, Orixa, Paramignya, Phebalium, Phellodendron, Poncirus, Ptelea, Ruta, Severinia, Skimmia, Swinglea, Thamnosoma, Triphasia, Vepris, Zanthoxylum.

RUTLAND BEAUTY: Convolvulus sepium.

RYDBERGIA: Actinea grandiflora.

RYE: Secale cereale. Wild: Elymus.

SABAL (Inodes), PALMETTO, Palmacex, More than 25 species of stout spineless fan-lyd, palms native in the western hemisphere, many of them planted but the original habitat of some of them yet unknown. Some of the tallest species reach 60 ft. and more in height but in others, as S. minor and S. Etonia, the trunk usually does not rise much above the ground. Nativity of the genus is from the seacoast of N. C. through Mex. and Cent. Amer. and also the W. Indies to N. S. Amer. S. Palmetto is an abundant native tree in Fla. Fls. very small in long branching spadices that may droop when in fr., hermaphrodite, greenish; sepals and petals each 3; stamens 6: fr. a small globose or pyriform dark drupe with thin flesh, mostly 1-seeded. The genus divides itself into two sections on the conformation of the If.: Sabal proper in which the petiole ends at the blade: Inodes, in which the petiole extends through the blade like a midrib and the lf. has a characteristic downward twist. The undivided part of the blade is the palman.

Palmettoes are simple in cultural requirements, thriving Paimettoes are simple in cultural requirements, turiving both in nature and in gardens in both moist and fairly dry lands. Fresh seeds germinate readily and in the following year the progeny may be transplanted. Whether the leaves on mature trees shed from the boles when a year or two old or hang dead and prone depends on vigor of tree, protection from wind and prime depends of vigor of tee, proceeding from wind and perhaps to some extent on the nature of the particular plant. The petules usually break midway and the old bases or boots may persist for years; when the grounds are extensive enough to afford distance these trunk coverings may be highly attractive.

acaulis: S. minor.

Adansònii: S. minor.

Beccariana. Tall tree long retaining its boots: lvs. at maturity with many long hanging segms., palman occupying about ½ length of blade, both surfaces green: fr. short-pyriform, about ½ in. crosswise diam., grayish-black. Nativity unknown.—One of the palms passing as S. princeps.

bermudana. BERMUDA PALMETTO. Stout tree to 30 or of ft., trunk likely to be inclined or crooked, soon becoming bare in exposed places: If.-blade 6-9 ft. across, green on both surfaces, palman about 1 ft. long, filaments few or none: spadix much branched, usually shorter than lvs.; fils. sessile: fr. pyriform with narrow base, about ¾ in. across. Endemic in Bermuda.—Formerly called S. Black-

Blackbúrnia (S. Blackburniana). Palm of unknown origin and perhaps not grown in our territory, distinguished by spadix shorter than petiole and fr. 34 in. across and much less than that endwise, not tapering to base. See S. bermudana.

causiarum. Puerto Rican Hat Palm. Stout tree to 40 or 50 ft. but usually lower, trunk commonly soon becoming nude: If.-blade about 2 in. across, palman about 1/2 its length, green on both surfaces but on some trees glaucous, filaments many: spadix usually exceeding lvs.; fis. slightly fragrant, white: fr. nearly or quite globose but with a very short tapering base, about ½ in. across. Puerto Rico.

Deeringiana: S. louisiana.

Etônia. Apparently acaulescent, the caudex crooked or S-shaped and commonly not rising above ground: Ivs. with continuing midrib, standing upright and rather stiff, deep green, very filterous, the blade 3 ft. long; segms. about 40, extending to more than half depth of blade, deeply divided into long narrow points: fr. about ½ in. diam., black or nearly so, globose. Dry lands, peninsular Fla.

exil. VICTORIA P. Large hardy tree with vivid green foliage, the lf.-bases on the trunk also green: main lf.-segms. about 2 in. broad and 3 ft. long: terminal branchlets of the spadix thickened: fr. solitary from each fl., nearly globular, about 3 in. diam. Planted in Victoria, Tex., and elsewhere in that region; probably Mexican.

Ghiesbréchtii: old hort, name, not identified.

glabra: S. minor.

glaucéscens: name in lists

havanénsis: confused name; perhaps sometimes

lamesiàna: S. Palmetto.

longipedunculàta: listed name.

louisiàna (S. Deeringiana). Low tree, to 15 ft., of which the trunk may compine 12 the height: If-blade green, to 6 ft. across but usually collapsed at apex of petiole when full grown inasmuch as petiole is not continuous; fr depressed-globose, 1/2 in. or less across. Lowlands, S. La.

mauritiæfórmis: confused name, probably not to be employed for plants in the trade in U. S.

minor (S. acaults. S. Adansonii. S. glabra. S. pumila). Dwarf P. Stemless palm, the caudex not rising above ground: Ivs. glaucous or pale green, not fillerous, firm to stiff, middle segms. extending about half depth of blade and others much farther: spadix equalling or exceeding the Ivs., with many short branches: fr. globose, about ½ in. diam. Ga. to Fla. and Tex., luxuriant when growing in

Palmétto (S. Jamesiana). CABBAGE P. Tree to 50 or even 90 ft., trunk with remains of lf.-bases or becoming bare, bearing a relatively small globular rather dense head of green foliage: lvs. 5-8 ft. long and often broader, conspicuously filamentose, middle segms. extending more than half way to the continuing midth and others still deeper, the points very long and narrow and decurved or hanging: spadix long and much branched, usually exceeding the lvs. in old trees: fr. nearly globose, black, 14-14 in. diam., 1-seeded. N. C. to Fla., near the coast except in Fla.

princeps: old hort, name of no definite application unless to S. Beccariana.

pùmila: S. minor.

texana. Texas P. To 50 ft., the trunk eventually shedtexana. Texas P. To 50 ft., the trunk eventually shedding most of the lf.-bases, the crown globular in old trees: lvs. yellowish-green, 5-6 ft. long and as broad or broader, moderately filamentose, cut half or more to the continuing midrib into very long-pointed segms.: spadix much branched, equalling or exceeding the lvs. fr. larger than in S. Palmetto, globular to nearly reniform and in the latter case perhaps \$4 in across, sometimes 2- or 3-seeded. Tex. in the lower Rio Grande valley and in Mex.

umbraculifera. Stout and tall, to 50 or 60 ft. and more, soon becoming bare in exposed situations: lvs. very large, green, filaments not conspicuous; spadix shorter than lvs. and often hidden among them; fr. oblate-globular, ½ in. or more across, shiny. Hispaniola.—Probably the heaviest of the palmettoes.

uresana. To 30 ft. or more: lvs. glabrous and very glaucous, somewhat waxy, 3 ft. or more long, with many segms, filaments many: fr. flattened-globose, 3/2 in. diam., edible. Sonora, Mex.

SABÀTIA. Gentianacex. American ann. or bien. erect herbs with forking sts., usually opposite sessile lys. and rose or white rotate large fls. terminating the branches; something like Centaurium.

angulàris. To 3 ft., branches opposite: lvs. ovate or oblong, to 1½ in. long: fls. rose-pink with greenish eye, to 1½ in. across, usually solitary at ends of branches. N. Y. to Fla. and La.

campéstris. To 15 in., sts. 4-angled, branches alternate: lvs. ovate-oblong, to 1 in. long: fis lilac, 1 in. long, solitary, calyx as long as corolla. Mo., Kans. to Tex.

paniculata. To 2½ ft., branches opposite: lvs. linear-oblong to lanceolate, to 1½ in. long, obtuse: fls. white, to ¾ in. across. Va. to F.a.

stellaris. To 2 ft., branches alternate: lvs. lanceolate-oblong to linear, to 2 in. long: fls. pink, rarely white, with yellow eye bordered with red, to 1 ½ in. across, solitary at ends of branches. Coast, Mass. to Fla.

SABIACEÆ. Sabia Family. Four genera of trees, shrubs or vines in trop. and warm-temp. Asia and Amer., with alternate simple or pinnate lvs., not showy bisexual or polygamous fls. having mostly 5 sepals, petals and stamens, superior 2-celled ovary, and indehiscent fr. Meliosma is sometimes planted for ornament outside botanic gardens.

SABINA: Juniperus.

SABÍNEA. Leguminosæ. W. Indian shrubs or small trees having deciduous even-pinnate lvs. of 6-15 pairs of lfts., large axillary papilionaceous fls. with diadelphous stamens, and fr. a compressed 2-valved legume. Grown in S. Fla. Propagated by seeds.

carinalis. Small tree: Ifts. 6-8 pairs, oblong, to ¾ in. long, glabrescent, apex rounded, truncate or emarginate, mucronate: fls scarlet to deep crimson, to 1½ in. long, 3-5 in axillary fascicles: pods linear, long-stipitate, flatly compressed. Dominica.

SABULINA: Arenaria.

SACALINE: Polygonum sachalinense.

SACCHARODENDRON: Acer.

SÁCCHARUM. Graminex. Very tall stout per. grasses with broad lys, and spikelets in large terminal fluffy silky panicles; native in tropics of Old World and one widely cult. for canesugar. See Grasses.

ciliare. To 12 ft.: lvs to 3 ft. and ½ in. broad: panicles to 1½ ft. long, linear-oblong, dense. S. W. Asia.

to 1½ ft. long, linear-oblong, dense. S. W. Asia.

officinarum. Sugar-Cane. To 15 ft., with solid canes:
lvs. to 3 ft. long and 2 in. wide, with broad midrib and
rough edges: panicles or "arrows" to 2 ft. long, plume-like
with open and drooping branches, the spikelets with tufts
of white hairs. Probably a cultigen.—Does not bloom regularly in the continental U. S. Propagated by pieces of the
st., but seeds are sometimes produced in tropics with which
breeding experiments are conducted.

SACCOLABIUM. Orchidacex. A small Old World genus of epiphytic orchids from Malaya, Philippines and Oceania, allied to Sarcochilus, none known to be in cult, and names in the trade are referred elsewhere as follows:

ampullaceum: Ascocentrum ampullaceum.

bellinum: Gastrochilus bellinus. Blùmei: Rhynchostylis retusa. gigantèum: Anota densiflora. miniatum: Ascocentrum miniatum. præmórsum: Rhynchostylis retusa. trichdmum: uncertain name botanically. violaceum: Anota violacea.

Wrightii: listed name.

SADLÈRIA. Polypodiacex. Low tree-ferns of Hawaii with tufted 2-pinnate fronds and linear sori in rows each side of rachis. Sometimes grown under glass. See Ferns.

cyatheoldes. Trunk 5 ft. or more high: fronds leathery, dark green, to 3 ft. long, on stalks to 2 ft. long, segms. linear, to ½ in. long, with revolute margins.

SAFFLOWER: Carthamus tinctorius

SAFFRON, FALSE: Carthamus tinctorius.

SAGE: Salvia. Bethlehem-: Pulmonaria saccharata.
-Brush: Artemisia tridentata and arbuscula. Jerusalem-:

SAGERÈTIA. Rhamnaceæ. Woody plants of Asia and warmer parts of N. Amer., with opposite lvs., small whitish bisexual fls. in clusters or spikes, and fr. a berry-like drupe; one species sometimes planted in S. U. S. Propagated by seeds and cuttings.

Michauxii: S. minutiflora.

minutiflora (S. Michaurii). Trailing or straggling, spiny: lvs. ovate, to 2 in. long, finely toothed, leathery, shining above: fls. in slender spikes to 1½ in. long: fr. purple, ½ in. across. N. C. to Fla. and Ala.

SAGINA. Pearlwort. Caryophyllacex. Little ann. and per. tufted herbs, sometimes used for edgings or in the rock-garden, having awl-shaped lvs. and very small fls.; natives of temp. and colder regions. Propagated mostly by division.

alpina. A prostrate per. perhaps not distinct from S. saginoides.

glabra. Creeping per., often rooting at nodes, sts. to 4 in. long: lvs. linear: fls white. July-Aug. S. Alps. Var. aurea, lvs. variegated yellow.

Linnæi: S. saginoides.

pilifera: S. subulata.

procumbens. Matted and spreading, to 3 in. high: lvs. linear, to 1/4 in. long: fls. white, solitary, star-like. May-Aug. Asia; nat. in N. and S. Amer.

saginoldes (S. Linnæi). Tufted per. to 4 in. high: lvs. linear or filiform, about 1/4 in. long: fls. white. Alpine and arctic Eu., Asia, N. Amer.

subulata (S. pulifera. Spergula pilifera). Hardy per, evergreen, densely tufted, covering the ground like a sheet of moss: Ivs. very small, stiff: fis. white, on long slender sts., covering the plant. July-Sept. Corsica. Var. aurea, lvs. marked with yellow.

SAGITTÀRIA. ARROWHEAD. Alismaceæ. Bog and aquatic per. herbs with tuberous or knotted rootstocks, arrow-shaped, lanceolate or ovate lvs. and fls. unisexual, both kinds usually on the same plant, in whorls of 3 in racemes or panicles and having 3 white deciduous petals; native in temp, and trop, regions in many parts of the world. Arrowheads are grown in ponds and aquaria. Propagated by division, seeds, and underground tubers when produced.

Engelmanniàna. To 1½ ft.: lvs. to 8 m. long and ½ in. wide, basal lobes ½ or more length of blade: fis. to 1 in. across. Mass., to Del.

gigantèa: possibly a hort, form of S. sagittifolia or S.

graminea. To 2 ft.: lvs. linear to elliptic: fls. to ½ in. across. Newf. to S. D. and Tex.—The plants in the trade as S. sinensis and sinensis gigantea apparently belong here.

guvanénsis: Lophotocarpus guyanensis. iapónica: S. sagittifolia var. flore-pleno.

lancifolia. To 6 ft.: lvs. lanceolate to elliptic: fls. to 2 in. across. Del. south to Fla. and Mex., trop. Amer.

latifòlia (S. variabilis). To 4 ft.: lvs. variable, from linear-lanceolate to broad arrow-shaped with lobes half as long as blades: fls. to $1\frac{1}{2}$ in. across. N. Amer.

montevidensis. Giant A. To 6 ft.: lvs. arrow-shaped, with lobes as long as blade: fls 2 in. and more across, with brownish-purple spot at base of petals. S. Amer.; nat. in S. U. S.

natans. Floating or sometimes erect to 1 ft.: lvs. linear to oblong-ovate. N. Eu., Siberia.—It is not certain that plants cult. under this name belong here.

papillosa. To 1½ ft.: lvs. linear to linear-lanceolate, to 6 in. long, leathery: infl. usually simple. Tex., La.

sagittiòlia. Old-World A. To 4 ft.: lvs. variable, linear or arrow-shaped with lobes longer or shorter than blade: fis about 1 in. across, spotted with purple at base of petals. Eu. Asia —Produces underground tubers which are eaten in the Orient. Var. flòre-plèno (S. japonica) has double fls.

sinénsis: S. graminea.

subulata. To 6 in.: lvs. stiff, linear or narrow-oblanceolate, to 1½ in. long: fls. few, to ¾ in. across. N. Y. to Fla. and Ala.

variábilis: S. latifolia.

SAGITTATE: like an arrowhead in form; triangular with the basal lobes pointing downward: see hastate.

SAHUARO: Carnegrea grgantea.

SAINFOIN: Onobrychis viciæfolia.

ST. ANDREWS-CROSS: Ascyrum hypericoides. Johns-Bread: Ceratonia Siliqua. Johnswort: Hypericum. Peters-wort: Ascyrum stans. Thomas-Tree: Bauhinia tomentosa.

SAINTFOIN: Onobrychis viciæfolia.

SAINTPAÙLIA. Gesneriacex. Small and condensed trop. African hairy perennials with basal long-stalked lvs., 2-lipped violet fls. in few-fld. cymes, the corolla-tube short, and capsular frs.; grown under glass and sometimes in windowboxes in warm countries. Propagated by seeds and by leaf-cuttings inserted in sand.

ionantha. African- and Usambara-Violet. Lvs. round or oblong-ovate, to 1½ in. long, toothed: fis. violet, to 1 in. across, with linear calyx-lobes: caps. narrow-oblong. Var. cordata is listed with darker heart-shaped lvs. and darker fis. Var. grandiflora has larger deep violet fis. Var. variegata has lvs. variegated with yellow and white.

kewénsis. Similar to S. ionantha but with entire white-hairy lvs., oblong-linear calyx-lobes and much broader hairier caps.

SALAL: Gaultheria Shallon.

SALICÀCEÆ. WILLOW FAMILY. Two genera of diœcious trees and shrubs mostly native in temp, regions of the northern hemisphere, having alternate simple lvs., the unisexual fls. without perianth borne in more or less silky-hairy catkins. 1 or many stamens, 1-celled ovary, and small capsular frs. Populus and Salix are planted for ornament and service. The systematology of the species is mostly difficult, and hybrids are

SALICÓRNIA. GLASSWORT. Chenopodiaceæ. Erect fleshy herbs native in salt marshes of Eu. Asia and N. Amer., of little hort. interest but sometimes listed: lvs. reduced to scales at the nodes and bearing the fls. in their axils, the stamens exserted.

europæa (S. herbacea). Ann. to 2 ft., turning bright red in autumn: spikes to 3 in. long in fr. Eu., Asia, N. Amer. herbàcea: S. europæa.

SALISBURIA ADIANTIFOLIA: Ginkgo biloba.

SALIX. WILLOW. OSIER. Salicacex. Shrubs and trees, or alpine species nearly herbaceous, diocious, with mostly lanceolate lvs. and little fls. borne in dense catkins before or after the lvs. grown for ornament, screens, shelter, holding of banks, and some of the species for the twigs from which baskets are made; mostly moist land plants.

Willows are well adapted to moist situations and along stream banks, but most of them succeed also in almost any soil. A few species are dry-soil plants. They grow rapidly. Propagated by ripe-wood cuttings taken in the fall and planted at once or kept in the cellar until spring: also by seeds sown in pans on moss as soon as the capsules are ripe. Weeping or special varieties may be top-grafted on upright stock. They are soft-wooded plants.

acuminàta: S. dasyclados.

acutifòlia. Similar to S. daphnoides but smaller, with narrower lys. and slenderer catkins. Russia to E. Asia.

aglàia: S. daphnoides.

agiai: S. aapanouaes.

álba. Whitte W. To 75 ft: lvs. lanceolate, to 4 in. long, finely toothed, with white silky hairs beneath: catkins with the lvs. Eu., Asia, N. Afr.; escaped in N. Amer. Var. caiva (S. cærulea) has more upright branches. Var. chermesina (S. vitellina var. britzensis), branchlets bright red. Var sericea (var regalis), lvs. densely silky beneath. Var. tristis (var. vitellina pendula), branches bright yellow and drooping. Var. vitellina (S. vitellina), branchlets yellow, lys. clausous beneath. lvs. glaucous beneath.

ambigua. Puzzle W. Hybrid between S. aurita and S. repens, low shrub with rather small silky-tomentose lvs.

americana péndula: S. purpurea var.

amygdálina (S. triandra). Almond-Leaved W. To 30 ft.: lvs. lanceolate or ovate-lanceolate, to 4 in. long, finely toothed, glossy dark green above, paler below: catkins with the lvs. Eu, Asia. Var. glaucophýlla (var. discolor) has lvs. grayish or whitish beneath.

amygdaloides. Peach-leaved W. Differs from S. amygdalina chiefly in the slender glandless petioles and cuspidate-acuminate lvs. N. Amer.

annulàris: S. babylonica var. crispa.

aurántha: listed name.

aurea: hort. name for forms with yellow branchlets.

aurita. Shrub to 6 ft.: lvs. obovate or oblanceolate, to 3 in. long, obscurely toothed, gray-tomentose beneath but becoming glabrous: catkins before or with the lvs. Eu., W. Asia.

babylônica. Weeping W. To 30 ft., with long drooping branches: lvs. narrow-lanceolate, to 6 in. long, finely toothed, grayish-green beneath: catkins with the lvs. China. Var. aûrea, branches golden-yellow. Var. crispa (S. annularis) has curled ring-like lvs. Var. péndula is synonymous with type. Var. rámulis-aûreis, branches yellowish, perhaps not distinct from var. aurea. Var. Salamònii is S. sepulcralis.

báltica: listed name.

blánda (S. pendula. S. Petzoldii var. pendula. S. babylonica var. dolorosa. S. dolorosa). Wisconsin Weeping W. Hybrid probably between S. babylonica and S. fragilii, with long drooping brauches.

Bóckii. Shrub to 9 ft.: lvs. oblong or obovate, to ½ in. long, entire or slightly toothed, deep green above, bluishwhite and silky beneath: catkins with lvs. in autumn. China.

brachycarpa. Shrub to 3 ft.: lvs. elliptic-oblong to oblanceolate, to 1 in. long, entire, hairy on both sides: catkins with the lvs. Man. to B. C. and Colo.

cærùlea: S. alba var. calva.

cæsia. Shrub to 31/2 ft., twigs glabrous: Ivs. broadly ovate, obovate or oblong, to 11/2 in. long, mostly acute, glabrous, gray-green above, pale beneath, short-petioled: catkins with the Ivs., nearly 1/2 in. long. Cent Eu. to Cent.

Cáprea. Goat W. Sallow. To 25 ft.: lvs. broad-ovate to oblong, to 4 in. long, slightly toothed or entire, gray-pubescent beneath: catkins before the lvs. Eu, Asia. Var. péndula, Kilmarnock W., has crooked drooping branches; to be worked on other stocks. Var. variegâta has lvs. vanegated with white.

cardinalis: listed name of a willow having bright red twing

chlorophylla: S. planifolia.

cinèrea. Grar W. Shrub to 15 ft.: lvs. elliptic to obovate-lanceolate, to 3½ in. long, wavy-margined, gray-pubescent beneath: catkins before or with the lvs. Eu, Asia. Var. tricolor has lys. vanegated with yellow and white or sometimes also with red.

daphnoides (S. aglaia). To 30 ft.: lvs. oblong- to narrow-lanceolate, to 4 in. long, finely toothed or nearly entire, glaucous beneath: catkins before or with the lvs. Eu., Asia.

lanceolate, to 8 in. long, gray-pubescent beneath: catkins before the lvs. Eu.

discolor. Pussy W. To 20 ft.: lvs. oblong, to 4 in. long, wavy-toothed or nearly entire, glaucous beneath: catkins before the lvs. N. S. to Va. and Mo.

doloròsa: S. hlanda

Doniana. Hybrid between S. purpurea and S. revens. with oblong or lanceolate lvs. glaucous beneath.

Elæágnos (S. incana). To 45 ft : lvs. narrow-lanceolate to 6 in. long, revolute at margins, white-tomentose beneath: catkins before the lvs. Eu., Asia Minor.

elegantissima (S. Sieboldii). Thurlow Weeping W. Branches long and drooping; lvs. lanceolate, to 6 in. long, toothed, bluish-green beneath: catkins with the finely toothed lvs. Japan(?).

Forbyana: S. rubra.

frágilis. BRITTLE OF CRACK W. To 60 ft., twigs brittle at base: Ivs. lanccolate, to 7 in. long, toothed, light green beneath: catkins with the Ivs. Eu., Asia; escaped in E. U. S. Var. bullata is a compact bushy form.

franciscàna: S. lassolepis var. Bigelovii.

glabra. Shrub to 4 ft.: lvs. broad-elliptic to oblong, to 3 in. long, wavy-toothed, glaucescent beneath: catkins with the lvs. Eu.

glacialis. Prostrate shrub: lvs. ovate to obovate, to ½ in. long, obtuse, entire or with few teeth at base, glabrous at maturity: pistillate catkins ovoid to globose, the scales black and nearly glabrous. Arctic coast of W. N. Amer. from Mackenzie River north to Pt. Barrow.

glaucophylloides. To 15 ft.: lvs. oval to oblong-lanceolate, to 5 in. long, finely toothed, glaucous beneath: catkins with the lvs. N. B. to Me. Var. glaucophylla has thicker lvs. Ont. to Wis.

gladcops. Shrub to 6 ft.: lvs oblanceolate or obovate, to 2½ in. long, entire, pale beneath; catkins with the lvs. Alaska to Calif., New Mex., Utah.

grácilis: S. petiolaris.

gracilístyla. Shrub: lvs. oblong, to 4 in. long, finely toothed, grayish-pubescent beneath: catkins before the lvs. Japan, Korea.

grandifòlia. Shrub to 10 ft.: lvs. oval to obovate, to 6 in. long, wavy-toothed, light green beneath: catkıns before or with the lvs. Eu.

hastata. HALBERD-LEAVED W. Shrub to 5 ft.: lvs. ovate to obovate, to 3 in. long, sometimes heart-shaped at base, finely toothed, glaucous beneath: catkins with the lvs. Eu., Asia.

Hèlix: probably S. rubra.

helvética. Shrub to 2 ft.: lvs. oblong or elliptic-lanceolate, entire, white-tomentose beneath: catkins with the lvs.

herbacea. Dwarf W. Subshrub to 1 ft., sts. creeping, often subterranean, angled: lvs. suborbicular, to ¾ in. long, tip rounded or notched, bright glossy green, margins crenate-serrate: catkins small. Mts. of Eu., Asia, N. Amer.

hùmilis. Prairie W. Shrub to 8 ft.: lvs. oblong-lanceo-

late, to 4 in. long, slightly toothed, glaucous and tomentose beneath; catkins before the lvs. Newf. to Minn. to N. C.

incana: S. Elæganos.

irrorata. Shrub to 10 ft., branchlets with white bloom: lvs. oblong to linear-lanceolate, to 4 in. long, entire or slightly toothed, shining above, glaucous beneath: catkins before the lvs. Colo. to New Mex. and Ariz.

japônica. Shrub to 6 ft.: vs. elliptic-oblong, to 5 in. long, sharply toothed, sılky-pubescent becoming glabrous: catkins with the lvs. Japan.

jessoénsis. Tree to 90 ft., branchlets light brown, glabrous: lvs. narrowly lanceolate, to 3½ in. long, finely toothed, very silky when young less so above at maturity, petiole to nearly 2 in. long: catkins with the lvs., on short stalks, to 2 in. long. Japan.

Lestadiana. Hybrid between S. lapponum and S. Caprea, with lvs. silky-pubescent beneath.

lævigata. RED or Polished W. To 40 ft.: lvs. lanceolate 10 40 it. lvs. lanceolate, to 6 in. long, nearly entire, glaucous beneath: catkins with the lvs. Calif. to Ariz.

Lambertiana: S. purpurea var.

lanata. Shrub to 5 ft., twigs mostly woolly: lvs. elliptic-orbicular to oblong-ovate, to nearly 3 in. long, silky above becoming glabrescent, entire to undulate: catkins with the lvs., 2 in. or more long. N. Eurasia.

lappònum. Shrub to 5 ft., much branched: lvs. ellipticoblong to lanceolate, to 2½ in. long, entire, pubescent above, tomentose beneath: catkins before or with the lvs. Mts., Eu. to Siberia.

lasiandra. To 60 ft.: lvs. lanceolate, to 4 in. long, wavy-toothed, glaucous beneath; catkins with the lvs. B. C. to

lasiólepis. Arroyo W. To 35 ft.: lvs. oblanceolate, to 4 in. long, nearly entire, glaucous beneath: catkins before the lvs. Wash. to Mex. Var. Bigelovii (S. franciscana) has lvs. pubescent below.

latifòlia. Hybrid between S. Caprea and S. myrsinifolia, with elliptic to oblong lvs. silky-pubescent when young.

laurifòlia: S. pentandra.

longifòlia. Sandbar W. Shrub to 12 ft. or tree to 25 ft.: lvs linear-lanceolate, to 4 in. long, slightly toothed: catkins with the lvs. N. Amer.

lùcida. Shining W. To 18 ft.: lvs. ovate-lanceolate or lanceolate, to 5 in. long, finely toothed, shiny on both sides: catkins with the lvs. Newf. to Neb.

ludificans. Hybrid between S. aurita and S. phylicifolia, with elliptic glabrous lys.

lûtea. Shrub or tree to 20 ft., branchlets light yellow: lvs. lanceolate, to 3 in. long, toothed, yellowish-green. Man. to Mont. and Utah.

magnifica. To 18 ft.: lvs. elliptic, to 8 in. long, nearly entire, glaucous beneath: catkins with the lvs. China.

Matsudana. To 40 ft: lvs. narrow-lanceolate, to 3 in. long, sharply toothed, whitish beneath: eatkins with the lvs. N. Asia. Var. tortuðsa is listed as having branchlets in spirals.

mollíssima. Hybrid between S. amugdalina and S. viminalis with lvs. gray-tomentose beneath.

multinérvis. Hybrid between S. aurita and S. cinerea with lvs. gray-pubescent beneath and small catkins.

muscina is listed as a shrub but the name is of unknown botanical standing.

mutábilis. Erect or decumbent shrub, twigs yellowishgreen: lvs. lanceolate, to 1½ in. long, serrate along upper half, blue-glaucous beneath, base obtuse, apex acuminate. Tyrol.

myricoldes. A hybrid of S. cordata and S. sericea with bescent branchlets; lvs. lanceolate, somewhat silky pubescent branchlets; lvs. lebeneath, having small stipules.

myrsinifdlia (S. nigricans). Shrub to 12 ft.: lvs. orbicularovate to oblong-lancelate, to 4 in. long, toothed, gray-green and glabrous or pubescent beneath: catkins before or with the lvs. Eu., Asia. Var. cotinifolia is listed.

myrsinites. Shrub to 1½ ft.: lvs. elliptic to lanceolate, to 2 in. long, toothed, shining green on both sides: catkins with the lvs. Eu., Asia.

myrtilloides. Shrub to 1½ ft.: lvs. elliptic, entire, light green beneath: catkins before or with the lvs. Eu., Asia.

nigra. Black W. To 35 ft.: lvs. lanceolate, to 5 in. long, finely toothed, pale green beneath: catkins with the lvs. N. Amer.

nigricans: S. myrsinifolia.

niobe: probably S. babylonica var. aurea.

nivalis. Tufted creeping shrub: lvs. oblong to ovate, to nearly ½ in. long, acute, smooth, dark green above, glaucous beneath, entire: catkins on leafy sts. Alta. to B. C., south to Mont, and Wash.

pátula. Hybrid between S. Elæagnos and S. aurita with lys. gray-pubescent beneath.

Pèasei. Prostrate shrub, branches flexuous or decumbent, to 2 ft. long, very dark brown, lustrous: lvs. elliptical to narrowly obovate, to nearly 1 in. long and ½ in. wide, crenate-dentate, dark green and lustrous above and below: catkins to 1½ in. long. N. H.—Grows in wet shaded mountainous ravines.

néndula: S. blanda.

pentanta. S. Jamad.

pentantra (S. Laurifolia). Bay or Laurel W. To 60 ft.:
lvs. elliptic, to 5 in. long, finely toothed, shining dark green
above, paler beneath: catkins with the lvs. Eu., escaped
in E. U. S.

petiolaris (S. gracilis). Shrub to 4 ft., twigs purple: lvs. lanceolate, to 3 in. long, serrulate, acuminate, base tapering, glabrous: catkins with the lvs. N. B. to Man. south to Tenn. and Wis.

petrophila. Creeping shrub to 4 in.: lvs. obovate to oblanceolate, to 2 in. long, entire: catkins with lvs. B. C. to Calif. and New Mex.

Pétzoldii péndula: S. blanda.

phylicifòlia. Shrub to 3 ft. or more: lvs. elliptic to lanceo-late, to 3 in. long, toothed, grayish-green beneath: catkins before or with the lvs. Eu., Asia.

planifòlia (S. chlorophylla). Shrub to 10 ft., branchlets purplish: lvs. to 2 in. long, elliptic to lanceolate, glabrous, somewhat glaucous beneath: catkins with or before the lvs., small. N. U. S. and Canada.

Pontederana (S. sordida). Hybrid between S. purpurea and S. cinerca, with lvs. silky and glaucous beneath.

and S. cinerea, with IVS. SILKY and glaucous beneath.

purpurea. Purple O. Shrub to 9 ft.: IVS. oblanceolate,
to 4 in. long, finely toothed, paler beneath: catkins before
the IVS. Eu., N. Afr., Asia. Var. Lambertiana (S. Lambertiana) has purplish stouter branches. Var. nana is listed as
a dwarf form. Var. péndula (S. americana pendula) has
slender drooping branches. Var. grácilis (var. uralensis)
has slender branches and narrow IVS.

regàlis: S. alba var. sericea.

rèpens. Creeping W. Shrub to 3 ft., the st. prostrate: lvs. elliptic to lanceolate, to 2 in. long, nearly entire, silky when young. Eu., Asia. Var. nftida (var. argentea) has lvs. densely silky when young. Var. rosmarinifòlia (S. rosmarinifòlia) has linear to oblong-lanceolate acute lvs.

reticulata. Depressed shrub: lvs. oval to orbicular, green above roughly netted, whitish beneath: catkins slender from long peduncle. Arctic and Antarctic regions.

retusa (S. serpyllifolia). Depressed shrub: lvs. obtuse to retuse at apex, small, rarely to ½ in. wide, entire, seemingly paralled-veined. Alpine regions of Eu. and Asia.

Reuteri. Hybrid between S. Elæagnos and S. daphnoides with lvs. silky-tomentose beneath.

rosmarinifòlia of the trade is S. Elæagnos or S. repens

rubens. Hybrid between S. fragilis and S. alba, with lvs. usually glaucous beneath.

rubra (S. Forbyana. S. Helix). Hybrid between S. purpurea and S. viminalis, shrub to 9 ft. with lanceolate lys. Salamònii: S. sepulcralis.

saximontana. Densely tufted creeping shrub to 2 in. high: Ivs. oblong or elliptic, to 3/ in. long, entire, glaucous beneath: catkins with the lvs. Mts., Wash. to New Mex.— Perhaps only a variant of S. nivalis.

Scouleriàna. To 30 ft.: lvs. oblong-obovate, to 4 in. long, nearly entire, silvery- or rusty-pubescent beneath but becoming glabrous. Alaska to Calif. and New Mex.

sepulcralis (S. Salamonii). Hybrid between S. babylonica and S. alba, with drooping branches and lvs. silkypubescent beneath.

serfcea. SILKY W. Shrub to 12 ft.: lvs. lanceolate, to 4 in. long, finely toothed, silky beneath: catkins before the lvs. Me. to Mich. and Va.

serpyllifòlia: S. retusa.

sesquitértia. Hybrid between S. purpurea X aurita and S. phylicifolia, shrub to 6 ft.

sibírica. Shrub to 3 ft., the branches red-brown: lvs. oval to oblong, 1/2 in. long: catkins with the lvs. Siberia. Sièboldii: S. elegantissima.

silesiaca. Shrub: lvs. lanceolate or ovate, to 6 in. long, toothed, pale green beneath. Eu.

Smithiana. Hybrid between S. viminalis and S. Caprea, shrub to 18 ft. with lvs. gray-pubescent beneath.

sórdida: S. Pontederana.

stipulàris. Large shrub: lvs. narrow-lanceolate, to 8 in. long, grayish-tomentose beneath. Eu.

stolonifera. Sprouting W. Plant prostrate, branches very slender, stolons leafless, subterranean to ½ in. diam.: lvs. to 1½ in. long, oval to obovate, apex rounded or acute,

base cuneate or obtuse, glaucous beneath, margins entire or with few small teeth; catkin-scales black, usually pubes-

subcerniea. Shrub to 7 ft., twigs becoming glabrous and purple: lvs. lanceolate to oblanceolate, to 2½ in. long, acute, glabrous above and white-silky beneath, margins mostly entire: catkins 1½ in. or more long. Wyo. to Wash. south to New Mex. and Calif.—Branchlets covered with conspicuous glaucous bloom in winter.

tetrápla. Hybrid between S. phylicifolia and S. myrsinifolia, of intermediate character.

triándra: S. amygdalına.

tristis. Shrub to 1½ ft.: lvs. oblanceolate, to 2 in. long, entire, white-tomentose beneath: catkins before the lvs. Me. to Fla. west to Minn. and Tenn.

uralénsis: S. purpurea var. gracilis.

Uva-drsi. Bearberry W. Prostrate shrub: lvs. obovate, to 1 in. long, entire or slightly toothed, shining above, glaucous beneath: catkins with the lvs. Alaska to Lab., south to mts. of N. Y.

viminàlis. Common O. To 30 ft.: lvs. lanceolate, to 10 in. long, entire, silvery-white and silky-tomentose beneath: catkins before the lvs. Eu., Asia: escaped in E. U. S.—The commonest species employed in basket-making.

vitellina: S. alba var.

Wentworthii: listed name.

Wilhelmsiana. Shrub: lvs. linear, to 11/2 in. long, nearly entire, becoming glabrous: catkins with the lvs. Asia.

Wimmeriana. Hybrid between S. purpurea and S. Caprea, with lvs. grayish below.

SALLOW: Salix Caprea.

SALMONBERRY: Rubus spectabilis.

SALOA: Blumenbachia.

SALOMONIA: Polygonatum.

SALPICHRÒA. Solanacex. Herbs, subshrubs and shrubs, one sometimes used as cover planting in S. Calif. and mentioned for bee forage: lvs. entire, long-petioled: fls. small, white or yellow, solitary, tubular or urn-shaped: fr. a berry. Propagated by cuttings of half-ripened wood and kept in a close atmosphere; also from seeds when obtainable.

rhomboidea. Cocks-Eggs. Per. climber from a fleshy root, somewhat woody, with a strong odor: lvs. ovate-rhomboid, to ¾ in. long: fls. nodding, white, urn-shaped, ⅓ in. long: berry yellow or white, said to be edible. Argentina.—It was once offered in the trade as Withania origani-

SALPIGLÓSSIS. Solanacex. Slender usually glandular-hairy herbs with alternate, entire, toothed or cut lvs., many colored usually large funnel-shaped fls. with wide throat, and capsular fr.; native in Chile.

Salpiglossis requires the usual treatment given sappinossis requires the usual treatment given insi-hardy annuals but the young plants should not be allowed to become stunted before they are transplanted to the garden. When desired for winter bloom in the greenhouse, the seed should be sown in late summer.

gloxiniæflora: hort. name for improved strain of S. mnuata.

grandiflòra: S. sinuata.

hýbrida: S. sinuata.

sinulta (S. grandistora. S. hybrida. S. variabilis).
Painted-Tongue. Half-hardy branching ann. to 2½ ft.:
lvs. elliptie- or oblong-linear, sinuate-toothed or cut: fis.
to 2½ in. long and as wide, straw-colored, primrose, yellow
through scarlet, nearly to blue, with much variation in
veining and other markings. Var. superbissima is unbranched and of more columnar habit.

variábilis: S. sinuata

SALPINGÓSTYLIS. Iridaceæ. One bulbous herb native in N. Fla. and probably S. Ga. S. cœléstina (Nemastylis and Ixia cœlestina). To 1½ ft.: lvs. narrow-linear, 5-6 in. long: fls. violet with white eye, 2½ in. across, nodding, usually solitary, blooming only from just after sunrise to about 8 A.M.—The genus Salpingostylis was founded in 1931 by John K. Small to accommodate Ixia cælestina of William Bartram (1791),

an overlooked plant of the lower southeastern

SALSIFY: Tragopogon porrifolius. Black: Scorzonera hispanica.

SALSOLA. Chenopodiacex. Weedy herbs of wide distribution with stiff prickly lvs. and bisexual axillary small fls.; rarely grown in gardens for interest but of slight ornamental value.

Kali. Saltwort. Ann. to 2 ft.: lvs. to 34 in. long, grayish: fis. solitary. Eu., Asia, seashores of E. N. Amer.—A related species is S. pestifer, the Russian thistle.

SALTBUSH: Atriplex.

SALT TREE: Halimodendron.

SALTWORT: Salsola Kali.

SALVERFORM, SALVER-SHAPED: with a slender tube and an abruptly expanded flat limb, as that of the

SÁLVIA. SAGE. Labiatx. Many herbs, subshrubs and shrubs, with tubular 2-lipped fls. in whorls of 2 or more arranged in spikes, racemes or panicles, the colors ranging widely from scarlet through purple and violet to azure-blue, white and even pale yellowish, but not pure clear vellow.

Some species are grown for ornament in the garden or conservatory, others for culinary or medicinal purposes. S. splendens, scarlet sage, is the most widely cultivated of the ornamental sages. It is treated as an annual. It should be grown in masses with a good background of green, preferably in full sun, but it may be used to brighten shady places such as a woody recess; if well managed it will bloom continuously from July to frost. The other salvias require only simple treatment, as flower-garden and border subjects; and the sweet-herb species, S. officinalis, persists for years when once established.

acetabulòsa. Shubby or suffrutescent per. to 3 ft., sts. ascending: lower lvs. pinnatisect, segms. of 1-2 pairs, upper lvs. entire, oblong, obtuse, hairy on both sides: fis. blush-purple, callyx plose-hispid, usually in whorls of 8-10 forming simple racemes. Asia.

apiàna (Audibertia polystachya). White S. To 10 ft., shrubby, white-tomentose: fls. white, to ¾ in. long. Calif.—One of the shrubs called "greasewood."

arborea: hort. name, probably for the shrubby form of S. splendens.

argentea. Silver S. Bien. to 4 ft.: lvs. broad-ovate, to 8 in. long, lobed, white-woolly: fis. rose-white, purplish, whitish or yellowish, % in. long, in panicles. Medit. region.—Although technically a bien., lateral rosettes are produced in successive seasons, thus prolonging the colony as if it were

atroviolàcea: S. pratensis var.

adrea. Shrub 3 ft. or more, white-tomentose: lvs. ovate, to 1 in. long, entire, leathery: fls. golden-yellow, to 2 in. long, in racemes to 4 in. long. S. Afr.

azūrea. Per. to 3 ft. or more, glabrous except perhaps above: lvs. oblong to linear: fls. blue or white, about ½ in. long, calyx puberulent, in mostly simple open not very long racemes. S. C. to Fla. and Tex. Listed vars. are angustifòlia and longifòlia.—The plants cult. under this name (var. grandifòra) are mostly or wholly the more western S. Putcheri.

ballotæflora. Shrub to 10 ft., much branched: lvs. ovate-triangular, to ¾ in. long, crenate, tomentulose when young: fls. bluish-purple, in few-fld. panicles. Tex. and Mex.

Baumgartenii: S. pratensis var.

Bertolònii. Per., erect or ascending: lvs. ovate-cordate, toothed or lobed, wrinkled, pubescent beneath: fls. red-purple or violet-blue, rarely white, in branched racemes. S. Eu.

bicolor. Spanish S. Bien. or per. to 3 ft.: lvs. broad-ovate, palmately lobed, sticky-pubescent: fis. bluish-violet and white, 1 in. long, in racemes to 2 ft. long. Spain, N. Afr.—See also S. coccinea var.

brachýcalvx: S. indica.

bractelta. Subshrub to 1½ ft., pubescent: lvs. pinnately divided, the floral-lvs. entire and persistent, sometimes colored: fis. purplish, in racemes. Asia Minor.

brunellodes: S. prunelloides.

cacalizefòlia. Per. to 3 ft.: lvs. broad-triangular, pubescent: fls. deep blue, small, in branched racemes. Mex.

cádmica. Per. to 1 ft.: lvs. oblong or oval, to 11/2 in.

long, entire or lobed: fls. white, 1 in. long, in racemes. Asia Minor.

cærûlea. Herb: lvs. ovate, to 4 in. long, pubescent above: fls. blue. 1 1/2 in. or more long. in racemes to 6 in. long. Brazil.

candelabrum. Subshrub to 3 ft.: lvs. oblong, to 4 in. long, entire, gray-tomentose beneath: fts. with upper lip white and lower violet streaked with white at throat. S. Spain.

cardinalis: S. fulgens.

carduacea. Thistle S. Ann. to 2 ft., thistle-like, tomentose: Ivs. basal, oblong, lobed, spiny-toothed: fls. lavender or blush-purple, 1 in. long, in many-fld. head-like wholls 1½ in. diam. subtended by spiny bracts, calyx woolly. Calif.

carnòsa (Audibertia and Audibertella incana). To 2 ft., much branched, gray-pubescent: fls. blue, ½ in. long, stamens exserted. Wash., Ida., Ore.

clandéstina var. angustifòlia (S. cleistogama). Per. to 2 ft.: lvs. oblong, to 4 in. long, pinnatifid: fis. blue, 1/3 in. long, in racemes to 1 ft. long. S. Afr.

cleistogama: S. clandestina var. angustifolia.

coccinea (S. rosea). Texas S. Ann. or per. to 2 ft., pubescent: Ivs. ovate, to 2½ in. long, toothed: fis. scarlet, to I in. long, in racemes to 8 in. long. S. C. to Fla. and Tex., trop. Amer. Var. álba has white fis. Var. bícolor has upper lip white, lower lip carmine-red. Var. major is somewhat shrubby, to 4½ ft., with larger bright scarlet-red fis.—The name coccinea is sometimes misapplied to S. splendens.

cólorans: S splendens.

Columbarize. Ann. to 15 in.: lvs. mostly basal, 2-pinnatifid, to 21/4 in. long, very wrinkled: fls. blue, 1/2 in. long, in 1 or 2 whorls. Calif.

dichroa. Per. to 3 ft.: lvs. oblong-ovate, to 8 in. long, toothed, pubescent: fls. deep blue with white spot on lower lip, in racemes 1 ft. or more long. N. Afr. Var. magnifica is listed as an improved form.

farinacea. Mealycup S. Per. to 3 ft., pubescent: lvs. ovate- to linear-lanceolate, to 4 in. long, toothed: fls. violet-blue, ½ in. long, in racemes to 8 in. long, calyx white or violet-tomentose. Tex. Var. alba has white fls.

fúlgens (S. cardinalis). CARDINAL S. MEXICAN RED S. Shrub to 3 ft.: lvs. ovate, to 3 in. long, toothed, white-woolly beneath: fls. bright scarlet, 2 in. long, in racemes to 1 ft. long. Mex.

globòsa. ROUNDTOP S. Bien. to 3 ft.: lvs. in a flattened sette, deeply cut, white-tomentose: fls. large, white. rosette, dee Asia Minor.

glutinosa. Per. to 3 ft., sticky-hairy: lvs. ovate-oblong, to 8 in. long, toothed: fis. pale yellow, 1½ in. long, in racemes. Eu., Asia.

Grahamii. Shrub to 3 ft.: lvs. oval, to 1 in. long, nearly

entire: fls. red, 1 in. long, in racemes 1 ft. or more long. Mex. grandiflora. Shrub to 2 ft. or more, sts. white-woolly: lvs. ovate, to 2 ½ in. long, toothed: fis. blue, to 2 in. long, in racemes. Asia Minor.

Gréggil. AUTUMN S. Shrub to 3 ft.: lvs. oblong, ½ in. long, entire: fls. red or purphsh-1ed, 1 in. long, in racemes to 4 in. long, in autumn. Tex., Mex. Var. álba has white fls. Var. rôsea has pule red fls.

Heèri. Subshrub to 5 ft.: lvs. ovate to lanceolate, toothed, wrinkled, pubescent beneath: fis. scarlet, 34 in. long, in racemes. Peru.

hlans. Per. to 2 ft., herbaceous, sts. hairy: lvs. ovate, acuminate, long-petiolate: fls. blue, in whorls of 6, racemes somewhat branched. Cashmir.

hispánica. Ann. to 2 ft.: lvs. ovate, to 3 in. long, toothed: fls. pale blue, in racemes to 4 in. long. S. Amer., Mex.

Hórminum. Ann. to 1½ ft., pubescent: lvs. oblong to ovate, floral-lvs. often colored: fis. lilac to purple, ½ in. long, in racemes. Medit. region. Var. violacea has light long, in racen violet-blue fls.

Hôveyi: S. ianthina.

ianthina (S. Hovey). Per. to 2 ft.: lvs. ovate, toothed, rinkled, floral-lvs. colored: fls. purple-violet, large. wrinkled, floral-lvs. c. Probably Mex. or Peru.

indica (S. brachycalyx). Coarse per, to 4 ft. with rough broad basal lvs. to 10 in. long: lvs. ovate to oval, sinuate-toothed, the uppermost sessile: fls. in separated whorls, ¾ in. or more long, upper lip blue-purple and strongly arching, lower spotted. Syria.

interrúpta. Shrub to 4 ft.: lvs. pinnately divided, the terminal lfts. largest, to 6 in. long, wrinkled, white-tomentose beneath: fls. bluish-white, in racemes to 2 ft. long. N. Afr.

involucràta. Roseleaf S. Subshrub: lvs. ovate or oblong-ovate, to 5 in. long, toothed, floral-lvs. bract-like, colored: fls. rose, 1 in. or more long, calyx red or purplish, in dense racemes to 6 in. long. Mex., Cent. Amer.

japónica. Per. to 1½ ft.: lvs. ovate, to 4 in. long, pinnately divided into deeply toothed segms.: fls. dark lilac or blue, in racemes to 5 in. long. Japan.

Jurisícii. Per. to 18 in. or more, sts. sparingly long-pilose: lvs. 1-2-pinnatisect, to 4 in. long, segms. narrowly linear-oblong: fls. small, purple, in branched racemes. Serbia.

lanceolata. Per. to 1½ ft.: lvs. oblong-lanceolate, to 3 in. long, slightly toothed: fis. purplish, ½ in. long, in racemes to 6 in. long. Neb. to Tex. and Mex.

leucántha. Mexican Bush S. Shrub to 2 ft.: lvs. linear-lanceolate, to 6 in. long, toothed, white-tomentose beneath: fis. white, ¾ in. long, the calyx lavender-tomentose, in racemes to 10 in. long. Mex.

leucophfila (Audibertia and Ramona nivea). Purple S. To 4 ft., sts. woody, white-tomentose: lvs. triangular-oblong, to 23½ in. long, obtuse, crenulate: fis. rose-purple to bluish, to ½ in. long. Calif.

lyrata. Per. to 2 ft., pilose, not much branched: basal lys. lyrate, to 3 in. long, toothed, hispidulous on both sides, st.-lys. oblong-lanceolate, few: fis. bluish-purple, to 1 in. long, in 6-fid. whorls, racemes lax, little branched. Conn. to Fla. west to Ill. and Tex.

mellifera (Audibertia and Ramona stachyoides). BLACK S. Shrub to 7 ftr, sts. often glandular-pubescent: Ivs. oblong-elliptic, to 2½ in. long, obtuse, green above, whitened beneath, crenulate: fls. pale blue, often tinged rose and occasionally white, to ½ in. long. Calif.—A bee

mexicana. Herb: lvs. ovate or oblong, to 3 in. long, toothed, pubescent: fls. blue, in racemes to 1 ft. long. Mex.—Name has been used for S. splendens.

Montbrètii. Per. to 1½ ft.: lvs. oblong or lanceolate, to 5 in. long, white-tomentose beneath. fls. blue, 1 in. long, in racemes to 9 in. long. Asia Minor, Syria.

Múnzii. Distinguished from S. mellifera by its more compactly rounded habit, more obovate lvs., darker blue fis. and usually unbranched infl. Calif.

napifolia. Differs from S. verticillata in the verticillate whorls of only 8-12 fls. each, rather than 20-30. Smyrna.

nemordsa: the plant in cult. under this name is usually S. superba; some of it may be S. sylvestris.

nilótica. Per.: lvs. ovate, entire, lower lvs. lyrate, to 6 in. long: fis. pale blue, in long raceme-like panicles. Trop. Afr.

nûtans. Hardy per. to 3 ft.: lvs. ovate-oblong, to 5 in. long, toothed, pv'escent beneath: fls. violet, 1/2 in. long, in racemes to 1/2 in. long, nodding as the fls. open. S. E. Eu.

officinalis. Garden S. Hardy subshrub used for seasoning, usually white-woolly: lvs. oblong, 2 in. or more long, toothed or entire, wrinkled: fis. purple, blue or white, ¾ in. long, in racemes. Medit. tegion. Var. ablifora has white fis. and rubriffora red. Var. tricolor has gray-green lvs. veined yellowish and pink becoming velvety-red.

patens. Gentian S. Half-hardy per. to 2½ ft., sticky-hairy: lvs. ovate or arrow-shaped, toothed: fis. blue, 2 in. long. Mts. of Mex.

Pitcheri (S. azurea var. grandiflora). Per. to 4 ft., closely grayish-pubescent: lys. linear or broadly so: fis. blue or white, to 1 in. long, calyx densely pubescent, spicate racemes long and rather dense. Minn. and Ill. to Kans. and Tex.— See S. azurea.

praténsis. Hardy per. to 3 ft., root sometimes tuberous. pratensis. Hardy per. to 3 ft., root sometimes tuberous. lvs. cordate-ovate, toothed, wrinkled, slightly spotted with blood-red: fls. bright blue, seldom red or white, 1 in. long, in racemes. Eu. Var. álba has white fls., atroviolácea, dark violet-purple, Baümgartenii, violet, rôsea, rose-pink, rubicúnda, rose-red. Var. Tenòrei is S. Tenorei.

prunelloides (S. brunellodes). Per. to 1½ ft.: lvs. ovate-oblong, toothed: fls. blue, in long-stalked racemes. Mex. Var. purpùrea, fls. purplish-red.

pulchélla. Herb or subshrub: lvs. broad-ovate, to 3 in. long, toothed: fls. red, 1 in. long, in long racemes. Mex.

Regeliàna. Per. to 1½ ft. or more, pubescent: lvs. ovate-cordate, to 3 in. long, obtuse, crenate: fis. lavender-purple, about ½ in. long, in axillary whorls, stamens included, glabrous. Russia.

ringens. Hardy shrub to 2 ft.: lvs. irregularly pinnately cut, pubescent: fis. reddish-purple or light blue, to 11/2 in. long, in racemes. Greece.

Roemerians. Per. to 2½ ft., pubescent: lvs. very broadly ovate to kidney-shaped, wider than long, to 1¾ in. across, the lower ones occasionally compound, sinuate-toothed: fis. scarlet-red, to 1 in. long, in panicles to 1 ft. long. Tex.—Material in the trade may be S. coccinea or S. splendens, either distinguishable by lvs. longer than wide.

ròsea: S. coccinea.

rugosa. Herb: lvs. oblong or sometimes ovate, to 8 in. long, toothed, pubescent and rugose: fis. white or purple and white, ¾ in. long, in racemes to 1 ft. long. S. Afr.

rùtilans. A plant with scarlet fis. to 1 in. long, of uncertain botanical standing; possibly a form of S. splendens.

Schiedeana. To 5 ft.: Ivs. ovate, to 3 in. long, toothed, slightly pubescent: fls. blue, ¾ in. long, in dense whorls in spikes to 5 in. long. Mex.

Sclarea. CLARY. Hardy bien. to 3 ft.: lvs. broad-ovate, to 9 in. long, hairy, toothed, floral-lvs. colored rose and white: fls. whitish-blue, to 1 in. long, in panicled racemes. S. Eu. Var. turkestánica has white fls. tinged pink, with involucral bracts to twice as long as calyces or more.

sclerótina: catalogue name, perhaps for S. serotina.

serôtina. Per to 2½ ft., finely pubescent: lvs. ovate to orbicular, to 1½ in. long, obtuse, crenate-serrate: fls. blue to white, to ½ in. long, in dense cylindrical panicles. S. Fla. to trop. Amer.

Séssei. Shrub to 15 ft.: lvs. ovate, to 5 in. long, toothed: fls. scarlet, 2 in. long, in loose panieled racemes, the calyx red. Mex.

Sibthorpii. Per. to 4 ft. or more: lvs. ovate, lower ones to 9 in. long and 4 in. wide, doubly serrate: fis. light blue, in long branched panicles. N. Medit. region.

spathàcea (Audibertia and Ramona grandiflora). CRIMSON S. Per. to 3 ft.: lvs. white-tomentose beneath: fis. to $1\frac{1}{2}$ in. long, crimson, in dense clusters. Calif.

spléndens (S. colorans). SCARLET S. Shrub to 8 ft., but cult. as an ann.: lvs. ovate, to 3½ in. long, toothed, glabrous, floral-lvs. and bracts colored: fls. scarlet, 1½ in. long, in racemes, the calyx scarlet. Brazil. Var. álba has white fls. Var. compácta, of smaller compact habit. Var. grandiflòra is listed.

supérba. Strong herb to 3 or 4 ft., with lanceolate serulate lvs. and purple fis. with red bracts; supposed to be a sterile hybrid of which one parent is probably S. sylvestris; known erroneously in cult. as S. nemorosa.

sylvéstris (S. valentina). Hardy per. to 3 ft.: lvs. oblonglanceolate, to 4 in. long, toothed, pubescent beneath, florallvs. colored. fls. purple-violet, small, in long slender racemes, Eu. and Asia. Var. álba (var. flore-albo) has white fls.

Tenòrei (S. pratensis var. Tenorei). Differs from S. pratensis in upper lvs., sts. and calyces not glandular: fis. dark blue. N. E. Medit. region.

tiliæfòlia. Herb: lvs. broad-ovate, to 1½ in. long, toothed: fls. blue, very small, in dense racemes to 3 in. long. Mex.

triangulàris. Per. to $1\frac{1}{2}$ ft.: lvs. ovate, to $1\frac{1}{4}$ in. long, toothed, pubescent: fls. blue, $\frac{1}{2}$ in. long, in racemes to 8 in. long. S. Afr.

tubifera. Herb or subshrub to 3 ft. and more: lvs. broadovate, toothed, nearly glabrous or white-pubescent beneath: fls. purplish-red, to 1 ¼ m. long, in racemes to 6 m. long. Mex.

turkestánica: S. Sclarea var.

uliginòsa. Boo S. Per. to 6 ft.: lvs. oblong-lanceolate, to 4 in. long, toothed: fls. blue or white, ¾ in. long, in racemes. Brazil, Argentina, Uruguay.

valentina: S. sylvestris.

variegata: hort. name referable to forms of S. officinalis and S. pratensus.

verbascifòlia. Per. to 1 ft.: lvs. broad-ovate, lobed, thick and wrinkled, white-tomentose below: fls. white with blue hairs, to ¾ in. long, in panicles. Caucasus.

verbenaca. Vervain S. Hardy per. to 2 ft.: lvs. oblong or ovate, lobed, to 4 in. long: fls. blue, rarely white, to ½ in. long, in long racemes. Eu. and Orient.

verticillàta. LILAC S. Per. to 3 ft., pubescent: lvs. broad-ovate, cordate or lyrate-punatifid, to 3 in. long: fls. llac-blue, ½ in. long, in dense remote whorls. Eu., Asia Minor, Caucasus.

virgâta. Per. to 6 ft., pubescent: lvs. broad-ovate, cordate, toothed: fis. light blue, to 1 in. long, in large branched panicles. S. Eu., Orient.

viscosa. Clammy S. Per. to 3½ ft., sticky-pubescent: lvs. ovate-oblong, to 1 ft. long, upper ones nearly sessile: fls. pink to red, in whorls of 4-6 in racemes or loose panicles to 14 in. long, corolla about 2½ times as long as calyx. Asia Minor

SALVÍNIA. Salviniaceæ. Floating flowerless (cryptogamous) annuals with small entire lvs. or fronds pimpled above; widely distributed. Grown in aquaria or greenhouse tanks, forming colonies on the surface of the water. Propagated by spores, or a single plant soon spreads.

auriculata (S. natans. S. brasiliensis). Fronds nearly round, about $\frac{3}{6}$ in. across. Trop. Amer.

brasiliénsis: S. auriculata.

natans of the trade S. auriculata.

SALVINIÀCEÆ. SALVINIA FAMILY. Two genera of free-floating aquatic ferns having two kinds of spores borne under the fronds. Azolla and Salvinia are grown in aquaria.

SAMANÈA. Leguminosæ. Trop. American trees and shrubs with 2-pinnate lvs., fls. in heads, and flattened nearly straight pods; planted in the tropics for shade trees. Propagated by seeds.

Saman (Pithecellobium and Inga Saman). RAIN-TREE.

MONKEY-Pod. Saman or Zaman. To 80 ft. with branches spineless, often spreading to 100 ft.: fts. yellowish with very long pink stamens, many in dense umbel-like heads: pods to 8 in. long. W. Indies, Cent. Amer.

SAMARA: indehiscent winged pericarp, as of the maple and ash

SAMBÙCUS. Elder. Caprifoliaceæ. Shrubs or small trees, rarely herbs, of wide distribution, having opposite pinnate lvs. with toothed lfts., small white wheel-shaped fls. in compound terminal corymbs or panicles, and fr. a small berry-like drupe that in some species is edible and in other species poisonous.

Elders are effective when planted in mass, and are also somewhat grown for the fruit which is edible in some species. Most of the elders are hardy North and thrive in rich rather moist soil. Propagated by seeds, cuttings and some kinds by suckers.

acutiloba: S. canadensis var.

aurea: yellow-lvd. races of S. canadensis and S. nigra.

cærùlea (S. glauca). Blue E. To 50 ft.: lvs. of 5-7 oblong lfts. to 6 in. long: fls. yellowish-white, in umbel-like eymes 6 in. across, June-July: fr. blue-black, glaucous. B. C. to Calif. and Utah. Var. nèo-mexicàna (S. intermedia) has 3-5 grayish-green lanceolate lfts. Ariz., New Mex. Var. velùtina (S. californica) has densely pubescent lvs. Calif.

califórnica: S. cærulea var. velutina.

callicarpa (S. racemosa var. callicarpa). To 20 ft. and sometimes tree-like: Ifts. oblong to obovate, pubescent underneath particularly on 11b, sharp-toothed to tip: fr. scarlet, in showy clusters. Calif. to Wash.

canadénsis. American or Sweet E. To 12 ft., stoloniferous, with white pith: lvs. of usually 7 oval or lanceolate
lits. to 6 in. long: fis. white, in umbel-like cymes to 10 in.
across, June-July: fr. purple-black, edible (with pomological vars.). N. S. to Fla. and Tex. Var. acutiloba (var. lacinata) has much dissected lits. Var. aurea has golden-yellow
lvs. and red frs. Var. chlorocárpa has greenish frs. Var.
máxima is a larger form with cymes to 15 in. across.

Ebulus. Dwarf E. Herbaceous per. to 4 ft., with many sts.: lfts. narrow-oblong and long-pointed, sharp-seriate: fts. white tinged pink, in broad cymes. fr. small, black. Eu., N. Afr., Asia.

glauca: S. carulea.

intermèdia: S. cærulea var. neo-mexicana.

leiospérma. The western form of $S.\ pubens$, nearly glabrous and frs. almost smooth. Alaska to Wash. and Wyo.

melanocárpa. To 12 ft.: lvs. of 5-7 oblong-lanceolate lfts. to 6 in. long: fis. yellowish-white, in an ovoid cyme to 3 in. across, July-Aug.: fr. black. B. C. to Calif.

microbotrys. Shrub to 6 ft., sts. light brown, pith of young sts. white: lfts. 5-7, ovate-lanceolate, to 4 in. long, sharply toothed: fls. nearly white, in hemispherical cymes to 2 in. across: fr. scarlet. Colo. to Calif.

to z in across: ir. scarlet. Colo. to Calif.

nigra. EUROPEAN E. To 30 ft.: lvs. of usually 5 oval
lits. to 5 in. long: fls. yellowish-white, in umbel-like cymes
to 8 in. across, May-June: fr. shining black. Eu., W. Asia,
N. Afr. Some of the hort. vars. are: álbo-variegāta, lvs.
variegated with white; argéntea, lvs. predominantly white;
aŭrea (var. folizi-luiets), lvs. golden-yellow; aŭreo-variegāta,
lvs. variegated with yellow; heterophýlla, lits. irregularly
dissected; laciniāta, lits. deeply dissected; latisécta, lvs.
said to be more finely cut than the former var.; pyramidālis,
habit columnar; rotundifolia, lits. usually 3, broad-ovate;
variegāta is listed.

pûbens. AMERICAN RED E. To 15 ft., pubescent when young, with brownish-red pith: lvs. of 5-7 oblong lfts. to 4 in. long: fls. in rather loose pyramidal cymes to 4 in. long in which the lower branches are spreading, May: fr. scarlet, not edible. N. B. to Ga. and Colo. Var. arboréscens is treelike. Var. leucocárpa has white frs. Var. máxima is histed as having cymes larger than type.

racemosa. European Red E. To 12 ft., glabrous, pith of sts. brown: lvs. of 5-7 ovate or oval lfts. to 3 in. long: fls.

yellowish-white, in dense ovoid panicles to 3 in. long with lower branches of it usually reflexed, Apr.—May: fr. scarlet. Eu., W. Asia. Var. laciniàta, lits dissected. Var. plumòsa, lits touthed to about middle, and golden-yellow in plumòso-aùrea. Var. tenuifòlia, lits. finely dissected.

Sieboldiana. To 20 ft.: lvs. of usually 7 oblong lfts. to 8 in. long: fts. yellowish-white, in ovoid panicles to 3 in. long, Apr.-May: fr. scarlet. Japan, China.

SAMOLUS. Primulaceæ. Small per. smooth herbs of wide distribution, having basal or alternate entire lvs. and small white fls. in racemes or panicles; sometimes planted for interest in moist places, but not showy.

Valerándi. To 1 ft.: lvs. obovate or oblong: fls. to 1/s in. across, in racemes. Eu., Asia; sparingly intro. into N. Amer.—The native S. floribundus is larger but with smaller fls.

SAMPHIRE: Crithmum maritimum.

SAMUÈLA. DATE YUCCA. Liliaceæ. Trees resembling Yucca, with sharp-pointed narrow filiferous lvs. and white fls. in dense panicles, the perianth-segms. united; planted in Calif.

carnerosana. To 18 ft., the trunk usually simple: lvs. to 1½ ft. long and 3 in. wide: fls. to 4 in. across, the tube 1 in. long: fr. to 3 in. long. Mex.

Faxoniana. To 15 ft., trunk simple or branched at top: lvs. to 4 ft. long and 3 in. wide: fls. to 4 in. across, the tube ½ in. or less long: fr. to 3 in. long. W. Tex.

SANCHÈZIA. Acanthaceæ. Herbs or shrubs of S. Amer. with large opposite lvs. and orange, red or purple tubular fls. subtended by bracts and usually borne in spikes; one species grown as a foliage plant in the greenhouse and out-of-doors in S. U. S., as well as for its heavily bracted spikes of showy bloom. Propagated by cuttings.

nobilis. Shrub to 5 ft.: lvs. oblong-ovate, to 1 ft. long, abruptly acuminate: fls. yellow, 2 in. long, with narrow revolute rim, stamens exserted, bracts red, to 1½ in. long, Ecuador. Var. glaucophylla has lvs. variegated or blotched along veins with white or yellow. Var. variegata is listed.

spectabilis: hort. name, probably for S. nobilis var. glaucophylla.

SANDALWOOD: Santalum. Bastard: Myoporum sand-wicense. Tree, Red: Adenanthera pavonina.

SANDBOX-TREE: Hura crepitans.

SANDERSÒNIA. Liliacex. One S. African per. herb with tuberous root, adapted to greenhouse cult., belonging to the Uvularia tribe. S. aurantiaca. To 2 ft.: lvs. alternate, linear or lanceolate, to 4 in. long, sessile: fls. bright yellow, to 1 in. long, solitary on slender drooping stalks, Nov.

SANDWEED: Hypericum fasciculatum.

SANDWORT: Arenaria.

SANGUINARIA. Papaveraceæ. One low spring-blooming per. herb with red juice, native in E. N. Amer. on rich lands and sometimes transplanted to the wild-garden. S. canadénsis. Bloodroot. Lvs. basal, palmately lobed, to 1 ft. across: fis. white, sometimes tinged with pink, to 1½ in. across, solitary on scapes about 8 in. high: fr. a narrow caps. to 1 in. long: rootstocks prominent. Var. múltiplex has double fis.

SANGUISÓRBA. BURNET. Rosaceæ. Hardy per. herbs native in north temp. zone, with alternate pinnate lvs., small bisexual or unisexual fls. without petals borne in heads or spikes, and fr. an achene inclosed in the calyx-tube. Grown in borders and S. minor for the lvs. used in flavoring. Propagated by seeds and division. See Poterium.

canadénsis (Poterium canadense). To 6 ft.: lfts. 7-17, oblong, to 3 in. long, toothed: fls. bisexual, white, in spikes to 6 in. long. Newf. to Mich. and Ga. Var. latifòlia (S.

sitchensis) is smaller with teeth of lfts. more rounded and less acute. N. W. Amer.

dictyocarpa (Poterium dictyocarpum). Perhaps not distinct from S. minor and from which it reputedly differs in its more ovoid fruiting calyx whose margin is non-ciliate. Cent. and N. Eu.

dodecándra (S. Vallistellinæ). To 3 ft.: lfts. 13-19, linear-oblong, toothed: fts. bisexual, greenish-yellow, in drooping spikes 2 in. and more long. Eu.

horténsis: catalogue name.

mèdia: the plant cult. under this name may be S. canadense.

minor (Poterium Sanguisorba). To 2 ft.: lfts. 7-19, oval, to ¾ in. long, deeply toothed: fls. bisexual and unisexual, greenish, in dense heads about ½ in. long, fruiting calyx acute, ciliate. Eu., Asia, E. N. Amer.

muricata (S. polygama. Poterium muricatum). Differs from S. munor in its glabrous lvs. with lits. slightly longer stalked and margins of fr. calyces winged. Cent. and S. Eu. myriophfila: listed name.

obtusa (S. obtusata. Poterium obtusum). To 3 ft.: lfts. about 13, oblong, toothed: fis. crimson, in spikes to 3 in. long, nodding at tips. Japan. Var. álba, fis. white.

obtusàta: S. obtusa.

officinalis. To 5 ft.: lfts. 7-13, lanceolate-oblong, to 3 in. long, toothed: fls. dark purple, in spikes about 1 in. long. Eu., Asia; somewhat nat. in N. Amer.

polýgama: S. muricata.

sitchénsis: S. canadensis var. latifolia.

spindsa: Poterium spinosum.

tenuifòlia (Polerium tenuifolium). To 4 ft. or more: lvs. mostly basal, ltts. 13-21, linear-oblong, to 3 in. long, deeply. toothed: fls. white or varying to purple, in spikes to 2 in. long. N. Asia.

Vallistéllinæ: S. dodecandra.

SANSEVIÈRIA. BOWSTRING-HEMP. Liliaceæ. Stiff and erect per. herbs with short thick rootstocks, very thick and erect long basal lvs. which are often variegated and mottled, and whitish or yellowish narrow fls. in racemes or spikes on slender scapes, the perianth-segms. united into a tube

Sansevierias are commonly grown as durable porch and house plants in the North and out-of-doors in the South; some kinds are naturalized in warm countries. Of easy culture in a rather heavy soil. Propagated by division; also by cuttings of the leaf about 3 inches long and placed in sand, from which a stolon-like part is produced.

æthiòpica. Subshrub, stemless: lvs. to 16 in. long, linear-lanceolate, running out into white awl-like tips to 3 in. long, erect-spreading, margins red or white, more or less glaucous, sometimes transversely dark green banded: fls. white, on infl. to 30 in. long. S. Afr.—By some authors combined with S. zeylanica.

Crâigii: hort. name for form said to have variegated lvss cylindrica (S. sulcata). Lvs. to 5 ft. long and 1½ in. thick, cylindrical or slightly flattened, striped and transversely banded with dark green: fls. white or tinged with pink, 1½ in. long. Trop. Afr.

grácilis. St. to 8 in. long and ½ in. diam.: lvs. terete, to 2 ft. long and ½ in. diam., slightly sheathing at base, apex spinose-acute, dull green with bright green longitudinal striations, glabrous: fls. white, in lax racemes to 3 in. long, perianth-tube to ¾ in. long, lobes to ¾ in. long, linear and revolute. Trop. Afr.

grandicúspis. Lvs. to 20 in, long and 1½ in, wide, nearly flat or channelled, narrowed into green point to 2 in, long, transversely banded with pale green, lined down back. Habitat unknown.

guineénsis: S. thyrsiflora.

hùmilis: listed name of unknown botanical standing.

Kirkii. Lvs. to 6 ft. or more long and 3 ½ in. wide, flat or concave, the petiole deeply channelled, wavy-margined, grayish-green mottled or slightly barred with pale green, lined on back: fls. greenish, to 5 in. long. Trop. Afr.

Lauréntii: S. trifasciata var.

párva. To 1½ ft.: lvs. to 18 in. long, narrowly lanceolate, recurved and spreading, very concave with green awn-like tip to 3 in. long, inflexible, variegated: fls. pale pinkish-white within and much darker without, arranged in pairs on raceme to 1 ft. high. British E. Afr.

pùmila: name of uncertain application, but probably a juvenule form of S. grandicuspis.

subspicata. To 1½ ft.: lvs. to 2 ft. long, lanceolate with slender petiole, dark green, mature lvs. not variegated: fls. white, solitary or in pairs in raceme to 1½ ft. high. S. Afr.

suffruticosa. Lvs. to 2 ft. long and ¾ in. wide, cylindrical, slightly banded with pale green, lined with darker green, rough: fls. whitish or greenish-white, ½ in. long. E. Afr.

sulcata: S. culindrica.

thyrsiflöra (S. guineensis). Lvs. to 1½ ft. long and 3½ in. wide, nearly flat but narrowing into channelled petiole, margined with yellow and banded transversely with pale green: fls. greenish-white, 1½ in. long, fragrant. S. Afr.

trifasciata var. Lauréntii. Resembling S. zeylanica but lvs. longitudinally striped with golden-yellow. Belgian Congo.

zeylanica. Lvs. to 2½ ft. long and ¾ in. wide, concave at middle, transversely banded with light green and lined down back: fis. greenish-white, 1½ in. long. Ceylon. Var. Mandaiana is listed.—Plants are not likely to be true to name.

SANTALÀCEÆ. SANDALWOOD FAMILY. More or less parasitic herbs or shrubs, of 27 widely distributed genera, having alternate or opposite entire lvs., bisexual or unisexual fls. with 3-6-lobed perianth, 3-6 stamens, usually inferior 1-celled ovary, and fr. a nut or drupe. Buckleya is sometimes cult.; sandalwood of commerce is obtained from Santalum.

SÁNTALUM. SANDALWOOD. Santalaceæ. Evergreen trees or shrubs native in India, Malaya, Australia and Polynesia, with opposite lvs., bisexual fls. in panicles, and drupaceous frs. Oil is extracted from the sweet-scented wood which is used as a perfume.

álbum. White S. Small tree: lvs. ovate to ovatelanceolate, to 2 in. long: fls. yellowish turning to red, in short panicles: fr. black. India.—Sometimes planted in warm countries.

SANTOLINA. Compositæ. Grayish low evergreen shrubs or rarely herbs with aromatic alternate small lvs. pinnately toothed, lobed or finely divided, and many-fld. heads of yellow or rarely white disk-fls.; pappus none; native mostly in the Medit. region.

Santolinas are employed as low border or edging plants. Propagated by cuttings taken in spring from plants wintered over in a frame or they may be taken from the plants in the fall before frost.

alpina: a confused name, the material in cult. probably referable to Anthemis montana.

Chamseyparissus (S. incana). LAVENDER-COTTON. Evergreen subshrub to 2 ft.: lvs. pinnate into minute segms., silvery-gray-tomentose: heads solitary, to ½ in. across, yellow, globular. Medit. region.—Often persisting in cemeteries and old yards.

incana: S. Chamæcyparissus.

lindávica: listed name.

pinnata. Per. to 1 ft. or more: lvs. small and narrow, deeply pinnatifid into narrow divisions: heads ½ in. or more across, solitary terminating stiff sts. Italy.

rosmarinifòlia. To 2 ft.: lvs. linear, to 1 in. long, fleshy, entre or slightly toothed: heads solitary, globular. S. Eu. tomentòsa: probably S. Chamæcuparissus.

virens (S. viridis). Per., spreading, to 15 in. high: lvs. very narrowly linear, acutely serrate, to 2 in. long and A in. wide: heads yellow, to ½ in. across, solitary on stout peduncles. Medit. region.

víridis: S. virens.

SANVITÀLIA. Compositæ. Ann. American herbs with opposite usually entire lvs. and small solitary heads, the rays white or yellow, the disks brown or purple; pappus of awns or teeth or none.

One sanvitalia is grown as a flower-garden annual; it prefers a light or open soil and full sunlight. Propagated by seed.

procúmbens. Ann. with trailing sts., hairy: lvs. ovate, to 1 in. long: heads ¾ in. across, rays yellow, disk dark purple. Mex.

SAPINDACEÆ. SOAPBERRY FAMILY. A heterogeneous assemblage, mostly trees and shrubs, but in a few cases herbaceous and tendril-climb-

ing, of about 125 genera, sometimes evergreen, the larger number in trop. regions of both hemispheres: lvs. usually alternate and pinnately or palmately compound: fls. unisexual or polygamous, having 4–5 sepals and petals or apetalous, 5–10 stamens, and superior 2–4-celled ovary: fr. of many kinds, often berry-like or drupe-like, sometimes a caps. or nut or winged body, in some cases a greatly inflated pod. Several genera are grown for the edible fr. and for ornament, as Alectryon, Blighia, Cardiospermum, Cupania, Diploglottis, Dodonæa, Euphoria, Harpullia, Kœlreuteria, Litchi, Melicocca, Paullinia, Sapindus, Serjania, Ungnadia, Xanthoceras.

SAPÍNDUS. SOAPBERRY. Sapindaceæ. Trees and shrubs of trop. regions with commonly pinnate lvs., small regular polygamous fls. in panicles or racemes, and fr. a fleshy or leathery berry; grown in the S. for ornament.

The fruits are rich in saponin which is employed for cleansing purposes in some countries. They thrive in sandy or dry and rocky soil. Propagated by seeds and cuttings in spring.

Drümmondii. Deciduous tree to 50 ft.: lvs. of 8-18 lanceolate lfts. to 3 in. long: fls. yellowish-white, in panieles to 10 in. long: fr. round, yellow turning black, to ½ in. across. Mo. to Mex.

Mukoróssii. Evergreen brittle tree: lvs. of 8-13 oblongovate or -lanceolate lits. to 6 in. long, the lf.-stalk narrowly winged: fr. yellow or orange-brown, 3/4 in. across. India to Japan.—The fr. has a large content of saponin; planted in Fla.

Saponaria. Evergreen tree to 30 ft.: lvs. of 7-9 elliptic to oblong-lanceolate lfts. to 4 in. long, the lf.-stalk usually broadly winged: fis. white, the panicles to 10 in. long. fr. round, orange-brown and shining, to 1/2 in. across. Trop. Amer.

trifoliatus. Small tree: lfts. elliptic-lanceolate, to 4 in. long, acuminate, leathery, glabrous: fls. white, in terminal pubescent panicles: fr. 2-3-lobed, to 3/4 in. long. Old World tropics.

SAPIUM. Euphorbiaceæ. Trees and shrubs of the tropics with milky juice, alternate simple lvs., monœcious fls. without petals borne in spikes, and capsular fr.; several species furnish rubber and the waxy seed-covering of S. sebycerum is used in making candles, soap, and dressing for cloth. Propagated by seeds or cuttings or varieties are top-grafted on seedling stocks.

sebferum (Stillingia sebifera). CHINESE TALLOW-TREE. VEGETABLE-TALLOW. Tree to 40 ft.: lvs. rhombic-ovate, to 3 in. long, abruptly acuminate: spikes to 4 in. long; fr. ½ in. across, the 3 large white seeds adhering to the central column. China, Japan; nat. in S. U. S.—With us it is known as a shade, ornamental or specimen tree; it has something the aspect of a poplar.

SAPODILLA: Sapota Achras.

SAPONÀRIA. SOAPWORT. Caryophyllacea. Herbaceous erect or spreading annuals and perennials with flat broad lvs. and red, pink or white fls. in cymes or panieles; native in Eu., Asia and N. Afr., a few grown in rockeries and borders. Of easy cult., thriving in any soil. Propagated by seed or division.

bellidifòlia. Glabrous tufted per. to 16 in.: lvs. spatulate: fls. yellow, in heads about 1 in. across at top of sts. S. Eu. to Greece.

caspitòsa. Tufted, with sts. to 6 in. high: lvs. linear: fis. rose, in 2-3-fid. cymes. Pyrenees.

calábrica (S. multiflora). Ann., sticky-hairy above: lvs. oblong-lanceolate: fls. pale rose, about ½ in. across, solitary in axils forming leafy panicles, spring. Italy, Greece. Var. álba, fls. white.

caucásica: S. officinalis var.

cerastioides. Ann. to 2 ft.: lvs. obovate to suborbicular, obtuse, glaucous: fts. in terminal dichotomous corymbose panicles, petals bifid with linear obtuse lobes, calyx-teeth ovate and obtuse, pedicels glandular-hairy. Caucasus.

lûtea. Tufted, to 6 in.: lvs. linear: fis. yellow, in dense heads, stamens violet. Eu.

multiflòra: S. calabrica.

multinora: s. calaorica.
ocymoldes. Per., trailing, much branched, to 9 in.,
soft-hairy: lvs. ovate-lanceolate: fls. bright pink, in broad
loose cymes, calyx purple. May-Aug. Cent. and S. Eu. Var.
álba, fls. white. Var. multiflora is said to be larger and more
floriferous. Var. spléndens, fls. larger and deeper rose.
Var. versícolor, fls. white turning rose.

officinalis (Silene Saponaria). Bouncing Bet. Stout glabrous per., little branched, to 3 ft. lvs. ovate-lanceolate, to 3 m. long: fts. pink or whitish, about 1 in. across, in dense terminal corymbs. May-Sept. W. Asia; widely nat. m N. Amer. Vaix. 4lba, rosea and rubra are listed color forms. Louble-ftd. forms are flore-pleno, caucasica and caucásica flòre-plèno.

semperflorens nana: hort. name of a dwarf robust long-blossoming form, probably of S. ocymordes although said to be non-trailing.

Vaccaria (Vaccaria vulgaris, parviflora and pyramidata. Lychnis Vaccaria). Cow-Herb. Ann, glabrous, to 3 ft.: lvs. ovate-lanceolate: fls. deep pink, 14 in. across, in loose cymes. Eu; widely nat. in N. Amer. Var. álba has white fls. Var. rôsea has pale pink fls.

Welnmannii: a form of S. caspitosa, to 3 in high, with paler fls. and shorter calvx.

SAPÒTA, Sapotacex, Evergreen tree cult. in the tropics for its delicious fr., native of trop. Amer. S. Áchras (Achras Sapota). Sapodilla. To 75 ft.: lvs. oblong to elliptic, to 5 in. long, shining: fis. white, to ½ in. across, solitary, axillary: fr. to $3\frac{1}{2}$ in. diam., rough, brown with vellow-brown translucent flesh and black shining seeds. -The milky latex of this tree is the chief source of Gum Chicle, important in the chewinggum industry.

gum industry.

Botanical names of sapodilla and sapote are confused, due to different interpretations of the historic records. Sapodilla is Sapota Achras of Philip Miller, 1768, although also known as Achras Sapota of Sapote or marmalade-plum is Achras Zapota of Luniaus, 1753; it has also been called Lucuma mammosa, Achradelpha mammosa and Calocarpum Sapota. The usage in Hortus has been checked, but general agreement is not attained.

The sapodilla grows well in any usual soil but seems to prefer fertitle sandy loam. Trees should not be planted closer than 25–30 feet; they require little pruning as their growth is more or less compact. Propagation is usually by seed but a better method, perhaps, is by shield-budding on common seedling stocks. Grafting and layering are also methods in India.

SAPOTACEÆ. SAPODILLA FAMILY. Mostly trop. and subtrop. trees and shrubs in both hemispheres, with milky juice, alternate simple and entire lvs., regular bisexual fls. having 4–6 separate sepals, gamopetalous corolla, as many stamens as corolla-lobes, superior ovary, and fr. a berry. There are more than 30 genera in the family of which several yield edible fr. and one gutta-percha. Those known to hort, are Achras, Argania, Bumelia, Chrysophyllum, Lucuma, Mimusops, Palaquium, Sapota, Sideroxylon.

SAPOTE: Achras Zapota. Black: Diospyros Ebenaster. White: Casimiroa edulis.

SARACA. Leguminosx. Trees with pinnate lvs., fls. in panicled racemes, and flattened leathery or woody pods; native in trop Asia; grown for ornament in trop, regions and sometimes under glass.

cauliflora. Bush-like tree: Ifts. 1 ft. or more long: fls. scarlet. India.

findica. Asoka. Sorrowless Tree of India. Small tree: lfts. to 9 in. long: fis. orange-red, fragrant: pods to 10 in. long. India, Malaya.

SARCÁNTHUS. Orchidacex. Old World epiphytes with non-pseudobulbous sts. bearing distichous fleshy flat or terete lvs. and lateral racemes or panicles of very small fls.; sepals and petals similar; lip spurred and joined to base of footless column. See Orchids for cult.

Williamsonii. Lvs. cylindrical, filiform: panicles exceeding lvs., loosely fld.; fls. amethyst-purple. Burma.

SARCOBÀTUS. GREASEWOOD. Chenopodiacex. A spiny much branched shrub of W. N. Amer. having alternate linear fleshy lvs. with some of the branches leafless and spine-like; plants may be diœcious or monœcious, staminate fls. in catkin-like spikes and pistillate fls. solitary in axils. One species, S. vermiculatus, is known. To 10 ft., usually glabrous, branches whitish: lvs. to 1½ in. long, obtuse or subacute: staminate infl. to 1 in. long, cylindrical, wing of pistillate calyx to ½ in. wide. Alkaline regions of W. Neb. to Wyo., Nev. and New Mex.—The wood is very hard, yellow and used for fuel.

SARCOCAÙLON, Geraniacex. Much branched. fleshy, spiny, suffrutescent shrubs of S. and Cent. Afr. distinguished technically from other genera of the family by fls. with 15 monadelphous stamens; spines represent persistent hardened lf.-petioles which may bear lf.-blades when very young, but normal lys. occur in axils of thorns.

Búrmannii. To 20 in. high, sts. terete, to 1½ in. diam.: lvs. obovate-cuneate, to ½ in. long, ffeshy, margins incised-crenate: fis. white with rose-pink center, to 2 in. across, solitary. S. Afr.

rígidum. To 20 in. high, sts. irregularly subconstricted, to 1½ in. diam., spines about 1½ in. long: lvs. obcordate, to ½ in. long, mucronate, margins entire: fis. rose-pink, to 2 in agross solitary. Can't Afr.

to 2 in. across, solitary. Cent. Afr.

SARCOCHÌLUS. Orchidaceæ. Epiphytic orchids of the Old World, with non-pseudobulbous leafy sts. and lateral infl. either racemose or paniculate; dorsal sepal and petals similar; lateral sepals broader, running down the columnfoot; lip 3-lobed, spurred or shoe-shaped. See Orchids for cult.

Calcèolus: Thrixspermum Calceolus.

pállidus (S. unquiculatus). Lvs. distichous, to about 14 in. long and almost 3 in. wide. infl. racemose, few- to many-fid., shorter than lvs.; fls. up to 2½ in. across; sepals and petals cream-white; lip cream-white of flesh color barred with red-brown or violet. Blooming all year. Malaya, Philipping. Philippines.

unguiculàtus: S. pallidus.

SARCOCÓCCA. Buxacex. Evergreen longleaved Asian shrubs with alternate entire lvs. and unisexual fls. without petals borne in short axillary racemes; sometimes planted for the attractive foliage; useful in southern states. Propagated by seeds and cuttings.

Chingii: listed name.

Hookeriàna. To 6 ft.: lvs. lanceolate, to 3 in. long: fr. black. Hımalayas. Var. hùmilis (S. humilis), to 4 ft., with shorter lvs. and stamens.

hùmilis: S. Hookeriana var.

prunifórmis: S. saligna.

ruscifòlia. To 6 ft.: lvs. ovate, to 2 in. long, lustrous dark green above: fis. whitish. fr. red. China.

saligna (S. pruniformis). Lvs. lanceolate-oblong, to in. long, caudate-acuminate: fis. yellow: fr. purple. Himalayas.

SARCÒDES. Monotropaceæ. Bright red or crimson saprophytic herb of W. U. S., distinguished from Monotropa by its sympetalous corolla and in the absence of a receptacular disk beneath the ovary. S. sanguinea. SNOW-PLANT. To 15 in., sts. covered with ovate to ligulate fleshy scales to $\frac{5}{8}$ in. long: fls. red, to $\frac{1}{2}$ in. long, in terminal racemes. In coniferous forests on mts. in W. Nev., Lower Calif. north to S. Ore., blossoming as soon as snow melts in June-July.

SARCOGLÓTTIS. Orchidacex. American terrestrial orchids closely allied to Spiranthes and sometimes considered to be generically inseparable, but differing in having generally larger fls.,

recurved lateral sepals decurrent on the ovary and reflexed terminal lobe of lip.

picta (Spiranthes picta). To about 2 ft. high: lvs. elliptic-oblanceolate, to about 18 in. long: racemes to about 12 in. long; fis. whitish, green or brown, about 2 in. long. Oct.-June. Cent. Amer., Trinidad, S. Amer.

SARCOPODIUM: Dendrobium.

SARCOSTÉMMA. Asclepiadaceæ. Succulent, leafless, trailing or twining herbs of semi-desert trop. regions of Old World, having yellowish-green to whitish fls. in umbels. S. vimināle. Trailing or shrubby suffrutescent shrub, occasionally with bract-like minute ovate lvs.: corolla pale greenish to sulfur-yellow, rotate to subcampanulate. May be grown in sandy soil as pot-plant under glass; propagated by cuttings or seed. This plant, or a related species, may be in cult. as Euphorbia pendula.

SARGENTODOXA: see Lardizbalacex. SAROTHRA: Hypericum gentianoides.

SARRACÈNIA. PITCHER-PLANT. Sarraceni-uceæ. American insectivorous plants sometimes grown as curiosities: stemless perennials with basal hollow lvs. or "pitchers" which are winged or keeled on one side and with a lid at top, solitary nodding yellow to crimson fls. with an umbrella-like stigma, and capsular frs.

Pitcher-plants are natives of moist or swampy places and should be grown in pots of fine sandy muck standing in about 1 inch of water. They withstand temperatures nearly to freezing (below freezing in native places when dormant), and S. purpurea is hardy North. Propagated by seeds which are obtained only by cross-pollination.

Cátesbæi: S. Sledgei.

Drúmmondii. Pitchers to 4 ft. long, green below veined with purple, the lid nearly erect and wavy-margined: fls. purple, to 4 in. across. Ga., Fla., Ala.

flàva. Pitchers to 3 ft. long, yellowish-green with crimson throat or sometimes entirely crimson, the hid slightly bent over mouth fls. yellow, to 4 in. across. Va. to Fla.

Jonesii. Pitchers to 2½ ft. long, green, sometimes inconspicuously veined with red, the lid curving over mouth: fls. dark red, 2 in. long. N. C. to Fla. and Miss.

minor (S. variolaris). Pitchers to 2 ft. long, veined toward top with green and purple and blotched with white or yellow, the lid bent over mouth. fls. pale yellow, to 2 in. across. N. C. to Fla.

psittácina. Pitchers decumbent, to 6 in. long, veined and spotted with purple and white, the lid strongly bent. fls. purple or greenish-purple, to 2 in. across. Ga., Fla., Ala.

purpùrea. Pitchers to 10 in. long, green to dark purple, the lid nearly erect: fls. purple or greenish-purple, to 2 in. across. Lab. to Fla. and Rocky Mts.

rubra. Pitchers to 20 in. long, veined with purple, the lid slightly bent: fis. crimson, fragrant, to 2 in. across. N. C. to Fla.

Slédgei (S. Catesbæi). Pitchers to 2½ ft. long, veined with purple, the lid erect or slightly bent: fls. yellow fading to white, to 2½ in. across. Ala. to Tex.—There is another Catesbæi which is a hybrid between S. flava and S. purpurea. variolàris: S. minor.

SARRACENIÀCEÆ. SARRACENIA FAMILY. Three genera of specialized insectivorous low herbs native in N. and S. Amer., Darlingtonia, Heliamphora and Sarracenia, sometimes cult. as fanciers' plants or for botanical demonstration. The family is characterized by basal tubular pitcher-like or trumpet-form lvs., bisexual fls. having 5 sepals and petals, numerous stamens, superior 3-5-celled ovary, and capsular frs.

SARSAPARILLA: Aralia.

SASA. Gramineæ. Bamboo shrubs, mostly dwarf or not very tall, with cylindrical culms, persistent lf.-sheaths, lvs. crowded at ends of branches tessellate, and narrow spikelets borne

in loose panicles, stamens usually 6; native in E. Asia and the Philippines. Many of them stand as far north as Washington and Philadelphia. See Rambao

álbo-marginàta: S. Vertchii.

argenteo-striàta: see Pleroblastus viridi-striatus. aureo-striàta: see Pleroblastus viridi-striatus.

auricoma: Pleroblastus viridi-striatus.

chrysantha (Arundinaria and Bambusa chrysantha). To 6 ft.: lvs. to 5 m. long and ¾ in. wide, glabrous, often variegated with yellow. Japan.

disticha: Pleioblastus distichus. hūmilis: Pleioblastus humilis. japonica: Pseudosasa japonica. paniculāta: S. senanensis.

pùmila: Pleioblastus pumilus.

pygmæa: Pleioblastus viridi-striatus var. vagans.

senanénsis (S. paniculata). To 6 ft., st.-sheaths with ciliate tongue: lvs. to 1 ft. long and 3 in. wide, shining above, glaucous beneath. Japan. Var. nebulòsa (Arundmara and Bambusa palmata) has puiplish sts. and st.-sheaths spotted with brown.

tessellata (Arundinaria tessellata. A. Ragamowsku, Bambusa tessellata. B. Ragamowsku). To 5 ft.: lvs. to 1½ ft. long and 4 in. across, toothed, glaucous and pubescent beneath. Japan.

variegata: Pleioblastus variegatus.

Veitchii (S. albo-marginata. Arundinaria and Bambusa Veitchii). To 3 ft., usually lower: Ivs. to 8 in. long and 21½ in. wide, glaucous and pubescent beneath, edges turning yellow, if.-sheaths with bristly tips. Japan.

SÁSSAFRAS. Lauraceæ. Aromatic deciduous trees, one native in N. Amer., one in Asia, one on Isl. of Formosa, with alternate entire or lobed lvs., unisexual or bisexual fls. before the lvs., and drupaceous fr. having a fleshy pedicel. Of easy cult. Propagated by seeds, suckers, and root-cuttings.

álbidum (S. oficinale. S. varufolium). Sassafras. To 60 ft. or more: Ivs. ovate, to 5 m. long, entire or 1-3-lobed at apex, pale beneath: fls. yellow, in racemes to 2 m. long; fr. dark blue, with bright red stalks. Me. to Fla. and Tex.

officinàle: S. albidum.

variifòlium: S. albidum.

SATIN-FLOWER: Lunaria. -Leaf: Chrysophyllum oliviforme.

SATURĒJA (incl. Calamintha). Savory. Labiatæ. Aromatic herbs and substrubs of warm countries, grown in borders for their bloom and also as sweet herbs: lvs. narrow, entire or broader and toothed: fls. whorled, in simple spikes or raceme-like panicles.

Savory is propagated by seed sown in the permanent position; also by division and cuttings of the new growth, in the case of the perennials.

Acinos (C. Acinos). Ann. to 6 in.: lvs. ovate, obtuse, slightly toothed: fls. in separated whorls, purple-blue. Eu.; nat. in E. N. Amer.

alpina (C. alpina). ALPINE S. Per., much branched and woody at base, 6 in.: lvs. ovate, ½ in. long, slightly toothed: fls. purple. Medit. region.

amœna: listed name.

annua. Ann. to 5 in.: lvs. ovate, acute, to ⅓ in. long, serrate, glabrous, petioled: fls. many in dichotomous cymes, calyx about as long as corolla. Russia.

Calamintha (C. officinalis and C. montana. Clinopodium Calamintha). Calamint. Small hairy-pubescent per., with creeping rootstocks, 1-2 ft. high: lvs. broad-ovate, obtuse, dentate: fis. small, in separated leafy whorls, lilac. Eu.—Sometimes confused as to name with S. montana.

Chándleri. To 3 ft., clump-forming: lvs. orbicular-ovate, to ¾ in. long, obtuse, remotely crenulate, petuoles ½ in. long: ffs. white, upper lip of corolla 2-cleft and lower lip 3-cleft, lobes obtuse. Calif.

chinénsis (C. chinensis). Per, with ascending hairy sts.: lvs. ovate, acute, toothed: fls. in very dense whorls. China. coccínea: Clinopodium coccineum.

córsica. Low suffrutescent herb, subglabrous or twigs pilose: lvs. ovate, to 1/8 in. long, acute, often appressed

silvery-hairy beneath: fls. rose-pink, to ½ in. long, solitary or in pairs, corolla about twice as long as calyx. Corsica.

crostica: Micromeria croatica. cuneifòlia: S. montana.

glabella (C. glabella). Per. with decumbent hairy sts. to 2 ft.: lvs. narrowly oblong, about 1 in. long, usually glabrous: corolla purplish, about twice as long as calyx, verticillate whorls of 6-10 fts. Ky. to Ind. south to Tenn. and Ark.

grandiflora. Per. to 18 in. or more: lvs. ovate, to 3 in. long, acute, coarsely dentate, usually sparsely plose or hispid: fls. purple, to 1½ in. long, few in short peduncled cymes, calyx about ½ in. long with awl-shaped lobes. Eu.

horténsis (C. hortensis). SUMMER S. Ann. to 1½ ft.: lvs. soft, oblong-linear, to 1½ in. long: fls. pink, purplish or white. Eu.; nat. in E. U. S.

illyrica: S. montana.

intricata. Suffrutescent per., densely tufted: lvs. obovate, usually 2-toothed and chate, glabrous: fis. white, usually solitary in lf.-axils, glandular-punctate on outside. Spain.

montana (C. montana and officinalis. S. cuneifolia. S. illyrica. S. pygmwa). Winter S. Per. or subshrub to 15 m.: lvs. stiff, oblong-linear, to 1 m. long, sessile and bases joined by ridge: fis. white or purplish. Eu., N. Afr.

Népeta (C. and Clinopodium Nepeta). Per. to 16 in.: lys. ovate, to 1 in. long, slightly toothed: fis. purplish or white. Eu., Asia; nat. in N. Amer.

pygmæa: S. montana.

rupéstris. Subshrub to $1\frac{1}{2}$ ft., woody at base: lvs. ovate, small, entire to crenate-dentate, obtuse, glabrous to canescent: corolla slightly longer than calyx, fls. in dense whorls. S. E. Eu.

stenophýlla: listed name.

SAURÓMATUM. Aracex. Per. herbs with a large solid corm-like underground tuber from which arise the short scape and large pedate If., one species sometimes planted for ornament and curiosity: somewhat arisema-like but scape separate from petiole-sheath: native in Himalayas and Afr. Some forms stand in N. Y. with protection in winter.

tion in winter.

guttatum (Arum guttatum). Tuber 3-6 in. diam.; scape 2-4 in. long, direct from tuber, usually before if.: spathe narrow and long-tailed, 1-2 ft. or more, dull purple or yellowish spotted and blotched purple, blade oblong-lanceolate: lifts. or segms. 5-15, long oblong-lanceolate, pointed, 6-12 in. long. Himalayas and subtrop. E. Asia.—Varrable, and has been grown in one of its forms as Arum cornutum and "red calla." Var. pedātum (S. and Arum pedatum). Petiole green, not spotted: spathe about 1 ft. long, yellowish and purple-spotted inside. Var. punctātum (S. punctatum). Petiole spotted: spathe brown-spotted at base, strate. Var. simlēnse (S. simlense). Small or depauperate. If. 5-parted: spathe 4 in. or less long. Var. venōsum (S. and Arum venosum). Lf.-segms. 7-11, petiole with long spots. with long spots.

nubicum. Differs from S. guttatum in blade of spathe being elongate-lanceolate and sterile fis. filiform, more numerous and not club-shaped.

pedatum: S. guttatum var. punctatum: S. guttatum var. simlénse: S. guttatum var. vendsum: S. auttatum var.

SAURURACEÆ. LIZARDS-TAIL FAMILY. Per. herbs of 3 genera in N. Amer. and Asia, having alternate entire lys., small fls. without perianth in racemes or spikes that are sometimes subtended by corolla-like bracts, 6 or 8 stamens, ovary of 3 or 4 carpels, and capsular frs. Anemopsis, Houttuynia and Saururus may be planted.

SAURÙRUS. LIZARDS-TAIL. Saururaceæ. Herbs in wet or moist situations, with heartshaped lvs. and fls. in dense terminal spikes or racemes. Propagated by division or seeds.

cérnuus. To 5 ft., with long rootstocks: lvs. ovate, to 6 in. long, palmately veined: fis. white, fragrant, in spikes to 6 in. long. Conn. to Fla. and Tex.

SAUSAGE-TREE: Kigelia pinnata.

SAUSSUREA. Compositæ. Herbs mostly of the north temp. zone with alternate entire, toothed or pinnate lvs. and heads of purple or bluish disk-fls.; pappus of bristles. Sometimes planted for ornament. The name Saussurea has been applied also to Hosta.

albéscens. Per. to 10 ft., st. simple, erect: lvs. oblong-ovate, to 12 in. long, acuminate, entire or sinuate-lobed, pubescent beneath: heads to 3/4 in. across, red. Himalayas.

deltoidea. Per. to 8 ft.: lvs. triangular-ovate or lower lyrate-punnatifid, to 1½ ft. long, white-tomentose beneath. heads to 1½ in. across, in leafy panicles. Himalayas.

AVANNAH FLOWER: Echites tomentosa.

SAVIN: Juniperus Sabina.

SAVORY: Saturera.

SAXEGOTHÀA. Podocarpacex. Evergreen tree native to Chile, S. conspicua. To 45 ft.: lvs. yew-like, linear, to 1 in. long, dark green above, with 2 broad white bands beneath: male fls. in short spikes: fr. conc-like, about ½ in. across, with several seeds.—To be grown far south in E. U. S. and in Calif. For cult. see Conifers.

SAXÍFRAGA. SAXIFRAGE. ROCKFOIL. Saxifragaceæ. Varied group of many attractive herbaccous perennials, a few ann. or bien., by some authors arranged in several genera: lvs. usually basal and clustered, those on the sts. commonly smaller: fls. white, pink, purple or yellow, in racemose, paniculate or cymose clusters, blooming commonly in late spring and early summer: native in temp. and subarctic regions, mostly in the mts. and in rocky places, many adapted to the rock-garden, a few to the border, while one (S. sarmentosa) is often grown as a windowand basket-plant.

Saxifrages are much prized by fanciers but are relatively little grown in North America. They require the usual treatment for rock-garden or border perennials. Increased by seed, by division and in some species by runners, also by the bulblets which some kinds produce.

The species of Saxifraga are divided into sections in order

to show natural relationships and to facilitate identification. The species of a given section possess in common the characteristics of that section and such are not repeated, for the most part, in the brief diagnoses given. The distinguishing characters of the sections of the genus follow:

Diptera: flowers irregular, having definitely unequal petals: plants generally hairy, runners usually present.

Tetrameridium: flowers 4-merous, without petals: leaves opposite, pitted.

The following sections have regular 5-merous flowers, often with a double perianth:

Boraphylla: rhizome subterranean, the secondary shoots permanently attached: ovary free: leaves without pits on upper surface, no lime secreted: fls. white. seed fusiform or spindle-shaped; capsule somewhat inflated, splitting above the middle.

Hirculus: differs from Boraphylla in its yellow to orange flowers and capsule not inflated, splitting below the middle.

Miscopetalum: differs from Hirculus in its obovate seed, and white flowers.

Robertsonia: differs from Boraphylla in the rhizome being above ground and fls. occasionally pink to carmine-red. Cymbalaria: leaves brown-striate: flowers yellow: seed

globose.

Tridactylites: annual or biennial, without pits on foliage leaves, rhizomes absent: flowers usually white.

Nephrophyllum: biennial or perennial, rarely annual, rhizome subterranean, secondaries with shortened bulbous internodes separating from the stem with age: leaves usually not persisting through winter, pits absent from cotyledons and foliage leaves: flowers white.

Dactyloides: perennials differing from Nephrophyllum in absence of bulbous structures, rhizomes above ground, leaves usually persisting through winter, herbaceous, not setose: flowers white, pink or red, rarely yellow.

Trachyphyllum: differs from Dactyloides in leaves not herbaceous, commonly very setose: flowers usually yellow, occasionally white.

Xanthizoon: rhizomes above ground, branched from the base: leaves alternate, pits present on margins and on

apex of cotyledons, covered with bristly hairs, not lime incrusted.

Euaizonia: rhizomes above ground, secondary shoots separating early from rhizomes, more or less stoloniferous, their apex with a rosette of leaves: leaves alternate, pits present, lime incrusted.

Kabschia: differs from Euaizoonia in secondary shoots remaining attached to the perennial rhizome.

Porphyrion: differs from Kabschia in leaves decussately opposite.

Hybrids: not a botanical section of the genus. Many horticultural and natural hybrids occur and are in cultivation, whose parents belong in different sections. These are sometimes difficult of identification, and as complete descriptions as practicable are given.

descriptions as practicable are given.

To economize space in the following brief diagnoses of species, or of plants under Latin names, letters are employed to distinguish the section to which the plant belongs: B. Boraphylla; C. Cymbalaria; Da, Dactyloides; Di, Diptera; E. Euazeoonia; H, hybrid; Hi, Hirculus; K, Kabschia; M, Miscopetalum; N, Nephrophyllum; P. Porphyrion; B, Robertsonia; Te, Tetramerulum; Tra, Trachyphylium; Tri, Tridactylites; X, Xanthizoon.

The section Engleria is encountered in trade publications. This is a segregate from Kabschia and is not considered botanically distinct by the more recent monographers of the genus

adscéndens (Muscaria adscendens). Tri: to 5 in., sticky-pubescent: lvs. cuneate, 3-5-lobed, to ½ in. long: fis. white, very small, in corymbs. B. C. to Colo., Eu.

émula: Bergenia media.

æstivālis (Micranthes astivālis). B: to 10 in.: lvs. cordate-orbicular, coarsely toothed, to 6 in. long: fis. white, very small, in panicles. Alaska to Wash., Siberia.

affinis: S. hypnoides.

aizoides (Leptasea aizoides). X: to 6 in.: lvs. linear-oblong or oblong, to ½ in. long, thick: fis. yellow, to ½ in. long, solitary or several. Arctic N. Amer., Eu., Asia.

oblong or oblong, to ½ in. long, thick: fis. yellow, to ½ in. long, solitary or several. Arctic N. Amer., Eu., Asia.

Aizoón (Chondrosea Aızoon). E: to 20 in.: lvs. in dense basal rosettes, narrow-spatulate, to 1½ in. long, with incrusted white teeth: fis. creamy marked with purple, to ½ in. across. Arctic N. Amer., Eu., Asia. Varieties and forms listed in the trade ınclude: álba, fis. white; atropurpirea, fis. rose-purple; balcana (S. balcana), fis. white with large red spots; balcanis, lvs. ashy-gray, short and thick, N. Italy; brevifòlia, fis. white; californica (S. carinthaca), fis. white; cristata, lvs. narrow and silvery, fis. craem-colored; cultrata, to 14 in., basal lvs. narrow, serrate and obtuse, fis. cream-colored, Carpathnan Mts.; defisa, rosettes small very silvery; emarginata, to 10 in. with loose rosettes and reamy fis.; flavéscens, fis. lemon-yellow; Hainoldii, to 1 fi., lagaveana, to 6 in., rosettes small and silvery, fis. creamy, thick and wax-like; Lámbertii, reported as a hybrid; lùtea, fis. yellow; major, lvs. oblong-linear not widening much at apex; mínima, very small, fis. white (var. minor); notata, lvs. margined with silver; paradóxa, lvs. bluish, fis. white; pectinata, lvs. margined with silver; fis. white spotted red; Porties, dense clusters of silvery-lvd. rosettes, fis. creamy; Réx, to 10 in., fis. cream, large; ròsea, fis. bright pink; rosularis, lvs. of rosettes incurved, fis. white; Stabiana), to 8 in., lvs. to 1 in. long.

Albertii. K: to 1 in., densely tufted: lvs. lingulate in blood of the colong to linear. Jacoba de concave above: fis. yellow in

Albertii. K: to 1 in., densely tufted: lvs. lingulateoblong to linear-lanceolate, concave above: fis. yellow, in panicles. Turkestan.

Allionii: S. moschata var.

alpina: name of uncertain application.

altissima. E: to 2 ft.: lvs. in basal rosettes, broadly tongue-shaped, to 4 in. long, with cartilaginous teeth: fls. white, slightly spotted with purple, ½ in. across. Tyrol.

ambigua. Hybrid between S. media and S. arctioides: to 2½ in.: fls. purple, red or coppery. Pyrenees. Andrewsii. Hybrid between S. Aizoon and S. Geum:

to 6 in.: fls. white spotted with red. anormalis: listed as having lvs. in rosettes, lightly lime

pitted, fis. yellow; the name has no known botanical standing, and the plant may be a hort. hybrid.

apennina: S. cuneifolia var. subintegra.

aphylla. Da: to 1 in., loosely tufted: lvs. spatulatelan eolate, entire or 3-5-toothed, to ½ in. long: fls. light yellow, very small, usually solitary. Mts., Eu.

apiculata. Hybrid between S. Rocheliana and S. sancta: to 3½ in.: fis. y llow. Var. álba, fis. pure white or pale cream. Var. Mályi (S. Malyi) has deeper yellow fis.

aquática. Da: to 20 in.: lvs. orbicular, about 1 in. wide, 3-lobed: fls. white, 3/4 in. across. Pyrenees.

arachnoidea. N: tufted, with procumbent sts. to 1 ft. long, densely hairy: lvs. 3-5-lobed, to ¾ in. long: fis. yellow. Cent. Eu.

arco-valleyi. K: rosettes to ¾ in. across: fls. bright red, to ¼ in. across. A hort. hybrid.

Arendali. Hybrid of mixed parentage which probably includes S. exarata and S. decryiens: to 4 in., with light green discoted lvs. in dense tufts: fls. rose to blood-red, to ¾ in. across. Var. splendens has larger and deeper red fls.

aretioides. K: to 2 in., densely tufted: lys, leathery and stiff, linear, to 1/2 in. long, the margins cartilaginous: fis. golden-yellow, 1/2 in. across. Eu.

argûta (Micranthes argula). B: to 1½ ft.: lvs. nearly orbicular, cordate, wavy-toothed, to 1 ft. long: fls. white with yellow spots, very small, in panicles. B. C. to Calif. and New Mex.

áspera. Tra: to 6 in. with creeping sts.: lvs. linear-lanceolate, chlate with stiff hairs, shining: fls. yellowish-white, in few-fld. panicles. Mts., Eu. Var. bryoides is densely tufted, to 3 in.

atropurpurea: S. moschata var.

austromontana (Leptasea austromontana). Tra: to 3 in., densely tufted: lvs. lanceolate, about ½ in. long, ciliate: fls. white spotted with yellow, ½ in. across. B. C. to New Mex.

halcana: S Airon var

baldénsis: S. Aizoon var.

hathoniénsis: S. decipiens var.

Beesiana: listed as having purple foliage in winter and rose fls.; probably a Bergenia.

Bellárdii: S. lingulata var.

Bertolònii. Hybrid between S. Friderici-Augustii and S. porophylla: to 3 in.: fis. red.

Biasoléttii. Hybrid whose reputed parentage is S. Grisebachti and S. porophylla var. Sibthorpiana forma thessalica: lvs. narrow-spatulate, acute: sts. red: fls. reddishpurple.

bidens (Micranthes bidens). B: lvs. erect or nearly so, to 2½ in. long, oblong to oval, more or less chiate: fls. white, sepals reflexed at maturity, petals clawed and 2-toothed at apex; scapes erect to 16 in., fls. clustered in cymules. Mont., Utah, Nev.

Biléckii. Hybrid of S. Ferdinandi-Coburgii and S. tom-beanensis: cespitose, to 3 in.: Ivs. linear, obtuse, fleshy, small. fls. yellow, large.

Bockelèri. Hybrid of S. Ferdinandi-Coburgii and S. Stribrny: small plant of tufted rosettes less than 1 in. across, fl.-sts. to 3 in. tall: basal lvs. linear-spatulate, to ¾ in. long, fleshy, white-pitted: fls. yellow tinged red.

Bongardii (Spatularia Brunomana). B: to 16 in.: lvs. oblanceolate, to 2½ in. long, toothed, harry fis. white with yellow spots, petals unequal, sometimes replaced by bulblets. Alaska to Ore.

Bòrisii. Hybrid between S. marginata and S. Ferdinandi-Coburgii: to 3 in.: fls. yellow.

Boryi. K: to 1½ in., tufted: lvs. oblong, spatulate: fls. white, to ½ in. long. S. E. Eu.

Bòydil. Hybrid between S. arctioides and S. Burseriana: fls. yellow. Var. álba, fls. white or pale cream-colored.

bráchypus (Micranthes brachypus). B: to 8 in.: lvs. oblong or elliptic, to 5 in. long, slightly toothed: fis. white, very small, in narrow panicles. Mts., Colo., Nev.

brevifòlia: S. Aizoon var.

bronchiàlis. Tra: to 8 in., tufted: lvs. stiff, linear, to ½ in. long, ciliate: fls. yellowish-white, spotted with reddish, ½ in. across. Asia, Alaska.

Brunoniana. Hi: to 5 in., laxly tufted, glabrous, shoots to 4 in. long: lvs. stiff, linear-lanceolate, to ½ in. long, mucronate, ciliate: fls. to ¾ in. across. Cent. Asia.

Búcklandii. Probably a hort. form of S. cuncifolia, differing in having 2 or 3 yellow spots on each petal.

Burnáttii. Hybrid of S. cochlearis and S. Aizoon: rosettes like S. cochlearis: fis. white, large. A natural hybrid of the Maritime Alps.

Burseriàna. K: to 4 in. deeply tufted: lvs. stiff, linearsubulate, to ½ in. long, the margins cartilaginous: fls.
white, usually solitary, 1 in. across. Eu. Var. crenàta,
petals crenate. Var. mājor (vars. grandiflora, magna and
tridentina) has larger fls. Var. mīnima (var. minor) is
smaller, to 1½ in. Var. speciõsa, fls. larger on bright red
scapes. Var. sulphurea, fls. yellow.

bursiculata. Garden hybrid of S. Burseriana var. major and S. apiculata: to 3 in., rosettes silvery-gray: lvs. linear-subulate, acutely pointed: fls. white, large, usually 3-4 in infl.

cæsia. K: to 3 in., densely tufted: lvs. linear-oblong, ½ in. long: fis. white, about ½ in. across, 1-2 together. Eu.

cæspitosa (Muscaria cæspitosa). Da: to 6 in., tufted: lvs. 3-lobed, about ½ in. long: fls. white, ½ in. or less across. N. N. Amer., N. Eu., N. Asia.

calábrica: listed as belonging in the Euaizoonia section with fis. white.

californica: S. Aizoon var.; not to be confused with the Pacific coast species of the same name, which is probably not in cult.

Cámposii (S. Wallacei). Da: to 6 in.: lvs. 3-lobed, shining: fls. white, 34 in. across. Spain.

canaliculata. Da: to 8 in., tufted: lvs. 3-parted, ½ in. across, the lateral lobes 2-3-parted, middle lobe entire, sticky below, very stiff, petiole deeply grooved: fis. white, ½ in. long, in panteles. Pyrences.

canis-dalmatica. E: listed with fis, white finely spotted red: lvs. heavily lime incrusted.

capillàris: S. cuneifolia.

capíllipes: S. cuneifolia var. subintegra.

carinthìaca: S. Aizoon var. californica.

cartilaginea (S. Kolenatiana). E: to 9 in.: lvs. in rosettes, oblong, to 1 in. long, the margins cartilaginous: fis. white, rose or purple, about ½ in. across. Asia Minor.

catalaunica. E: to 2 ft., densely tufted: lvs. obovate margins white-crustate, glaucous: fis. white, in panicled cymes. Spain.

caterhaménsis: S. Cotyledon var.

caucásica. K: basal lvs. to 11/4 in. long, lanceolate, margins pitted: fis. yellow, to 3/8 in. across, in corymbs. Caucasus. Var. Desoulavyi (S. Desoulavyi), has smaller but strongly ciliate lvs.

ceratophýlla: S. trifurcata. Cholentiàna: catalogue name.

chrysantha. Hi: low tufted plant to 2 in. tall with creeping sts.: lvs. basal, imbricated in rosette oblong, smooth, fleshy: fls. yellow, large, usually 1-3 in terminal infl., on slender glandular-pubescent peduncles. Mts. of Colo. and

Churchillii: S. Aizoon var.

circuénta: listed name of plant said to be similar to S. catalaunica.

Clarkei. Garden hybrid of S. Vandellii and S. media: to $2\frac{1}{2}$ in.: lvs. to 4 in. long, linear-oblong to linear-subulate, glandular-hairy: fls. rose, to 3/8 in. across, usually in 1-2fld. infl.

Clarmayiana. Garden hybrid, listed as producing creamcolored fis. and placed in Euarzoonia section

cochlearis. E: to 9 in., densely tufted: lvs. linear-spatulate, to 1 in. long, margins cartilaginous: fls. white, to ¾ in. across. Alps. Var. longifòlia is listed as a hybrid with "fine white plumes." Var. måjor has larger white fls. Var. minor, lvs. silvery, in minute rosettes.

columbiana (Micranthes columbiana). B: to 1 ft.: lys. oblong or elliptic, to 4 m. long, finely toothed or wavy: fis. white or greenish, very small, in panicles. Wash., Ore. to

conffera. Da: to 3 in., densely tufted: lvs. oblong-linear, leathery, margins ciliate: fls. white. Spain.

cordifòlia: Bergenia cordifolia.

coriophélla: S. marginata var.

cortusæfòlia. Di: to 1½ ft.: lvs. roundish, to 3 in. long, 5-11-lobed, fleshy fls. white, to ¾ in. long, in loose panicles. E. Asia. Var. Fórtunei (S. Fortunei) has kidney-shaped lvs. to 2 in. long and 4 in. wide, usually 9-lobed, and smaller fls. with toothed petals. Japan.

corymbosa (S. luteo-viridis). K: to 6 in., densely tufted: lvs. spatulate, to 1 in. long, with cartilaginous margins: fis. pale yellow or yellowish-green, 1/4 in. across. Eu.

Cotylèdon. E: to 2 ft.: lvs. in rosettes, tongue-shaped, to 3 in. long, toothed: fls. white veined with pink, fragrant, to 34 in. necross. Mts. of Eu. Var. caterhaménsis, to 3 ft., fls. white spotted red. Var. icelándica (S. icelandica), the largest form of the species, with large flat rosettes and bronzy leathery lvs. Var. longifòlia, lvs. silvery, fls. white. Var. montavoniénsis, lvs. glossy, fls. white with red sts. Var. nepalensis is var. pyramidalis. Var. norvégica, listed as producing "arching sprays" of white fls. Var. prolifera, sts. decumbent, bearing 20-30 rooting rosettes. Var. pyramidàlis (var. nepalensis) grows to 4 ft. Cotyledon. E: to 2 ft.: lvs. in rosettes, tongue-shaped,

crassifòlia: Bergenia crassifolia.

cristàta: probably spelling error for S. crustata.

crustata (S. incrustata). E: to 1 ft., densely tufted: lvs. linear, to 1½ in. long, crustated with lime: fls. white, sometimes marked with purple at base, ¾ in. across. Tyrol.

cuneata. Da: to 6 in., loosely tufted: lvs. cuneate, ½ in. long, 3-lobed, leathery and shining: fls. white, ¼ in. long, in loose panicles. S. Eu.

cuneifòlia (S. capillaris). R: to 1 ft.: lvs. in rosettes, broad-spatulate, to 1 1/4 in. long, rounded and toothed at apex: fls. white, yellowish at base, 1/4 in. across. Eu. Var.

infundibulifórmis with "spoon-shaped lvs." is listed; it may not differ materially from the type. Var. subintegra (S. apennina, S. capillipes) has nearly entire lvs.

cuscutæfórmis. Di: to 6 in., with thread-like stolons: les basal, oval, to 2 in. long, coarsely toothed or wavy, veined with white: fis. white, 1 in. across, petals very unequal. Japan.

Cymbalaria. C: ann. or bien. to 1 ft.: lvs. kidney-shaped or ovate, to 1 in. long, lobed or crenate: fis. yellow, to ½ in. across. Caucasus, Asia Minor.

dactyloides: a section of Saxifraga comprising the mossy saxifrages.

dalmática: listed as in Kabschia section with "minute spiny cushions, fls. white in trusses,"

decípiens. Da: to 1 ft. but usually lower, tufted: lvs. obovate-cuneate, cut into 3-5 linear lobes: fls. white, about ½ in. across. Eu.—By some authorities considered a subspecies of S. cxspitosa. Runs into many hort. vars., a few of which are: álba, fls. white; Arkwrightii, fls. to 1 in. across; bathoniénsis (S. bathoniensis), fls. scailet; grandiflora, to 8 im., fls. red fading pink; grándis, to 6 in., fls. rose; hýbrida, a strain of red-fld. hybrids; rôsea, fls. rich rose-red; sanguines fls. dean blood-red. guinea, fis. deep blood-red.

Delavavi: Bergenia Delavavi.

dénsa: S. moschata var.

Desoulàvvi: S. caucasica var.

Eastwoodiæ (Heterisia Eastwoodiæ). B: to 16 in.: lvs. nearly orbicular, to 3 in. across, deeply cordate and shallowly lobed, long-petioled: fls. white. Wash. to Calif.

elàtior: S. Hosta.

Elizabethiæ. Hybrid between S. Burseriana and S. sancta: to 2 in.: fls. yellow.

Engleri. Hybrid between S. Aizoon and S. cuncifolia: to 4 in.: fis. very small.

Eudoxiàna. Hybrid of S. Ferdinandi-Coburgii and S. sancta: lvs. silvery, sts. tinged red: fis. deep orange-yellow, usually 2-3 in head.

exarata. Da: to 6 in., tufted: lvs. 3-parted or -lobed: fls. white varying to rose or purple. Mts. of S. Eu.

Férdinandi-Còburgii. K: to 2 in., densely tufted: lvs. oblong, to ½ in. long, ciliate: fis. yellow, about ½ in. across. Macedonia.

ferruginea (Spatularia ferruginea). B: to 6 in., covered with reddish haurs: lvs. spatulate or oblanceolate, to 2½ in. long, toothed: fls. white, ½ in. long, in cymes. Alaska to B. C.

flagellàris (Leptasea flagellaris). Hi: erect stoloniferous plant to 8 in.: lvs. obovate to lanceolate: fls. golden-yellow, to nearly 1 in. across, almost sessile, in corymbs of 1-10. N. Eu., Asia, N. Amer. in Rocky Mts. to Ariz.—A moisturedemanding bog plant.

flavéscens: S. Aizoon var.

Fórtunei: S. cortusæfolia var.

Fránzlii: listed as belonging to the Kabschia section, th "spiny lys. and golden-yellow fis."; the name is unknown botanically.

Freisei. K: a hybrid, perhaps in part of S. porophylla, listed with lvs. spiny, fls. rose-pink.

Friderici-Augustii. K: to 6 in., tufted: lys. linear-lanced late or spatulate, entire: fls. violet-purple, in spike-like racemes. S. E. Eu., Asia Minor.

Gaudinii. Da: hybrid between S. Aizoon and S. Cotyledon: rosettes silvery-gray: fls. white.

geranioides. To 10 in., tufted: lvs. palmately 3-lobed, the lobes 2-3-toothed: fls. white, ½ in. long. Mts. of Eu.

Gèum (Micranthes Geum). R: to 1 ft.: lvs. nearly orbicular, to 1 in. across, coarsely toothed, on very long petuoles: fls. white, ½ in. across. Eu., Newf. Var. dentâta, lvs. sharp-toothed, fls. white spotted with yellow or purple. Var. minor is listed as a small-lvd. form.

glaciàlis. Hi: to 2 in.: rosette lvs. narrowly spatulate, to 13 in. long, obtuse, margins sparsely and minutely fimbriate, st.-lvs. lanceolate-obovate: fls. yellow within and orange-yellow to purplish outside, in subcorymbose infl., petals elliptic, acutish. Szechuan, China.

globulifera. Da: to 4 in., tufted: lvs. spatulate, ½ in. long, usually 3-lobed, petioles dilated at base: fis. white, ¾ in. across. S. Spain, N. Afr.

Godseffiana. Hybrid between S. sancta and S. Eliza-

grandiffora: S. stbirica, which is doubtfully in cult.; material so listed may be hort. forms or races of other species.

granulata. Meadow S. N: to 20 in., bulbous at base and with numerous bulblets in axils of basal lvs.:lvs. kidney-shaped, to 1 in. long and 1½ in. wide, lobed: fis. white, 1 in, across. Eu., N. Afr. Var. flore-pleno has double fis.

Greenwoodii. A hort, hybrid of Euaizoonia section better known as Greenwood: fls. creamy-vellow.

Grisebachii (S. montenegrina). K: to 8 in., tufted: lvs. spatulate, to 1½ in. long, the margins cartilaginous: fis. purple, ½ in. or less across; infl. spicate. Medit. region.

Gusmusii. Hybrid between S. thessalica and S. corumbosa: fls. reddish-pink.

Haagii. Hybrid between S. Ferdinandi-Coburgii and S. sancta: to 3 in. fls. golden-yellow, to ½ in. across.

Hàinoldii: S. Azzoon var.

Haussmannii. Hybrid between S. mutata and S. aizoides:

Haworthii. Da: lvs. pale green, in dense cushions to 6 in. high: fls. white, to ½ in. across. Hort. origin, name of uncertain botanical standing.

Heinrichii. Hybrid of S. aretioides and S. Stribrnyi: basal lvs. linear-lanceolate, short, acuminate: fls. yellow becoming reddish, to 1/4 in. across, usually 6-8 on scape to 31/4 in. tall. hibérnica: S. Sternbergii.

hirsuta. R: similar to S. Geum but with cordate-ovate or oval lvs. pinnately-rather than palmately-nerved. Eu.

Hostii (S. elatior). E: to 2 ft.: lvs. in rosettes, tongue-shaped, to 4 in. long, wavy-margined and incrusted with lime. fls. white sometimes dotted with purple, ½ in. across, in many-fld. panicles. Eu.

Huetiana. C: ann. or bien. to 6 in.: lvs. kidney-shaped, 5-7-lobed, fls. bright yellow, 34 in. across. Asia Minor.

hypnoides (S. affinis. S. sponhemica). Da: to 6 in., having many barren shoots lvs. linear, 1 in. long, sometimes 3-5-lobed and 1/2 in. long; fis. white, to 1 in. across. Eu. Var. gemmifera (S. Kingui) is a compact form. Var. rosea, fis. rose.

icelándica: S. Cotuledon var.

incrustàta: S. crustata.

integrifòlia (Micranthes integrifòlia). B: to 134 ft., very sticky: lvs. obovate, entire or slightly wavy, to 7 in. long; fls. white, small, in panicles. Calif.

intermèdia. Hybrid of S. Grisebachii and S. Stribrnyi: differs from S. Grisebachii in its incemose infl. and longer pedicels. fls. red.

irrigua. N: to 1 ft.: lvs. in rosettes, kidney-shaped, ½ in. long, deeply 3-lobed and the lobes toothed, on petioles to 2 in. long fls. white, to 1 in. across, in many-fld. panicles. Eu.

frvingii. Hybrid between S. Burseriana vai. and S. Friderici-Augustii: to 1 in. or moie: fis. pink with deeper center.—Some authors think S. hlacina is also involved in the parentage.

Ténkinsii: listed name.

juniperifòlia (S. juniperina). K: to 3 in., tufted: basal lvs. stuff, lanceolate, to ¾ in. long, culate, st.-lvs. to ¾ in. long: fls. yellow, ⅓ in. across. Caucasus. Var. pseudosancta (S. pseudo-sancta) differs in st.-lvs. to ¾ in. long.

juniperina: S. juniperifolia.

Kéllereri. Hybrid between S. Friderici-Augustii and probably a form of S. Burseruana: habit of former with rosettes to 2 in. across, lys. longer and narrower, pitted with white dots: fls. pink, darker in center, cylindrical, petals not reflexed, on sts. to 5 in. tall.

kestoniénsis. Hybrid probably of S. Burseriana: 3 in.: fls. white on bright red sts., early-flowering.

kewensis. Hybrid between S. Burseriana var. macrantha and S. Friderici-Augustii: lys. linear-lanceolate, in cushions, sts. glandular-hairy: fis. with rose petals and deep red sepals, bracts red tipped green.

Kingii: S. hypnoides var. gemmifera.

Kolenatiàna: S. cartilaginea.

Kýrillii. Hybrid between S. marginata and S. Ferdinandi-Coburgii: 3 in.: fis. pale yellow.

lævigata: listed name. lagaveana: S. Aizoon var. Landaueri: listed name. lantoscàna: S. lingulata var.

lasiophýlla: S. rotundifolia var. repanda.

latepetiolata. N: to 10 in., densely tufted: lvs. kidney-shaped, to 13/4 in. long, 3-parted into lobed segms., glandular-hairy, petiole broadly winged: fls. white, small. Medit.

Leichtlinii: Bergenia ligulata var. or S. lingulata var.

leucanthemifòlia (S. Michauxii. Hydatica petiolaris). B: to 1½ ft.: lvs. oblanceolate, to 7 in. long, coarsely toothed: fls. white, ¼ in. across. Va. to Ga.

ligulata: Bergenia ligulata.

lilacina. K: to 1 in., tufted: lvs. oblong, to 1/4 in. long, margins cartilaginous: fls. pale lilac with purple lines, 1/4 in. across, solitary. Himalayas.

Lindsayi: listed name of plant said to belong in section Dactyloides and having white fis.

lingulata. E: to 1 ft., tufted: lvs. linear-spatulate, to 3 in. long, the margins recurved and incrusted: fls. white, 1/4 in across. S. Eu. Vars. listed include Albertii, larger than across. S. Eu. Vars. listed include Albertii, larger than type, foliage bluish-gray, lime incusted, fls. white spotted red, probably of hybrid origin; albida, foliage slivery; australis, lvs. longer and broader; Bellárdii, a large glabrous form; cocheàris is S. cochlearis; lantoscana, (S. landoscana), lvs. short and blunt; Leichtlínii, fls. rose-red, probably of hybrid origin; rosea, fls. rose, perhaps not distinct from var. Leichtlinii; superba, larger creamy-white fls. in arching plumes, an improved form of var. lantoscana.

longifolia. E: to 2 ft.: lvs. in rosettes, linear-spatulate, to 3 in. long, margins incrusted: fls. white, rarely purple-spotted, ½ in. across, in many-fld. panieles. Pyrenees.—A short-lived plant of rocky crevices, perhaps best treated as a bien. Vars. include: cochlearis is S. cochlearis; Cotyledon; grandiflora has larger fls.; Lownii is listed as a hybrid with pinksh fls. and major with white fls.; magnifica, rosettes to 1 ft. across and panieles large.

lùtea: S. Aizoon var.

lùteo-víridis: S. corumbosa.

Lyallii (Micranthes Lyallii). B: to 1 ft.: lvs. obovate, coarsely toothed, to 2½ in. long: fls. white with yellow spots, in few-fld. panicles. Alaska to Mont.

Macnabiana. Hybrid between S. Cotyledon and S. lingulata: fis. white spotted with purple.

Mályi: S. apiculata var.

Maly: S. apiculata var.

margināta. K: to 3 in., tufted: basal lvs. obovate, lower
margināta. K: to 3 in., tufted: basal lvs. obovate, lower
margināta. K: to 3 in., tufted: basal lvs. obovate, lower
to ½ in. across, usually 5-7 in a corymbose infl. or erect
black-glandular-pilose stalks. S. Italy. Var. coriophylla.
(S. coriophylla. S. Rocheliana var.). Lower lvs. small,
obloing, with few pits: fls. ivory-white. Bosnia, N. Albania.
Var. Rocheliāna (S. Rocheliana). Lvs. spatulate, light graygreen, horizontally spreading: fls. white, scape not as prominently alphalular-nilose as tyne. S. E. Eli. inently glandular-pilose as type. S. E. Eu.

Mariæ-Therèsiæ. Hybrid between S. Burseriana var. major and S. Grisebachu: with small rosettes to 34 in. across: fls. rose, sessile, usually 6-8 on fleshy sts. to 31/2 in. tall, petals small and narrow.

mèdia. K: to 3 in., tufted: lvs. oblong- or linear-spatulate, to 1 in. long, margins cartilaginous: fis. purple, 1/4 in. long, in branched panicles. Eu.

Megásea: see Bergenia.

Mertensiana (Heterisia Mertensiana). B: to 1 ft.: lvs. cordate-orbicular, to 3 in. across, toothed, long-stalked: fls. white with yellow spots at base. Alaska to Cahf. Var. glandipilosa is glandular-pilose.

Michanxii: S. leucanthemifolia.

micranthidifòlia (Mıcranthes micranthidifolia). B: to 3 ft.: lvs. elliptic or oblanceolate, to 1 ft. long: fls. white, small, in narrow panicles. Pa. to Ga. and Tenn.

montavoniénsis: S. Cotyledon var.

montenegrina: S. Grisebachii.

moschata. Da: to 5 in.: lvs. linear, entire or 2-3-lobed: fls. yellowish, rarely purplish or white. Eu. Var. Allionii (S. Allionii), fls. white. Var. atropurpurea (S. atropurpurea), fls. dark purple. Var. dénsa has densely packed foliage. Var. Rhèi (S. Rhei), fls. rose.

muscoides. Da: to 2 in., densely tufted: lvs. linear, ¼ in. long: fls. white or yellowish, ¼ in. across. Eu. Var. álba, fls. white. Var. atropurpurea, fls. dark red. probably of hybrid origin. Var. dénsa has densely pucked foliage.

mutata. E: to 1 ft., with thick rhizome: Ivs. in rosettes, thick, spatulate, to 3 in. long, very obtuse, the margins cartilaginous: fls. yellow or orange, about ½ in. across. Eu.

Nelsoniana (Micranthes Nelsoniana) B: to 8 in.: lvs. cordate-orbicular or kidney-shaped, to 6 in long, toothed; fls. white, small, in compact heads. Alaska to B. C.

nepalénsis: S. Cotyledon var. pyramidalis.

Newcombei (Spatularia Newcombei). B: to 10 in., glandular-hairy: lvs. spatulate, to 3 in. long, coarsely toothed: fls. white with yellow spots at base of petals, in corymbs. Queen Charlotte Isls.

nivalis (Micranthes nivalis). B: to 6 in. high, usually less: Ivs. ovate, thick, coriaceous, dark green above and purplish-red beneath: fls. white, in cymules on erect glandular-viscid scapes. Circumboreal, including N.S.

Obristii. Hybrid between S. Burseriana and S. marginata: to 4 in.: fls. ivory-white, to 1 in. across.

obscura. Supposed to be a hybrid between S. pubescens and S. geranioides: to 8 in., tufted: fls. white. Pyrenees.

occidentalis (Micranthes occidentalis). B: to 8 in.: lvs. ovate or oblong, to 2½ in. long, toothed, often red-pubescent beneath: fis. white, small, in cymes. Alta. to Mont.

ochroleùca. Hybrid between S. Burseriana var. minor and S. sancta: habit of former with smaller lvs. and pale yellow fls.

odontoloma. B: to 11/4 ft.: lvs. basal, orbicular, to 3 in. across, coarsely toothed: fis. white, in loose panicles. Wash..

oppositifòlia (Antiphylla oppositifolia). P: to 2 in., densely matted: lvs. obovate, keeled, to ½ in. long, ciliate: fix rose or purple, to ½ in. across. Eu., Asia, N. N. Amer. Var. pyrenaica has large crunson fis. Var. spléndens has large purplish-crimson fls.

orbiculàris: Bergenia crassifolia var.

palmata: a name of uncertain application.

paradóxa: S. Aizoon var.

Pauline. Hybrid between S. Burseriana var. minor and S. Ferdinandi-Coburgii: to 2 in.: fis. pale yellow, ¾ in. OCTOR

pectinata. Hybrid between S. Aizoon and S. crustata: fls. white spotted with purple.

pedemontana. Da: to 4 in., tufted: lvs. 3-lobed, the best toothed, to $\frac{3}{4}$ in. long, petioled: fis. white, to 1 in. across, S Eu.

peltàta: Peltiphyllum peltatum.

pensylvánica (Micranthes pensylvanica). Swamp S. B: to 3 ft., with thick rhizome: lvs. basal, oblong to spatulate, to 1 ft. long, ciliate: fls. greenish, to ½ in. across. Me. to Va. and Mo.

petiolàris: S. rivularis.

Pétraschii. Hybrid between S. tombeanensis and S. maranata yar. Rochebana: to 2 in.: fls. white, 1 in. across.

porophýlla. K: to 5 in , tufted: lvs. oblong-spatulate to linear, to $\frac{1}{2}$ in. long, the margins cartilaginous: fis. pink or purple, $\frac{1}{2}$; in. across. S. Eu. Var. montenegrina is listed; perhaps referable to S. Grisebachii.

Portize: probably synonymous with S. lingulata var. australis, also a var. of S. Aizoon.

primuloides: S. umbrosa var.

prolifera: S. Cotyledon var.

pseudo-Kotschyi. Hybrid between S. marginata var. Rochelana and S. Kotschya: differs from the former in its more spatulate lvs. and yellow fis.; from the latter in its longer petals and acutely apiculate lvs.

pseùdo-sáncta: S. juni perifolia var.

pulchélla: name of uncertain application.

punctata. B: to 11/2 ft.: lvs. reniform-orbicular, wavy-toothed: fls. white, 1/8 in. long, in loose panicles. Eu.

púngens. Hybrid between S. marginata var. Rocheliana and S. juniperifolia: to 2 in.; fis. golden-yellow.

purpuráscens: Bergenia purpurascens.

pyramidalis: S. Cotuledon var.

pyrendica: S. oppositifolia var.

ranunculifdia: Hemieva ranunculifolia.

retusa. P: tufted, to 2 in.: lower lvs. imbricated, oblong-lanceolate, 3-cornered: fls. ruby- or purple-red, in 1-4-fld. clusters. S. Eu. in high mts.

Rhèi: S. moschata var.

rhomboidea (Micranthes rhomboidea). B: to 1 ft.: lvs. ovoid, to 2½ in. long, toothed: fls. white, ½ in. long, in cymes forming heads. Mont., Wyo., Colo.

rivulāris (S. petiolaris). N: tufted plant to 3 in.: basal lvs. kidney-shaped, palmately 3-7-lobed, petioles 3-5 times longer than blades, upper lvs. short-petioled and 3-lobed; fls. white, sometimes tinged purple, usually 1-5 on axillary pediuncles to 3 in. long. Circumboreal, in N. Amer. to White Mts. and in Rocky Mts. to Mont.

Rocheliana: S. marginata var.

Rosiniæ: listed as a hort, hybrid.

rotundifòlia. M: to 2 ft.: lvs. in rosettes, kidney-shaped, to 2 in. across, conrsely toothed, on petioles much longer than lvs.: fls. white spotted with red or purple, to ¾ in. across [Eu., Asia Var. repánda (S. lastophylla), lvs. wavytoothed, densely pubescent.

rubicúnda: listed name.

rufidula (Micranthes rufidula). B: to 6 in.: lvs. ovate or oval, to 1½ in. long, toothed, red-tomentose beneath: fis. white, ½ in. long, the stalks purple. B. C.

Salomònii. Hybrid between S. Burseriana and S. marginata var. Rocheliana: to 2 in.: fls. white, 34 in. across. sancta. K: to 2 in, tufted: lvs. stiff, lanceolate, 1/3 in. long, the margins ciliate and cartilaginous: fis. orange-yellow, 1/4 in. across. Medit. region.

sanguinea of hort is S. decipiens var.

sarmentosa (Sekika sarmentosa). STRAWBERRY-GERAsarmentosa (Senica sarmentosa). STRAWBERRY-GERA-NIUM. Di: to 2 ft., with filiform stolons resembling the straw-berry: lvs. orbicular-cordate, to 4 in. across, coarsely toothed, on long petioles, reddish below, veined with white above: fts. white, to 1 in. across, 2 petals much longer than others. E. Asia.—A favorite basket and vase plant. scárdica. K: to 4 in., tufted: lvs. oblong to lanceolate, to ½ in. long, stiff, keeled beneath, margins cartilaginous: fis. white or rose, ½ in. long, in corymbs. Medit. region.

Schleicheri: S. stellaris.

Schöttii. Hybrid between S. corumbosa and S. Stribrnyi:

Séndtneri: listed name.

serratifòlia: S. umbrosa var.

splendens: a name applied to many hort, forms and of uncertain application.

sponhémica: S. hypnoides.

squarrosa. K: to 3 in., densely tufted: lvs. linear or linear-lanceolate, ½ in. long, with narrow cartilaginous margin: fls. white, to ½ in. long. Mts., Eu.

Stabiana: S. Aizoon var.

Stánborgii: listed name.

stellaris (S. Schleicheri). B: to 6 in.: lvs. obovate, to 2 in. long, toothed: fls. white, star-like, to 1/2 in. across. Eu., Asia, N. Amer.

stenoglossa. E: to 1 ft.: lvs. linear, to 1 in. long, sharp-toothed: fls. white, in panicles. Probably Eu.

Stérnbergii (S. hibernica). Da: lvs. 3-5-parted, ciliate: fls. creamy-white. Ireland.

Stracheyi: Bergenia Stracheyi.

Stribrnyi. K: to 5 in., tufted: lvs. oblong-spatulate, to 1 in. long, with margins cartilaginous: fis. purple, 1/4 in. across, nodding. Cent. Eu.

Stuartii. Hybrid with S. Stribrnyi as one parent: to 4 in.: fls. pale yellow or purple, 1/3 in. across

Súndermannii. Hybrid of S. marginata and S. Burseri ana: tufted plant with rosettes to $\frac{5}{2}$ in a cross: 19x. deltoid, to $\frac{1}{2}$ in. long, upper surface concave, margins chalky-white: fls. white, to $\frac{3}{2}$ in across, petals with wavy margins and twice as long as sepals, infl. of 1–2 fls. on green sts.

supérba: probably S. lingulata var.

taygetèa. R: to 6 in.: lvs. kidney-shaped, ½ in. long, slightly 5-9-lobed: fls. white spotted purple, ½ in. long, in panicles. Greece.

tellimoides: Boykinia tellimoides.

by in. long: fls. white or yellowish, very small. Mts., Cent. Eu.

tennesseensis (Micranthes tennesseensis). B: to 1 ft.: lvs. elliptic-ovate to orbicular-reniform, to 5 in. long: fis. white with yellow eye, in open cymules, petals to $\frac{1}{2}$ in. long. Tenn.

thessálica: a form of S. porophylla with very narrow lvs. tirolénsis. Hybrid between S. cæsia and S. squarrosa: to 31/2 in.: fls. white.

Tólmiei. B: to 5 in.: lvs. linear, 16 in. long, imbricated on the short sts.: fls. white, very small. B. C. to Calif.

tombeanénsis. K: to 2 in.; lvs. ovate- to linear-lanceolate, 3-angled, ½ in. long: fis. white, ½ in. long. Alps, S. Eu.

tricuspidata (Leptasea tricuspidata). Tra: to 8 in.: lvs. linear, to ¾ in. long, with 3 spine-tipped lobes at apex: fls. white, small. N. N. Amer.

trifurcata. Da: to 8 in.: lvs. kidney-shaped, to ¾ in. across, palmately 3-parted, the segms. toothed or lobed, on very long petioles: fls. milk-white, to ¾ in. across. Pyrenees. Var. ceratophylla (S. ceratophylla) does not differ from the species.

umbrosa. London Pride. R: to 1 ft.: lvs. thick, ovate to oblong, to 2½ in. long, the margins cartilaginous, often reddish beneath, petioled: fls. white or pink, to ½ in. across. Eu. Var. Cólvillei is said to grow to 6 in. with many pink to white fls. Var. primuloides (S. primuloides), to 6 in., lvs. primrose-like, fls. rose-pink. Var. serratifòlia (S. serratifolia), lvs. erect, sharply serrate.

valdénsis. E: to 3 in., densely tufted: lvs. spatulate-linear, to ½ in. long, keeled, purplish beneath: fis. white, ½ in. long, in corymbs. Mts., Cent. Eu.

Vandéllii. K: differs from S. Burseriana in fis. several to many, not solitary. Alps, Cent. Eu.

vespertina (Leptasea respertina). E: to 5 in.: lvs. oblong, to 14 in. long, spine-tipped: fis. white, often spotted yellow, small. Alaska to Ore.

virginiénsis (Micranthes virginiensis). B: to 1 ft.: lvs. in rosettes, ovate to oblong, to 3 in. long, toothed: fis. white, about ½ in. across. N. B. to Ga. and Tenn.

viridis: listed name for plant said to belong in section Euaizoonia.

Wállacei: S. Camposii.

Wildiana. Hybrid between S. Aizoon and S. Geum: to 8 in.: fis. white, to 1/3 in. across.

Zelébori: listed name for plant which may be only a form of S. Aizoon.

Zimméteri. Hybrid between S. Aizoon and S. cuneifolia.

SAXIFRAGÀCEÆ. SAXIFRAGE FAMILY. A widely distributed family mostly of temp, regions, of various character and habit; about 75 gions, of various character and mant; about 75 genera of herbs, shrubs and trees, having usually bisexual regular fls. with 4-5 sepals and petals, 4-10 stamens, 2-5 carpels, and fr. a caps. or berry; differs from Rosaceæ in technical characters. Several genera are grown for ornament and the current and gooseberry for the edible frs.; genera herein treated are Abrophyllum, Anopterus, Astilbe, Bauera, Bensonia, Bergenia, Bolandra, Boykinia, Cardiandra, Carpenteria, Carpodetus, Chrysosplenium, Decumaria, Deinanthe, Deutzia, Elmera, Escallonia, Fendlera, Francoa, Hemieva, Heuchera, Hydrangea, Itea, Jamesia, Kirengeshoma, Leptarrhena, Litho-fragma, Mitella, Parnassia, Peltiphyllum, Philadelphus, Pileostegia, Quintinia, Ribes, Rodgersia, Saxifraga, Schizophragma, Suksdorfia, Tanakæa, Tellima, Tiarella, Tolmiea, Whipplea.

SAXIFRAGE: Saxifraga. Golden: Chrysosplenium.

SCABIOSA. SCABIOUS. MOURNING BRIDE. PINCUSHION-FLOWER. Dipsacex. Herbs ann. or per, and perhaps bien, with opposite entire or divided lys. and 4-5-lobed fls. in terminal longstalked composite-like showy heads subtended by herbaceous involucral bracts, the calyx bristly; Old World, often weedy.

Scabiosas are popular flower-garden subjects and thrive in any good soil and sunny exposure. Propagated by seeds, and perennials also by division.

africana. Lvs. obovate, irregularly toothed, to 6 in. long d 2 in. wide, upper lvs. undivided or pinnatifid, softand 2 in. wide, up tomentose. S. Afr.

agréstis: S. gramuntia.

amoena. Per. to 3 ft.: lvs. lyrate-pinnatifid: fls. pale blue or lilac, in globose heads. W. Asia.

or lilac, in gloose heads. W. Asia.

atropurpurea. Sweet Scabious. Erect ann. (or grown as such) to 3 ft. and more, cult. in many forms: basal lvs. lyrate-pinnatifid, st.-lvs. pinnate into oblong toothed lobes: fis. dark purple, rose or white, in ovate or oblong heads to 2 in. across. S. Eu. Some of the hort. vars. are: candidisima, fis. white and often double; compacta, of compact habit; flore-pleno, fis. double; grandiflora (var. maxima), fis. large; major, tall; nana (var. minor), smaller, much branched; pumila, dwarf.

austràlis: Succisa australis.

brachiata. Ann. to 1 ft.: lower lvs. ovate-oblong, upper ones pinnate-dissected with terminal lobe large and obovate: fls. pale blue. Greece.—By some considered as Tremastelma

canéscens. Per., erect or ascending: lvs. simple, pinnatifid or pinnately lobed, segms. lanceolate, entire: heads bluish-violet, on long peduncles. Cent. Eu.

caucásica. Per. to 2½ ft.: basal lvs. lanceolate-linear, entire, st.-lvs. divided: fis. light blue, in flattish heads to 3 in. across, the involucre gray-tomentose. Caucasus. Var. álba has white fis. Var. cærulea, fis. light blue, large. Var. goldingénsis has large deep lavender fis. Var. magnifica has large lavender-blue fis. Var. perfécta, fis. large and

Columbaria. Per. to 2 ft.: basal lvs. ovate, toothed, st.-lvs. pinnately cut into linear segms.: fls. blue, in ovate heads to 1½ in. across. Eu., Asia, Afr. Var. anthemifòlia, lvs. 2-3-pinnatifid, fls. said to be pink, to 2½ in. across. Var. ròsea, fls. pink, is listed.

Fischeri. Per., much branched: lvs. pinnately cut into linear entire segms.: fls. bluish-purple. Dahuria.

geórgica. Per. to 2 ft., sts. branched, usually white-pilose: lvs. pinnately divided or lyrate, terminal segms. oblong-lanceolate, larger than laterals: heads pale yellow, on long peduncles, involuoral bracts broadly triangular.

gigantèa: listed name of doubtful application.

goldingénsis: S. caucasica var.

graminifòlia. Per. to 1 ft.: lvs. linear, entire, silvery: fls. pale blue, in flattish heads to 1½ in. across. Eu.

gramuntia (S. agrestis). Per. to 2½ ft.: basal lvs. lyrate, st.-lvs. 2-3-pinnatisect, segms. narrowly linear: fls. lilac, the marginal ones radiating. S. Cent. Eu.—By some authors treated as a variant of S. Columbaria.

grandiflòra: S. atropurpurea var.

japónica. Per. to 2 ft.: lvs. pinnately divided into narrow segma: fls. violet-blue, in heads to 2 in, across. Japan.

lùcida. Per. to 1 ft.: basal lvs. ovate-oblong, serrate, st.-lvs. pinnatisect, segms. lanceolate: fis. rose-lilac, in dense hemispherical heads to 1½ in. across. Cent. Eu.

lyrata: doubtful name.

lyrophylla: Knautia lyrophylla.

macedônica: Knautia macedonica.

miesantha: listed name of unknown botanical standing. minor aurea: S. atropurpurea var. nana.

ochroleùca. Per. to 1½ ft.: basal lvs. lyrate-pinnatifid, st.-lvs. 1-2-pinnate into oblong or linear segms., whitishpubescent: fts. yellow. Eu., Asia. Var. Webbiana (S. Webbana) has lower lvs. white-villous and usually dissected. S. E. Eu. to Asia Minor.

palæstina. Erect ann., branched: lvs. oblong, dentate or lyrate, harry; involucral bracts oblong-lanceolate: fis. pale yellow, rarely hlac, heads large. Balkan region, Cent. Eu.

parnassiæfòlia: probably error for S. parnassii.

parnássi: Pterocephalus parnassi.

pennsylvánica: an erroneous catalogue name for Cephalaria tatarica.

Pèteri: listed name.

prolifera. CARMEL DAISY. Ann. to 2 ft.: lvs. oblonglanceolate to linear: fis. cream-colored, in nearly sessile heads to 2 in. across. Asia Minor to N. Afr.

pterocéphala: Pterocephalus parnassi.

pyrenàica (S. vestita). Per. to 1½ ft., white-tomentose: basal lvs. oval-lanceolate, toothed, st.-lvs. pinnately divided: fls. blue-lilac. S. Eu.

rhodopèa: a form of S. ochroleuca.

silenifòlia. Per. to 1 ft.: lower lvs. spatulate, e upper pinnate into linear segms.: fls. lilac. S. E. Eu.

speciòsa. Tufted per to 2 ft.: lvs. oblong, pinnatifid at base, to 2 in. long, pubescent: fls. lavender to mauve, outer ones to ¾ in. long, head nearly flat, to 2 in. across. Himalayas.

stellata. Ann. to 1½ ft.: basal lvs. toothed, st.-lvs. pinnately divided: fls. blue, in globose heads 1 in. across. S. Eu.

suaveolens. Per. to 11/2 ft., glabrescent: basal lvs. entire, survoicus. Fer. to 1221t., giaorescent: ossai ivs. entire, oblong-lanceolate, st.-lvs. pinnatifid, segms. linear, entire: fis. blue, fragrant, in nearly hemispherical heads to 2 in. across. Cent. Eu. to Asia Minor.

Succisa: Succisa pratensis.

sylvática: Knautia sylvatica.

trinisefolia. To 2½ ft.: foliage glabrescent, lower lvs. bipinnatifid, to 4 in. long, segms. of upper ones linear, somewhat fleshy and bristle-tipped: heads yellow, to 1½ in. across. Greece to Bulgaria.

vestita: S. pyrenaica.

Webbiana: S. ochroleuca var.

SCABIOUS: Scabiosa. Shepherds -: Jasione.

SCABROUS: rough; feeling roughish or gritty to the

SCALE: a name given to many kinds of small mostly dry and appressed leaves or bracts; a vestige.

SCAPE: leafless peduncle arising from the ground; it may bear scales or bracts but no developed foliage leaves and may be one- or many-flowered. Tulips are borne on scapes.

SCARIOUS: leaf-like parts or bracts that are not green, but thin, dry, and membranaceous, often more or less translucent.

SCARLET-BUSH: Hamelia erecta. Lightning: Lychnis chalcedonica. Plume: Euphorbia fulgens. Runner: Phaseolus coccineus.

SCELETIUM. Aizoaceæ. S. African perseparated from Mesembryanthemum (which see for cult.), the lvs. several times broader than thick and naturally withering to a skeleton. S. tortuosum (M. tortuosum). Branches long and procumbent, leafy at top: lvs. ovate-lanceolate, somewhat recurved, tapering to both ends, about 1 in. long: fls. white, 2 in. across.—The plants of this genus are poisonous.

SCHAUÈRIA. Acanthaceæ. Trop. herbs or shrubs with opposite entire lvs. and tubular 2-lipped yellow or red fls. in terminal spikes, the calyx-lobes and bracts very long and narrow and giving a shaggy appearance to the fl.-cluster; one species grown in the greenhouse. Propagated by cuttings.

by cuttings.

flavicoma. To 4 ft.: lvs. ovate or ovate-lanceolate, to 6 in. long, shining: fis. pale yellow, 1½ in. long. Brazil.

SCHEÈLEA. Palmaceæ. Heavy feather-lvd. palms of trop. Amer., not known to be cult. within our limits: see note under Attalea.

SCHEFFLÈRA. Araliaceæ. Trop. shrubs or small trees with compound lvs. and polygamous or diocious fls. borne in umbels, heads or racemes; for outdoor cult. in S. U. S.

actinophýlla. To 30 ft.: lvs. digitately compound into 6-8 elliptic-oblong entire lfts. to 6 in. long: fis. greenish, in panieles to 1½ ft. long. Australia.

digitata. Tree to 25 ft.: lvs. digitately compound into 7-10 oblong toothed lfts. to 7 in. long: fis. greenish, to 1/2 in. across, in panicles to 1 ft. long. New Zeal.

SCHÌMA. Theacex. Evergreen trees or shrubs native in trop. Asia, with alternate simple lvs.; showy fls., and fr. a woody caps.; one species grown in S. Calif.

Wállichii. Tree to 100 ft.: lvs. elliptic-oblong, to 7 in. long, nearly entire: fls. white, fragrant, to 2 in. across, in short terminal racemes: fr. ¾ in. across. India to Sumatra.

SCHÌNUS. Anacardiaceæ. Trees with simple or compound lvs., small fls. in racemes or panicles, 10 stamens, and round 1-seeded drupaceous fr.; polygamo-diocious; native mostly in S. Amer., a few grown in sub-trop. regions, and in greenhouses N. Planted as lawn and avenue trees, but S. Molle is subject to black scale and is sometimes a menace. Propagated by seeds or cuttings.

depéndens. Shrub or small tree to 15 ft.: lvs. simple, oblong, usually entire: fls. yellow, in short axillary racemes: fr. deep puiple. W. S. Amer.

latifòlius. Lvs. simple, to 3 in. long and 1 in. wide: fls. white, in short racemes. Chile.

lentiscifolius. Shrub to 3 ft.: lvs. of 4-6 pairs of oval or lanceolate nearly entire lfts.: fts. white, in loose panicles to 3 in. long fr. pink or whitish. Brazil.

Molle California Pepper-Tree. Peruvian Mastic-Tree. Evergreen tree to 20 ft., with graceful hanging branches: Ivs. of many linear-lanceolate entire or toothed lfts.: ffs. yellowish-white, in much branched terminal panicles: fr. rose-color. American tropics.

terebinthifòlius. Brazilian Pepper-Tree. Christmas-Berry-Tree. Tree to 20 ft., of more rigid habit than S. Molle: lvs. usually of 7 oblong lits. very dark green above and lighter below: fr. bright red. Brazil.

SCHISÁNDRA (commonly but not originally spelled Schizandra). Magnoliaceæ. Twining shrubs native in Asia and 1 in N. Amer., with simple lvs., unisexual red or white fls. in axillary clusters, and mostly red berry-like frs. in drooping racemes.

Both sexes should be planted if the decorative fruit is desired. S. chinensis is haidy North. Propagated by seeds, cuttings of green wood under glass, root-cuttings, layers and suckers.

chinénsis. Climbing to 25 ft.: lvs. obovate, to 4 in. long, toothed, shining above: fls. white or pinkish, ½ in. across, fragrant, May-June, stamens 5: berries scarlet. N. E. Asia, Japan.

coccinea. Lvs. ovate to elliptic, to 6 in. long, acute to acuminate, fleshy, slender-petioled: fls. crimson. S. C. to Fla.—Not hardy N.

sphenanthèra. To 18 ft.: lvs. broadly obovate to ovate, to 4 in. long, margins minutely toothed: fls. greenish outside and orange within, to 1 in. across, stamens many: berries brownish-red. Cent. and W. China.

SCHISMATOGLÓTTIS. Araceæ. Soft or herbaceous plants native in the Malay Archipel-

ago, having lanceolate, cordate or arrow-shaped lvs. usually variegated, and unisexual fis. borne on spadices shorter than the cylindrical spathes; grown in greenhouses where a temperature of 70° should be maintained throughout the winter. For cult., see *Dieffenbachia*.

asperata. Lvs. ovate or obovate, to 5 in. long and 3 in. wide, deep green minutely white-dotted above, pale and black-dotted beneath, the petioles about length of blades. Borneo. Var. álbo-maculata (S. crispata) has lvs. silvery above except the margins and nerves.

calyptrata. Lvs. to 3 ft. long, blade about 1 ft. long and ½ ft. across, lobes to 2 in. long, ovate: spathe-tube to 1 ½ in. long, green, limb pale yellow, to 2¾ in. long; spadix shorter than tube. N. W. Malaya.

crispata: S. asperata var. albo-maculata.

decòra: S. pulchra.

marantæfòlia var. maculàta: see Aglaonema commutatum.

neo-guineensis (S. novo-guineensis. Colocasia neo-guineensis). Lvs. ovate-cordate, to 10 in. long and 6 in. wide, bright green irregularly spotted with yellowish-green, the petioles twice longer than the blades: spathes about 3 in. long with green tube and white limb. New Guinea.

picta. Lvs. ovate- or oblong-cordate, to 8 in. long and 5 in. wide, pale green marked with white dots on either side of midrib, the petioles 1 ft. long: spathes about 2½ in. long, greenish-yellow. Java.

púlchra (S. decora). Lvs. cordate-ovate, 5 in. long and 2½ in. wide, irregularly variegated with silvery-white, the petioles to 6 in. long; spathes 3 in. long, pale green. Borneo.

Roebelinii: an unidentified trade name; possibly Aglaonema Robelinii.

siaménsis: an unidentified trade name; perhaps Aglaonema siamense.

SCHIVERÉCKIA. Cruciferæ. Eurasian little perennials like Alyssum and Draba, differing in technical characters; one species is sometimes grown in rock-gardens.

Bornmuelleri. To 2½ in. and more, pubescent: basal lvs. in rosettes, oblong-elliptic, to ½ in. long, entire: fis. white. Asia Minor.

podólica (Alyssum podolicum). Tufted, 2-4 in. high, grayish: lvs. narrow-oblong to oblanceolate, ½ in. or less long: fis. white, in short racemes. S. E. Eu., Asia Minor.

SCHIZÀA. Schizæaceæ. Small mostly trop. ferns with thread-like simple or divided lvs., the sori borne in rows along the segms. of fertile lvs. which form terminal spikes. See Ferns.

pusilla. Curly-grass-Fern. Sterile lvs. linear and grass-like, exceeded by the fertile lvs. or stalks which are 3-5 in. long and terminated by a close pinnate fertile portion. Coast, Newf. to N. J., well known in pine barrens.—Sometimes planted: it looks more like a little grass than a fern.

SCHIZÆÀCEÆ. Schizea-Fern Family. About 4 genera of mainly trop. ferns, often climbing, with simple or pinnate lvs. and sori in rows on specialized segms., which may be spikelike. Lygodium is grown in greenhouses and Schizæa may be planted in the open.

SCHIZANDRA: Schisandra.

SCHIZÁNTHUS. BUTTERFLY - FLOWER. Solanaceæ. Erect annuals or biennials with very irregular fls. grown in the garden and greenhouse for the showy profuse bloom and dainty much-cut foliage: fls. variously colored, in terminal cymes or panicles, the corolla-tube long or short, the limb spreading, irregular and deeply cut: native to Chile.

These plants are of easy cultivation. Seed sown indoors in fall produces flowering plants in early spring or late winter. Sown in the garden in spring for summer and autumn bloom.

excélsior compáctus: hort. form of S. pinnatus.

grácilis. Similar to S. pinnatus but with smaller fis. having shorter upper lip and much narrower lateral lobes.

Gràhamii. To 5 ft.: fls. typically lilac or rose, middle segm. of upper lip yellow or orange, not notched, corollatube as long as calyx, stamens slightly exserted.

grandiflòrus: S. pinnatus.

hýbridus: hort, race of large-fld, plants of unknown origin.

papilionàceus: S. pinnatus.

pinnatus (S. grandisforus. S. papilionaceus). To 4 ft. or more: fls. to 1 1/4 in. across, the color and markings varying greatly, lower lip usually lilac or violet, the upper paler, its middle segm. with a yellow blotch near the base and spotted with purple or violet, corolla-tube shorter than callyx. stamens prominently exserted. Color vars. are candidíssimus, carmíneus, lilácinus.

retusus. To 2½ ft.: fis. to 1¾ in. across, the large middle segm. of upper lip mostly orange and notched, corolla-tube as long as calyx, stamens slightly exserted. Var. álbus has white fis. with middle segm. of upper lip yellowish. Var. rôseus has rose-pink fis. Var. trimaculatus has purplish-red fis. with 3 golden-yellow purple-bordered spots.

wisetonénsis. Hybrid between S. pinnatus and S. Grahamu: intermediate between the parents: fis. from white through bluish and pink to carmine-brown, middle segm. of upper lip mostly suffused with yellow, corolla-tube shorter than calyx, stamens slightly exserted. Var. compáctus is a denser low-growing form.

SCHIZOBASÓPSIS. Liliacex. S. African bulb grown as a curiosity in greenhouses. S. volùbilis (Bowiea volubilis). Bulb 5 in. thick, sending up a twining green st. which is much branched below and performs the function of the absent lys.: fls. small, green or greenish-white, the perianth-segms., distinct.—Plants should be kept dormant from May to early Oct., at which time the bulbs should be repotted and kept well watered. Propagated by seeds or sometimes by division of the bulbs.

SCHIZOCARP: a dry fruit which splits into two one-seeded halves as in the Umbelliferw and the maples.

SCHIZOCÉNTRON. Melastomaceæ. One Mexican creeping herb sometimes grown in greenhouses and baskets. S. élegans (Heeria and Heterocentron elegans). Forming a dense mat: lvs. ovate, to ½ in. long: fls. purple, 1 in. across, solitary. For rôseum see Heterocentron.—Propagated by cuttings.

SCHIZOCODON: Shortia.

SCHIZOLÒBIUM. Leguminosæ. Tall trees native in Brazil and Panama, one cult. in warm regions. S. parahÿbum (S. excelsum) has bipinnate fern-like lvs. white beneath, yellow fls. in large erect racemes, and flattened 1-seeded pods. Brazil.

SCHIZONOTUS: Holodiscus, Sorbaria.

SCHIZOPÉTALON. Cruciferæ. Little delicate ann. from Chile, S. Wálkeri, sometimes grown in the flower-garden or in frames or a cool house for its attractive white fragrant fringed fls. Seeds sown in the open in early May produce flowering plants late in June and through the summer. Sometimes seeds are sown in autumn and the plants carried over cool under glass, for bloom in early spring. The plant grows 9 in. to 1 ft. or more high, erect, bearing the fls. in a terminal upright raceme.

SCHIZOPHRÁGMA. Saxifragaceæ. Woody plants climbing by aërial rootlets, differing from Hydrangea in the marginal sterile fls. which comprise only 1 long-stalked unlobed sepal; the loose terminal clusters of white fls. are showy: lvs. bright green, opposite, long-petioled.

Like Hydrangea petiolaris (with which it is sometimes confused) the young plants produce small leaves and little growth if unsupported and allowed to trail over the ground. Propagation is by seeds, greenwood cuttings under glass, and by lavers.

hydrangeoides. Japanese Hydrangea-Vine. Climbing to 30 ft.: lvs. deciduous, broad-ovate to nearly orbicular, to 4 in. across, toothed, pale beneath: cymes to 9 in. across; marginal calyx-lobe white, ovate, to 1½ in. long. Japan; hardy N.

integrifòlium. Climbing to 12 ft.: lvs. deciduous, ovate, to 3 in. long, nearly or quite entire: cymes 10 in. across; marginal calyx-lobe ovate, 1½ in. long. China; not hardy N. Var. denticulătum, lvs. toothed. Var. mólle has lvs. more densely hairy beneath and longer sterile sepals.

SCHIZÓSTYLIS. CRIMSON FLAG. KAFIR-LILY. Iridaceæ. S. African herbs with fleshy roots, not bulbous or cormous, narrow lvs., and red fls. borne in spathes, the tube slender. Grown in the greenhouse for winter bloom and for cut-fls. Propagated by division of roots.

coccinea. To 2 ft.: lvs. to 1½ ft. long, grass-like: fls. 2 in. across, deep crimson, tube straight and 1 in. or more long

SCHLUMBERGÈRA. Cactacex. Brazilian cacti much like Zygocactus but the fl. regular or essentially so and nearly rotate rather than elongated: sts. much branched, joints short and mostly flattened and crenate or serrate: fls. purple to scarlet, with very short tube and stamens in 2 clusters: fr. angled rather than terete. Cult. as for Zygocactus. See Cacti.

Bridgesii (Epiphyllum Bridgesii). Epiphytic; joints flattened, green, margins somewhat cremate fls. purple to crimson, to 2½ in. long, terminal, regular. Brazil, Bolivia.

Gaértneri (Epiphyllopsis Gaertneri. Epiphyllum Makoyanum). Easter Cacrus. Habit more or less upright with dreoping branches; joints oblong to obovate and crenate, about 1½ in. long, with 6-12 bristles from the arcoles; fls. scarlet, to 3 in. long.

Makoyana: S. Gaertneri.

Russelliana (Epiphyllum Russellianum). Epiphytic, to 1 ft. long, erect or pendent; joints about 1 in. long, upper ones flattened, the lower terete, green becoming brown, bristles few, short: fls. reddish-purple, to 2 in. long, terminal. Brazil.

SCHMALTZIA: Rhus.

SCHOLAR-TREE, CHINESE: Sophora japonica.

SCHOMBÚRGKIA. Orchidaceæ. Epiphytes native in trop. Amer., with pseudobulbs bearing 2–3 lvs. and fls. in terminal racemes or panieles; sepals and petals more or less wavy; lip 3-lobed and united with the base of column. Cult. as for Cattleya; see Orchids.

crispa. Pseudobulbs fusiform, with 2-3 lvs. to 10 in. long: infl. to 3 ft. long, many-fld. at the apex; fls. to 2½ in. across; sepals and petals wavy on margin, yellowish- or reddish-brown; lip whitish tinged with rose, with 5 keels. British Guiana.

Húmboldtii. Pseudobulbs nearly cylindrical, to 8 in. tall: lvs. 2-3, thick and leathery, to 10 in. long: scapes to 4 ft. high, paniculate, many-fid.; fls. to 3 in. across; sepals and petals wavy-margined, pale lilac or rose-purple, the latter becoming darker toward tip; lip bright purple with yellow on disk. Venezuela.

supérbiens: Lælia superbiens.

Thomsoniana. Pseudobulbs subcylindric, 2-3-lvd.: lvs. leathery, to 8 in. long: infl. longer than lvs, loosely paniculate, to 15-fld.; fls. 2½ in. wide; sepuls and petals wavy-margined, whitish-cream or yellowish; lip yellow near base, deep maroon-purple above. June. W. Indies.

tibicinis. Pseudobulbs subcylindric, hollow, to 24 in. long, with 2-4 lvs. to 11 in. long, leathery: mfl. to 10 ft. high, racemose or panieulate, many-fld.; fls. to about 3½ in. across; sepals and petals very wavy-margined, red-brown, lilac or burnt orange; lip whitish with yellow center and lilac apex. Feb.-Aug. Cent. Amer.

undulata. Pseudobulbs fusiform, to 12 in. high, 2-3 lvd.: lvs. to 9 in. long; infl. to 3 ft. long, at apex loosely racemose; ffs. to 1½ in. across; sepals and petals wine-purple, very wavy; lip with lateral lobes pale rose and mid-lobe purple. Dec.-July. Trinidad, Venezuela, Colombia.

SCHONLANDIA: Corpuscularia.

SCHÒTIA. Leguminosæ. African shrubs and small trees with pinnate lvs., red fls. in short panieles, and flattened leathery pods; grown in the greenhouse or in the open in warm regions.

brachypétala. Small tree: lfts. 8-10: fls. crimson, stalked, the petals very small. S. Afr.

latifòlia. Tree to 30 ft.: lfts. 4-8, obtuse to emarginate, to 1 m. long: fis. rose or pink, nearly sessile. S. Afr.

speciòsa. Tree to 10 ft.: lfts. 8-32, mucronulate, rarely to ½ in. long: fis. crimson, stalked. S. Afr.

SCHRÁNKIA (Morongia). Leguminosæ. Per. woody herbs or shrubs mostly with prostrate prickly sts., of Amer. and Afr.: lvs. 2-pinnate, sensitive: fls. pink or purple, small, in heads or spikes: pods linear, spiny. Sometimes planted

angustàta: S. microphulla.

angustisiliqua. Sts. weak: Ifts. linear-elliptic, to 11/2 in. angustisinqua. Sts. weak; itts. linear-elliptic, to 1½ in. long; fls. pink to rose-purple; pods to nearly 3 in. long and γ in. thick. S. Fla.

microphfila (S. angustata. Leptoglottis microphylla). Differs from S. uncinata in lfts. not prominently veined beneath as in that species, and longer pods. Va. to Fla. and Tex.

Roemeriana. Sts to 4 ft. long: lfts. 1/2 in. long: fls. pink: pods 1 1/2 in. long. S. Tex.

uncinkts. Sensitive Brier. Decumbent per. with sts. to 4 ft. long, bearing hooked prickles: Ifts. 1/2 in. long: fls. pink, in dense globose heads to 1 in. across: pods 2 in. long. Va. to Fla. and Tex.

SCHWÁLBEA. Scrophulariacex. A small genus of E. N. American per. herbs, characterized by 2 bractlets subtending each fl., calyx 5-lobed, caps. dehiscing septicidally and narrow winged seeds. One species, S. americana, is offered. To 2 ft.: lvs. alternate, ovate to oblong, to $1\frac{1}{2}$ in. long, acute, 3-nerved, upper ones becoming bract-like: fls. pale yellow tinged purple at tip, to 1½ in. long, corolla irregular. Wet sandy soil, E. Mass. to Va.

SCHWANTÈSIA. Aizoaceæ. Stemless succulents: lvs. in rosettes, keeled, blue-green with whitish spots: fls. solitary, short-stalked, goldenvellow; stigmas 5. Of the S. African Mesembryanthemum group.

Hérrei. Plant to 6 in. across: lvs. to 1¼ in. long and ½ in. wide: fls. to 2 in. across, petals numerous, in 3 series.

SCIACASSIA: Cassia stamea.

SCIADÓPITYS. Taxodiacex. One slow-growing Japanese evergreen tree, of ornamental value, S. verticillata. UMBRELLA-PINE. Lvs. of two kinds, small and scale-like, and the conspicuous ones in whorls of 15–35, linear, to 6 in. long, glossy above, with 2 white bands below, furrowed: cones to 5 in. long, with woody scales. Hardy in S. New England. For cult. see Conifers.

SCILLA. Squill. Liliacex. Bulbous mostly small herbs with narrow basal lvs. and blue, purple or white fls. in racemes terminating the scape, the perianth-segms. distinct or nearly so; planted for the early spring bloom of most species.

Squills are of easy culture out-of-doors if left undisturbed for a number of years, with an occasional top-dressing. They may also be grown in pots in a cool greenhouse. Propagated by offsets planted early in autumn. The usual kinds are hardy and early spring flowering.

amona. Star-Hyacinth. To 6 in.: lvs. to ¾ in. across: fls. blue to whitish, wheel-shaped, to ¾ in. across, in 4-6-fld. tacemes. Germany, N. Italy.

autumnalis. To 6 in.: lvs. partially terete: fis. rose wheel-shaped, ½ in. across, in open racemes. Eu., N. Afr.-Blooms in autumn.

bifòlia (S. laza). To 6 in.: lvs. to ½ in. across: fis. blue with white and reddish vars., wheel- or star-shaped, ½ in. across, mostly nodding, in 3-8-fid. racemes. Eu., S. W. Asia. Var. álba, fis. white. More commonly planted in var. taùrica (S. præcox) which is a larger plant with 12 or more blue flowers.

campanulàta: S. hispanica.

chinénsis. Chinese S. To 1 ft.: lvs. linear: fis. rose typed with green, ½ in. long, in dense spike-like racemes. China.

Clusii: S. peruviana.

hispánica (S. campanulata). Spanish Bluebell. To 20 in.: lvs. to 1 in. across: fls. blue to rose-purple, campanulate, 1 in. across, often nodding, in 12- or more-fld. racemes. Spain, Portugal. Vars. álba and álbo-major have white fls. Garden forms are vars. cærûlea, excélsior and

hyacintholdes. Hyacinth S. To 3 ft.: lvs. to 11/4 in. across: fls. violet-blue, campanulate, 3/4 in. across, in manyfld. racemes. Medit. region.

itálica. Italian S. To 1½ ft.: lvs. ½ in. across: fls. pale blue, fragrant, ¼ in. long, wheel-shaped, in 6-30-fld. racemes. S. Eu. Var. álba, fls. white.

láxa: S. bifolia.

natalensis. To 3 ft., bulb large, tunic brown, membranous: lvs. about 9, ovate, to 6 in. long, acummate: fis. usually deep blue, many in long lax racemes, segms. elliptic, obtuse, filaments white. S. Afr.

nonscripta (S. nulans). ENGLISH BLUEBELL. To 1 ft.: lvs. ½ in. across: fis. blue, cylindrical or tubular, ½ in. across, in 6-12-fid. racemes. Eu. Var. álba has white fis., cærdlea blue, delicata pale pink, rôsea rose or pink, rubra reddish.

nutans: S. nonscripta.

peruviàna (S. Clusn). To 1 ft.: lvs. to 1 in. across: fls. purple to reddish or white (var. álba), wheel-shaped, ½ m. long, in 50- or more-fid. short racemes. Medit. region, the specific name being a misnomer. Var. cærtlea, fls. bluish.

Dracox: S. bifolia var. taurica.

praténsis. Similar to S. italica but with very small fls. in 12-30-fld. racemes and linear lvs. Eu.

sibfrica. To 6 in.: lvs. to 3/2 in. across: fls. deep blue, 1/2 in. across, wheel-shaped, in about 3-fld. nacemes, often nodding. Russia, S. W. Asia. Garden vars. are álba, atrocærilea, ardrea. Var. tabrica (multifora) is listed as an earlier form with light blue fis. having dark blue lines.

vérna. To 6 in.: lvs. about ½ in. across: fls. blue, ½ in. across, fragrant, in corymb-like racemes. W. Eu.

SCINDAPSUS. Ivy-Arum. Araceæ. Malayan herbs climbing by rootlets, with simple usually variegated lvs., broad sheathing petioles, and bisexual fis. on densely-fid. spadices slightly shorter than the boat-shaped spathes; cult in the greenhouse, the same as *Philodendron*.

argyræus: S. pictus var.

argyreus: S. picus var.

adreus (Pothos aureus). Tall climber: lvs. ovate or
ovate-oblong, to 1½ ft. long and 14 m. wide, entire or
margins lobed, blotched with pale yellow. Solomon Isls.
Var. superbus is an improved form. In var. Wideoxii the
variegations do not blend into the green portion of the lf.
but terminate abruptly, the petioles and portions of sts.
often ivory-white in color.

pictus. Climbing to 40 ft.: lvs. obliquely ovate-oblong, to 6 in. long and 3 in. wide, spotted dark green above: spathes about 3 in. long, white. E. Indies. Var. argyræus (Pothos argyræus) has deeply cordate lvs. spotted with silvery-white above.

Wilcoxii: S. aureus var.

SCÍRPUS. Bulrush. Cyperacex. Grass-like herbs with bisexual fls. in little spikelets or heads that are solitary or in spikes or umbels; about 150 widely distributed species. Grown in shallow water or damp places and S. cernuus in the greenhouse. Propagated by seeds, division and suckers.

acutus (S. occidentalis). To 9 ft., the lvs. mostly reduced to basal sheaths: spikelets in clusters of 2-7 or solitary. N. Amer.

atrovirens. To 4 ft., with leafy sts.: lvs. to ½ in. wide: spikelets in dense heads. N. S. to Ga. and La.

cérnuus (Isolepis gracilis). Tufted, with thread-like stato 1 ft. which become drooping, almost leafless: spikelets solitary. Eu., but widely nat.

cyperinus (S. Eriophorum). To 6 ft.: lvs. ¼ in. across often longer than sts., rough-margined: spikelets in headlike clusters in compound umbels. Newf. to Fla. and La.

Eriophorum: S. cyperinus.

Holoschènus. To 4 ft., with 1 or 2 stiff narrow basal lys.; spikelets in dense heads. Eu., Asia.

Hýstrix (S. natalensis). Ann. to 6 in., tufted: lvs. to 6 in. long and $\frac{1}{1}$ in. wide, mostly from near base of st.: spikelets about $\frac{1}{4}$ in. long, in single dense head. S. Afr.

lacústris. To 9 ft., often much less, lvs. reduced to basal sheaths: spikelets in head-like clusters. Eu., Asia.—Differs from its American representative, S. validus and also from S. Tabernæmontani in the 3-cleit style.

microcárpus. To 5 ft. or the lvs. sometimes longer: spikelets in head-like clusters. N. Amer.

natalénsis: S. Hystrix.

occidentàlis: S. acutus.

Tabernæmontâni. To 2 ft. and more, the lvs. reduced to 1 or 2 sheaths: spikelets in terminal cymes, the styles 2. Eu. Var. zebrinus has sts. banded with white.

tuberdsus: Eleocharis dulcis.

zebrinus: S. Tabernæmontani var.

SCLERÁNTHUS. KNAWEL. Illecebraceæ. Small tufted ann. or per. herbs of the Old World, having opposite subulate lvs. and small green funnelform or urceolate fls. with 1-10 stamens inserted on perianth throat, petals filiform between the stamens or absent, styles 2: fr. a membranous utricle inclosed in persistent perianth. Propagated by seed or division, adapted to rockery.

biflorus. Cushion-forming, to 4 in. diam. or more and often with creeping sts. to 6 in. long: lvs. crowded, imbricated, to ½ in. long, minutely serrulate, leathery: fis. minute, usually in pairs on short solutary peduncle which elongates in fr., stamen 1. Australia and New Zeal.

SCLEROCÁCTUS. Cactaceæ. Two spiny cacti of S. W. U. S. much like Echinocactus and Ferocactus, but the fr. is nearly naked and the thin scattered scales bear small tufts of wool in their axils: usually simple but sometimes clustered, some of the central spines hooked: fls. somewhat bell-shaped, borne on young areoles above the spine-cluster. Cult. as for Echinocactus. See Cacti.

polyancistrus (Echinocactus polyancistrus). Solitary, globose to oblong, to 16 in. tall; ribs 13–17, to ½ in. high, wavy and rounded; radial spines 15–18, to 1 in. long, white; centrals 3–5, to 5 in. long, unequal, often hooked: fls. rosemagenta or yellow, to 3½ in. long. Calif., Nev., W. Ariz., S. Utah.

Whipplei (Echinocactus Whipplei). Body or branches globose and about 3 in. diam., or oblong and to 6 in. long; ribs 13-15; radial spines 7-11; centrals usually 4: fis. purplish or lavender, to 1½ in. long. Colo., Utah, N. Ariz., on high mesas.

SCLEROPÒA. Gramineæ. Low tufted ann. grasses of the Medit. region, with narrow lvs. and flattened spikelets in panicles; one species sometimes planted for ornament. See Grasses.

rígida (Festuca rigida). To 1½ ft.: lvs. to 4 in. long and $\frac{1}{12}$ in. wide: panieles to $3\frac{1}{2}$ in. long, with short spreading or ascending branches. S. Eu.; nat. in S. U. S. and Bermuda.

SCOKE: Phytolacca americana.

SCOLOPENDRIUM VULGARE: Phyllitis Scolopendrium.

SCÓLYMUS. Compositæ. Stout erect or widebranching thistle-like ann. and per. herbs with pinnately spiny-toothed or lobed alternate lvs. and yellow ligulate fls. in sessile heads; pappus a ring or few bristles; native of the Medit. region.

The Spanish oyster-plant is grown for its edible tap-root. It requires practically the same culture as parsnips and salsify. It is milder in flavor than the root of the true oyster-plant.

hispánicus. Golden Thistle. Spanish Oyster-Plant. Bien., much branched, to 2½ ft.: lvs. pinnately cut: heads few-fid., about 1 in. long. S. Eu.

SCORPIOID: said of a coiled cluster in which the flowers are two-ranked and borne alternately at the right and the left; common in Boraginaces. SCORPIÙRUS. Leguminosæ. Decumbent or very diffuse herbs with simple lvs., nodding mostly yellow papilionaceous fls. solitary or few in the axils, and variously coiled pods which are grown as curiosities and surprises under the name "worms." Propagated by seeds sown where plants are to stand.

muricata. Fls. 3-4 on stalks longer than lvs.: pods linear, loosely coiled near end, bristly. Medit. region.

subvillòsa. Fls. 1-4 on stalks longer than lvs., standard sometimes reddish: pods linear, tightly coiled, bristly. Medit. region.

sulcata. Fls. 1-2 on stalks longer than lvs.: pods linear, flatly coiled, rough. Medit. region.

vermiculata. Fls. solitary on stalks shorter than lvs.: pods thick, rough with stalked tubercles. Medit. region.

SCORZONÈRA. Compositæ. Herbaceous perennials, rarely annuals: lvs. more or less grasslike, sometimes lobed or dissected: fls. ligulate, in long-peduncled heads; pappus plumose: natives of the Old World.

One species is cultivated as a root-vegetable, the same as parsnips and salsify. It is treated as an annual or biennial. The leaves are also eaten in salads.

hispánica. Black Salsify. Per. to 3 ft., usually pubescent, the long fleshy tap-root with a black skin; lvs. oblong to linear, undulate: heads to 2 in. long, yellow. Eu.

purpurea (S. rosea). Per. to 2 ft., glabrous: lvs. narrowly linear, to 10 in. long, entire: heads to 1½ in. across, ray-fls. violet-purple. Eu.

ròsea: S. purpurea.

SCREW-PINE: Pandanus.

SCROPHULÀRIA. FIGWORT. Scrophulariaceæ. Erect commonly per. herbs in the northern hemisphere, strong-smelling, with mostly opposite broad serrate to dentate lvs., and small unshowy greenish, purple or yellow fls. in terminal cymes, the corolla tubular and irregularly 5-lobed, sterile stamen manifest; rarely planted in the flower-border or for medicinal purposes.

aquática. To 4 ft., glabrous, sts. 4-winged: lvs. ovateoblong, obtuse, cordate at base: fls. dull purple, in panicles to 2 ft. long. Wet places, Eu., W. Asia.

californica. Per. to 6 ft.: lvs. ovate-cordate, to 5 in. long, serrate to doubly-serrate: fis. dull reddish, about ½ in. long, infl. often sticky-hairy. Ore. to N. W. and Calif.

chrysantha. Bien. or per. to 2 ft.: lvs. cordate-orbiculate, doubly-serrate, lower ones long-petioled, upper ones sessile: fig. greenish-yellow, stamens long-exserted, calyx laciniate. Caucasus.

lanceolata (S. leporella. S. occidentalis). To 8 ft., sts. mostly puberulent and lacking grooved sides, blooming in early summer: lvs. lanceolate to ovate, rather short-stalked, truncate at base, very sharp-serrate: fls. green or purple, shining outside. Vt. to Ore., Va. and Okla.

lateriflora. To several ft., glaucous and glabrous: lvs. lanceolate-cordate, to 5 in. long, toothed: fis. about $\frac{1}{17}$ in. long. Caucasus.

leporélla: S. lanceolata.

marilándica. To 10 ft., st. glabrous and with grooved or sunken sides, blooming midsummer or later: lvs ovate to ovate-lanceolate, cordate or rounded at base, to 5 in. or more long, slender-petioled: fls. dull greenish-purple outside, 1/3 in. long. Me. to Ga. and Tenn.

musashiénsis. Sts. erect: lvs. ovate-oblong, acute, irregularly dentate, white-pilose when young: fls. to ½ in. long, corolla-lobes short and rounded, glabrous, infl. a 3-fld. axillary cyme, calyx-teeth lanceolate-acute. Japan.

nodosa. Similar to S. marilandica but only to 3 ft. high, with smaller lvs. which are often cordate and double-toothed. Eu., N. Asia.

occidentàlis: S. lanceolata.

peregrina. Ann. to 2 ft.: lvs. cordate-ovate, toothed: fis. dark reddish-purple. Medit. region.

vernalis. To 2 ft., usually bien.: lvs. cordate-ovate, hairy, double-toothed: fls. greenish-yellow, stamens barely or not exserted, calyx not laciniate. Eu.

SCROPHULARIACEÆ. FIGWORT FAMILY. About 180 genera of herbs, shrubs and trees, trop. and temp. regions in eastern and western

hemispheres, having usually irregular bisexual fls. with 4–5-toothed or -parted calyx, gamopetalous 4–5-lobed corolla which is often personate, commonly 4 but sometimes 2 or 5 stamens, superior 2-celled ovary and fr. a caps. or berry. Plants of many genera are grown for ornament and some for medicinal purposes, as Allophyton, Alonsoa, Anarrhinum, Angelonia, Antirrhinum, Aureolaria, Bowkeria, Calceolaria, Campylanthus, Castilleja, Celsia, Chænostoma, Chelone, Chionophila, Collinsia, Cymbalaria, Diascia, Digitalis, Erinus, Euphrasia, Galvesia, Gerardia, Gratiola, Hebe, Hebenstretia, Hydrotrida, Isoplexis, Jovellana, Kickxia, Lagotis, Leucophyllum, Linaria, Manulea, Maurandia, Mazus, Mimulus, Mohavea, Nemesia, Orthocarpus, Ourisia, Paulownia, Pedicularis, Penstemon, Phygelius, Phyllopodium, Rehmannia, Rhinanthus, Rhodochiton, Russelia, Schwalbea, Scrophularia, Sibthorpia, Synthyris, Tonella, Torenia, Verbascum, Veronica, Veronicastrum, Wulfenia, Zaluzianskya.

SCURVY-GRASS: Cochlearia.

SCUTELLÀRIA. SKULLCAP. Labiatæ. Herbaceous annuals and perennials, rarely subshrubs, with blue, violet, searlet or yellow 2-lipped fls. in pairs in the axils or in terminal spikes or racemes; widely distributed.

Scutellarias are sometimes grown in borders and rockgardens and S. Ventenatu under glass. The herbaceous types are propagated by seeds and division; the shrubby kinds in spung by cuttings of half-ripened wood.

álbida. Pubescent: lvs. broad-ovate, 1½ in. long, toothed, petioled: fls. opposite, whitish or dull, ½ in. long, in racemes 1 ft. or more long. S. E. Eu., Cent. Asia.

alpina. Spreading per. to 10 in.: lvs. ovate, to 1 in. long, slightly toothed, short-petioled or nearly sessile: fis. purple and white or somewhat yellowish, 1 in. long, in dense terminal racemes. Eu. Var. lupulina (S. lupulina bicolor) fis. yellow. Var. nana, low, to 5 in. Other color forms are vars. álba, cærûlea, rôsea.

altíssima. Per to 3 ft.: lvs. cordate-ovate, 3 in. long, coarsely toothed, petioled: fls. opposite, creamy-yellow, ½ in. long, in long one-sided racemes. S. E. Eu., Caucasus.

angustifòlia. Per. to 6 in.: lvs. oblong-lanceolate or linear, to 1 in. long, entire, petioled. fls. violet-blue, to 1 in. long, solitary in axils. B. C. to Calif. and Utah.

baicalénsis. Half-crect per. to 1 ft.: lvs. lanceolate entire, nearly sessile: fls. blue, in racemes. E. Asia. Var cœléstina has large spikes of bright blue fls. 1 in. long.

Bríttonii. Per. to 8 in., sticky-pubescent: lvs. ovateoblong, to 1 in. long, entire, usually sessile: fls. blue, corolla pubescent, to 1¼ in. long, axıllary and usually solitary. Neb., Colo. and Wyo.

coccinea. Shrub or subshrub: lvs. oblong, to 1 in. long, nearly entire, petioled, violet-purple beneath: fis. scarlet, to ¾ in. long, in terminal spikes 1½ in. long. S. Amer.

cœléstina: S. barcalensis var.

Colúmnæ. To 3 ft.: lvs. ovate, 2 in. long, wavy-toothed, petioled: fls. dark purple, to 1 in. long, in racemes 6 in. or more long. S. Eu.

galericulata. Per. to 3 ft., stoloniferous: lvs. oblong-lacolate, to 2½ in. long, shallowly serrate, acute: corolla blue, to 1 in. long, puberulent, solitary in axils. N. Amer., Eu., Asia.

incana. Per. to 4 ft., finely white-downy except occasionally on upper sides of lvs.: lvs. ovate-oblong, to 4½ in. long, petioled, acute, crenate-serrate: fis. blue, to ¾ in. long, in loose racemes, corolla canescent. Ont. to Fla. west to Mich., Kans. and Ala.

fadica. Per. to 1 ft., sts. procumbent at base: lvs. round-cordate, petioled, toothed: fls. bluish, in dense racemes to 4 in. long. China, Japan. Var. japônica (S. japônica) is lower, with blue or lilac fls.

integrifolia. Pubescent per. to 2½ ft.: lvs. linear to oblong, to 2 in. long, entire, petioled or upper sessile: fis. blue or whitish, in terminal racemes. Mass. to Fla. and Tex.

japónica: S. indica var. lupulina: S. alpina var.

Mocinians. Tender shrubby plant to 1 ft.: lvs. ovate,

1 in. long, wavy: fls. red with yellow throat, 1½ in. long, in dense terminal spikes. Mex.

nervòsa. Per. to 2 ft., stoloniferous, little or not at all branched: lvs. ovate-orbicular to lanceolate, to 2 in. long, marguns crenate-toothed: fls. blue, to ½ in. long, puberulent, solitary in axils. Ont. to N. C. west to Mo. and Tenn.

orientàlis. Procumbent per.: lvs. ovate, ¾ in. long, deeply toothed or nearly pinnatifid, long-petioled, white-tomentose beneath: fls. purplish or yellow, 1 in. long, in spike-like racemes to 3 in. long. S. E. Eu., Asia.

pilòsa. Per. to 3 ft., downy becoming glandular-pubescent above: lvs. ovate to oblong, to 3 in. long, margins crenate-toothed: fls. blue, to 34 in. long, in terminal racemes or solutary in axils. S. N. Y. to Fla. west to Mich., Mo. and Tex.

resinòsa. Per. to 1 ft., gray-pubescent: lvs. ovate or oval, ½ in. long: fis. blue or purplish, ½ in. long. Colo. to Ariz.

serrata. Showy S. Per. to 2 ft., glabrous or nearly so: lvs. ovate to elliptic, to 4 in. long, toothed: fls. blue, to 1 in. long, in terminal racemes. N. Y. to S. C. west to Ky. and Tenn.

tuberosa. Per. to 5 in., the rootstocks tuberous: lvs. ovate, $\frac{1}{2}$ in. or less long, petioled, toothed, purplish beneath: fls. violet-purple, $\frac{3}{4}$ in. long. Calif., Ore.

Ventenátii. Per., erect: lvs. cordate-ovate, sinuate-dentate: fls. scarlet, about 1 in. long, in elongating terminal racemes. Colombia.

versicolor. Per. to 3 ft., usually erect, soft-hairy: lvs. ovate to orbicular-ovate, rugose, veins very conspicuous, rounded-toothed. fls. bright blue, whitish on lip and lower side, about 1 in. long. Pa. to Minn. and southward.

SCUTICÀRIA. Orchidacex. S. American epiphytes with very short branching sts. bearing a solitary subcylindrical whip-like lf. and short lateral 1–3-fld. scapes; sepals and petals similar; lip concave. For cult. see Orchids.

Hádwenii. Lvs. to 18 in. long: peduncle to 8 in. long: sepals and petals greenish-yellow spotted with brown; lip entire, whitish-yellow spotted with light brown, with marginal area whitish spotted with rose. May-June, Sept. Brazil

Steelei. Lvs. to 48 in. long; peduncles to 1½ in. long, 1-3-fld.; fls. pale yellow spotted with brown-purple; lip 3-lobed with an orange crest at base. June-July. British Gunana.

SCYTHIAN LAMB: Cibotium Barometz.

SEAFORTHIA: Ptychosperma elegans; but the palm commonly planted as Seaforthia elegans is Archontophænux Cunninghamiana.

SEA-KALE (Crambe maritima). Heavy hardy succulent perennial herb of the coasts of western Europe, grown for the young shoots which when blanched are used as a pot-herb, like asparagus. The great thick glaucous-blue leaves are conspicuous and showy and may contribute a good element in ornamental borders. See Crambe.

The young spring shoots (leaf-stalks) of seakale are blanched by growing into loose fine earth with which the crown has been covered to the depth of a foot or more; or a light-tight box or other receptacle may be inverted over the plant. If the growth is not cut for the kitchen until late in the season, it is well to allow a part of the plant to go naturally into leaf in order to maintain the vigor of the root; and in any case after the cutting is over, the plant should be stimulated into good growth for the remainder of the season as with asparagus and rhubarb. Sea-kale should give good yields for eight to ten years.

Sea-kale comes readily from seeds, sown in their globular seed-like pods. It is well to carry the seedlings in a bed the first year, and then to transplant to permanent quarters. The field distance is ordinarily about 3 × 3 feet. A good harvest from seedlings should be had the third year from seed. The plant is also propagated by means of root-cuttings, and a good crop may then be taken the second year. Cuttings 4 or 5

inches long are made of vigorous roots, and these cuttings are usually planted directly in the field.

SEA URCHIN: Hakea laurina. SEBESTEN: Cordia Sebestena.

SECALE. Graminea. Ann. or per. grasses of Eu. and Asia, differing from Triticum in technical floral characters; one species a valuable cereal grain and forage plant. The name is pronounced in three syllables. See Grasses.

cereale. Rye. Tufted ann. to 5 ft., bluish-green: lvs. to ½ in. across: spikes dense, curved, to 6 in. long, long-awned: fr. light brown, ½ in. long. Cultigen.

SECHIUM. Cucurbitacex. Tendril-bearing monœcious herbaceous vine with per. root, grown for its edible frs. and tubers, native in trop. Amer.: fls. small and whitish, the pistillate 1 or 2 in the axils, staminate racemose: fr. large and thick, with one big seed.

edule (Chayota edulis). Chayote. Christophine. Tall-climbing or running: lvs. broad-ovate to triangular-ovate, to 10 in. across, angled or shallowly lobed: fr. of various shapes and sizes in the cult. vars., mostly somewhat pearshaped and 3-4 in. long, furrowed, green or white, at the apex closed or puckered over the seed which is 1-2 in. long. See Chayote.

SECURÍDACA. Polygalacex. Trop. American shrubs, trees or vines with alternate entire lys., mostly pink or purplish irregular fls. in racemes or panicles, the lower petal with a fringed crest, and fr. a 1-seeded winged samara.

diversifòlia (S. erecta. Elsota diversifòlia). Trailing or climbing shrub: lvs. ovate to oblong, to 5 in. long, thick: racemes to 5½ in. long: fr. to 2¼ in. long. W. Indies, Cent. Amer. to Ecuador.

erécta: S. diversifolia.

tenuifòlia. Lvs. oblong, pale and pubescent beneath: fls. to ½ in. long, long-stalked, in long loosely-fld. racemes. Trinidad.

SECURÍGERA. Leguminosæ. One ann. herb from the Medit. region. S. Securidaca (S. Coronilla. Coronilla Securidaca). To 1 ft.: lvs. pinnate: fls. yellow, papilionaceous, nodding, in axillary umbels: pods flattened, to 3½ in. long, curved, the edges thickened.—Propagated by seeds sown in spring where the plants are to stand.

SECURÍNEGA. Euphorbiaceæ. Temp. and subtrop. monocious shrubs having lvs. alternate, deciduous, entire: fls. unisexual, small, greenishwhite, apetalous: fr. a dehiscent caps. One hardy species, S. suffruticosa (S. ramiflora), is grown in temp. regions. To 6 ft., sts. spreading: lvs. elliptic to lanceolate-ovate, to 2½ in. long, often acute, mostly bright green, base wedge-shaped: staminate fls. in clusters of 5-10, pistillate fls. solitary: caps. subovoid, to ¼ in. diam., on peduncles to 5% in. long. N. E. Asia.

SEDGE: Carex. Family: Cyperacex.

SEDUM. STONECROP. LIVE-FOR-EVER. Crassulacex. Succulent mostly per. more or less evergreen low herbs of the north temp. zone, with white, yellow or rose, rarely red or blue fls. in terminal cymes, bearing twice as many stamens as petals. The greater number in cult. are small herbs without prominent rhizome or upright stock and they have a decumbent or trailing habit and often root at the joints. Certain of the species have erect more or less stiff sts., however, and these are usually broad-lvd.: the common run-wild live-for-ever (S. Telephium) is an example.

Some of the species are grown under glass for the interesting habit and more or less showy bloom. The low hardy kinds are popular in rock-gardens and edgings. The stone-crops are of easy cultivation, even in thin poor soils. Propose the stone-crops are of easy cultivation, even in thin poor soils. agated by seeds or offsets or pieces planted as cuttings.

acerphyllum: listed name; plants received under this designation have been S. sediforme.

designation have been S. sectiforms.

Acre (S. neglectum). Creeping evergreen forming mats, to 5 in · lvs. alternate, imbricated, oblong-triangular, about is in long: fls. bright yellow, ½ in. across, in late spring and summer. Old World. Var. álbum with white fls. is listed, but it is probably not of this species. In var. aureum the lvs. are bright yellow in spring. Var. élegans has the young shoots tipped silvery. Var. mains is of large stature. Var. minus is a small form. Var. minimum is also listed.

acutifolium: S. subulatum; plants in the trade under this name are likely to be S. sediforme.

Adolphii. Bushy evergreen per.: lvs. alternate, broadly lanceolate, $1\frac{1}{2}$ in. long, very fleshy: fls. white, $\frac{3}{4}$ in. across. Mar.-Apr. Mex.

Aizon (S. Maximowiczii. S. Luggeri). Per. to 1½ ft. with large thick knotty rootstocks and long tuberous roots: lvs. alternate, linear- to ovate-lanceolate, to 3 m. long, sharply toothed: fis. yellow to orange, ½ in. across, in summer. Siberia to Japan. Var. floribundum is very tall and narrow-lvd.

Albertii (Sempervivum Albertii). Evergreen, creeping, to 2 in. high: Ivs. linear-oblong, to ½ in. long: fls. white, ½ in. across, in early summer. E. Turkestan.—Possible not distinct from S. gracile.

albomarginatum roseum: listed name.

alboròseum (S. japonicum). Per to 2 ft., with tuberous roots: lvs. mostly opposite, ovate to obovate, to 3 in. long, toothed: fls. greenish-white, ½ in. across, in early autumn. Japan, China. Var. variegàtum has lvs. blotched in center with yellow.

album (S. balticum. S. turgidum). Creeping evergreen forming mats, to 8 in. high, variable: lvs. alternate, linear-oblong, to ½ in. long: fls. white, ¾ in. across, in summer. Eu., Asia, N. Afr. Var. athoum has smaller lvs and fls. and the infl. fewer-fld. Var. brevifolium has very short lvs. Var. chloróticum is yellowish-green with fls greenish-white. Var. micránthum has fls. half size of type. Var. murale has purple foliage and pinkish fls. Var. purpūreum is listed, with purplish foliage. Other varieties listed are aŭreum, bathoniensis, cárneum, tenuifòlium, and virens.

allantoides. Evergreen, to 1 ft.: lvs. alternate, clubshaped, cylindrical, very blunt and glaucous, curved upwards: fls. greenish-white, ½ in. across. June-July. Mex.

alpestre. Small per. with creeping st.: sterile shoots short with the oblong-obovate lvs crowded at the typs; flowering shoots to 3 in., loosely leafy, bearing several greenish-yellow fls. Cent. and S. Eu., Asia Minor.

alpinătum: listed name.

altíssimum: S. sediforme.

amaramacánthum: listed name; plants received as this have been S. amecamecanum.

amecamecanum. Evergreen subshrub to 8 in.: lvs. crowded, oblanceolate, ¾ in. long: fls. pale yellow, ⅓ in. across, in rather dense cymes to 1 in. across. Mex.

amplexicaule: S. tenurfolium.

Anacampseros. Nearly evergreen, procumbent, to 6 in. high: lvs. alternate, obovate to orbicular, to 1 in. long: fls. dull purple, 1/4 in. across, in summer. S. Eu.

ánglicum. Creeping evergreen, making mats, to 2 in. high: lvs. alternate, elliptic, cylindrical, to $\frac{1}{2}$ 6 in. long: fls. white, $\frac{1}{2}$ 6 in. across, in summer. W. Eu. Var. minus is smaller than the type, with pinker fls. Vars. álbum and glaùcum are also listed.

annuum. Much branched ann. to 3 in : lvs. alternate, oblong-linear, ⅓ in. long: fls. yellow, small. June-July. Eu., Asia Minor, Greenland.

anomalum. Low per., decumbent or ascending, light green and slightly pinkish: lvs. spatulate in rosettes, oblong to oblanceolate on fl. sts. and to 1/4 in long: fls. bright yellow, nearly sessile. S. W. Calif.—Probably not specifically distinct from S. spathulifolium.

anopétalum. Creeping evergreen per., flowering shoots to 9 in.: lvs. crowded, linear, to ¾ in. long: fls. whitish, rarely yellow, in cymes to 1 in. across. June-July. Eu., Asia Minor. Var. élegans is listed.

arbòreum: see Crassula argentea; plants received under this name have been S. sediforme.

asiáticum: S. crassipes.

atlanticum (Monanthes atlantica). Glabrous, with the ovate or suborbicular lvs. densely crowded at the tips of the sterile shoots: flowering shoots to 1 in. high, with 3 to 5 yellow fis. Morocco.

athoum: S. album var.

atratum. Ann. or bien. to 2½ in.: lvs. club-shaped, Cent. Eu.

aureum: see S. mexicanum.

azureum: has been applied to both S. cæruleum and S.

bálticum: S. album.

Beyrichianum: S. Nevii var.

boloniénse: S. sexangulare.

Borderi: S. Telephium var.

Braunii: name applied to S. spurium or S. kamtschaticum.

brevifolium. Creeping mealy evergreen to 2 in. high: lvs. crowded in 4 rows, ovoid, 1/8 in. long: fls. white, 1/8 in across, in summer. Medit. region. Var. álbum with bronzy lvs. is listed, but probably does not belong here. Var. Póttsii does not differ from the type.—Plants listed as S. Pittonii are to be referred here.

Brownii: name applied to S. spurium and S. kamt-schatzum, also to one form of S. Aizoon.

Bufordianum Pittonii: listed name.

bupleuroides. Per. to 1 ft., dicecious, with much thick-ened rootstock: lvs. alternate, rather distant, triangular-ovate, cordate, ½-1 in. long: fls. dark red-purple, ¼ in. across. Himulayas.

cærdleum (S. azureum). Ann. to 4 in.: lvs. alternate, ovoid to oblong, to 34 in. long: fls. blue, white at base, 14 in. across, in summer. Medit. region.

callichroum. Glabrous ann. to $1\frac{1}{2}$ in. high: lvs. oblong to ovate, semi-terete, $\frac{1}{2}$ in. long: fis. pink. Persia.

cárneum: S. lineare var. variegatum.

carpáticum: S. Telephium var. Borderi.

cauticolum. Glaucous per. with procumbent sts. to 6 in. long: lvs. opposite, orbicular-spatulate, to 1 in. long: fis. rosy-purple, in a flattish subumbellate cyme. Japan.

Cepèa. Hairy ann. or per. to 1½ ft.: lvs. variously arranged, linear-obovate, red-spotted, to ½ in. long: fls. white, ¾ in. across, on long pedicels. Cent. and S. Eu.

Charowanum: catalogued as a dwarf for carpeting.

chrysanthum (Cotyledon chrysantha. Rosularia pallida. Umbilicus chrysanthus). St. short: lvs. oblong-spatulate: fls. yellowish striped with red on backs of petals. Asia

coccineum: S. quadrifidum; also sometimes applied to a phase of S. spurium.

coloniénse: a small blue-green plant of the hispanicum

confusum. Much branched evergreen per. to 1 ft.; lvs. alternate, obovate-spatulate, to 1½ in. long: fls. yellow, to ¾ in. across, in late spring. Probably Mex.—It may be known in cult. as S. spathulfolium.

corsicum: S. dasyphyllum var. glanduliferum.

crássipes (S. asiatram). Per. to 1 ft.: lvs. alternate, linear to lanceolate, to ¾ in. long: fls. yellowish-white to greenish, ½ in. across, in summer. Himalayas, China.

Crista-gálli: listed name. cristatum: S. rupestre.

cruéntum: trade name.

cupreum. Foliage narrow: fls. yellow. Name unidentifiable botanically.

cupressoides. Decumbent evergreen per.: lvs. closely imbricated, cypress-like, ovate, 1/2 in. long, very fleshy: fls. bright yellow, 1/2 in. across, solitary or few. July-Aug.

dasyphyllum. Evergreen, to 2 in.: lvs. opposite, ovoid, ½ in. long: fls. white tinged pink, yellowish at base, ½ in. across, in early summer. Eu., N. Afr. Var. glandulfferum (S. corsicum) is densely glandular-pubescent. Var. macro-phyllum has lvs. to ½ in. long. Var. glaucum is listed.

dendroideum. Evergreen per. to 2 ft.: lvs. crowded at tips of branches, spatulate-orbicular, to 1½ in. long, rounded on one side: fls. bright yellow, ½ in. across. Mex. Var. cristatum is listed.—Crossula argentea is also sometimes known under this name.

diffusum. Per. with spreading sts. to 6 in. long: lvs. alternate, oblong, to 1/2 in. long: fis. white, to 1/2 in. across. Mex.

divergens. Creeping evergreen, to 6 in.: lvs. opposite, obovate, ¼ in. long: fis. bright yellow, ¾ in. across, in early summer. Ore. to B. C.

diversifolium. Glabrous tufted per, with elongate de-cumbent floriferous sts. to 8 in. long: lvs. of sterile shoots densely imbricate, obovate, 4 in. long; lvs. of flowering shoots crowded, caducous, obovate to oblong, to 1/2 in. long: fls. 1/2 in. diam., yellow. Mex.

divérsum: listed name.

Douglasii. Evergreen per., green often tinged red, st. to

12 in. high, simple: lvs. linear to linear-lanceolate, nearly terete, to ½ in. long: fis. bright yellow, sessile, ½ in. across. Mont. to B. C. and Calif.

Eastwoodis (Gormania Eastwoodis). Per. with stout horizontal rootstock: basal rosette lvs. spatulate, to ¾ in. long, pale green: fl.-sts. to 6 in. high; fis. red, in dense cyme. Calif.

élegans: S. rupestre.

Ellacombianum. Smooth per. to 6 in. high, related to S. Aizoon but lacks the much thickened rootstock and tuberous roots of that species, has many arching sts. and spatulate crenate-serrate lvs.: lvs. yellow, ½ in. across, in a close flat leafy umbel-like cluster. Japan.—Sometimes grown under the name S. Selskianum.

euphorbioides: of doubtful status: has been applied to S 412002

Èwersii (S. azureum). Per. to 1 ft.: lvs. opposite, broadly ovate, ¾ in. long: fis. purplish-pink, ½ in. across, in late summer. Himalayas to Mongolia. Var. homophylium is much smaller and more glaucous. Var. turkestánicum does not differ from the type.

exifideum: said to be an early-flowering form of S. acre.

Fabaria: S. Telephium var.

facoirdianum. listed name

farinosum. Per., woody at base, to 3 in. high: lvs. terete, oblong to obovoid, to 1/4 in. long: fis. white. Madeira.

fimbriatum (Cotyledon fimbriata). Rosette Ivs. linear to oblanceolate, tipped with broad fimbriate cartilage and long narrow spines: fis. pinkish, long-pedicellate, in a raceme or dense spike. China. Var. Chanètii (Orostachys Chanetsi) has larger fis. and rosette Ivs. broader with narrow cartilage, entire or sparingly toothed, tipped with long

florairianum: listed name; plants grown under this name have been S. Middendorffianum.

floriferum. Semi-evergreen per. with ascending or decumbent sts. to 6 in.: lvs. spatulate, to $1\frac{1}{2}$ in. long, toothed in upper part: fls. yellow, $\frac{1}{2}$ in. across, in cymes to 2 in. across. July-Aug. China.—Perhaps only a var. of S. kamschatteum.

Forsterianum: S. rupestre var.

frigidum: S. integrifolium.

fusiforme. Much branched tufted per to 6 in.: lvs. fusiform, thick in middle and narrowed at ends, to ¾ in. long, glaucous: fls. greenish-vellow. in few-fld. terminal cymes. Madeira.

glaucum: S. hispanicum var. bithunicum.

globòsum: listed name.

Górmanii: trade name of doubtful status.

grácile. Evergreen per. to 2 in., sts. procumbent below: lvs. linear-oblong, to ½ in. long, dotted with red: fis. white often dotted with red, ¼ in. across. June-July. Caucasus.

grandiflorum: listed name.

Gréggii. Per. with tusted sterile sts. and slender fl.-sts. to 6 in.: lvs. oblong or obovate, imbricate, $\frac{1}{2}$ in. long: fis. yellow, 1-3 in an infl. Mex.

guatemalénse. Procumbent per. rooting at joints: lvs. cylindrical, 1/3 in. long: fis. reddish-yellow, 1/4 in. long. Guatemala.

gypsicolum. Creeping evergreen per. forming mats, to 6 in. high: lvs. imbricated, ovate-rhomboid, ¼ in. long, thick, tinged red: fls. white, ¼ in. across, in corymbs 1½ in. across. Spain, Portugal.—Sometimes considered a var. of S. album.

Hállii: S. obtusatum.

Hâyesii. Sts. prostrate, reddish-purple: lvs. spatulate, ½ in. long, glaucous: fls. rosy-lavender, ¼ in. across, anthers black-purple.—This seems to be a small form of S. Ewersii, known only from gardens.

hirsùtum. Evergreen tufted per. to 3 in., sticky-pubes-cent: lvs. oblanceolate, to ¾ in. long, very fleshy: fls. white or pinkish, ¼ in. across. S. Eu.

hispánicum. Ann. or bien. to 6 in.: lvs. linear to oblong-lanceolate, to 1 in. long: fis. pinkish-white, ½ in. across, in early summer. Switzerland to Persia. Var. bithýnicum (var. minus, S. glaucum, S. lydrum var. glaucum) is a per. to 2 in. high, with glaucous-blue foliage densely crowded on the barren shoots.

Hóbsonii (S. Praegerianum). Per. with thick rootstock and long petiolate oblanceolate basal lvs.: fl.-sts. prostrate, to θ in. long, with lvs. oblanceolate or oblong: fls. rose-red.

hfbridum (S. sibiricum). Creeping evergreen forming mats, to 6 in. high: lvs. alternate, oblong-lanceolate, 1 in. long, toothed: fls. yellow, ½ in. across, in spring and again in late summer. Siberia, Mongolia.

ibéricum: S. stoloniferum.

integrifolium (Rhodiola integrifolia. S. frigidum. S. rhodioloides). Per. to 1 ft., diœcious, with fleshy rootstock: Ivs. obovate or somewhat oblong, about ½ in. long: fls. usually dark purple. Colo., Calif. to Alaska.—Probably a subspecies of S. Rosea.

intermedium: name of doubtful application.

Jaccardiànum. Pubescent, with sterile sts. densely leafy at tips, to 2½ in., and fl.-sts. to 4 in.: lvs. spatulate, to % in. long: fls. 7-10-merous, yellow. Morocco.

japônicum: S. alboroseum. S. japonicum macrophyllum is the same or else S. maximum; true S. japonicum is probably not in the American trade.

Jépsonii: probably S. laxum.

kamtscháticum. Per. to 9 in.: lvs. alternate or opposite, obovate, to 2 in. long, toothed: fls. orange-yellow, ⁵4 in. aeross, in summer. N. E. Asia. Var. varlegátum has lvs. with marginal white band. Var. flavíssimum is listed.

laconicum. Similar to S. acre, but differing in its oblanceolate spotted lvs., divergent carpels connate at base, and taller fl.-sts., to 3½ in. Asia Minor, Greece.

Lággeri: S. Aizoon: also applied to S. maximum.

láxum (Gormania laxa). Green per. with fl.-sts. to 1 ft.: lvs. spatulate, to 34 in. long: fls. red or pink. Ore.—Species of doubtful status.

Leibergii. Tufted per. to 10 in.: sterile sts. loosely rosulate with the lateral lvs. oblanceolate, to ½ in. long, and the central ones spatulate, to ½ in. long: fls. yellow, in open cymes. Wash., Ore., Ida., Wyo.

Liebmannianum. Glabrous almost deciduous per., sts. to 6 in, procumbent, thickened by the persistent silvery bases of the old lvs., each with a black tip: lvs. oblong, blunt, 12 in. long, densely imbricate: fls. 3/8 in. across, white. Mex.

lineare. Evergreen, to 6 in. high: lvs. linear to linear-lanceolate, cylindrical, to 1 in. long: fls. yellow, star-like, ½ in. across, in summer. Japan, China. Var. robistum is stouter, more branched and gray-green. Var. variegatum (S. carneum variegatum) has lvs. margined with white.

lycopodioides: see Crassula lycopodioides.

Ifdium. Evergreen, to 3 in.: lvs. crowded, linear, cylindrical, ¼ in. long: fls. white, ¼ in. across, in early summer. Asia Minor—The form advertised as var. ylaucum is properly S. hispanicum var. bithynicum. Var. purpuráscens and var. ròseum are also listed.

macroph filum: a garden name applied to S. alboroseum and S. maximum.

mageliénse. Evergreen per. to 4 in.: lvs. alternate or opposite, obovate, ¼ in. long: fls. white, ¼ in. across, in late spring. Italy, Greece, Asıa Minor. Var. olympicum (S. olympicum) is lower in growth and has the lvs. subspathulate-oblong to almost orbicular and the infl. shortly racemose or corymbose.

Maximowiczii: S. Aizoon.

máximum. Ann. to 3 ft.: lvs. commonly opposite, broadly ovate, to 3 in. long, toothed: fls. greenish-white, ¾ in. across, in late summer. Eu., S. W. Asia. Var. atropurpureum has deep purple lvs. and st. Var. hæmatôdes is a smaller form of var. atropurpureum. Var. variegātum is variegāted with yellow.

Meddémpium: listed name.

mesemberatum; listed name.

mexicanum. Evergreen decumbent or trailing bright green per., floriferous and useful in pots, hanging-baskets and porch-boxes: lvs. nearly terete, to ½ in. long; fls. golden-yellow, sessile, to ½ in. across. Nativity in doubt.—Sometimes known as S. aureum.

micránthum: S. album var.

Middendorfflanum. Tufted per. to 1 ft.: lvs. alternate, nearly linear, 1½ in. long, toothed: fis. yellow, ½ in. across, in summer. Siberia, Manchuria Var. diffusum has sts. somewhat decumbent, often rooting at base and lvs. to 2 in. long.

monregalense. Per. to 5 in., sts. decumbent below: lvs. in whorls of 4, oblanceolate, 1/4 in. long, fleshy: fis. white, 1/4 in. across. July-Aug. S. Eu.

montanum: name of uncertain application.

moranense. Evergreen much branched low per., sts. 3-4 in. high, red and wiry, bare and procumbent below: lvs. triangular, sessile, ½ in. long and half as broad: fls. white, red tinged on back, sessile, nearly ½ in. across. S. Mex.—Sometimes erroneously known in cult. as S. Greggii and S. Laebmannanum.

múlticeps. Per. to 4 in., subshrubby and much branched: lvs. alternate, crowded, linear-oblong, ¼ in. long, very fleshy: fls. yellow, to ½ in. across. July. Algeria.

murale: S. album var.

negléctum: S. acre.

nevadense. Small ann. to 4 in. high, with linear sub-

terete lvs. to ¼ in. long: fls. 5-merous, with reddish-white petals connate at base and with 5 stamens, Spain and N. Afr.

Nèvii. Per. to 4 in., tufted: lvs. alternate, spatulate, to ½ in. long: fls. white with purple anthers. ½ in. across. June. Mts., Va. to Ala. and Ill. Var. Beyrichianum is more diffuse and greener with narrower lvs.

nicacense: S. sediforme.

nipponicum: listed name.

ndtans (Cremnophila nutans). Per. with woody sts. to 3 in. long and fi.-sts. usually pendent: lvs. in dense rosettes, to 3 in. long, 1½ in. wide and ½ in. thick: fis. bright yellow, ½ in. long, in many-fid. panieles. Mex.

Nuttallianum. Tufted ann. to 3 in.: lvs. alternate, linearoblong, to 34 in. long: fis. yellow, about 1/4 in. across, in spring. Mo. to Tex.

oaxacanum. Creeping evergreen: lvs. alternate, obovate, 1/4 m. long: fls. yellow, in 1-4-fld. cymes. Mex.

obtushtum (Gormania obtusatum and Hallii. Echeveria Hallii and Brittonii. S. Hallii). Green or somewhat glaucous, to 6 in. high: Ivs. spatulate, to 34 in. long: fls. yellow, with acute or acuminate segms. little longer than filaments, in a rather narrow cluster. Calif., in the Sierras.

obtusifòlium. Tufted per. to 3 in.: lvs. obovate, 1 in. long, very obtuse, veined with red: fis. white, in corymbose cymes. Caucasus.

olympicum: S. magellense var.

oppositifòlium: S. spurium.

opsinifolium: listed as 3 in. high with foliage turning red in autumn; plants received as this have been S. serangulare.

orbicularis: listed as of the hispanicum group, making a dense blue-green mound.

oreganum (Gormania oregana). Green, to 6 in. high: lvs. spatulate-cuneate, less than ¾ in. long: fis. bright yellow fading pink, the narrow long segms. much surpassing the stamens, in a compound cluster to 3 in. across. Ore. to Alaska.

oxypétalum. Erect glabrous subshrub to 3 ft., with st. becoming thick and stout at base: lvs. obovate, flat, sometimes retuse, to $1\frac{1}{2}$ in. long: fls. $\frac{1}{2}$ in. across, dull red, honey-scented. Mex.—Deciduous or semi-evergreen.

pachyphfilum. Evergreen per. to 4 in., very fleshy, sts. sometimes rooting: lvs. alternate, crowded, cylindrical, to 1½ in. long, very blunt, curved upward, tipped with red: fls. bright yellow, ½ in. across, in cymes to 2 in. across. Mex.

pállidum. Per. to 5 in.: lvs. linear, 1 in. long: fls. white or rose. Asia Minor, India.—This name has been erroneously applied to several other species, particularly to S. hispanicum.

Pálmeri. Glaucous evergreen per., sts. decumbent and more or less rooting, to 9 in. high: lvs. spatulate, entire, about 1 in. long, alternate or in rosette: fls. \(^1/2\) in. across, petals orange and sepals green, on drooping or wide-spreading branches. Mex.

perfóssum: see Crassula Schmidtii.

pilòsum. Bien. to 4 in.: lvs. densely imbricated, hairy, linear-spatulate to oblong-obovate, to ¾ in. long: fis. rose, to ¾ in. across, in late spring. Asia Minor.

Píttonii: S. brevifolium.

populifòlium. Subshrub to 1½ ft.: lvs. alternate, ovate, 34 in. long, toothed: fls. pale pink or white, to 3/4 in. across, in late summer. Siberia.

potosinum. Evergreen per. with weak sts. to 6 in. high, glaucous: lvs. crowded, linear and nearly cylindrical, to ½ in. long: fis. white, ½ in. across, in cymes. Mex.

præáltum. Evergreen shrub to 2 ft. or more: lvs. alternate, lanceolate-spatulate, to 2½ in. long, very fleshy, shining: fls. bright yellow, ¾ in. across, in panicles to 4 in. long. May-June. Mex. Var. cristatum is listed.

Praegerianum: S. Hobsonii.

pruinatum. Evergreen, very glaucous, to 6 in. high: lvs. alternate, linear, ¼ in. long: fls. straw-colored, to ¼ in. across, in summer. Portugal.—The plants usually cult. under this name belong to 8. rupestre.

pruinoides: listed name.

pruinosum. White-pruinose per. with short sterile shoots and fl.-sts. to 8 in.: lvs. spatulate-oblong to obovate, ½-1 in. long: fls. bright yellow. Calif.—Doubtfully distinct from S. spathultfollum.

pulchéllum. Ann. or per. to 1 ft.: lvs. crowded, linear, cylindrical, ½ in. long: fls. rosy-purple, ½ in. across, in summer. E. Ü. S.—Two phases occur: one, an ann., flowers in early spring; the other, per., flowers in summer and thrives in damper habitats.

Púrdyi. "Has densely crowded lf. rosettes which throw out red threads at the end of which are tiny plants": lvs. oblong-spatulate, to about 1 in. long, in flat rosettes: fl.-sts. to 4 in. high, with a rather densely flowered compact cymer fls. white. Calif.

purpuráscens: a trade name, perhaps a form of S. Tele-phium; the plant grown in S. Calif. under this name is Sempervivum or Monium arboreum.

quadrifidum (8. coccineum). Glabrous per. with stout clongate rootstock densely clothed with black wiry old sts.: fl.-sts. 2-6 in. high with lvs. oblong to lanceolate, entre, acute, ½ in. long: fls. yellow or purple. Asia.

radiatum. Per. to 7 in.: lvs. oblong to oblong-ovate, to ½ in. long: fs. bright yellow, petals wide-spreading, ¼ in. long. Mts., Calif.

refléxum. Creeping evergreen, forming a mat, to 1 ft. high. lvs. crowded, linear, cylindrical, ½ in. long. fls. bright yellow, $\frac{5}{8}$ in. across, in summer. Eu. Var. cristâtum is a crested or fascatate form. Var. minus, a small form, is listed. Var. réptans and var. semperflòrens are also listed.

replesianum: listed name.

réntana. listed name

retusum. Evergreen subshrub to 1 ft. high: lvs. alternate, spatulate, notched at tip, to 1 in. long: fis. white, ½ in. across, in terminal cymes to 2 in. across, late summer. Mex.

rhodánthum (Clementsia rhodantha). Erect glabrous perwith stout rootstock, sts. several, to 12 m., not branched, very leafy. Ivs. linear-lanceolate, acute, flat, 1 m. long: fls. rose-color, about 1 in. long; in a dense raceme to 3 m. long. Mont. to Ariz.

Rhodiola: S. Rosea.

rhodioloides: S. integrifolium.

roanense (Rhodiola roanensis). Tufted per. to 16 in.: lvs. elliptic or cuneate, to 1½ in. long: fis. purplish, ½ in. across. N. C., Tenn.—Probably only a phase of Sedum

Rôsea (S. Rhodiola. Rhodiola rosea). Roseroot. Perto 1 ft., dicecious, with rose-fragrant root: lvs. scattered, imbicated, obovate, to 2 in. long: fts. yellow or greenishyellow, ¼ in. across, in spring and early summer. Circumpolar regions.—This has been generally listed as S. roseum. Plants in the trade as Gormania Rhodiola may belong here. roseum: see S. Rosea.

rûbens. Ann. or bien. to 4 in., sticky-pubescent: lvs. oblong-linear, ¾ in. long, very fleshy, turning red. fls. white or reddish, ½ in. across. July. Eu., N. Afr., Canary Isls.

rubricaule. Sts. to 1 ft. high, puberulent, densely dotted with red or purplish papille: basal rosettes dense; cauline lvs. ovate, thick, bright green: fls. white. Mex.—Probably a var. of S. ebracteatum.

rupéstre (S. eleyans, S. virens, S. cristatum), Creeping rupestre (S. elegans. S. virens. S. cristatum). Creeping evergiere forming mats, to 1ft high, glaucous Ivs. crowded, linear, to $\frac{5}{8}$ in. long: fls. golden-yellow, $\frac{1}{2}$ in. across, in summer. Ett. Var. Forsterianum (S. Forsterianum) is a green form. Var. minus is smaller and glaucous. Var. mäjus and var. spiråle are also listed.

rupicolum. Per. with thick fleshy ellipsoid lvs. and yellow fls. Perhaps related to S. stenopetalum. Wash.

sarmentòsum. Prostrate evergreen: lvs. in 3's, broadly lanceolate, 1 in. long: fls. bright yellow, ½ in. across, in summer. N. China, Japan.

Sartorianum: the plant grown under this name is usually S. Stribrnyi.

Schlèhanii: listed name.

Schóttii: listed name.

Scopòlii: listed name.

sediforme (S. altissimum. S. nicaeense). Per. to 2 ft.: lvs. alternate, lanceolate, to 1½ in. long: fls. greenish-white, ½ in. across, in summer. Medit. region.

Selskianum. One of the Aizoon group: hairy per. with ann. erect sts. to 1½ ft. high: lvs. alternate, flat and scarcely fleshy, lance-oblong and the upper ones linear-oblong, toothed on upper half: fls. bright yellow, ¼ in. across, in large leafy umbel-like cluster. Manchuria.—Plants grown under this name may be S. Aizoon or S. Ellacombianum.

Semenòvii (Cotyledon Semenovii). Per. to 2 ft.: lvs. crowded, linear, to 2 in. long: fls. greenish-white, in dense racemes to 3 in. long, in early summer. Turkestan.

sempervivoides (Umbilicus platyphyllus). Bien. to 1 ft.: lvs. alternate, ovate, 1 in. long; fls. red, 14 in. across, in summer. Asia Minor.—Umbilicus persicus and U. Pestalozze are perhaps to be referred here.

Sempervivum: see S. sempervivoides.

sexangulare (S. boloniense). Creeping evergreen, forming mats, to 3 in. high: lvs. usually in 6 spiral rows, linear, cylindrical, ¼ in. long: fls. yellow, ¾ in. across, in summer. Eu.

sibfricum: S. hybridum.

Sièboldii. Decumbent per.: lvs. in 3's, nearly round, to 1 in. long, glaucous-blue or red: fls. pink, ½ in. across, in late autumn. Japan. Var. fòliis mèdio-variegàtis has center of lf. yellow.

spathulifòlium. Little evergreen glaucous per. tinged

red when exposed: fl.-sts. to 5 in., leafy: lvs. of sterile shoots spatulate, flat and fleshy, 1 in. long, of flowering shoots oblong and sessile, fleshy: fls. bright yellow, to $\frac{1}{2}$ in. across, in a leafy cyme. B. C. to Calif. Var. purpureum has lvs. deep purple, except when young. Vars. glaucum and rubrum are also listed.—This name may be applied in cult. to Sconfusum.

speciòsum: trade name.

spectabile. Glaucous per. to 1½ ft.: lvs. opposite or in 3's, obovate, 3 in. long: fis. pink, ½ in. across, in autumn. Japan, Cent. China. Var. álbum has white fis., atropurpureum and rübrum crimson fis. and variegatum variegated foliage. Vars. brilliantíssimum, Brillii, and roseum are listed.—Crassula argentea is also grown under this name.

spinosum (Cotyledon spinosa. Orostachys spinosus. Umbulcus spinosus). Densely matted per.: lvs. in rosettes, spatulate, thick, with white spiny tip: fls. yellow, in spicate panicles. E. Asia.

sparints. In Assars sparint (S. oppositifolium). Creeping per. forming mats, nearly evergreen, to 6 in. high: lvs. opposite, obovate, 1 in. long: fis. pink varying to white, ½ in. across, in summer. Caucasus. Var. splendens is a deep crimson form, var. 4lbum a white form. Vais. coccineum, cuphrium, and ròseum are also listed.

Stáhlii. Evergreen to 8 in.: lvs. opposite, ovoid, 1/2 in. long: fls. yellow, 1/2 in. across, in summer and autumn. Mex.

stellatum. Ann. to 6 in.: lvs. alternate, spatulate, to in. long: fis. purplish, 3% in. across, in early summer.

stenopétalum. Evergreen per. to 6 in., tufted: lvs. alternate or crowded, linear-lanceolate, to ¾ in. long fls. bright yellow, ½ in. across. June. Alta. to Calif. Var. subalpinum is not different, but a synonym.

stoloniferum (S. ibericum). Cieeping, nearly or quite evergreen, to 6 in. high: lvs. opposite, spatulate, 1 in. long. fiv. rose, ½ in. across, in early summer. S. W. Asia. Var. coccineum is offered, with pink fis. and foliage deep bronze in winter.

Stribnyi. Evergreen tufted per. to 6 in., sts. rooting below: lvs. crowded, linear, ½ in. long, slightly glaucous: fls. bright yellow, ½ in. across. July. Bulgaria, Giecce.

subulatum (S. acutifolium). Per. to 8 in. high, with sterile sts. ascending to 2 in.: lvs. terete, linear, very acute, subimbricate, to ½ in. long: fls. white, with petals fused at base. Asia Minor to Persia.

Tatarinòwii. Per. with short thick rootstock, to 8 in. high: lvs. fleshy, oblanceolate to oblong, coarsely dentate to deeply lobate, to 1 in. long: fls. white to pink. China.

telephioides. Per. to 10 in., glaucous and purplish: lvs. scattered, oblong, to 2 in. long, often toothed: fls. pale pink, 14 in. across, in autumn; petals 3-4 times as long as sepals. N. Y. and Pa. to N. C. and Ga.

N. Y. and Fa. to N. C. and Ga.

Telèphium. Per. to 2 ft.: Ivs. obovate-oblong, 3 in. long, toothed: fis. greenish-white (in typical var.) to red-purple, in late summer. W. Eu. to Japan. Var. Börderi (sometimes known as S. carpaticum) has deeply and uregularly toothed lvs. Var. Fabària is smaller, with narrower lvs. and hlacpurple fis. Var. purpàreum (S. triphyllum) has purple fis. in a dense terminal cyme.

tenéllum. Per., woody at base, with lvs. of sterile shoots imbricate, oblong to suborbicular, $\frac{1}{16}$ in, long: fl.-sts. with lys, imbricate, subterete, linear to oblong, to $\frac{1}{4}$ in, long: fls. white tinged with red, in a small dense infl. Armenia, Caucasus.

tenuifolium (S. amplexicaule). Small procumbent per. with wiry much branched sts., the barren shoots 1-3 in. long and bearing linear terete glaucous lvs. with clasping base: fis. to ½ in. across, golden-yellow, in a forked infl. S. Eu.—Allied to S. pruinatum.

ternatum. Evergreen, to 6 in.: lvs. in 3's, obovate, to 1 in. long: fls. white, ½ in. across, in late spring. E. U. S. Var. minus is much smaller than type.

tetragònum: see Crassula tetragona.

tortuosum. Per. with thick and tortuous branches: lvs. alternate, spatulate, 1 in. long: fis. white. Mex.

Tournefórtii: a listed name.

Trelèasei. Evergreen sprawling per., very fleshy and glaucous: Ivs. alternate, crowded, oblong-obovate, to 1 ½ in. long, curving upwards: fls. bright yellow, ½ in. across, in nearly globular cymes to 1½ in. across. Mex.

triphyllum: S. Telephium var. purpureum.

triste: listed name

túrgidum: S. album.

turkestánicum: S. Ewersii var.

umbellatum: listed name.

undulatum: listed name.

uniflorum. Sts. weak and slender, 5-6 in. long: lvs. alternate, subterete, obtuse: fls. solitary at ends of branches,

reddish. Luchu Isls.—This name has also been applied to a form of S. Douglasii.

vèris var. álbum: listed name.

villosum. Bien to 6 in., pubescent: lvs. alternate, linearoblong, to ¼ in. long, fleshy: fls. pale purple, ¼ in. across. June-July. N. N. Amer., Eu.

virens: S. rupestre. Var. monstrosum is listed.

Wallichianum: properly a synonym of S. crassipes but applied to other species.

Wâtsonii (Gormania Watsonii). Per. with stout horizontal rootstock. basal lvs. spatulate, obtuse or emarginate, to 1 in. long: fls. pale yellow, in an clongated cyme, with the petals united for about 1/2 their length. Ore.

Winkleri (Cotyledon Winkleri. Umblucus Winkleri). Per. to 2 in., glandular-hairy: lvs. in dense rosettes at tips of branches, cylindrical, to 3\u03e4 in. long, glaucous: fis. white with purple anthers. Spain.

Woodii. Per. to 4 in.: basal lvs. broad-spatulate, ½ in. long; lvs. of flowering shoots alternate, narrower: fls. yellow, ½ in long. Ore.

yosemiténse. Per., stoloniferous, very fleshy: sts. to 6 in. high with small obtuse spatulate to oblong lvs.; basal lvs. obovate to nearly orbicular: fls. light yellow, the petals about ½ in. long and exceeding sepals. Yosemite.—Probably not specifically distinct from S. spathulifolium.

SEED: the ripened ovule; the essential part is the embryo, and this is contained within integuments.

SEEDAGE: see Propagation.

SEGMENT: one of the parts of a leaf, petal, calyx, that is divided but not truly compound; one of the parts or petals in the perianth of monocotyledons.

SEKIKA: Saxifraga sarmentosa.

SELAGINÉLLA. Sclagincllacex, which is defined by the genus. Moss-like branching flower-less herbs with numerous scale-like lys. often of two kinds, the fruiting bodies (spores) borne in terminal sessile spikes; widely distributed; grown for the ornamental foliage out-of-doors and in the greenhouse, in conditions suitable for ferns.

Selaginellas are of easy cultivation in shady moist situations. Propagated by spores or cuttings in spring. Cuttings of some of the greenhouse kinds should be scattered over the soil of the propagating bench, covered with glass and kept in a temperature of 70°, until they form roots at the ioints.

africana: S. Vogelii.

amcena: S. caulescens.

apòda (apus). BASKET S. Ann. with creeping flaccid sts. to 4 in. long: lvs. minute, pale green. Me. to Tex.

Braunii. Sts. erect, to 1½ ft. high, straw-colored, not branched below: lvs. scattered, very small. W. China.

Brownii: S. Kraussiana var.

cæsia: S. uncinata, S. Willdenovii.

cauléscens (S. amæna). Sts. crect, stiff, to 2 ft. high, unbranched below, greenish: lvs. bright green, crowded. Malaya, China, Japan. Var. japónica (S. japonica) is less branched and graceful above.

cuspidata. Sts. much branched nearly to base, densely tufted: lvs. pale green edged with white. Cuba, Mex., Venezuela.

denticulata. Per. with matted creeping sts. 6 in. or less long: lys. crowded, toothed. Medit. region.—Most of the material cult. under this name is S. Kraussiana.

Douglasii. Prostrate, sts. rooting and creeping to 1 ft.: lvs. in 4 ranks, yellowish-green. B. C. to Calif.

elegantíssima: a garden name.

Emmeliana. Sts. erect, to 1 ft. high, branched nearly to base. lvs. bright green, crowded. Trop. Amer. Var. aurea has yellowish lvs. and var. variegata is variegated with white.

erýthropus. Sts. erect, to 1 ft. high, unbranched below, crimson: lvs. crowded, dark green. Trop. Amer.

flabellata. Sts. erect, stiff, to 8 in. high, with short unbranched part below: lvs. obliquely ovate. Tropics and subtropics.

grándis. Sts. erect, to 2 ft. high, unbranched below: lvs. lanceolate, long for the genus, dark green. Borneo.

hæmatodes. Sts. erect, to 2 ft. high, unbranched below, crimson. Venezuela to Peru.

japónica: S. Kraussiana or S. caulescens var.

Kraussiana (S. japonica). Moss-like per. with creeping rooting sts.: lvs. crowded, bright green. Azores to S. Afr. Var. Brownii (S. Brownii) is a dwarf form and vars. aurea and variegata variegated.

lepidophýlla. Resurrection Plant. Sts. stiff, to 4 in. long, densely tufted, curling up into a ball when dry but will expand when put in water: fis. flat, crowded. Tex. to S. Amer.—See also Anastatica.

Mandaiàna: a trade name.

Mártensii. Per. with ascending sts. to 1 ft. long, branched to base and rooting in lower half: lvs. pale green. Mex. Var. variegāta is marked with white.

pilifera. Much like S. lepidophylla but differing in the awl-shaped lys. Tex., Mex.

regalis: a hort. name.

rupéstris. Rock S. Densely tufted per. with branching sts. to 5 in. long: lvs. tipped with a white awn. E. U. S.

sérpens. Per, with trailing much branched sts. to 9 in. long: lvs. bright green, crowded. W. Indies.

uncinata (S. cassa). Per. with creeping rooting sts. to 2 ft. long: lvs. blue-green, close together on the short branches. China.

viticulòsa. Sts. erect, 1 ft. or less high, branched near top: lvs. erowded. Cent. Amer.

Vogelii (S. africana). Sts. erect, stiff, to 2 ft. high, unbranched below, brown: lvs. green or bronzed. Afr.

Wallacei. Loosely tufted, sts. prostrate, to 6 in. long, rooting sparingly: lvs. stiffly imbricated on all sides, slightly glaucous. B. C. to Calif.

Wällichii. Sts. erect, to 4 ft. high, branched to base: lvs. crowded. India, E. Indies.

Willdendvii (S. cassa arborea). Sts. straw-colored, erect when young but soon climbing to 20 ft. or more: lvs. bluegreen, crowded. Tropics of Old World.

SELENICÈREUS. Cactaceæ. Clambering, trailing or climbing cacti, more or less epiphytic and reaching the tops of trees, with aerial roots and joints ribbed or angled, most of the species bearing small spines: fls. large with long somewhat curved tube which is commonly covered in the axils of the seales with felt or hairs or bristles. S. U. S. to Argentina. See Cacti.

These plants are among those known as night-blooming cereus, raised under glass in cold countries and in the open in frostless places. They are readily grown, and old plants bloom freely.

Boeckmannii (Cereus Boeckmannii). Sts. to ¾ in. thick and strongly angled; ribs 3-8; spines 3-6; fls. pure white within and brownish outside, not scented, to 15 in. long. Cuba, Hispaniola, E. Mex.

brevispinus. Climbing or clambering, not much branched, to 1¼ in. long; ribs 8-10, somewhat undulate; areoles tawny; spines to ¼ in. long, radials about 12, centrals 3-4, usually curved or hooked; fis. white, the outer segms. yellowish, to 4 in. long. Cuba.

coniflorus (Cereus coniflorus). Climbing; ribs 5-6 and wavy or knobby on edges; radial spines 4-6 and yellow; central 1 and ½ in. long. fls. white, yellow outside, to 10 in. long. Mex.

Donkelaari (Cereus Donkelaari). To 25 ft. or more but very slender, about 3% in. thick; 11bs 9 or 10 and sometimes indistinct; spines 10-15, central 1: fis. white, reddish outside, about 7 in. long. Yucatan.

grandiflorus (Cereus grandiflorus). Sts. rather stout, about 1 in. diam; ribs 7 or 8 or fewer; spines needle-like and intermixed with white hairs: fls. white, salmon outside, about 7 in. long. Jamaica, Cuba. Var. armatus is said to have longer spines. Var. Téllii has very slender sts. about ½ in. diam., ribs 4-5, fls. smaller than in type.

hamatus (Cereus hamatus. C. rostratus). Branches about ½ in. thick, strongly 4-angled or seldom 3-angled, areoles often forming spur-like reflexed processes; spines few on old branches and black: fis. white, pale green outside, to 10 in. long. S. and E. Mex.

hondurénsis (Cereus hondurensis). Climbing, sts. ½ in. diam.; ribs 7-10; spines ½ in. long and with many white hairs or bristles: fls. white, yellow or brownish outside, 8 in. long. Honduras, Guatemala.

Knuthianus. Sts. to 1 in. diam.; ribs 7-10, low; spines brown, central 1 when present, radials 4, short and stiff; fls. white within and reddish-green outside, to 10 in. long, vanilla-scented. Cent. Amer.

Macdonaldiæ (Cereus Macdonaldiæ). Old sts. terete, about ½ in. thick, younger ones somewhat 5-angled, several and very short: fls. pure white, leddish or yellowish on outside, to 12 in. or more long. Probably Uruguay and Argentina.

Mállisonii: A porocactus Mallisonii.

Máxonii: S. Urbanianus.

Múrrillii. Sts. climbing, to 18 ft. long and 1/2 in. diam.;

ribs 7-8; spines 5-6 and minute: fls. white, greenish-yellow outside, 6 in. long. Mex.

Nélsonii. Sts. climbing, much branched, to ½ in. diam.; ribs 6-7, low, notched; spines about 12, to ½ in. long, white to yellow: fls. reddish-brown outside, to 8 in. long. Mex.

nycticallus: S. pteranthus.

ngeildo-gninuldgus: not distinct from S. spinulosus.

pteranthus (Cereus pteranthus. C. nyclicallus). Sts. stout, to 1 or 2 in. thick, strongly 4-6-angled; spines 1-4, dark: fis. very fragrant, white, 10-12 in. long. Mex.

spinulosus (Cereus spinulosus). Sts. 1-2 in. thick and bearing many roots, commonly angled; ribs 4-6 or more; spines very short, the radials 5 or 6 and with 2 reflexed bristles at base, central 1 or 2: fls. pinkish to white, about 5 in. long. S. E. Tex., Mex.

triangulàris: Hylocereus undatus.

Urbanianus (S. Maronii). Sts. to 1½ in. diam., light green to purple; ribs 3-6 and usually 4-5, becoming inconspicuous with age; spines about 4-7, to nearly ½ in. long, brownish: fis. white inside, tan without, to 12 in. long. Cuba, Hispaniola.

vagans (Cereus vagans). Sts. creeping and ½ in. diam.; ribs about 10; spines numerous and short: fls. white, brownish outside, 6 in, long, Mex.

viridicárous: listed name.

Wércklei. Sts. slender, branched, to 5% in. diam.; ribs 6-12, obtuse, low; spines absent: fis. bright red, to 6 in. long. Costa Rica.

SELENIPÈDIUM. Orchidacex. Small genus of trop. American orchids with 2 fertile anthers borne on the side of the column, a large simple inflated sac-like lip with entire incurved margins and 3-celled ovary. Most of the plants cult. in greenhouses under this name are now referred to Phragmipedium, probably no true Selenipediums being generally known to hort.

SELF-HEAL: Prunella vulgaris.

SELÎNUM (Sphenosciadium). Umbelliferæ. Coarse per. herbs of the northern hemisphere. having pinnately decompound lvs., involuces of few lvs., involucels of numerous bracts, and large umbels of white fls.; differing from Angelica, in part, in frs. with prominently winged ribs. Propagated by seeds or division; adapted to moist heavy soil.

capitellatum. To 5 ft., glabrous except infl.: lvs. large, with conspicuously dilated petioles, lfts. coarsely lacuniately lobed or toothed: umbels to 5 in. across, fls. pubescent. E. Ore, to Nev. and Calif.

SÉMELE. Liliacex. One shrubby vine from the Canary Isls. suitable for greenhouse cult. or out-of-doors in the S. S. andrógyna (Danae androgyna). CLIMBING BUTCHERS BROOM. Lvs. represented by scales, the apparent lvs. being leaf-like branches or cladodes to 4 in. long and 2 in. or more broad, ovate, leathery: fls. small, yellow, borne in clusters on the margins of the cladodes. Sometimes cult. as an Asparagus. The name Semele is pronounced in three syllables.

SEMIARUNDINÀRIA. Gramineæ. Erect bamboo-like shrubs with sts. mostly round but with the upper internodes flattened, lvs. with 4-7 pairs of veins, lf.-sheaths covered with stiff smooth bristles at least on the apical end; differs from Arundinaria in lf.-sheaths falling, not persistent.

fastuosa (Bambusa, Arundinaria and Phyllostachys fastuosa. A. Narihira). To 40 ft., sts. hollow, marked with purplish-brown: lvs. to 7 in. long and 1 in. wide, shining above, glaucous beneath, slightly pubescent. Japan.

SEMMANTHE. Aizoacex. S. African somewhat woody branching plant once included in Mesembryanthemum (which see). S. lácera (M. lacerum) grows to 3 ft. high, with 2-angled branches: lvs. somewhat scimitar-shaped, sharply

3-angled, glaucous, toothed on keel, to 2 in, long: fls. rose, 2 in. across, the inner petals short. The name is pronounced in three syllables.

SEMPERVIVUM. HOUSELEEK. Crassulaceæ. Succulent clustered per, herbs of the Old World. usually without distinct trunk or caudex, with thick lvs. compacted into basal or terminal rosettes, the st.-lvs. smaller, alternate and often bract-like: fls. greenish, white, rose, yellow or purple, in terminal usually compact cymes; parts of the fl. 6 to many, the stamens two times as many as the petals. Numerous names are known in cult. but many of them represent variants or hybrids of the few species, particularly of S. tectorum. The species entered here are presumably hardy in the northern states. The species native in the Canary and Madeira Isls. are better kept distinct, in the genera Æonium, Aichryson and Greenovia, represented by plants grown in the United States.

One houseleek, S. tectorum, is an old-fashioned plant about houses and in borders, prized for its durable rosettes and the progeny of smaller ones. In European countries it often grows on roofs, whence the Latin name (tectum, roof); it is also somewhat escaped in this country. Other kinds are useful in rock-gardens, spreading slowly. Propagation is naturally by the small rosettes or offsets; they grow readily from seeds when available, but some of them seldom bloom.

acuminatum: S. alaucum.

acitum: listed name

admonténse: name without botanical standing.

Albertii: Sedum Albertii.

álbidum: a whitish form of S. tectorum.

Allionii (S. austriacum. S. hirsutum). To 6 in.: rosettes to 1 in. across, pale green, the lvs. lanceolate or ovate-lanceolate, ½ in. long, incurved: fls. greenish-white, ½ in. long. Alps.

alpéstre: S. montanum.

alpinum: a var. of S. tectorum, but smaller, the green lvs. red at base. Alps, Pyrenees.

Anacámpseros: listed name. androsacoides: listed name.

angustifòlium. Hybrid between S. arachnoideum and S. tectorum.

anomalum: a form of S. tectorum.

anomalum: a form of S. lectorum.

arachnofdeum (S. sanguineum). Cobweb H. To 4 in.: rosettes ¾ in. across, the lvs. connected by cobwebby strands, tipped with long hairs: fls. bright red, 1 in. across, in a dense few-fid glandular panicle. Mts., S. Eu. Var. glabréscens (S. Doellanum, S. heterotrichum) is loosely cobwebby. Var. Lággeri (S. Laggeri) is a larger form, with rosettes twice as broad. Var. tomentosum (S. tomentosum, S. Webbianum) has white-tomentose rosettes. Other vars. listed are fimbriatum, hastipétalum, måjus, mínimum, minus, rübrum and transalpinum.—S. pulyerum is a form of S. arachnoideum or a hybrid between it and S. tectorum. of S. arachnoideum or a hybrid between it and S. tectorum.

arboreum: Æonium arboreum.

arenarium (S. cornulum. S. Kochii). To 9 in.: rosettes globular, the lvs. reddish-brown on back: fls. pale yellow tinted reddish outside, about ½ in. long, petals tricuspidate. Tyrol.—Plants grown under this name are likely to be a form or hybrid of S. montanum.

arvernénse (S. Boutignyanum). To 8 in.: rosettes 2½ in. across, the lvs. oblong-lanceolate, cuspidate, about 1 in. long, with red-brown blotch at top: fis. pale pink, about ½ in. long, in panicle 3 in. long. France.—This plant is a form of S. tectorum.

árvulum: listed name.

assimile: S. Schlehanii; but the plant grown under the name is likely to be S. tectorum.

atlanticum. To 1 ft.: rosettes to 3 in. across, the lvs. oblanceolate, cuspidate, to 1½ in. long, pale green: fls. pale red, 1 in. across, in panicle 3-4 in. across. Morocco.—Considered to be a subspecies of S. tectorum.

atropurpureum: listed name of no botanical significan .e.

atrorubens: listed name. atroviolaceum: listed name.

austriacum: S. Allionni.

Bantianum: listed name.

barbátulum: name applied to the hybrid between S. arachnoideum and S. montanum; this hybrid is also listed as S. barbulatum and S. elegans.

barbulatum: another name applied to the hybrid between S. arachnoideum and S. montanum.

Baulicinum: listed name.

blándum: S. Schlehanii. Var. variegatum is listed.

Boissièri. A form of S. tectorum: to 9 in.: rosettes 2½ in. across, the oblanceolate cuspidate lvs. tipped with redbrown, about 1 in. long: fls. pale red, 1 in. across, in a close small panicle.

Bòrisii: S. ciliosum. Bourgeanum: listed name. Routionvanum. S amernense

Braunii. To 9 in.: rosettes to 2 in. across, lvs. obovate. slightly cuspidate, glandular, to 1 in. long: fis. dull yellow, with greenish keels, to 1 in. across, in a close panicle to 4 in. across. Tyrol.—To be regarded as a pale-fid. form of S.

Brownii: presumably an erroneous spelling of the preceding.

cæspitdsum: Æonium cæspitosum.

calcareum (S. californicum). To 1 ft.: rosettes 2 in. across, the very glaucous lvs. oblanceolate and cuspidate, tipped with red-brown: fls. pale red, ¾ in. across, in a panicle 3-4 in. long. France.—A subspecies of S. lectorum.

califórnicum: S. calcareum. canariénse: Æonium canariense.

canéscens: without botanical standing.

cantábricum: listed name. cantálicum: S. tectorum.

Chamædrys: listed name; probably not a Sempervivum.

Chavinii: probably a hybrid. ciliatum: Eonium ciliatum.

ciliosum (S. Borisii). Rosettes to 2 in. across, very hairy, gray-green, the lvs. oblong-oblanceolate, 1 in. long, red on back when older: fls. greenish-yellow, 1 in. across, the infl. about 2 in. across. Bulgara.

cineráscens: S. erythraum. Clayrmayianum: listed name.

Clusianum: probably a synonym of S. tectorum.

Comollii: probably hybrid of S. tectorum and S. Wulfenii.

compéctum: S tectorum Cooperi: listed name. cornutum: S. arenarium. crassicable: listed name.

cuneatum: Eonium cuneatum. débile: S. montanum.

decòrum: Æonium decorum.

dichotomum: Archryson dichotomum.

Doellianum: S. arachnoideum var. glabrescens.

dolomíticum. Tufted, to 4½ in.: rosettes dense, to 2 in. across, the lvs. obovate-lanceolate, ½ in. long, ciliate, tipped red-purple: fls. rose-red with darker stripe and white dots, I m. across, the infl. 1½ in. across. Alps.

domésticum: Aichryson domesticum.

Doramæ: Æonium undulatum.

élegans: name applied to hybrid between S. arachnoideum and S. montanum. Var. Lággeri is listed.

erythræum (S. cinerascens). Tufted, to 8 in.: rosettes wide open, 2 in. across, the lvs. obovate, ¾ in. long, purplish densely covered with white hairs, densely ciliate: fis. redpurple with white lines, 1 in across, the infl. 2 in. across Bulgaria.

Fárreri: listed name.

fasciatum: listed name.

Fauconnéttii (S. flavipilum, S. pseudo-arachnoideum). To 8 in.: rosettes 1½ in. across, the oblanceolate lvs. tinged with red or purple, about ¾ in. long: fls. bright red, 1 in. across. Jura Mts.—Perhaps a hybrid of S. arachnoideum and S. tectorum.

fimbriàtum. To 10 in., glandular: rosettes 1½ in. across, the oblanceolate lvs. tipped with a tuft of hairs, outer becoming red: fls. bright red, 1 in. across, in open panicle. Pyrenees, Tyrol.—Regarded as a hybrid between S. arachnoideum and S. Wulfenii.

Finchii: listed name.

flagellifórme. To 4 in.: rosettes 1½ in. across, the lvs. pale green, oblanceolate and pubescent, to ¾ in. long: fls. bright red, 1 in. across, glandular, nearly or quite sessile in a dense head. Siberia.—The plant grown under this name may be a form of S. glaucum.

flavípilum: S. Fauconnettii. floribundum: listed name.

Funckii. To 9 in.: rosettes 2 in. across, the lvs. oblanceo-

late and cuspidate: fls. bright red-purple, 1 in. across, glandular, in a paniele 2-3 in. across. S. Eu.—A hybrid; but the plant passing under this name is probably S. calcareun

Fûnori: listed name. Gaùdinii: S. grandiflorum.

gigantèum: listed name.

glaucum (S. acuminatum. S. Schottn). To 1 ft., sts. hairy above: rosettes to 3 in. across, the oblanceolate lvs. glaucous with brownish spot at tip: fls. red, 1 in. across, in panieles 2-3 in. long. Cent. Eu.—Probably a var. of S. tectorum.

globiferum. To 1 ft.: rosettes to 3 in. across: fls. pale yellow, to 1 in. across. Russia.—A dubious name; the plant so called is apparently a form or hybrid of S. montanum.

glutindsum: Aonium glutinosum.

gnaphalium: sometimes applied to S. arachnoideum.

Goochie: Zonium Goochie.

grandiflorum (S. Gaudinni). To 8 in.: rosettes 1½ in. across, the obovate lvs. pale green and pubescent, to 1 in. long: fis. pale yellow, to 1½ in. across. European Alps.

Greenii. A form of S. tectorum but the plant in cult. may be S. glaucum: to 6 in.: rosettes 1½ in. across, the oblanceolate glaucous lvs. tipped with red-brown, to 1 in. long: fls. pale red, ½ in. across, in small paniele. French

Guillemôtii: S. tectorum.

Hausmannii. To 6 in.: rosettes with lvs. ciliate on margin and tipped with brown and a tuft of hairs: fis. rose-red. Tyrol.—Probably hybrid of S. arachnoideum and S. montanum

Haworthii: Æonium Haworthii.

heterôtrichum: S. arachnoideum var. alabrescens.

Heaffelii (S. patens). To 8 in.: rosettes 2 in. across, the lvs. obovate and cuspidate, with white-ciliate margins and upper part tinted red-brown: fls. pale straw-color, nearly The stranger of the stranger o

Hillebrandtii: a form of S. hirtum with broader glabrous st.-lvs. and grayish-green rosette-lvs.

hirsùtum: S. Allionii.

hirtum. To 9 in.: rosettes 1½ in. across, the obovate lvs. glandular-pubescent: fis. pale yellow, to ¾ in. long, in panicle to 4 in. across. S. Eu. Var. rarifolium is listed.

hispfdulum: probably synonymous with S. montanum.

hispidum: trade name; apparently a form or hybrid of S. montanum.

Histori: listed name.

holochrysum: Æonium holochrysum.

Hookeri: listed name. houghifdlium: listed name. Howardii: listed name.

Hûteri. Hybrid with S. Wulfenii as one parent.

hýbridum: Æonium cæspitosum.

juraténse: S. tectorum. kánswanii: listed name.

Kindingeri. To 10 in.: rosettes open, to 2½ in. across, the lvs. cuneate-oblong, 1 in. long, densely pubescent: fis. ivory-waxy, reddish at base, 1½ in. across, the infl. to 4 in. across. Macedonia.

Kochii: S. arenarium.

Lággeri: S. arachnoideum var.

LaHárpei: trade name without botanical standing.

Lamôttei: form of S. tectorum or hybrid from it.

lenéllum: listed name. lesurinum: S. tectorum.

leucánthum. To 8 in.: rosettes to 3 in. across, with lvs. numerous, crowded, erect in upper part, hairy, and purple-typed: fis. to 1 in. across, 11-13-parted, with petals pale yellow or greenish-yellow. Bulgaria.

Lindleyi: Æonium Lindleyi.

longifòlium: name of doubtful botanical status.

longobárdum: name with no botanical standing.

Lòwei: Monanthes brachucaulon.

magnificum: listed name.

Málbyi: listed name.

Manriquedrum: Æonium Manriqueorum.

Mettenianum. To 6 in.: rosettes to 2 in. across, the lvs. marbled and tipped with red-brown: fls. rose. Cent. Eu.—Considered a form of S. tectorum.

minutum: S. tectorum,

modéstum. Hybrid between S. montanum and S. tectorum.

Moggridgei. To 9 in.: rosettes 2 in. across, the long-cuneate or oblanceolate lvs. ¾ in. long and tipped with tufts of haus fls. red, ¾ in. across, calyx glandular. S. Eu.—An offshoot of S. arachnoideum.

Mòlevi: listed name

monstròsum: listed name.

montanum (S. alpestre. S. debile). To 6 in.: rosettes compact, to 1¾ in. across, lvs. oblanceolate, ciliate, to 1 in. long: fis. bright mauve-red or purplish, in a hany panicle to 2 in. across. Alps, Pyrenees. Var. stiriacum has larger rosettes and fis., the lvs. tipped red-brown. Vars. flagel-lifórme and pygmæum are listed.

Morellianum. Hybrid of uncertain status.

Neilreichii: form of S. hirtum with glabrous st.-lvs. and very narrow rosette-lvs.

Nèvii: listed name; possibly Sedum Nevii.

nigrum: listed name.

nobile: Æonium nobile.

obtusum: hort, name of no botanical standing.

Óllonii: trade name.

ornatum: S. Schlehanii var. brunneifolium.

pállidum; S. tectorum.

parviflorum. Probably a hybrid between S. montanum and S. tectorum.

parvulum. Hybrid between S. montanum and S. tec-

patens: S. Heuffeln.

penicillatum. Hybrid between S. arachnoideum and S.

percárneum: Æonium percarneum.

Piedovanum: listed name. pilíferum: see S. arachnoideum.

Pilosélla. Hybrid between S. arachnoideum and S.

Pfttonii. To 6 in.: rosettes 1½ in. across, the oblanceo-late pubescent lvs. blotched and typed with light red: fls. yellowish-white, in a dense hairy head. Styria.

Pòmelii. Hybrid between S. arachnoideum and S. tectorum.

Pótsii: listed name.

Pòwellii: listed name.

pseùdo-arachnoideum: S. Fauconnettu.

pulchéllum: Æonium spathulatum var. cruentum.

pumilum. To 4 in.: rosettes to 1 in. across, the lvs. pubescent: fls. bright mauve-purple, 1 in. across. Caucasus. purpureum: listed name. Var. acutifòlium is also listed.

pyrenaicum. To 10 in.: rosettes 2 in. across, the lvs. glaucous typped with reddish: fis. pale rose. Eu.—A form of S. tectorum.

Rángeri: listed name.

Reginæ-Amaliæ: S. Schlehanii.

Requiènii: S. tectorum.

rhæticum. Hybrid between S. montanum and S. tectorum.

rhodánicum: S. tectorum.

robústum: S. tectorum var.

rdseum. Hybrid between S. arachnoideum and S. Wulfenn, with lvs. light green and glabrous, but with a tuft of woolly hairs at the tip. petals yellow with red lines or reddish with a yellow margin.

Royanum: a form of S. tectorum.

ribens: listed name.

rubicúndum: S. Schlehanii.

rubrum: name without botanical status.

rupéstre: S. tectorum or a form of it; plants grown under this name, however, are likely to be a form or hybrid of S. montanum.

rupicolum (S. Theobaldii, S. montanum X S. Wulfenii), Rosettes to 2 in. across, lvs. reddish at base: fls. pale greenish-yellow striped with red. Tyrol.

ruthénicum (S. Zelebort). To 12 in.: rosettes 1½ in. across, the lvs. obovate and pubescent, short-ciliate: fls. pale yellow, the petals about ½ in. long, filaments purple, E. Eu.

sabaùdum: S. tectorum.

sanguineum: S. arachnoideum.

Scherzianum: of no botanical standing.

Schlèhanii (S. assimile. S. blandum. S. Reginæ-Amaliæ. S. rubicundum). To 6 in.: rosettes 4 in. across, the lvs. obovate, pale, nearly glabrous, to 1 in. long: fls. pale rose, 34 in. across, calyx densely pubescent. Transylvania. Var. brunneifòlium (S. ornatum) has lvs. brown, red in winter.

Schnittspähnii. Hybrid between S. arachnoideum and S. tectorum.

Schôttii. Hybrid between S. montanum and S. tectorum: another Schottii is synonymous with S. glaucum.

sedifòlium: Æonium sedifolium.

Seguièri: name referable to Sedum dasyphyllum.

selaucum: listed name. setòsum: listed name.

sobolfferum. To 9 in.: rosettes 1 ½ in. across, lvs. obovate, to 1 in. long, the outer ones brown-tinged: fls. pale yellow, in dense panicle to 4 in. across. Austria.—Plants so named may be a form of S. montanum.

spathulatum: Æonium spathulatum.

speciòsum: S. tectorum. spindsum: listed name.

spinulifòlium: trade name of uncertain application.

Stándsfieldii: listed name.

stenopétalum: uncertain name; perhaps a hybrid.

stiriacum: S. montanum var. striatum: listed name. subcicladanum: listed name.

Syleri: listed name.

tabulæforme: Æonium tabulæforme.

tectòrum (S. cantalicum. S. compactum. S. Guillemotii. S. juratense. S. lesurinum. S. minutum. S. pallidum. S. Requienn. S. rhodanicum. S. sabaudum. S. speciosum). COMMON OR ROOF HOUSELEEK. HEN-AND-CHICKENS. OLD-MAN-AND-WOMAN. To 12 in. 10settes 3-4 in. across, with many cuneate-obovate cuspidate lvs. to 3 in. long. fls. pink-red, to 1 in. across, on secund curving hairy branches, the petals mostly 12. Eu., Asia, variable; somewhat iun wild in U. S. Var. robústum has the rosettes to 6 in. across and the lvs. purple-tipped. Vars. mājus, modéstum, rūbrum, violāceum, violāscens, and vīride are listed. are listed.

tenéllum: listed name. ternatum: listed name. Theobáldii: S. rupicolum.

Thomayeri. Hybrid between S. arachnoideum and S. tectorum, with dense rosettes and hairy lys.

Thómpsonii. Hybrid between S. arachnoideum and S. tectorum.

Tissièri. Hybrid of uncertain parentage.

tomentosum: S. arachnoideum var.

tortudsum: Aichruson domesticum. Var. variegatum is listed.

Tournefórtii: listed name of no scientific standing; possibly Eonium spathulitum.

triste. A form of S. tectorum: to 1 ft.: rosettes to 3 in. across, lvs. oblanceolate and cuspidate, the upper part of lvs. red-brown: fls. bright red, 1 m. across, m panicle to 6 in. long.

Túscanii: listed name.

Umbílicus var. cheiránthum: name without botanical status; possibly may be applied to Umbilicus chrysanthus which is Sedum chrysanthum.

umbréllum: name without botanical significance.

undulatum: Æonium undulatum

Vérlottii. Hybrid between S. montanum and S. tectorum.

villosum: Aichryson villosum.

violaceum: trade name of no botanical standing.

violáscens: S. tectorum. vulgáricum: listed name.

Webbianum: S. arachnoideum var. tomentosum.

Wólfii: listed name.

Wülfenii. To 9 in.: rosettes 2 in. across, lvs. obovate and cuspidate, slightly glaucous, ciliate, reddish at tip, to 1 in. long: fls. pale yellow, in dense hairy panicle 2-3 in. across. Cent. Eu.

Zelébori: S. ruthenicum. SENEBIERA: Coronopus.

SENECIO (incl. Cineraria). GROUNDSEL. Compositx. Vast number of widely dispersed herbs, shrubs and small trees, sometimes fleshy, with alternate or basal lvs. and solitary or clustered heads of variously colored ray- and disk-fls.; involucral bracts in 1 series, usually reinforced at the base with shorter bracts having a calyx-like appearance but the margins not overlapping as in Ligularia; pappus of soft whitish bristles.

A few herbaceous kinds are grown for flowers, foliage or climbing habit. They are of easy culture. Practically all the species may be propagated by seed, the perennials by drvision; stem- and root-cuttings may be employed. S. mikannoides is easily increased by cuttings of the running shoots.

abrotanifòlius of lists is S. adonidifolius.

acanthifòlius: S. Cineraria.

aconitifòlius. Hardy per., tall: lvs. palmately parted, lobes somewhat toothed. heads small, pinkish-red, in loose corymbs, of disk-fis. only. Amur, N. China.

adonidifòlius (S. abrotantfolius). Per. to 1½ ft.: lvs. finely punnately cut: heads small, brilliant orange, in a compound corymb. S. Eu.

alàtus. Per. to 2 ft.: lvs. ovate or ovate-lanceolate, to 1 ft. long, the petiole with broad toothed wings: heads ½ in. long, in branched panicles. Himalayas.

antennariifolius. Per. to 1½ ft., white-woolly: lvs. mostly basal, oval to spatulate, to 2½ in. long, densely white-woolly beneath and green above, upper lvs. linear: heads corynbose, to 1 in. across, ray-fls. golden-yellow. Va. and W. Va.

arenarius. Ann., erect, to 1½ ft., sticky-pubescent: lvs. variable, oblong to obovate, entire, toothed or 1-2-pinnatifid: heads several in lax corymbs, ray-fis. purple, disk-fis. yellow, pedicels long. S. Afr.

articulatus: Kleinia articulata.

aurantiacus (Cineraria aurantiaca). Per. to 1½ ft.: va. oval, basal, with only a few linear st.-lvs.: heads orangered. Alps.

aureus. Golden G. Golden Ragwort. Per. to 2 ft.: basal lvs. cordate-ovate, to 6 in. long, toothed, sometimes tunged purple beneath; st.-lvs. pinnately cut. heads yellow, ¾ in. across, in cotymbs. Newf. to Fla. and Tex.

Balsámitæ: S. pauperculus.

Bidwillii. Shrub to 5 ft, white-tomentose: lvs. oblong, to 2 in. long, leathery and thick; heads 1/4 in. across, in corymbs, of disk-fis. only New Zeal.

Buchánanii: S. elwagnifolius var.

canus. Tuited white-tomentose per. to 1 ft.: lvs. oblongobvate, to 5 in. long and 1 in. wide, entire or toothed: heads \(\frac{1}{2} \) in. long, in cymes, rays yellow. B. C. to Neb.

centropáppus. Shrub to 10 ft., glabrous, much branched: lvs. broadly linear, to 3 in. long, crowded at ends of branches, sessile, entire: heads to ½ in. across, in small painteles at ends of branchlets forming a large corymbose paintele, ray-fis. 4-6 and scarcely longer than involucie, pappusbristles toothed and plumose. Australia.

Cineraria (Cineraria maritima. S. acanthifolius). Dusty Miller. Per. to 2½ ft., stiff, white-woolly: lvs. pinnately cut into oblong blunt segms.: heads yellow or cream, to ½ m. long, in cynnes. Medit. region.—Blooms all seasons in favorable climates; hardy N. in protected places; favorite for the white herbage. Var. aureo-marginatus, lvs. bordered with orange-yellow. For var. candidissimus see S. leucostachys.

cineráscens (Kleinia cinerascens and tomentosa of hort.). Per to 2 ft., woody at base, erect, white-woolly: lvs. pinnattfid, to 5 m. long, usually 2-4 lobes on each side, margins revolute, often glabrate above: corymbs 3-8-headed, to ½ m. across. S. Afr.

clivorum: Ligularia clivorum.

compactus. Shrub to 3 ft., much branched: lvs. obovate, to 1½ in. long, slightly toothed, white-tomentose beneath: heads yellow, 1 in. across, in leafy racemes. New Zcal.

confusus. Glabrous vine or scandent shrub. Ivs. thickish, narrowly ovate-acuminate, to 2 in. or more long, remotely dentate. heads with orange or orange-red rays, ½ in. or more across, in terminal clusters. Mex.; cult. in the Rio Grande region.

crassissimus (Kleinia crassissima of hort.). Much branched shrub to 2½ ft.: lvs. broad-obovate, to 2½ in. long and 1 in. wide, entire or with few teeth, very thick and fleshy: heads small, peduncled, ligules oblong. Madagascar.

cruentus (Cineraria cruenta). Florists Cineraria. Short-stemmed woolly per.: Ivs. large, cordate-ovate, undulate and toothed. fis. purple-red. Canary Isls.—The supposed parent of the florists cineraria, perhaps hybridized with other species, its fis. more or less double, in white, shades of blue, pink and red-purple. Cineraria stellata is of more open growth, 2 ft., the fl.-heads single and smaller. See Cineraria.

Dòria. Per. to 4 ft., glabrous: lvs. oval-oblong, to 15 in. long, toothed, glaucous: heads yellow. Eu.

Dorónicum. Leopards-Bane. Per. to 2½ ft., pubescent: lvs. thickish, ovate to lanceolate, to 7 in. long, toothed to entire: heads orange or yellow, to 2½ in. across, few. S. Eu.

Douglasii. Subshrub to 6 ft., white-tomentose when young: lvs. linear or pinnate into linear lobes: heads yellow, 1/2 in. long, in corymbs. Calif. to Tex. and Nev.

elæagnifòlius. Shrub to 10 ft., yellowish-tomentose: lvs. obovate to oblong-lanceolate, to 5 in. long, leathery: heads ½ in. across, in panteles, of disk-fis. only. New Zeal. Var. Buchánanii (S. Buchananii) grows 4 ft. high and lvs. to 2 in. long.

élegans (S. purpureus. Jacob.ca elegans). Purple Ragwort. Ann. to 2 ft., sticky-hairy: lvs. mostly oblong, to 3 in. long, pinnately lobed or toothed: heads in loose corymbs, rays purple or reddish, disk yellow. S. Afr.—There are double vars. and with white, rose and crimson fls. Flower-garden and conservatory plant.

Elmeri. Tufted per. to 8 in.: lvs. spatulate-oblanceolate, to 2 ¼ in. long, toothed: heads 1/2 in. long, in cymes. Wash. ensifolius: trade name.

Féndleri. Per. to 1 ft., loosely woolly becoming glabrate: lvs. oblanceolate, to 2 in. long, pinnatifid, lobes rounded heads corymbose, about 3% in. across, ray-fis. yellow. New Mex. to Colo. and Utah.

fibrillosus. Per. to 2 ft.: lvs. to 3 in. long, toothed: heads yellow, 1/2 in. across, in racemes, of disk-fis. only. China.

ficoides: Kleinia ficoides.

Fléttii. Per. to 8 m.: Ivs. mostly basal, oblong, to 5 in. long, pinnate into cut-toothed segms.: heads 1/4 in. long, in colymbs, rays dark yellow. Wash.

Fùchsii. Per. to 5 ft.: lvs. oval to lanceolate, 6 in. long, toothed. heads yellow, fragrant, ½ in. long, in corymbs. Eu.

glastifòlius. To 3 ft. or more, erect: lvs. oblong-lanceolate, to 3 m. long, glabrous, unequally toothed, lower ones strongly decurrent: heads in corymbose panicles, to $\frac{1}{2}$ m. across, ray-fis, puiple. S. Afr.

grandiflorus. Per. to 5 ft.: lvs. pinnate into linear segms.: heads with purple rays and yellow disk, in corymbs. S. Afr.

grandifòlius. Shrub to 15 ft.: lvs. ovate, to 1½ ft. long, wavy-toothed, tomentose beneath. heads yellow, in cymes. Mex.

Grèyii. Shrub to 8 ft.: lvs. oblong or oblong-ovate, to 3½ in. long, leathery, white-tomentose beneath: heads yellow, 1 in. across, in corymbs to 5 in. across. New Zeal.

Hárfordii. Per. to 1½ ft.: lvs. to 6 in. long, pinnate into lobed and toothed segms.: heads ½ in. across, in cymes, rays bright yellow. Wash.

Héctori. Shrub to 12 ft.: lvs. oblong-lanceolate, to 1 ft. long, crowded toward end of branchlets, toothed to pinnatifid, white-tomentose beneath: heads white, to 2 in. across, in large corymbs. New Zeal.

Heritièri. Per. somewhat shrubby, about 1 ft.: lvs. suborbicular, to 1¾ in. broad, 5-7-lobed, white-woolly beneath: heads mostly solitary, purple. Teneriffe.

Húntii. Shrub or tree to 20 ft., sticky-pubescent: lvs. elliptic-lanceolate, to 4 in. long, entire. heads yellow, to 34 in. across, in large panicles. Chatham Isls. (New Zeal).

incanus. Per. to 6 in.: lvs. pinnately cut, white-woolly: heads yellow, about ½ in. across, in corymbs. Alps.

Jacobæa. Tansy Ragwort. Bien. or per. to 4 ft.: lvs. to 8 in. long, 2-3-pinnately cut: heads yellow, ½ in. across, in many-fid. corymbs. Eu.; nat. in E. N. Amer.

japónicus: Ligularia japonica.

Kaémpferi: Ligularia Kaempferi.

Kirkii. Shrub to 15 ft. high and 20 ft. across, occasionally epiphytic: lvs. linear-lanceolate to obovate, to 4½ in. long, obtuse, entire or distantly serrate: heads to 2 in. wide, in dense much branched corymbs to 3 ft. across, ray-fis, pure white, recurved, disk-fis, yellow. New Zeal.; not hardy N.

lanatifòlius. Per. to 10 m., branched and quite leafy: lvs. linear, pectinate-pinnatifid, the segms. wavy-toothed: heads crowded, to ½ in. across, ray-fis. absent. Colo. to Neb.

Lédebouri: Ligularia macrophylla.

leucóstachys. Shrubby at base but herbaceous as usually grown from cuttings, white-tomentose: Ivs. pinnathful into linear lobes: heads in compound corymbs. Argentina.—Known in cult. as S. Cineraria var. candidissimus; distinguished from S. Cineraria by less still habit and the numerous very narrow lf.-lobes; good plant for poich boxes.

lobatus. Ann. or bien., to 3 ft., often somewhat woolly. lvs. pinnately parted, with broad toothed segms.: heads yellow, with narrow rays. S. E. U. S.—The plant grown as Cineraria lobata has slender very diffuse habit, and roundush notched lvs. S. Afr.

16ngipes. Per. or subshrub, erect: lvs. fasciculate, narrowly linear to filiform, acute, apically seriate, margins revolute: heads discoid, on long peduncles, usually 3-7 in each cyme, involucral bracts I-seriate, glandular. Patagonia.

Lyallii. Per. to 11/2 ft., pubescent: lvs. linear, to 10 in. long, entire: heads yellow, to 21/2 in. across, in large corymbs. New Zeal.

macrophyllus (Jacobæa macrophylla). Per. to 4 ft.:

lower lvs. obovate-oblong, to 11/2 ft. long: heads yellow, in compound cymes. Eu.

maritimus. A S. African species not known to be in cult.; material so listed may be S. Cineraria or Artemisia Stellerrana.

mikanioides. German Ivy. Tall-twining: lvs. ovate with deep basal sinus, shaiply 5-7-angled: heads small, yellow, in close clusters, of disk-fls. only. S. Afr.—Often known erroneously as S. scandens; an old window-garden and conservatory plant.

Monròi. Shrub to 6 ft., white-tomentose: lvs. oblong, to 1½ in. long, leathery, wavy-margined: heads yellow, to ½ in. across, in corymbs. New Zeal.

multibracteatus. Ann. to 1½ ft.. lvs. lanceolate, to 2½ in. long, with few coarse teeth: heads in long-stalked corymbs, rays purple, disk yellow. S. Afr.

nebrodénsis. Ann. or bien. to 1½ ft.: lvs. pinnately cut: heads yellow, to 1 in. across, in corymbs. Eu.

obovatus. Per. to 2 ft.: basal lvs. obovate or oblong, to 4 in. long, wavy-toothed; st.-lvs. often pinnatifid: heads yellow, ½ in. across, in corymbs. Me. to Fla. and Tex.

ovalis: Gynura auriculata.

palmatifidus: hort. name, probably for Ligularia janonica

pauciflòrus: an uncertain name.

paupérculus (S. Balsamitæ). Balsam G. Per. to 1½ ft.: basal lvs. oblong, to 5 in. long, wavy-toothed; st.-lvs. pinnately cut: heads yellow, to ¾ in. across, in corymbs. Newf. to B. C. and Neb.

Petasitis. Velvet G. California-Geranium. Bold per to 8 ft.: lvs. ovate or suborbicular, 9-13-lobed, to 8 in. across, grayish-tomentose beneath: heads yellow, in terminal many-headed panieles. S. Mex.

petrocállis. Per. to 4 in.: basal lvs. nearly orbicular, to 34 in. long: heads golden-yellow, ½ in. long, solitary or in 2's. Mts., Colo., Utah, Ida.

pseudaureus. Per: to 2½ ft., glabrous: basal lvs. broadly ovate, to 2 in. long, obtusely serrate, long-petioled; st.-lvs. oblanceolate-elliptic, to 3½ in. long, pinnatifid: heads corymbose, to ½ in. across, ray-fls. bright yellow. New Mex. to Calif. north to B. C. and S. D.

púlcher. Per. to 4 ft., white-cobwebby: lvs. oblong-lanceolate, to 10 in. long, thick, shallow lobed or toothed: heads to 3 in. across, rays red-purple, disk yellow. Uruguay, Argentina.

purpureus: S. elegans.

Purshiana. Per. to 8 in., densely tomentose: basal lvs. broadly spatulate, to 2 in. long, obtuse, entire: heads bright yellow, about ¾ in. across, 2-10 in small cymes. Sask. to B. C. south to Tex. and Utah.

remotifòlius. Shrub to 6 ft.: lvs. to 5 in. long and 3 in. wide, tomentose beneath: heads ½ in. across, in panicles to 6 in. long, of disk-fls only. New Zeal.

réptans (Klenna reptans of hort.). Plant with prostrate rooting stolons to 3 in. long: lvs. linear-oblong, to 134 in. long, cut-toothed: heads solitary, yellow. S. Afr.

Riddellii. Per. to 3½ ft., sts. glabrous, very leafy: lvs. pinnate, segms. linear-filiform, entire, glabrous: ray-fls. about 12, light yellow, heads to 1½ in. across. Neb. to Wyo., Tex. and New Mex.

Rodriguêzii. Ann. to 7 in.: lvs. oblong-lanceolate, td 2 in. long, obtuse, dentate, metallic-green above, purplish beneath: heads short-rayed, to ½ in. across, rose-pink, in 2-3-headed lax cymes. Spain.

rotundifòlius. Shrub or tree to 30 ft.: lvs. orbicular or broad-oblong, to 5 in. across, thick and leathery, yellowishtomentose beneath: heads 1/3 in. across, in panicles, of disk-fis. only. New Zeal.

saxifragoldes. Per. to 1½ ft.: lvs. all basal, oblong-orbicular, to 7 in. long, soft white-silky above when young, long-petuoled; heads corymbose, to 1½ in. across, rayfls. yellow. New Zeal.

scándens. CLIMBING G. Woody, climbing to several ft.: lvs. ovate or oval-lanceolate, sometimes with a few divisions at base of blade, toothed, grayish-green, pubescent: heads yellow, in panicles. China.—See S. mkanioides.

scorzoneroldes: Per. to 14 in., pubescent: lvs. linear- or ovate-lanceolate, to 8 in. long, entire: heads white, yellow or pinkish, to 2 in. across, in large corymbs. New Zeal.

sibíricus: Liquiaria sibirica.

spartioldes. Per. to 2 ft., quite leafy: lvs. linear, glabrous, entire. heads corymbose, to 1½ in. across, yellow. Tex. to Ariz. north to Neb. and Wyo.

speciòsus. Per. to 2 ft.: lvs. obovate or lanceolate, to 7 in. long, toothed or lobed, glandular-hairy: heads bright purple, $1\frac{1}{2}$ in. across, in spreading corymbs. S. Afr.

stenocéphalus: Ligularia stenocephala.

subscandens. Climbing herb: lvs. to 4 in. long, pinnate

into oblong or ovate toothed lobes: heads ochre-yellow, k in. long, in much branched cymes. Trop. Afr.

succuléntus: Kleinia repens.

sylváticus. Ann. to 1½ ft.: lvs. pinnately cut into linear toothed lobes. white-hairy: heads yellow, in corymbs. Eu.

tangiticus. Per. to 7 ft.: lvs. broadly ovate or triangular, to 7 in. long, pinnately divided into toothed segms., pale: heads yellow, very numerous in terminal pyramidal panicles. W. China.

thapsoides. Per. or bien.: lvs. oblong, wavy-toothed, white-tomentose beneath: heads 1/2 in. across, in racemes. of disk-fls. only. Greece.

triangulàris. Per. to 3 ft., leafy: lvs. triangular, to 6 in. long, toothed: heads 1/3 in. long, yellow, in corymbs. Wash.

tropæolifòlius (Kleinia tropæolifolia). Per. to 1 ft.: basal lvs. orbicular, peltate, to 3 in. across, long-petioled, violet beneath: heads in globose corymbs, rays yellow. Nyassa-

tyroliénsis: a listed name.

Veitchianus: Ligularia Veitchiana.

viscòsus. Ann. to 1½ ft., sticky-hairy: lvs. pinnate into lanceolate segms.: heads yellow. Eu., W. Asia.

Visianus. To 2 ft., white-tomentose: lvs. oblong-lanceo-Visianus. To 2 ft., white-tomentose: ivs. onlong-innecolate, jagged-toothed, cobwebby above, densely tomentose beneath: heads yellow, in panieles. Montenegro.

Wébsteri. Per. to 10 in., often woolly: basal lvs. ovate or oblong, to 5 in. long, toothed: heads solitary, ½ in. long. Wash.

Wilsonianus: Ligularia Wilsoniana.

SENEGALIA: see Acacia.

SENNA: Cassia, Bladder: Colutea, Scorpion: Coronilla Emerus.

SENSITIVE-PLANT: Mimosa pudica. Wild: Cassia nictitans.

SEPAL: one of the separate leaves of a calyx.

SEQUÒIA. Taxodiacex. Titanic evergreen tree native in W. N. Amer., often becoming 300 ft. or more high and with immense boles, with linear or scale-like lys. and drooping cones with woody scales. For cult. see Conifers.

gigantèa: Sequoiadendron giganteum.

sempérvirens. Redwood. Lvs. linear, to 1 in. long, mostly spreading in 2 ranks: cones to 1 in. long. S. Ore., N. and Cent. Calif. in the Coast ranges; to be planted, outside its native regions, only far S. or in very mild climates. Var. adpréssa has young lvs. and tips of branchlets creamy, var. gladca blush lvs., and var. péndula drooping branches.

Washingtoniana: Sequoradendron giganteum.

SEQUOIADÉNDRON. Taxodiacex.typic genus of the western slopes of the Sierra Nevada range in Calif., formerly treated as belonging to the genus Sequoia, differing in lvs. uniform, ovate to lanceolate, appressed or slightly spreading, winter-buds not scaly, cones of 25-40 scales, and the seeds requiring two seasons for the maturity of the embryos. There are many other technical differences of the floral structures.

giganteum (Sequoia gigantea and Washingtoniana). GIANT SEQUOTA. Tree to 100 ft. or more, having trunk many ft. in diam. and bark to 20 in. thick, narrowly pyramidal when young: cone ellipsoid, to 3½ in. long, very hard and woody, remaining on the tree many seasons. Trees have persisted in Cent. N. Y. to 30 ft. or more in height in protected places, but are reliable only in the central and southern states. Var. aireum has yellow lvs., var. glacum blush, and var. péndulum strong deflexed branches forming a narrow column.

SERAPIAS: the name of a European genus of orchids, formerly used for some members of *Epipactis*, which see.

SERENOA. SAW- or SCRUB-PALMETTO. Palmacex. Hermaphrodite small fan-palm, S. C. to Fla. and Tex., unarmed except for the numerous fine saw-teeth on the slender petiole: spadix axillary, much branched, usually surpassing the petioles; fls. narrow-oblong in bud, fragrant; stamens 6: fr. an ovoid or globose 1-seeded black drupe, $\frac{1}{2}$ - $\frac{3}{4}$ in. long. See Palm.

arboréscens: Paurotis Wrightii.

rèpens (Sabal and S. serrulata). Mostly with prostrate repens (Sabat and S. serruata). Mostly with prostrate or creeping branching sits and making great masses or colonies, sometimes the trunk erect and several ft. tall: If.-blades 2-2½ ft. across, either green or glaucous, cleft below the middle into 20 or more rather stiff segms. bifd at apex. In its apparently acaulescent form it covers great

serrulàta: S. repens.

SERICOCÁRPUS. Compositæ. Aster-like per. herbs of N. Amer. with alternate lvs. and panicled heads of white ray-fls, and vellowish or purplish disk-fls.; pappus of bristles. Sometimes transferred to the wild-garden or border.

asteroides. To 2 ft.: lvs. obovate or oblong, toothed or entire, to 4 in. long: heads ½ in. long. Me. to Fla. and Ala.

SERICOGRAPHIS: Jacobinia pauciflora.

SERICOTHECA: Holodiscus.

SERÍSSA. Rubiacex. Shrub to 2 ft., native in S. E. Asia and grown under glass and in the open far S. Propagated by cuttings over heat. S. fætida (S. japonica). Lvs. opposite, small and clustered on flowering branchlets, ovate, to ½ in. long, fetid when bruised: fls. white, to ½ in. long, funnelform with 4-6-lobed limb, solitary or clustered. Var. variegata has lvs. margined with vellow.

SER JANIA (or Seriania). Sapindaceæ. Woody twining or tendriliferous vines bearing alternate mostly pinnate compound lvs., yellowish irregular polygamous fls. in axillary racemes or panicles, and winged frs.; sometimes grown in S. Calif. and similar climates; native in trop. and semi-

fuscifòlia. Lvs. biternate into ovate toothed lfts. rufous-pubescent beneath: fr. ovate or elliptic, about ½ in. long. Brazil.

glabrata. Lvs. biternate into ovate coarsely toothed glabrous lfts.: fr. cordate-ovate, 1% in. long. S. Amer.

SERRADELLA: Ornithopus sativus.

SERRAFALCUS HUGHII: Bromus intermedius.

SERRASTYLIS: Macradenia modesta.

SERRATE: saw-toothed.

SERRÁTULA. Compositæ. Per. herbs allied to Centaurea: lvs. alternate, toothed or cut: heads purple, solitary or in corymbs, of disk-fls.; pappus of hairs; native in the Old World. Sometimes planted in the border.

nudicaulis. To 3½ ft.: lvs. oblong or oval, entire or toothed below. heads solutary. Eu.

tinctòria. To 3 ft.: lvs. variable, deeply pinnatifid or cometimes entire: heads about ½ in. long, in loose corymbs. Cent. Eu.

SERVICE-BERRY: Amelanchier. -Tree: Sorbus domestica and torminalis.

SESAME: Sesamum orientale.

SÉSAMUM. Pedaliaceæ. African and Asian herbs with often rough foliage, 5-lobed 2-lipped tubular fls. solitary in the axils, and capsular frs.; one species grown for the seeds which yield bene oil. In the N. grown as an ann. from seeds; sometimes raised under glass for interest.

alàtum. To 3 ft. erect, branched: lower lvs. long-petioled, blades palmately divided into 3-5 segms. or lfts., latter linear-lanceolate, to 3 in. long, acute, enture, mealy-glandular below, upper lvs. entire, linear to lanceolate, petioles short: fls. pink to carmine with dark spots in throat, to 1 in. long: caps. 1½-2 in. long, finely pubescent, seeds winged. Trop. Afr.

capense. To 6 ft.: lvs. all palmately 3-5-foliolate, lfts. obovate-oblong to linear, to 2½ in. long, obtuse, entire, nearly glandular on both sides: fts. violet outside, darker within, to 1½ in. long: caps. to 1¾ in. long, seeds winged.

indicum: S. orientale.

orientale (S. indicum). Sesame. To 2 ft., sparingly and finely pubescent: lvs. oblong or lanceolate, to 5 m. long, sometimes 3-lobed: fis. pink or white, 1 in. long, with shorter upper lobes: caps. 1 in. or more long, with 4 grooves, seeds not winged. Tropics.

SESBÀNIA (Sesban). Leguminosx. Herbs or shrubs with pinnate lvs., papilionaceous fls. in axillary racemes, and long compressed pods; grown for ornament in warm climates and one for cover-cropping.

aculeata: S. bispinosa.

bispinosa (S. aculeata). To 10 ft., prickly: lfts. to ½ in. long: fls. pale yellow spotted with reddish-brown, in racemes to 6 in. long: pods 8 in. long. Tropics.

Emerus (S. macrocarpa). Subshrub to 16 ft., sts. somewhat angled: lfts. 24-50, apex obtuse, to 1½ in. long: fls. yellow, to ½ in. long, standard spotted dark purple and ¾ in. wide or more: pods to 8 in. long. Fla., Cent. Amer. and W. Indies.

exaltàta. Ann. to 12 ft., sts. mostly terete: lfts. 30-70, apex mucronate, to 1 in. long: fls. yellow, ½ in. long or less, standard ½ in. wide or less: pods to 9 in. long. Mo. to La. and probably S. Calif. to Mex.—Sometimes employed as green-manure crop. Some of the material grown as S. macrocarpa may belong here.

grandifiòra: Agati grandiflora.

macrocárpa: S. Emerus.

punícea: Daubentonia punicea. Tripètii: Daubentonia Tripetii.

SESSILE: not stalked: sitting.

SETÀRIA (Chætochloa). Gramineæ. Ann. and per, grasses distributed in warm regions, one a valuable grain and fodder plant and a few others ornamental: spikelets subtended by persistent bristles longer than the spikelet, borne in terminal spike-like panicles. See Grasses.

itálica (S. macrochæta. Panicum germanicum). Foxtail.
Millet. Ann. to 5 ft.: lvs. to 1 ft. or more long and 1 in.
wide, rough: spikes to 1 ft. long and 2 in. across, curved or
nodding, the bristles green, brown or purplish: fr. yellow,
brown, red or black. Cultigen but widely spiead. Var.
nigrofrácta, Hungarian-Grass, has brown bristles, dense
spikes to 3 in. long, and nearly black frs. Var. rubrofrácta,
Siberian and Turkestan M., has purple bristles and
reddish or orange fr. Var. stramineofrácta, German and
Golden Wonder M., has very large spikes and yellow fr.

macrochèta: S. stalica.

nigra: listed name.

palmifòlia (Panicum palmifòlium). Palm-Grass. Per. to 6 ft.: lvs. to 2 ft. long and 3 in. wide in middle, plicate: panicles to 2 ft. long, open and interrupted. E. Indies.—Often grown in greenhouses and in the open far S. There is a form with striped lvs.

plicata (Panicum plicatum. P. excurrens). Often confused with S. palmifolia but the lvs. are smaller, to 8 in. long and 1/2 in. wide, and the panicles narrower.

Poiretians. Tufted per, several ft. tall: lvs. to 1½ ft. long and 1 m. wide, strongly plicate: panicles to 2 ft. long, narrow, branches ascending. Mex. to Brazil.

sulcata (Panicum sulcatum). Similar to S. Poiretiana but taller with larger lvs. and more open panicles, the branches drooping. W. Indies to Ecuador.

SEVEN STARS: Ariocarpus retusus.

SEVERÍNIA. Rutacex. S. buxifòlia (Atalantia buxifolia, Triphasia monophylla), the only species, native in S. China and Formosa, is an ornamental spiny shrub or small tree, suitable also for hedges far S.: lvs. simple, ovate-oblong and rounded or emarginate at apex, petiole very short: fls. small, white, solitary or few in axils; stamens 10, not united: fr. a globular berry, shining black, about 1/3 in. diam.

SHADBUSH: Amelanchier.

SHADDOCK: Citrus maxima; see Citrus Fruits (page 183).

SHALLOT: see Onion.

SHALLU: Sorghum vulgare var. Roxburghii.

SHAWIA: Olearia.

SHEATH: any long or more or less tubular structure surrounding an organ or part; as the sheath of a grass leaf, heing its lower part.

SHEEP-BERRY: Viburnum Lentago. SHEEPS-BIT: Jasione perennis.

SHELL-FLOWER: Alpinia speciosa, Molucella lævis.

SHEPHÉRDIA (Lepargyrea). Elæaanaceæ. Shrubs or small trees of N. Amer. with brown or silvery scales, having opposite simple lvs., small yellowish dioccious fls., and drupe-like frs.; grown for ornament and S. argentea for the frs. which are made into jelly. Adapted to dry rocky soils. Propagated by seeds sown in fall or stratified.

argentea. Buffalo-Berry. To 18 ft., thorny: lvs. oblong, silvery on both sides: fr. red or yellow in var. xanthocarpa. Man. to Minn. and Kans.—Sometimes grown for its edible frs. and as a hedge plant in the Northwest, valuable for its great hardiness.

canadénsis. To 8 ft., thornless: lvs. ovate or oval, silvery beneath: fr. red or yellow. Newf. to Alaska and south. Var. rùbra, fr. red, Var. xanthocárpa, fr. yellow.

SHERWOODIA: Shortia galactfolia.

SHIBATÆA. Graminex. Bamboo-like shrubs having much flattened zigzag nearly solid sts.; differs from Phyllostachys in its ovate-oblong to ovate-lanceolate petioled lys, and shorter irregular sts.

kumasáca (Phyllostachys kumasaca, ruscifolia and viminalis. Bambusa kumasaca and viminalis). To 6 ft., sts. much flattened lvs. to 5 in. long and 1 in. wide, shining above, slightly glaucous beneath. Japan.

SHIELDWORT: Peltaria.

SHINLEAF: Purola. One-flowered: Moneses uniflora.

SHOO-FLY PLANT: Nicandra Physalodes.

SHOOTING-STAR: Dodecatheon.

SHÓRTIA. Diapensiacex. Evergreen stemless herbs with creeping rootstocks, basal lvs., bellshaped nodding fls. solitary on slender scapes, and capsular frs.; somewhat like Galax.

Shortias are grown in rock-gardens and similar places. They should be planted in shady situations and require leaf-mold and humus. Propagated by division and runners.

califórnica: Baeria aristata.

galacifòlia (Sherwoodia galacifolia). Oconee-Bells. To 8 in.: Ivs. orbicular, to 3 in. long, slightly wavy-margined: fls. white, 1 in. across. Mts. of N. C. Var. ròsea has rose fls.

ilicifòlia: S. soldanelloides var.

soldanelloides (Schizocodon soldanelloides). Fringed Galax. Fringe-Bell. Alpine, to few in. high: lvs. round, coarsely toothed: fis. deep rose, white or blush toward edge, the corolla-lobes fringed, 1 in. across, 4–6 on a scape, Japan. Var. ilicifolia (S. alicifolia) has larger and fewer teeth on the lf .- margins.

uniflora. Nippon-Bells. Differs from S. galacifolia in the more heart-shaped and deeply wavy-margined lvs. Japan. Var. grandiflora has larger fls.

SHRIMP-PLANT: Beloperone auttata.

SHRUB: a woody plant that remains low and produces shoots or stems from the base and not a single trunk; contrast to tree, among woody plants; bush.

SIBBALDIA. Rosacex. Low tufted perennials allied to Potentilla, with alternate lvs. of 3 lfts. and small yellow fls. in cymes; adapted for alpinegardens and hardy.

procumbens. To 4 in.: lfts. wedge-shaped, to ¾ in. long, 3-5-toothed at apex: fls. ¾ in. across. Arctic and alpine regions, N. Amer., Eu., Asia. Var. grandiflòra is listed.

SIBBALDIOPSIS: Potentilla tridentata.

SIBIRÆA. Rosacex. Deciduous shrubs once included in Spiræa, having alternate entire lvs., small unisexual fls. in terminal panieles, and fr. of 2-seeded follicles united at base; native in Asia and S. E. Eu. Propagated by seeds or layers.

lævigåta (Spiræa lævigata). To 5 ft.: lvs. oblong, to 4 in. long, bluish-green: fis. greenish-white, in panicles to 5 in. long. Siberia; hardy N.

SIBTHÓRPIA. Scrophulariaceæ. Creeping per. herbs with orbicular-reniform lvs. and yellow, vellowish-rose or red fls. with short tube and 4-8 corolla-lobes; grown as a ground-cover in the greenhouse or out-of-doors in mild climates.

africana: S. europæa var.

europæa. Very slender trailer: lvs. to ½ in. across, 7-0-lobed: fis. small, the 2 upper lobes of corolla yellowish, the 3 lower pink. Moist shady places, England, France, Spain, Portugal. Var. africana (S. africana) differs in being more hairy, in the slightly larger all yellow or purplish fis. Trop. Afr. Var. variegata has bright golden-green lvs.

SICANA, Cucurbitacex. Tendril-bearing monocious American vines, probably more than a single species, per. but grown as an ann. in this country for its ornamental fragrant fr. which is also edible: fls. solitary, yellowish, corolla 1 in. or less long.

odorífera. Curuba. Cassabanana. To 40 ft. and more: ocorners. Curuba. Cassabarana. 10 40 ft. and more: lvs. nearly orbicular and several-angled or -lobed, to 1 ft. across: fr. long-oblong and nearly cylindrical, to 2 ft. long, orange-enimson and scented. S. Amer.—Somewhat grown in the Gulf regions. *Benincasa hispida* is sometimes confused with Cassabanana.

SÍCYOS. Cucurbitacex. Ann. tendril-bearing monocious vines of Amer. and Australasia, one of which is sometimes grown as a screen: fls. small, white or greenish, mostly in fascicles: fr. small, indehiscent, usually spiny.

angulatus. Bur- or Star-Cucumber. To 20 ft. or more, with hary petioles and peduncles. Ivs. cordate-orbicular, sharply angled or lobed. fr. about ½ in. long, spiny, 1-seeded, in clusters. E. Canada and U. S.—Likely to become a weed.

SIDA. Malvacex. Herbs or shrubs of wide distribution and mostly of warm climates: allied to Abutilon and Malvastrum, differing from the former in seeds solitary in each carpel and from the latter in the bracteate involucel wanting. One species may be cult.

cordifòlia. Woody per. to 4 ft.: lvs. ovate to suborbicular, to 4 in. long, crenate-dentate, velvety, cordate: fls. tawny-yellow, to $\frac{2}{3}$ in. across. Trop. Amer.

hermaphrodita. VIRGINIA-MALLOW. Per. to 12 ft.: lvs. palmately 3-7-lobed, to 6 in. across, lobes acuminate, toothed: fls. white, to nearly 1 in. across, in umbellate corymbs on slender pedicels: fr. composed of 10 one-seeded carpels. Woods and river banks, Pa. to Ohio, south to Va. and Tenn.—The plant offered as S. Abutilon probably leads to the plant of belongs here although the name is botanically a synonym of Abutton Theophrastu.

SIDALCEA. Malvacex. Per. and ann. herbs (ours per.) with alternate palmately lobed or divided lys., purple, pink or white fls. in terminal spikes or racemes, and 5 or more carpels separating at maturity; native in W. N. Amer. Of easy cult. in the per. border. Propagated by seeds or division. Garden hybrids are reported.

califórnica: S. malvæflora var.

campéstris. To 4 ft.: basal lvs. orbicular, 9-lobed, st.-lvs. with linear segms.: fls. rose or lilac, to ¾ in. long. B. C. to N. Calif.

cándida. Per. to 3 ft., nearly or quite glabrous: radical lvs. broad and crenate or bluntly lobed, upper lvs. 5-7-parted: fls. white, to ¾ in. long, in racemes. Rocky Mts. grandiflòra: hort. name.

Héndersonii. To 3 ft.: lvs. orbicular, 5-7-lobed into toothed segms.: fls. deep rose, 1 in. long. B. C. to Ore.

hýbrida: hort. name.

Listeri: S. malvæflora var.

malvæflora. CHECKERBLOOM. Per. to 2 ft. with erect or somewhat decumbent branches: lower lvs. crenate or lobed, upper ones cleft into very narrow parts: fls. rose, to 1½ in. long, in many-fld. racemes. Calif. Var. atropurpurea has purple fls., californica is much more hairy, and Listeri has satiny pink fls.

Murravàna: S. spicata.

Murrayana: S. spicata.

nèo-mexicàna. To 8 ft.: basal lvs. orbicular, to 4 in.
across, 5-0-lobed, st.-lvs. divided into linear or oblong
segms.: fls. lilac varying to rose or white, to ¾ in. long.
New Mex. to Wyo.

nervàta. Believed to be only an eastern form of S.
oregana and by some authorities treated as a synonym:
plants from the extreme eastern limits differ from S.
oregana in being glabrous or nearly so, the lobed lower lvs.
and much larger fis. to 1½ in. across. Wyo., Utah.—Plants
cult. as S. malvæflora may belong here, also the form known
as Roser Com. as Rosy Gem.

oregana. Per. to 5 ft., pubescent: lower lvs. toothed or slightly lobed, upper cleft into lanceolate or linear parts: fls. rose-pink, ½ in. long, in dense spikes. Ore. to Calif.

parviflora. Per. to 4 ft., glabrous to somewhat pubescent: lvs. palmately toothed or divided: fls. rose, ½ in. long, in long slender racemes. S. Calif.—Probably not now in cult. ròsea: hort. name, perhaps for garden form of S. mal-

næflora. spicata (S. Murrayana). Per. to 4 ft., pubescent or hirsute: lvs. crenately lobed to parted: fis. purplish, ½ in. long, in dense spikes. Calif.

SIDERANTHUS. Compositæ. Ann. or per. herbs of the Ericameria kind, with alternate lvs. and yellow heads of ray- and disk-fls.; pappus of

ánnus. Ann. to about 1½ ft., glandular-pubescent: lvs. oblanceolate, dentate, to 2½ in. long: heads corymbose, to 1½ in. across, ray-fls. light yellow. Neb. to Tex.

phyllocéphalus. Ann. to 2 ft., sts. pubcscent, usually diffusely branched: lvs. punnathid or entire, segms. or teeth bristle-tipped: fls. brownish-orange or dult yellow, in heads to 2 in. across. Sandy beaches, Tex. and N. Mex.— Xanthisma texanum has been grown under this name.

rubiginosus (Haplopappus rubiginosus). Ann. to 3 ft., sts. sticky-pubescent: lvs. simple, oblong to lanceolate, remotely dentate: fls. yellow, to nearly 1 in. across. Tex.—Some of the material in cult. may be S. annua.

spinulòsus. Per. to 1½ ft.: lvs. about 1 in. long, pinnatifid into linear or oblong toothed or cut segms.: heads clustered, ½ in. across. Sask. to N. Mex.

SIDERITIS. Labiatæ. Herbs or shrubs with entire or toothed lvs. and small yellowish 2lipped fls. in clusters or spikes; native in Medit. region and Asia; sometimes grown in per. border.

eubœa. White-tomentose: lvs. oblong: fls. in cylindrical spikes. Greece.

hyssopifolia. To 8 in., subshrubby: lvs. oblong, incised-dentate, usually hairy: fls. with 5-toothed calyx, usually in verticillate whorls, rarely forming a spike. S. Eu.

libanótica. Subshrub, sts. glabrous, to 1½ ft.: lvs. obovate to lanceolate, serrate, glabrous to hairy: fls. yellow, in whorls of 4-8, calyx mucronate. S. Eu.

SIDEROCARPUS: Ebenopsis.

SIDERÓXYLON. Sapotaceæ. Trees or shrubs of the tropics, extending into S. Fla., with alternate leathery lvs., small 5-lobed fls. in clusters and fr. a berry; one species cult. in S. Calif.

costatum: S. novo-zelandicum.

nòvo-zelándicum (S. costatum). Tree to 45 ft.: lvs. obovate, to 4 in. long, shining: fr. 1 in. long. New Zeal.

SIEVERSIA: Geum.

SIGMATÓSTALIX. Orchidaceæ. Low herbs native in Cent. and S. Amer., with small 1-2-lvd. pseudobulbs and small fls. in racemes or panicles, the sepals and petals similar, the lip with long claw. See Orchids for cult.

radicans. Lvs. to about 7 in. long and 1/6 in. wide: infl. few- to several-fld., racemose; sepals and petals greenish-white; lip white with yellow callus. Nov.-Mar., Aug. Brazil.

SILÈNE. CATCHALY. CAMPION. Caryophyllacex. Erect, tufted, decumbent or more or less climbing ann. and per. herbs with red, pink or white fls. in cymes or solitary blooming in the summer, a few well into autumn; of wide dis-tribution over the world. The name Silene is pronounced in three syllables.

A few species are cultivated in rock-gardens and borders. The culture is very simple. If the seeds of the annual kinds are sown in the fall, much earlier bloom is secured the following spring. The perennials are increased by seeds, lowing spring. The

acadis. Cushion Pink. Moss Campion. Moss-like tufted per. to 2 in. high: lvs. linear, to ½ in. long: fls. reddishpurple, ½ in. across, solitany, May-Aug.; petals entire or shefitly notched. Eu., N. Amer. Var. álba has white fls. Var. carmínea is listed. Var. exscápa, fls. pale pink. Var. nórdica has darker fls. than the type. Var. pedunculàta is listed as having long-stalked fls. Var. saxátilis is listed.

álba (S. nivea). Per. to 3 ft.: lvs. lanceolate, to 5 m. long: fls. white, yellowish beneath, 34 in. across, few or solitary, June-July; petals 2-lobed; calyx inflated. Pa. to Neb.

albánica: name of unknown botanical standing.

alpestris (Heliosperma alpestre). ALPINE CATCHELY. alpestris (Heliosperma alpestre). Alpine Catchell. Per. to 6 in., more or less sticky: lvs. linear-lanceolate: fis. glistening white, about ½ in. across, in panicles, June-Aug.; petals 4-lobed. Mts. of Eu. Var. flore-pleno has double fis. Var. grandiflora has larger fis. Var. rosea is listed as having rose-pink fis.

alpina: confused name.

antirrhina. Ann. to 2½ ft.: lvs. oblanceolate, to 2 in. long. fls. pink, ¼ in. across, in loose panicles. N. Amer.—A weedy plant.

Armèria. Sweet William Catchfly. Ann., erect, to 2 ft., glaucous: lvs. ovate-lanceolate, to 3 in. long: fls. pink or rose, to 3 in. across, in terminal compound cymes, July-Sept.; petals slightly lobed at tip. S. Eu.; escaped in U. S. Var. álba has white fls. Var. spléndida is an improved

Astèrias. Per. to 4 ft., rather sticky: lvs. lanccolate to oblong, 4-5 in. long: fls. purple, in many-fld. head-like cymes 1 in. across; calya reddish; petals entire. Macedonia, Rumania. Var. grandiflòra, to 3 ft., fls. crimson-scarlet, in globose heads, July-Aug. Balkan Mts.

auriculata. Per. to 6 in., sticky-pubescent above, not much branched: lvs. oblong-lanceolate, short, acute, densely chlate: fls. rose-red, usually only 1-3; petals bind. Greece.

Bèhen. Ann. to 1½ ft.: lvs. obovate, acute: fls. pink, very small, in cymes, the petals narrowly and deeply lobed. Asia Minor.

Benoistii. Ann. to 1 ft., pilose to puberulous but not glandular: lvs. ovate to lanceolate, petioled to sessile, pubescent, margins somewhat crisped: fls. yellowish-green outside, purplish within; petals with 2 oblong-linear lobes; pedicels erect, to ½ in long, pilose to densely puberulous; pods ovate, to ½ in. long. Algeria.

Bérgeri: S. regia.

Bonnettii: S. pendula var.

brachypétala: S. nocturna.

californica (Melandrium californicum). Per. to 1 ft.: lvs. ovate or oblanceolate, to 3½ in. long: fls. crimson, to 1¼ in. across; petals deeply 4-lobed. Calif, Ore.

Campánula. Per. to 8 in.: lvs. linear-lanceolate: fls. white tinged red beneath, ½ in. long, solitary or in 2's; petals 2-parted. Mts. of S. Eu.

caramánica. Per. to 1½ ft.: lvs. linear-lanceolate: ffs. large, solitary, July; petals 2-parted. Asia Minor.

caroliniàna (S. pensylvanica. Melandrium pensylvanicum). WILD PINK. Per. to 10 in., sticky-hairy: lvs. spatulate or lanceolate, to 4 in. long: fls. rose or white, 1 in across, in terminal cymes, Apr.-June; petals notched E. N. Amer.

chloræfòlia. Per. to 2 ft., woody at base lvs elliptic, about 1 in. long, the upper cordate: fls. white turning reddish, large, in loose paincled cymes, May-June; petals 2-lobed. W. Asia.

chlorántha. Erect per.: lvs. oblong-lanceolate: fls. greenish-yellow, nodding, in panieles; petals 2-parted. Asia Minor.

compâcta (S orientalis). Bien. to 2 ft., glaucous: lvs. ovate to oblong-lanceolate, to 2 in. long: fls. pink, in dense sessile heads to 3 in. across, the upper lvs. forming an involucre, July; petals entire. E. Eu., Asia Minor.

cónica. Ann. to 2 ft., canescent-hairy but not sticky: lvs. linear-lanceolate, acute, to 1½ in. long, sessile: fls. rose to purple, to ½ in. across, few in open cymes. Eu; escaped from cult. in N. E. U. S.

conoidea. Ann. to 1 ft.: lvs. lanceolate: fls. pink, small, in cymes; petals entire or slightly notched. S. Eu. to W.

Correvoniana: hort, name for plant said to be of tufted habit and having small rose-pink fls.

crética. Ann. to 3 ft., villous-pubescent at base to sticky-glandular above: lvs. obovate-oblong to linear-subulate: fts. purplish-red, in erect few-fid. panicles; petals deeply lobed; calyx glabrous. W. Asia, nat. in Eu and N. Afr.

Cucubálus (S. venosa. S. inflata). BLADDER CAMPION.

Per. to 3 ft.: lvs. ovate to lanceolate: fls. white, in loose panicles; petals 2-lobed; calyx inflated. Eu., Asia.

dianthifòlia. Per to 6 in., densely tufted: lvs. narrow-linear, to 1 in. long: fls. solitary or in 2's, petals 2-parted above middle. Asia Minor.

dichôtoma. Branching pubescent ann. or bien. to 2 ft.: lvs. lanceolate, to 3 in. long: fls. white, to ½ in. across, sessile, in many-fld. paired racemes, summer; petals 2-parted to middle or more. Eu.; nat. in N. Amer.

dinárica. Per. to 2 in., tufted: lvs. linear, to ½ in. long: fls. solitary, rose, the petals 2-cut. Carpathian Mts.

Drûmmondii of the trade lists may be S. Scouleri.

élegans. To 8 in.: lvs. linear-lanceolate, to 2 in. long: fls. usually in 2's; petals 2-lobed. Portugal.

Elizabethiæ (Mclandrium Elizabethæ). Per. to 6 in., tufted, sticky-pubescent: lvs. narrow-lanceolate, to 3 in. long: fis. rose or rose-purple, 1½ in. aeross, in panicles; petals 2-lobed Italy.

Fabaria. Freet, to 3 ft.: lvs. fleshy, obovate to ellipticlanceolate: fls. in branching cymes, June; petals 2-parted to base. Asia Minor.

flavéscens. Tufted per. to 8 in., yellow-pubescent: lvs. lanceolate: fls. bright yellow, large, solitary or in 2's; petals 2-parted. S. E. Eu.

Fortunei. Per. to 3 ft., woody at base: lvs. linear-lanceolate: fls. rose or white, ½ in. or more across, the calyx-tube to 1 in. long, solitary or in short racemes, Sept.; petals 2-parted with cut lobes. China.

frigida: hort, name, probably for Lychnis apetala.

Frivaldskyåna (S. linda). Per. to 2½ ft. or more, glaucous: lvs. narrowly spatulate to linear-lanceolate, to 5 m. long, acute, clasping at base: fls. cream-colored to white, in short-pedicelled pairs on erect spikes. Greece.

fruticòsa. Per. to 1½ ft., woody at base: lvs. obovate to linear-lanceolate, shining above: fls. red or rose, in dense panicles; petals 2-lobed. S. Eu., Asia Minor.

fruticulòsa. Low per.: lvs. lanceolate: fls. whitish, solitary; petals 2-parted. Medit. region.

gáilica (S. sylvestris). Ann. to 15 in., erect or ascending, glandular-hairy: lvs. oblong-spatulate to linear-subulate: fls. white to rose, in axillary spikes, petals entire or emarginate. Old World.

gigantèa. Tall per.: lower lvs. tufted, obovate, tomentose: fls. white, in many-fld. panicles; petals 2-parted. S. E. Eu.

glauca. Ann. or bien. to 6 in.: lvs. lanceolate to linear: fis. small, usually in 2's; petals 2-lobed. Medit. region.

græca: S. pendula.

grándis. Per. to 2 ft., very leafy: lvs. roundish-ovate, clasping, to 3 in. long: fls. pink, ½ in. across, in clusters; petals unequally 4-lobed. Calif.

Hayekiàna. Per. to 15 in., much branched, glabrous: lvs. linear, acute, to 1½ in. long: fls. white to pale pink, to ¾ in. across; petals deeply 2-lobed. Balkan regions to Crete.

Hookeri (M-landrum Hookeri). Per. to 5 in.: lvs. obovate, to 2 in long: fls. white or pink, to 2 in. across, solitary, deeply 4-parted and fringed. Calif., Ore. Var. rosea is the pink-fld. form.

inflata: S. Cucubalus.

Ingramii (Melandrium Ingramii). Per. to 1 ft., white-hairy: lvs. oblanceolate, to 3½ in. long: fls. solitary or in 2's, violet to purple, to 1¾ in. across; petals usually 4-lobed. Ore.

itálica (S. ocymoides. S. viscosissima). Branching, hairy: lvs. oblong to linear: fls. white, in panicles, Apr.-July; petals 2-lobed. S. Eu., N. Afr.

japónica. To 1½ ft., sts. short-hairy below, glabrous above: lvs. linear-lanceolate, to 1 in. long, long-acuminate, leathery, margins revolute: fls. deep purple, few in terminal racemes Japan.

laciniata (Melandrium laciniatum). MEXICAN CAMPION. INDIAN PINK. Per. to 5 ft., with erect or decumbent much branched sts.: lvs. linear-lanceolate, to 6 in. long: fls. bright red, to 34 in. across, terminal and solitary; petals deeply 4-lobed. Mex., S. Calif. Var. Pürpusii is dwarf with cardinal-red fls.

læta. Ann. to 1 ft.: lvs. lanceolate: fls. rose, rather small, in few-fld. cymes; petals notched. Medit. region.

latifòlia (S. vulgaris). Per. to 2 ft., glaucous: lvs. spatulate to lanceolate: fls. white or pinkish, drooping, in cymes or panicles. Eu.; nat. in N. Amer.

leptoclada. Probably ann, erect, usually unbranched, gray-hairy, sticky above: lvs. oblong-spatulate to narrowly linear: fls. white, usually only 1-2; petals briefly 2-lipped. Asia Minor.

Lerchenfeldiàna. Low tufted per., glaucous: lvs. lanceolate or oblong: fis. rose, in terminal cymes: petals slightly notched. S. E. Eu.

iongifiòra. Per. to nearly 4 ft.: lvs. narrowly spatulate to lanceolate, glabrous: fls. white to rose-red, to 1½ in. across; petals deeply 2-lobed; calyx long and narrowly cylindric. S.E. Eu.

maritima. Per. to 1 ft. or more, glaucous: lvs. lanceolate or ovate-lanceolate: fis. 1-4 on a st., white, about ¾ in. across; petals 2-lobed; calyx much inflated. Eu. Var. plèna has larger very double fis. about 1¼ in. across. Var. rôsea, to 6 in., fis. rose.

melifera. Per. to 2½ ft., puberulous below, sticky-pubescent above: lvs. ovate to spatulate-lanceolate or uppermost ones linear-lanceolate, acute, pubescent: fis. pale greenish-white, small, in lax panicles; petals deeply 2-lobed. Spain and Algiers.

monachdrum: S. quadridentata.

montana. Per to 16 in., puberulent below, sticky-pubescent above: lvs. oblanceolate to linear-lanceolate, to 2½ in. long: fis. greenish-white to rose, to 3½ in. across, in spicate panicles; petals 4-lobed. Calif.

Moorcroftiana. Per. to 1½ ft., densely tufted: lvs. spatulate to linear-lanceolate: fis. dull red or white, in 1-3-fid. clusters; petals 2-parted. Himalayas.

multicaulis (S. Waldsteiniana). Per. to 1 ft., branched: lvs. lıncar-lanceolate, to 1 m. long: fls. whitish and green beneath or pink and brownish beneath, in cymes; petals 2-parted. Medit. region.

muscipula. Ann. to 2 ft.: lvs. lanccolate: fls. rese, in loose cymes; petals notched. Medit. region.

nicæénsis. Bien. to 1 ft., sticky-pubescent: lvs. linearoblong to subulate: fls. greenish-white to pale rose, in slender erect panicles; petals 2-lobed; calyx glandular. Medit. region.

nívea: S. alba.

noctiflora. Ann. to 2 ft.: lvs. oblong-lanceolate: fls. pink or nearly white, opening at night, in few-fld. panicles; petals 2-parted. Eu.

noctúrna (S. brachypetala). Ann. to 2 ft., glandularpubescent: Ivs. oblong-spatulate to lanceolate, to 4 in. long: fls. rose-pink to white, axillary and nearly sessile; petals 2-lobed; calyx with short lanceolate teeth. Medit. region.

nùtans (S. transsilvanica). Per. to 3 ft.: lvs. oblongobovate: fls. white or greenish, nodding, in loose panicles; petals deeply 2-lobed. Eu.

ocymoides: S. italica.

orientàlis: S. compacta.

Otites (S. wolgenensis). Per. to 1 ft.: lvs. spatulate to linear: fls. diœcious, yellowish-green, small, in panicles, May-July; petals entire. Eu., Asia.

ovata. Per. to 4 ft.: lvs. ovate to elliptic-lanceolate, to 6 in. long: fis. white, ½ in. across; petals lobed. N. C. to Ga. and Ala.

paradóxa. Much branched, woody at base: lvs. oblong to linear, white-ciliate: fis. in panicles; petals deeply 2lobed. S. Eu.

péndula (S. græca. S. rosea). Ann. to 10 in., soft-hairy, sts. decumbent at base, branched above: lvs. ovate-lanceo-late: fls. flesh-colored, about ½ in. across, in loose axillary racemes, becoming pendulous; petals 2-parted, Medit. region. Var. álba, fls. white. Var. Bónnettii, sts. brown-red, fls. purplish, shiny. Var. compácta, of compact habit. Var. rosea, fls. rose-pink.

pensylvánica: S. caroliniana.

petræa: S. Saxifraga.

porténsis. Ann. to 1 ft., somewhat hairy at base: lvs. all linear, acute, canaliculate, mostly glabrous: fls. rose-pink to white, long-peduncled; petals 2-lobed; calyx glabrous. S. W. Eu.

Pseudo-Atòcion. St. branched at base, nearly or quite erect, 4-15 in., glandular-pubescent: lower lvs. spatulate, narrowed into ciliate base; upper ovate-lanceolate, acute, ciliate: fis. ½-1 in. across; calyx long-tubular; petals rose, obovate and entire. Balearic Isls. and Algeria.

Pseudo-Otites: a form of S. Otites.

pudibunda (Heliosperma pudibunda): a form of S. quadridentata.

pulchélla: hort. name.

Pumilio. Tufted per. to 3 in.: lvs. linear: fis. rose, 11/2 in. across, solitary, June; petals entire. Austrian Alps.

pusilia. Tufted low per.: lvs. spatulate: fis. white, solitary or in 2's; petals 4-toothed. S. Eu.

pygmæa. Low villous per., sts. branched at base, ascending: basal lvs. spatulate, upper ovate: fls. few, erect, in panicles; petals 2-lobed. Caucasus.

quadridentata (S. monachorum). Per. to 4 in., with slender rather sticky sts.: lvs. spatulate to linear: fls. white, solitary or in 3's; petals 4-lobed. S. Eu.

quadrifida: the correct spelling for the name of this plant is S. quadridentata.

règia (S. Bergeri). ROYAL CATCHFLY. Per. to 4½ ft., somewhat sticky and rough-hairy: lvs. thick, ovate-lanceolate, to 3 in. long: fis. numerous, deep scarlet, 1 in. across, in narrow panueles, July; petals notched or cut. Ohio to Ala, and Mo.

Regis-Férdinandii. Many-stemmed per.: lvs. linear, Macedonia.

Reichenbachii. Tufted per. to 4 in., woody at base: lvs. oblanceolate to linear, cliate: fls. white, in raceme-like nodding panicles; petals 2-parted. Dalmatia.

reticulata. St. erect, branched at base, to 1½ ft., glabrous but sticky: lower lvs. spatulate-lanceolate, attenuate into petiole, upper linear: fls. ½-½ in. across; pedicels shorter than calyx which is tubular-clavate; petals rose, deeply emarginate. Algeria,

Rôemeri. Per. to 1 ft., tufted, pubescent: lvs. oblong-spatulate to linear: fls. white, in cymes or heads; petals 2-lobed. Greece.

ròsea: S. pendula.

rubélla. Erect, branching: lvs. ovate-oblong to linear: fls. rose, small; petals notched. Medit. region.

ruhérrime: hort, name.

rupéstris. Per. to 8 in.: lvs. lanceolate: fis. pale pink, in cymes; petals 2-lobed. Eu.

Rùprechtii: S. saxatılıs.

Saponària: Saponaria officinalis.

saxátilis (S. Ruprechtii). Tufted per.: lvs. oblong to linear: fls. greenish, nodding, fragrant, 1-3 together; petals 2-parted. Armenia.

Saxifraga (S. petræa). Tufted per. to 10 in., woody at base: lvs. linear or linear-lanceolate: fls. whitish, in 2-3-fld. cymes or solitary; petals 2-parted. Eu., Asia Minor.

Schafta. Moss Campion. Soft-hairy per. to 6 in., simple or slightly branched: lvs. oblanceolate, small, in rosettes: fls. rose or purple, 1 or 2 on a st, axillary or terminal; petals notched. Caucasus.

Schmückeri. Tufted per. to 4 in.: lvs. oblong, gray-pubescent; fls. purple, 1-3 together. Rocks, Albania.

Scouleri. Sticky-hairy per. to 2½ ft.: lvs. lanceolate: fls. white or purplish, in whorled spikes, July-Aug.; petals 2-parted. Ore. to Vancouver Isl.

Shortii: listed name.

sibírica. Probably per.: lvs. oblong-linear, briefly ciliate: fls. white to rose, in erect panicles; petals emarginate; calyx glabrous. E. Russia to Siberia.

squamigera. Ann. to 1½ ft.: lvs oblong to linear: fls. white, in panicles; petals 2-lobed. Asia Minor.

stellata. Staury Campion. Per. to 3 ft., erect, branched, rough-pubescent: lvs. mostly in whorls of 4, ovate-lanceolate, to 4 in. long: fis white, to 34 in. across, nodding in an open panicle, June-Aug.; petals fringed. Woods, Mass. to Ga. and Tex.

Sáksdorffi. Tufted per. to 4 in.: lvs. linear to spatulate, 1/2 in. long: fls. white, 1-3 together; petals notched. Mts., Wash.

sylvéstris: S. gallıca.

tatárica. Per., sts. densely leafy: lvs. linear-oblong: fls. white, in loose raceme-like panicles; petals 2-parted. E. Eu., W. Asia

tíncta: S. Frivaldskyana.

transsilvánica: S. nutans.

vallèsia. Per. to 4 in., tufted, sticky-pubescent: lvs. spatulate or lanceolate: fis. rose-violet, greenish beneath, the petals 2-parted. Alps.

vendsa: S. Cucubalus.

verecúnda. Per. to 1 ft., sts. erect or decumbent, pubescent below, glandular-hairy above: lvs. linear-lanceolate, acumnate: fls. rose-pink, to ½ in. across, in 1-3-fld. clusters; petals narrowly 2-lobed. Calif.

virgínica. Fire Pink. Per. to 2 ft., sticky-hairy: lvs. oblanceolate, to 5 in. long: fls. 1 in. or more across, crimson or scarlet, in loose cymes, more or less nodding, May-Sept.; petals cut or notched. N. Y. to Ga. and Ark.

viridiflora. Per. to 2 ft., sticky-pubescent: lvs. ovate-oblong: fls. greenish-white, nodding, in long loose panicles; petals 2-parted. S. Eu.

viscosíssima: S. italica.

vulgăris: S. latifolia.

Waldsteiniana: S. multicaulis.

Wherryi. Allied to S. caroliniana but differing in calyx the same length as claws of petals and densely covered with whitish hairs, and styles about length of ovary. Ohio to

wolgenénsis: S. Otites.

Zawádskii. Per. to 8 in.: lvs. lanceolate: fls. white, in few-fld. racemes; petals 2-parted. Austria.

SILICLE: the short broad fruit of certain Cruciferæ.

SILIOUE: the long fruit of certain Cruciferse

SILK-COTTON-TREE: Cerba pentandra. -Plant, Chi-se: Bochmeria nivea. -tassel Bush: Garrya. -Tree: nese: Bochmeria nivea. -tassel Bu Albizzia Julibrissin. -Vine: Periploca.

SILKWEED: Asclepias.

SILKY: a covering of soft appressed fine hairs: sericeous.

SÍLPHIUM. ROSINWEED. Compositx. Coarse tall hardy herbaceous perennials with sunflowerlike heads of yellow ray- and disk-fls.; pappus none or of awns; native in N. Amer. Differs from Helianthus in bearing sterile disk-fls. and in other technical characters.

Silphiums thrive in any good soil and in full sunlight. They are useful for rear borders. Propagated by seed or division

integrifòlium. To 5 ft.: lvs. ovate or ovate-lanceolate, to 5 in. long, entire or slightly toothed, sessile: heads to 2 in. across. Aug.-Sept. Ohio to Tex.

laciniàtum. Compass-Plant. To 12 ft., rough: lvs. 1 ft. or more long, 1-2-pinnate, the upper clasping: heads to 5 in. across. July-Sept. Ohio to Tex.

perfoliatum. Cup-Plant. Indian Cup. To 8 ft., st. square: lvs. ovate, to 1 ft. long, upper connate-perfoliate: heads to 3 in. across. July-Sept. Ont. to Ga. and La.

terebinthinaceum. PRAIRIE DOCK. To 10 ft.: lvs. mostly basal, ovate-cordate, to 1 ft. long, toothed to punatifid, long-stalked; heads to 3 in. across. July-Sept. Ont. to Ga.

trifoliatum. To 7 ft.: lvs. lanceolate, to 7 in. long, entire or toothed; heads to 2 in. across. July-Oct. Pa. to Va. and

SILVER-BELL: Halesia. -Tree: Leucadendron um. -Vine: Actinidia polyyama. -Weed: Po -Weed: Potentilla Anserina.

SILVERBERRY: Elæagnus commutata.

SILVERROD: Solidago bicolor.

SILVERY: with a whitish metallic more or less shining luster.

SÍLYBUM. Compositæ. Thistle-like herbs of the Old World: lvs. with spiny-toothed lobes and conspicuously white-spotted above: heads large, purplish, solitary and terminal, of disk-fls.; pappus of bristles. Of simple cult.; increased by seed, blooming first year.

eburneum. Ann. or bien differing from S. Marianum in the outer bracts of involucre erect and with very short spiny point. N. Afr.—This plant has been listed as Carduus arabicus.

Marianum (Carduus Marianus). St. Marys, Blessed, Holk, or Milk Thistle. Ann. or bien. to 4 ft.: lvs. to 2½ ft. long, undulate, glossy: heads to 2½ in. across, rosepurple, bracts of involuere with long spreading-reflexed spiny point. Medit. region; nat. in Calif.

SIMARUBÀCEÆ. Quassia Family. Trees and shrubs of about 30 genera mostly in trop. regions, known to cult. chiefly in the genus Ailanthus; Quassia and Picrasma also planted. The family is characterized by mostly alternate pinnate lvs., small unisexual or bisexual fls. with 3-5 sepals and petals, as many or twice as many stamens, superior 2-5-celled or -parted ovary, and usually drupe-like fr. The family yields bitter qualities, insecticides, medicinal products,

SIMMÓNDSIA. Euphorbiaceæ. Diceious much branched boxwood-like stiff evergreen shrub to 7 ft. native in S. Calif., Ariz. and Mex. and sometimes planted in its region. S. califórnica. Jajoba. Goat-Nut. Lvs. opposite, oblong to ovate, 1½ in. long, entire: fls. small, apetalous: caps. to 1 in. long.

SIMPSONIA MICROCARPA: Thrinax microcarpa. SINAPIS: Brassica.

SINARUNDINÀRIA. Graminex. Erect clumpforming bamboo-like shrubs with round sts. whose sheaths have deciduous appendages and each node producing several branches; differs from Semiarundinaria in the narrower lys. having only 2-4 pairs of veins and the lf.-sheath bristles flexuous

Mûrieliæ (Arundinaria Murieliæ). To 12 ft., sts. yellow: lvs. to 5 in. long and ½ in. wide, long bristly-acuminate, rough above. China.

nítida (Arundinaria nitida). To 20 ft., st.-sheaths purplish: lvs. to 3 in. long and ½ in wide, glaucous beneath. China.—The hardiest of the arundinarias.

SINGHARA-NUT: Trapa bispinosa.

SINNÍNGIA. Gesneriacex. Brazilian pubescent herbs with tuberous corm-like roots, opposite long-stalked lvs., large tubular 5-lobed fls. solitary or clustered, and capsular frs.; one species is the gloxinia of florists and greenhouse cult., with large richly colored fls.

Gloxinias require a warm humid atmosphere in the grow-Gloxinuas require a warm humid atmosphere in the growing season, and protection from strong sun. After blooming the tubers should be stored in a temperature of about 45° until February when they may be started into growth again. Care should be exercised in watering not to wet the leaves. Propagated by seeds or by leaf-cuttings in a propagating bed; either method should produce flowering plants in about one year or perhaps less.

harbata: listed name of unknown hotanical standing

speciòsa (Gloxinia speciosa). GLOXINIA. Nearly stemless: lvs. oblong or oblong-ovate, 6 in. or more long, toothed: fls. violet or purplish, varying to red and white or spotted, 3 in. and more long, bell-shaped. Var. macrophylla has large lvs. veined with white. Improved forms are advertised as Glozina hybrida grandulora and G. imperialis.

SINOCRÁSSULA. Crassulacex. Usually referred to Sedum but possibly distinct, differing in having only 5 stamens, an urceolate corolla, and erect carpels; about 6 species in the Himalavan region.

maculata: listed name.

SINOFRANCHETIA: see Lardizabalaceæ.

SINOMÈNIUM. Menispermacex. Woody vine from Japan and China. S. acutum. Lvs. ovate, to 6 in. long, entire or palmately 3-7-lobed, dark green above, slightly glaucous beneath: fls. small, in panicles to 10 in. long: fr. a bluish-black drupe. In var. cinèreum the lvs. are densely gray-pubescent beneath.—Not fully hardy in the N. Propagated by seeds and cuttings.

SINUS: a fold or re-entering angle; the space or recess between two lobes of a leaf or other expanded organ.

SIPHONANTHUS: Clerodendrum Siphonanthus.

SIPHONOSMÁNTHUS. Oleacex. Evergreen shrubs differing from Osmanthus in the salverform corolla, tube nearly cylindrical, longer than lobes, and anthers dehiscing inwardly.

Delavayi (Osmanthus Delavayı). To 6 ft.: lvs. ovate, to 1 in. long, toothed. fls. white, fragrant. Apr. China.

SIRIS-TREE: Albizzia Lebbek.

SISSOO: Dalbergia Sissoo

SISYMBRIUM: a generic name of the Cruciferæ variously defined, sometimes applied to the water-cress (Nasturtum); species not in cult. See Arabidopsis.

SISYRÍNCHIUM. BLUE-EYED-GRASS. Iridaceæ. American small perennials with short rootstocks, grass-like tufted lvs. and small blue or yellow fls. in terminal umbels, the perianth-tube short or none. Of easy cult. in any garden soil, making attractive clumps. Propagated by seeds and

ánceps: S. angustifolium.

angustifòlium (S. anceps). To 2 ft.: fis. deep violet-blue. 1/2 in. long. N. Amer.

béllum. To 1 1/2 ft.: fls. violet-purple, to 1/2 in. long. Calif. Bermudiàna. To 20 in., sts. flattened and winged, usually branched: lvs. about 1/3 in. wide: fls. violet-blue, yellow at base, to 3/3 in. long, perianth-segms, emarginate and long-aristulate. Bermuda.—Bermudana was an early substantive name for the plant, taken over by Linnæus.

biràmeum. To 1½ ft., loosely tufted, 2-branched: fis. dark blue with yellow eye, ½ in. long. Wash.

borealle (Hydastylus borealis). To 10 in., sts. broadly winged lvs. about ½ in. wide: fls. yellow, to ¾ in. across: caps. ellipsoidal. B. C. to Wash.

bráchypus (Hydastylus brachypus). Perhaps not distinct from S. californicum, but reported to differ in its fl.-pedicels shorter than the bracts and smaller seeds. Calif.

califórnicum (Hydastylus californicus). To 1 ft. or more, sts. broadly winged: fls. bright yellow, to ½ in. long. Ore. to Calif.

convolùtum. To 1 ft., leafy sts. broadly winged: fls. yellow with brown veins. Trop. Amer.

Douglasii (S. grandiflorum). To 1 ft., sts. compressed but not winged. fis. reddish-purple or rarely white, to ¾ in. long: caps. depressed-globose. B. C. to Ida. and Calif.

gramineum: S. graminoides.

graminoides (S. gramineum). To $1\frac{1}{2}$ ft., pale green, sts. broadly 2-winged: fis. blue, to $\frac{3}{4}$ in. across. N. S. to Fla. and Tex.

grandiflorum: S. Douglasii.

idahoénse. To 1½ ft., sts. winged, glaucous: fls. deep violet-blue with yellow eye, to ¾ in. long. B. C. to Ore. and Wyo.

inalatum. To 1½ ft., sts. simple and wingless, having a mass of fibrous roots: fls. purple or purplish. Ida.

inflatum (Olsynium inflatum). To 15 in.: lvs. 2, to 3 in. long: fis. bright purple with yellow or greenish center. Wash.—Said to differ from S. Douglasii in its smaller brighter fis. which are more numerous and the stamens reddish, never yellow.

iridifòlium (S. larum). To 1 ft.: fls. yellowish-white, ½ in. long. Brazil to Chile.

láxum: S. iridifolium.

macrocéphalum. To 2 ft.: fls. yellow, 1/2 in. long, segms. lacmate. Brazil, Uruguay.

macrorhizum is listed.

mucronatum. To 1 ft., sts. flat, narrowly winged: fls. violet. Mass. to Va. and Mich.—Differs from S. angustifolium in being more slender and delicate in habit and in having smaller caps.

pachyrhizum (S. Sellowii). To 2 ft., st. 2-edged: fls. yellow, ¼ in. long. Brazil.

palmifòlium. Culms and narrow lvs. flat and striate, to 16 in. or more: fls. striate, small, in brown-bracted paniculate spikes, bracts I in. or more long and long-pointed. S. Amer; planted in S. Calif.

Séllowii: S. pachyrhizum.

striatum. To 3 ft.: fls. yellow, striped in center, to 3/4 in. long. Chile, Argentina.

tanacetifòlium is listed.

vàrians. To 1 ft.: fls. light blue, to 1/2 in. long. Okla. to

SITOLOBIUM: Dennstaedtia cicutaria.

Slum. Umbelliferæ. Per. aromatic herbs with pinnately compound lvs., small white fls. in compound umbels, and ovate frs.; S. Sisarum is grown for the edible roots.

Skirret does best in rich soil. Seed may be sown in fall or spring in drills and the seedlings thinned to 8 inches in the row. Roots may be dug and stored in sand over winter or left in the ground.

cicutæfòlium; S. suave.

latifòlium. To 3 ft.: lfts. 11-17, oblong-lanceolate, to 11/4 in. long, margins evenly and closely serrulate. Eu.

Sigarum. Skirret. To 3 ft., with clustered tuberous roots: lvs. with 3-7 lanceolate toothed lfts. E. Asia.

suave (S. cicutæfolium). WATER PARSNIP. To 6 ft.: lfts. 7-17, to 5 in. long, margins acutely and distantly serrate. N. Amer.

SKÍMMIA. Rutaceæ. Evergreen shrubs native Himalayas to China and Japan, with alternate simple lvs., small white fls. in terminal panicles, and berry-like frs.; grown for ornament far S.

but not hardy in the N., and sometimes grown under glass for the fragrant bloom.

Plants may be grown in pots in a mixture of sand, peat and loam, or set out in partly shaded situations. With the diœcious species, both pistillate and staminate plants should be provided to insure good fruit. Propagated by seeds or cuttings over heat.

Fortunei: S. Reevesiana.

fragrans: S. japonica.

japónica (S. fragrans. S. oblata). To 5 ft., polygamous or diœcious: frs. bright red. Japan.

oblata: S. japonica.

Recvesiana (S. Fortunei). To 2 ft.: fis. usually bisexual: fr. dull red. China. Var. variegata (S. Fortunei var. argentea) has lvs. bordered with white.

SKIRRET: Sium Sisarum.

SKULLCAP: Scutellaria.

SKUNK-CABBAGE: Sumplocarpus fatidus. Vellow. Lysichtum.

SKUNKWEED: Gilia squarrosa, Polemonium confertum.

SKY-FLOWER: Duranta repens.

SKYROCKET: Gilia aggregata and pulchella,

SLIPPER-FLOWER: Pedrlanthus trthymalordes.

SLIDDERWORT. Calceolaria

SLOE: Prunus spinosa.

SMARTWEED: see Polygonum.

SMELÓWSKIA. Cruciferæ. Tufted gray-to-mentose per. herbs with pinnatifid lvs. and white or vellow fls. in racemes; adapted to rock-gardens; belongs in the Hutchinsia group.

americana. To 8 in.: lvs. to 2 in. long, cut into spatulate or oblong segms.: pods to ½ in. long. Mts., Mont. to Colo. and Utah.

calýcina. To 6 in.: lf.-segms. of 2-5 pairs, linear to obovate, obtuse, lvs. sometimes entire: fls. whitish, to 1/3 in. across. Arctic regions.

evàlis. To 4 in., densely white-villous: If.-segms. 5-7, entire or 2-3-cleft, oblong: petals clawed: pods ovoid, to ½ in. long. Mts., Alta. to Wash. and Calif.

SMILACINA (Vagnera). FALSE SOLOMONS-SEAL. Liliaceæ. Rhizomatous per. herbs having alternate usually sessile lvs., small white or greenish fls. in terminal racemes or panicles, the perianth-segms. distinct, and round red or greenish berries. Of easy cult. in moist partly shady places; useful for colonizing. Propagated by division.

amplexicaulis. To 3 ft.: lvs. ovate, to 6 in. long: fis. in panicles to 6 in. long: berries red spotted with purple. B. C. to New Mex.

bifdlia: Maianthemum bifolium.

racemòsa. To 3 ft.: lvs. to 6 in. long and 3 in. wide: fls. numerous, in panicles to 4 in. long: berries red. N. Amer.

sessilifòlia. To 2 ft.: lvs. ovate-lanceolate, to 6 in. long: fls. few, in racemes to 2 in. long: berries dark purple. B. C. to Calif.

stellata. To 20 in.: lvs. to 5 in. long and 1½ in. wide: fis. several, in racemes to 2 in. long. N. Amer., Eu.

trifòlia. To 15 in.: lvs. to 5 in. long and 2 in. wide: fls. few, in racemes to 2 in. long. N. Amer., Siberia.

SMILAX. GREENBRIER. Liliaceæ. Vines climbing by tendrils borne in pairs at the base of the petioles, the lower lvs. reduced to scales, the upper entire or lobed, with small unisexual fls. in axillary umbels, the perianth-segms. distinct, and fr. a berry; several species yield sarsaparilla and others are gathered for winter greens from the wild; they are mostly woody and often thorny plants. They are sometimes transferred to wild-gardens, or colonized; sometimes the trop, species are seen in greenhouses. The smilax of florists is Asparagus asparagoides.

aspera. Lvs. evergreen, ovate to lanceolate, to 5 in. long, usually heart-shaped at base, commonly blotched with white: fr. red. S. Eu. to India.

Bona-Nox. Saw-Brier. Rootstock with large tubers: lys. deciduous or partially evergreen, triangular-ovate or arrow-shaped, spiny on margins, to 4½ in. long, shining: fr. black. Va. to Fla. and Mex.

China. Semi-woody climbing vine, sparsely spiny or spineless: Ivs. lanceolate, broadly elliptic or sometimes nearly orbicular, base cuneate, mostly 2-4 in. long: fr. green, to 3% in. duam. China, Japan to Cochin-China.

glauca. Cat-Brier. Lvs. deciduous or partially evergreen, ovate, to 6 in. long, glaucous; fr. bluish-black. Dry soil, Mass. to Fla. and Tex.

herbacea. Carrion-Flower. Lvs. deciduous, ovate to lanceolate, to 5 in. long, obtuse or heart-shaped at base: fr. bluish-black. N. B. to Okla.

híspida. Lvs. deciduous, ovate, to 5 in. long, usually heart-shaped at base, rough-edged; fr. black. Conn. to N. C. and Tex.

lanceolata. Lvs. evergreen, lanceolate, to 3½ in. long, shining above; fr. dark red. Va. to Fla. and Tex.

laurifolia. FALSE CHINA-BRIER. Lvs. evergreen, oblong, to 5 in. long, glaucous beneath, wedge-shaped at base: fr. black. N. J. to Fla. and Tex.

myrtifdlia: Asparagus asparagoides var.

officinalis. Lvs. ovate-oblong, heart-shaped, to 6 in. long, leathery, glabrous and shining. S. Amer.

rotundifòlia. Horse-Brier. Lvs. deciduous, ovate to nearly orbicular, to 6 in. long, rounded or heart-shaped at base: fr. bluish-black. N. S. to Ga. and Tex.

Wâlteri. Lvs. deciduous, ovate or oblong, to $4\frac{1}{2}$ in. long, mostly heart-shaped at base: fr. coral-red. N. J. to Fla. and La.

SMITHIÁNTHA (Nægelia). Gesneriaceæ. Trop. American herbs with opposite soft usually cordate lvs., tubular red or yellowish-white fls. in terminal panicles, and capsular frs.; grown in a warm greenhouse as for gloxinias and others. Propagated by stolons or offsets.

cinnabarina (Gesneria cinnabarina). To 2 ft, hairy: lvs. with red or purplish hairs: fls. cinnabar-red spotted with white '1½ in. long, drooping, the tube swollen to base. Mex.

hfbrida. Hort. hybrid between S. zebrina and S. multiflora var. Leitchlinn, having fls. dark purplish-red outside and yellow within with red dots.

multiflora (Gesneria amabilis). To 11/2 ft.: lvs. hairy: fls. white or cream, drooping, tube scarcely swollen. Mex.

robústa: hort. name, perhaps of S. hybrida.

zebrina (Gesneria zebrina). To 3 ft., densely pubescent: lvs. marked along vens with purple-red or dark brown: fls. red, yellow spotted red beneath, 1½ m. long, tube contracted at base. Brazil. Var. discolor has more contrastingly colored purplish-red and green foliage, fls. brownspotted within; said to be a hybrid of S. zebrina and S. multiflora.

SMOKE-TREE: Cotinus Coggygria, Dalea spinosa.

SMOOTH: said of surfaces that have no hairiness roughness or pubescence, particularly of those not rough or scabrous.

SMYRNIUM. Umbelliferæ. Erect bien. herbs mostly of the Old World, with bi- or tri-ternately compound glabrous lvs. and greenish-yellow fls. in compound umbels, usually without involucres, fr. ovate, laterally flattened.

Olusatrum. To 4 ft., stout: lower lvs. to 1½ ft. long, segms. broadly ovate, to 2½ in. long, coarsely serrate, crenate or occasionally lobed: umbels to 4 in. across: fr. to ½ in. long. W. Eu. and Medit. region; nat. in Bermuda.

SNAIL-FLOWER: Phaseolus Caracalla.

SNAILSEED: Cocculus.

SNAKE-HEAD: Chelone glabra.

SNAKEROOT, BLACK: Cimicifuga racemosa. Button: Eryngium aquaticum, Liatris. Seneca: Polygala Senegu. Virginia: Aristolochia Serpentaria. White: Eupatorium rugosum.

SNAKES-HEAD: Fritillaria meleagris.

SNAKEWEED: Polygonum Bistorta.

SNAKEWOOD TREE: Cecropia palmata.

SNAPDRAGON: Antirrhinum. SNAPWEED: Impatiens. SNEEZEWEED: Helenium.

SNEEZEWORT: Achillea Ptarmica.

SNOWBALL: Vaburnum.

SNOWBERRY: Chiococca, Symphoricar pos albus. Creeping: Chiogenes hispidula.

SNOW-BUSH: Breynia nivosa. -in-Summer: Cerastium tomenlosum. -on-the-Mountain: Euphorbia marginala. -Plant: Sarcodes sanguinea. -Wreath: Neviusia alabamentomentosum.

SNOWDROP: Galanthus. -Tree: Halesia.

SNOWFLAKE: Leucojum. Water: Nymphoides indicum.

SOAP-BARK TREE: Quillaja Saponaria, -Plant: Chlorogalum pomeridianum.

SOAPBERRY: Sapindus. SOAPWORT: Saponaria.

SOBOLE: sucker-ground-shoot.

SOBOLIFEROUS: bearing shoots from the ground; sometimes said of palms and other tree-like plants producing two or more trunks that arise in the nature of suckers, forming something like a set or cluster of stems in distinction from a single stem or trunk.

SOBRÀLIA. Orchidacex. Trop. American reedlike orchids, terrestrial or rarely epiphytic, with mostly leafy sts. and fls. commonly solitary or in terminal racemes; sepals and petals spreading from a campanulate base; lip wrapped around column forming a tube with gradually expanding blade. Treated much like Cologyne; see Orchids.

Kienastiana: S. macrantha var.

leucoxántha. Sts. to 3 ft. high: lvs. to 7 in. long: fls. solitary, to about 4 in. long; sepals and petals white; lip with golden-yellow throat streaked with orange. Apr.—Sept. Costa Rica.

macrántha. Sts. to about 6 ft. high: Ivs. to 12 in. long: fls. about 6 in. across; sepals and petals rose-violet; lip wavy-margined, violet with cream or yellow throat. May-Nov. Mex. to Costa Rica. Var. Kienastiàna (S. Kienastana) is a dwarf var. with white fls.

virginàlis. Sts. to 3 ft. high: lvs. to about 6 in. long and 1½ in. wide: fls. white with yellow throat, wavy, about 3½ in. long, solitary. Colombia.

xantholeuca. Sts. to about 6 ft. high: lvs. to 11 in. long: fls. 1 or few and successive, about 6 in. across; sepals and petals lemon-yellow; lp lemon-yellow with orange throat marked with reddish lines. July-Sept. Guatemals.

SOILLESS GARDENING. The growing of plants in nutrient solutions, without aid or support of soil. Such culture has long been practiced as a laboratory and experimental procedure, but in recent years methods are perfected whereby plants may be grown without soil under glass with satisfaction and a new literature is developing. This particular subject of plant-growing is known also as Hydroponics.

In brief, the process consists of growing plants with their roots in water containing a solution of essential mineral requirements. The process, to be successful, must be under the constant supervision of a person who understands the principles of plant growth, as a trained technician. Because of this, the process of water-culture of plants is not advised for use by the amateur or the average commercial horticulturist. Many erroneous and fantastic assertions have been made about the water-culture production of crops. These include statements that quantities of fruits and vegetables may be produced on "skyscraper" farms in large cities, that they may be grown in the cellars of homes, in closets or in converted abandoned factories. All such statements are inaccurate in fact and misleading in implication.

There are commercial possibilities in the waterculture production of special high-priced crops in regions highly favorable climatically and that have a good water supply. In addition they must be situated to supply markets ordinarily serviced by regions of low soil fertility. Such an organization demands a trained staff and costly equipment. To date, no evidence is available on which to base any prediction as to the future development on a commercial basis of the water-culture method

The use of prepared commercial mixtures of nutrient salts by amateurs will not remove the major difficulties of the process. The principal barrier to their success lies in the fact that plants do not take up nutrients in the same proportions at all stages of their development, and it is not feasible to add salts indiscriminately from time to time to compensate for the lack of balance of these commercial mixtures. Other factors are responsible for many of the amateur failures with water culture methods. These include inability to provide sufficient sunlight for the plants, insufficient aeration of the water solutions and a lack of facilities to compensate for loss of water from the nutrient solutions by transpiration or by evaporation. Formulæ are available to the amateur who, realizing the difficulties and limitations of the water-culture method, wishes to undertake it with serious purpose.

SOILS. Experience in choice and handling of land for orchards and vegetable-gardens is now extensive for practically all parts of the country; and while there is much need of additional investigation, the subject is one for special technical discussion. The usual treatment of soils, therefore, requires no description here. There are many available books and bulletins.

Tillage and fertilizing, together with sufficient drainage, are fundamental or primary requirements in the effective rearing of plants. Tillage has many and far-reaching results aside from destroying weeds and facilitating planting. It provides good root-hold if deep enough and it extends the feeding area at the same time that it renders soil nutrients more available. The frequently shallow-tilled surface conserves moisture by preventing evaporation in open lands; but when land is covered with a crop and therefore closely occupied by roots the moisture may be transpired through the plants before it reaches the upper layers, yet even in this case tillage of closely-rowed crops is useful in eliminating weeds and in keeping the land fit.

We now know that the soil reaction, i.e., its alkalinity or acidity, is an important factor in the successful rearing of many ornamental plants with which the recorded experience is not extensive or sufficient, and this factor may be discussed

as at present understood.

In 1926 Dr. Edgar T. Wherry, then in the United States Department of Agriculture, published in Bulletin No. 4 of the American Horticultural Society, a list of several hundred plants of horticultural interest arranged according to their soil acidity preferences. In Better Homes and Gardens for April, 1930, the same author contributed an article on the development and maintenance of acid-soil gardens. Extracts from these articles were published in Hortus for 1930, and since the work has stood the test of time, most of the same material is republished here, with revisions by Wherry, and quotations from his writing. The subsequent work of Messrs. Wiggin and Gourley, as published in 1931 in Bulletin 484 of the Ohio Agricultural Experiment Station, and that of Dr. G. M. Shear, as published in 1938 in Technical Bulletin 63 of the Virginia Agricultural Experiment Station, have also been taken into

account. Several other state experiment stations have issued lists or tables of crop plants giving their acidity ranges under the climatic conditions prevailing in the region covered, and may be obtained on application or consulted in libraries.

"In recent years it has come to be recognized that certain species of plants, including some of the most highly prized ornamental shrubs, are favored by acids in the soil and injured or killed by alkaline materials, such as lime and manure. There has arisen, accordingly, a new type of horticulture, which may be termed, for short,

acid-soil gardening.

"Do many sorts of plants require a high degree of acidity in their soils and so fit into this new type of garden? Yes, it may be said that the number is rather large. On scanning the catalog of a well-known eastern nursery, some 225 native American species were found to be included, and of these, 80, or more than one-third, represent plants which field observations have shown to prefer acid-soil conditions. Evidently, therefore, no one who goes in for the cultivation of our own American ornamentals can afford to ignore soil acidity.

"Perhaps the gardener has tried to grow some of these plants and they have dwindled and died in spite of all the care lavished on them. The reason has probably been that the soil was not sufficiently acid. Set aside a part of your garden as a special acid-soil bed and try again. Unless the climatic conditions are extremely unfavorable one will find that such plants can be successfully cultivated far from their native haunts in the

woodlands."

The appearance of moss or of sorrel on a plot of ground is commonly supposed to indicate that the soil has become acid, but such is not necessarily the case, and actual tests as to reaction should always be made. There are simple outfits for the testing of the soil in respect to acid and alkaline reaction, with a dye that changes color one way or another. Directions come with the outfit and persons without experience are able to operate it.

It is often supposed that leaf-mold and all types of humus are acidifying materials, but "chemical examinations of hundreds of samples of these substances have shown that in the majority of cases they are neutral, or nearly so, and quite unsuited to this purpose. Peat moss derived from the disintegration of sphagnum moss can usually be depended upon to be strongly acid. So also can the upland peat which accumulates under pine, spruce, and hemlock trees, or under rhododendron, mountain-laurel, and blueberry bushes; or, lacking these, crumbling treebark, rotted wood, and well-weathered sawdust may be used. To be on the safe side, however, tests should invariably be made with soil testers, and no material which does not show a color corresponding to a high degree of acidity should be used to fill in the beds."

"Most acid-soil plants prefer a porous, opentextured soil, which can best be obtained by mixing with the organic substance just enumerated a considerable volume of sand as free as practicable from clay and from lime. White sand from a pine-barren or bank sand is particularly desirable, but river sand, such as used in cement work, is usually satisfactory.

"In case it is inconvenient to prepare a special acid-soil bed by digging out and refilling, treat-

ment of the native soil with acidifying agents may be used and often gives good results. If a heavy mulch of any of the strongly acid organic materials already discussed is spread over the bed, rain or sprinkling-water will leach more or less acid from them and gradually carry it down to the plant roots. Fresh leaves of oak and various other trees yield a certain amount of acid and may be used for mulching, but when they become soggy, black, and rotted, they lose their acidity and must be renewed.

"Acidifying chemicals may also be used, especially when quick results are desired, although they must be applied cautiously. One of the most desirable chemicals is commercial tannic acid, which costs around 10 cents a pound. It may be scattered over the surface of the ground, then dissolved by soaking the bed thoroughly. Another substance which has found favor for use in the same manner is crude aluminum sulfate, which is even cheaper. It is extensively used for clearing water and can be conveniently obtained thru a local waterworks or from any dealer in heavy chemicals. Also, applications should never be made to mixed plantings, because the increase in acidity which would help an azalea, for instance, would be fatal to a nearby lilac bush.

"The amounts of these chemicals to be applied varies greatly with the conditions. In soils which are sandy, sterile, and moderately acid at the start, 4 ounces of acidifying agent a square yard may be sufficient to develop high acidity. Average neutral garden loams require 1 pound, whereas in limestone regions as much as 5 pounds to the same area may be necessary. all cases it is desirable to wait a few weeks after making an application to give the acidifying substance time to mix thoroughly with the soil; then repeat the test on another sample from root level. If the desired degree of acidity proves not to have been obtained, the treatment can then be made again and again until the acid-tester shows proper reaction.

Even when a bed has been made acid enough for satisfactory growth of plants, it is not safe to assume that it will remain so indefinitely. The earthworm brings up lime from the subsoil and mixes it with the upper layers, thus often neutralizing an acid plot. The indicator tests should be made once or twice each year, and if high acidity is not being maintained, the application of acidi-

fiers should be repeated.

Soil reactions are often stated in "pH units," but the numbers are logarithmic and difficult to interpret. It is simpler for the horticulturist to divide soils into four reaction-classes, which, with the plant habitats they characterize, are:

Circumneutral. Soils in which neither acid nor (pH 8 to 6)

alkaline influences are markedly dominant. The soils of the Mediterranean region where so many of our garden plants are native are mostly of this class.

Minimacid..... Humus-rich meadows, swamps, (pH 7 to 6) and woods, in calcareous regions. Fields and gardens under standard types of cultivation.

Subacid....... Many sorts of marshes, meadows, swamps, and upland woods. Long-abandoned fields and gardens in non-calcareous regions.

....Various kinds of peat bogs.
4) Swamps where the water is Mediacid... (pH 5 to 4) lacking in calcium bicarbonate. Thickets of rhododendron, kalmia, and other ericaceous plants. Woods where such plants as hemlock, pine, spruce, or oak are Accumulations of dominant. upland peat, rotting wood, and Mountain similar materials.

peaks and sandhills where the

substrata are non-calcareous. The following plant lists are taken from Bulletin 4 and other publications above referred to. The reactions given are considered to represent optimum values for the individual species, but many plants will grow nearly as well in soils of classes adjoining those in which the plant is listed. Common garden flowers not included in any of these lists appear to thrive equally well in soils of all degrees of acidity ordinarily encountered.

1. Circumneutral soil plants. Many, though not necessarily all, species of the genera:

Abelia Iris Acer Juninerus Actea Lactuca Adiantum Lespedeza Ligustrum Æsculus Alvssum Lonicera Lychnis Ampelopsis Anemone Lycopersicon Antirrhinum Malus Apium Medicago Melilotus Asparagus Mertensia Aster Narcissus Astilbe Berberis **Enothera** Beta. Zea Mays

3. Subacid soil plants

Abies Acer pensylvanicum spicatum Agrostis capillaris stolonifera Aletris farinosa Aleurites Fordii Anaphalis margaritacea

Antennaria Arachis hypogæa

Aronia

Soils	591
Asarum virginicum	Halesia tetraptera
Aster linariifolius	Heuchera villosa
macrophyllus	Houstonia serpyllifolia
patens	Hydrangea macrophylla
spectabilis	Hypoxis hirsuta
Athyrium Filix-femina	Ilex Cassine
Azalea (Rhododendron)	glabra
Baptisia tinctoria Betula lenta	opaca Ipomœa Batatas
Botrychium dissectum	Iris carolina
matricariæfolium	Kaempferi
obliquum	tenax
Calluna vulgaris	Juniperus communis montana
Campanula divaricata	horizontalis
Carex (Cymophyllus) Fraseri	Kalmia angustifolia
Castanea dentata pumila	latifolia Vaigia mantana
Ceanothus americanus	Krigia montana Leucothoë
Chamædaphne calyculata	Liatris graminifolia
Chamælirium luteum	squarrosa
Cheilanthes lanosa	Lilium carolinianum
Chelone Lyonii	Grayi
obliqua	philadelphi cum
Chimaphila	superbum
Chionanthus virginica	Listera cordata
Chrysopsis mariana	Lupinus Hartwegii
Cimicifuga americana	perennis
Citrullus vulgaris	Lycopodium clavatum complanatum (flabelliforme)
Claytonia caroliniana	lucidulum
Clematis crispa Clethra	obscurum
Clintonia umbellulata	Lyonia ligustrina
Clitoria mariana	Magnolia (excepting M. glauca)
Comptonia asplenifolia	Maianthemum bifolium
Convallaria majalis	canadense
Coreopsis major	Medeola virginica
pubescens	Melanthium virginicum
rosea	Menyanthes trifoliata
verticillata	Mitchella repens
Corydalis sempervirens Cunila mariana	Mitella nuda Monotropa uniflora
Cyclamen indicum	Myrica
Cypripedium arietinum	Nemopanthus mucronatus
Cytisus scoparius	Œnothera glauca
Dalibarda repens	Opuntia compressa
Dennstaedtia punctilobula	Oxalis montana
Dentaria diphylla	Parnassia asarifolia
Dicentra eximia	Paronychia dichotoma
Diphylleia cymosa	Phlox amœna ovata
Disporum languinosum Dryopteris Boottii	stolonifera
Clintoniana	Picea
dilatata (americana)	Pinus, many though not all species
Erica	Polygala paucifolia
Eryngium aquaticum	Pteridium aquilinum (latiusculum)
Eupatorium aromaticum	Pyrola
Fothergilla Gardenii	Quercus Catesbæi

SO IA: Glucine Max.

SOLANACEÆ. NIGHTSHADE FAMILY. More than 75 genera of wide distribution comprising herbs, shrubs, vines and trees, with usually alternate entire to pinnate lvs., bisexual fls. with 5-lobed calyx and gamopetalous corolla, the latter commonly wheel-shaped, 5 stamens of which 1 or more may be sterile, superior mostly 2-celled ovary and fr. a berry or caps. The family abounds in medicinal and poisonous properties and the potato, tomato, eggplant, red pepper, tobacco and others are of great economic importance. Genera herein treated are Atropa, Browallia, Brunfelsia, Capsicum, Cestrum, Cyphomandra, Datura, Fabiana, Grabowskia, Hyoscyamus, Iochroma, Lycium, Lycopersicon, Mandragora, Nicandra, Nicotiana, Nierembergia, Petunia, Physalis, Quincula, Salpichroa, Salpiglossis, Schizanthus, Solandra, Solanum, Streptosolen.

SOLÁNDRA. CHALICE-VINE. Solanaceæ. Woody plants, erect or climbing, glabrous or pubescent, sometimes grown in warm greenhouses and frequently in the open in S. E. U. S. and Calif. for the large, showy, winter-blooming, tubular, white, creamy, or yellow, solitary fis. and the leathery entire lvs., and berry-like 2-celled fr. in the large calyx-lobes; native in trop.

Solandras need a temperature of at least 50° and plenty of sunlight, also abundant water from early autumn to late spring, when grown under glass. In summer, during the rest season, they should be kept dry. A somewhat sandy loam is best, as too rich soil produces rank growth and little bloom. Propagated by cuttings of firm young shoots taken with a heel, giving them slight bottom heat.

Cléggii: listed name.

grandiflora (Swartzia grandiflora). To 30 ft. or more, climbing: lvs. to 5 in. long: fls. fragrant, white, cream-colored or somewhat yellowish, to 10 in. long, the slender part of tube included in an enlarged calyx which is 2-3 in long. W. Indies.

guttata (Swarizia guttata). To 20 ft., somewhat climbing, with hairy or pubescent twigs: lvs. to 6 in. long, pubescent underneath: fls. fragrant, cream-color changing to yellowish, spotted or feathered with purple, 9 in. long, the slender part of tube much longer than calyx which is 3 in. long and pubescent. Mex.—See S. niida.

Hártwegii: S. nıtida.

longifibra (Swartzia longifibra). To 2 ft., with trailing branches: lvs. obovate, petioles purplish: fls. white, to 1 ft. long, 3 times as long as calyx, contracted at throat. W. Indies.

niagninca: nort. name.

nitida (S. Hartwegii. Swartzia nitida). To 20 ft. or
more, erect or clambering and climbing, quite glabrous:
lvs. mostly glossy: fls. yellow, 10 in. long, with purplish
stripes, the corolla-lobes more or less reflexing. Mex.—
Apparently the usual species in cult., although often passing
as S. guttata.

spectábilis: hort. name for a white-fld. form.

SOLANUM. NIGHTSHADE. Solanaceæ. Very many species of herbs, shrubs and even trees, some of them climbing and some strongly spiny, including many ornamental subjects for the garden or conservatory, also the potato, egg-plant, and a few medicinal plants: lvs. alternate, simple or compound: fls. often showy in white, yellow, blue and purple, wheel-shaped or shallowly bell-shaped: fr. a berry which is often decorative: native in many parts of the world, the following grown for ornament except S. Melongena, S. muricatum, S. tuberosum and sometimes S. nigrum. The genus is difficult to botan-

Most of the species may be propagated from seeds, sown where the plants are to stand in the case of the annuals, but indoors for the foliage types. The greenhouse shrubby forms are increased also by softwood cuttings; S. Pseudo-Capsicum, Jerusalem-cherry, by both seeds and cuttings. The tuberous species are usually raised from the tubers, or from divisions of them, containing at least one eye or bud. See also Egyplant, Potato, Tomato; also Potomato.

aculeatissimum (S. ciliatum). Per, undershrub to 2 ft., with spiny sts. and lvs.: lvs. broad-ovate, 5-7-lobed, 4 in. long, fls. white, 1 in. across, in few-fld. cymes; fr. orange, globose and corrugated, to 2 in. across. Tropics.

æthiòpicum (S. Pierreanum). Shrub to 2 ft., unarmed: lvs. oblong, 5 in. long, undulate, glabrous: fls. white, ½ in. across, in few-fld. cymes: fr. pale red, globose, often lobed, large. Trop. Afr. to Asia.

alatum. S robustum

amazónicum. Shrub to 6 ft.: lvs. ovate-lanceolate, to 6 in long lobed or entire, vens and petiole minutely prickly, margins crenulate: fis. blue-violet with bright yellow starshaped eye and stigma, to 2 in. across, in many-fid. leafy racemes. Mex.; not hardy N.

arbòreum. Tree to 40 ft.: lvs. oblong-cuneate, acuminate, to 8 in. long or more, glabrous, entire: corolla white, nearly ½ in. across, lobes laciniate-oblong, acute. Venezuela.

atropurpureum. Shrubby, with dark red spiny sts.: lvs. 5-7-parted into lanceolate undulate or sinuately lobed segms, pale beneath: fls. pale yellow, ½ in. long, in racemes about 1 in. long: fr. white turning yellow, globose, ½ in. across. Brazil.

auriculatum. Velvety-tomentose shrub to 20 ft., unarmed: lvs. ovate-oblong, to 8 in. long, entire, having small orbicular lvs in axils: fis violet or bluish-white, ½ in. across, in corynibs: fr. globose, ¾ in. across. Trop. Afr., trop.

aviculare (S. laciniatum). Shrub to 10 ft., unarmed and glabrous: lvs. variable, lanceolate and entire or pinnately lobed, to 1 ft. or more long: fls. purplish, to 1 in. across, in cymes: fr. yellowish, ovoid, 1 in. long. New Zeal., Australia.

Capsicastrum. False Jerusalem-Cherry. Shrub to Capsicastrum. False Jenusalem-Chern. Shrub to 2 ft., unarmed: lvs. oval or oblong, to 3 in. long, pubescent beneath, undulate: fls. white, ½ in. or less across: fr. scarlet or orange-red, ovoid and pointed, ½ in. across. Brazil. Var. Mélvinii is a compact form about 1 ft. high. Var nanum is listed. Var. variegatum has variegated lvs.—This species has pubescent twigs.

ciliatum: S. aculeatissimum.

citrullifòlium. Ann. to 3 ft., with yellow prickles: lvs. 2-pinnatifid, to 6 in. long: fis. violet, to 1½ in. across, in racemes: fr. prickly, 1 in. across. Ia. to Tex. and Mex.

Clèvelandii: an improved form, probably of S. Pseudo-Capsicum.

coccineum: S. integrifolium.

cornutum. Pubescent very prickly ann. to 4 ft.: lvs. 2-pinnatifid, to 5 in long: fls. yellow, 1 in. across, in cymes: ir. prickly, small. Mex.

crispum. Shrub or small tree: lvs. ovate to ovate-lanceolate, entire, to 4 in. long: fls. pale violet, ¾ in. across, in corymbs: fr. globose, pale yellow, about ¼ in. across. Chile, Peru.

crotonifolium. Pubescent shrub with flexuose branches: lvs. oblong, entire, to 6 in. long, white-tomentose beneath: fls. tomentose outside, ½ in. across, in racemes: fr. globose, about ½ in. across. N. S. Amer.

Dulcamara. BITTER-SWEET. Shrubby climber to 8 ft.: lvs. ovate or ovate-oblong, to 4 in. long, entire or lobed at base: fls. violet spotted with green, ½ in. across, the lobes reflexed, in long-stalked cymes: fr. scarlet, ovoid, ½ in. long, showy but poisonous. Eu. to Asia; nat. in N. Amer.

elæagnifòlium. Per. to 3½ ft., silvery: lvs. oblong, to 6 in. long, wavy-margined: fis. violet or white, 1 in. across, in cymes: fr. yellow or black, globose, ½ in. across. Mo. to Ariz.

fasciculatum: confused name.

Gayanum. St. woody, pubescent: lvs. oval-oblong, entire, ciliate: fis. blue, hairy outside: fr. about ¼ in. across. Chile.

gigantèum. To 25 ft., somewhat shrubby, the st. with short stout prickles: lvs. oblong, to 8 in. long, white-to-mentose beneath: fls. pale violet or blue, ½ in. across, in many-fid. cymes: fr. red, globose, ½ in. across. India, Ceylon.—Called "African-holly" in S. Calif. where it is grown out-of-doors.

gracile. Pubescent ann. to 2 ft.: lvs. ob.ong-lanceolate, to 4 in. long, whitish beneath: fis. white, ½ in. across, in racemes about 1 in. long: fr. black, globose, ¼ in. across. Brazil

guatemalénse: S. muricatum.

Hendersonii. A form of S. Pseudo-Capsicum or a hybrid, having numerous white fls. and orange-red frs.

heterodóxum. Spiny pubescent ann. to 3 ft.: lvs. 2-pinnate: fls. blue, ½ in. across, in short racemes: fr. green turning black, globose, ¼ in. across. Mex.

insequale (Cyphomandra fragrans). Shrub to 8 ft., branches greenish-yellow to gray, glabrous: lvs. ovate to oblong-lanceolate, to 4½ in. long, short-petioled: fis. white, to ½ in. across, 10-20 in raceme-like cymes: berry globose, yellow. Brazil.

integrifolium (S. coccineum). SCARLET OF TOMATO EGG-PLANT. Pubescent spiny ann. to 3 ft.: lvs. ovate or oblong-ovate, sinuate-lobed, to 8 in. long: fls. white, 34 in. across, in few-fld. clusters: fr. scarlet or yellow, globular, to 2 in. across, furrowed, grown for ornament. Afr.

jasminoides. Shrubby climber to 10 ft., glabrous and unarmed: lvs. ovate-lanceolate, to 3 in. long, entire or lower ones pinnate: fls. star-shaped, white tinged blue, 1 in. across, in branching clusters. Brazil. Var. grandiflörum has large clusters of fls.

lacinidtum: S amoulare

lanceolatum: S. laurifolium.

laurifolium (S. Lanceolatum). Shrub to 8 ft., often with prickles: lvs. oblong or oblanceolate, to 7 in. long, densely tomentose beneath: fls. pale blue, ½ in. long, in many-fld. cymes: fr. ½ in. across. Mex.

Lycopérsicum: the same as Lycopersicon esculentum.

macranthèrum. Woody climber: lvs. ovate-acuminate, entire or somewhat repand, long-petioled, pubescent: fls. violet, in corymb-like clusters, anthers conspicuous although short: berry red. Mex.; planted in Calif.

macránthum. Spiny pubescent shrub to 6 ft. or more: lvs. ovate to lanceolate, sinuately lobed, to 1 ft. or more long: fls. bluish-violet, to 2 in. across, in racemes to 5 in. long. Brazil.

marginātum. Spiny shrub to 4 ft.: lvs. oblong-ovate, sinuately lobed, to 8 in. long, densely white-tomentose beneath: fis. white lined with blue, 1 in. across, in cymes: fr. yellow, globose, 1½ in. across, spiny. N. Afr.

Melongèna. Pubescent spiny herb or subshrub to 3 ft.: lvs. ovate, angled or lobed, to 9 in. long: fls. violet-purple, to 1½ in. across, usually solitary: fr. blackish-purple, 6 in. long. Afr., Asia. Var. depréssum. DWARF EGGPLANT. Small and glabrous: lvs. to 6 in. long: fr. to 5 in. long. Var. esculéntum. Common Eggplant. Grown as ann.: lvs. to 15 in. long: fls. nodding, to 2 in. across: fr. shining, to 1 ft. long, purple, white, yellowish or striped. Var. serpentinum. SNAKE EGGPLANT. Fr. to 1 ft. long and 1 in. thick, curled at

muricatum (S. guatemalense). Pepino. Spiny herb or subshrub to 3 ft.: lvs. oblong-lanceolate, to 6 in. long, entire or undulate: fls. bright blue, to ¾ in. across, in long-stalked clusters: fr. yellow marked with purple, ovoid, to 6 in. long, edible. Peru.

nigrum. Prostrate or erect ann. to 2½ ft.: lvs. ovate or lanceolate-ovate, entire or angled, to 5 in. or more long, eaten as greens: fls. white, ½ in. across, in drooping clusters: fr. black, ¼ in. or more across. Cosmopolitan.—Cult. forms are known as "Garden Huckleberry" (var. guineense), "Wonderberry" and "Sunberry."

Pierreanum: S. æthiopicum.

Psendo-Cápsicum. Jerusalem-Cherry. Shrub to 4 ft., glabrous and unarmed: lvs. oblong, to 4 in. long, undulate, shining above: fis. white, ½ in. across, solitary or clustered: fr. scarlet or yellow, globular, ½ in. across, long persistent, for which it is grown in pots. Old World.

Pseudo-Melongèna. Glabrous unarmed ann.: lvs. ovate, undulate, dark green: fis. nodding: fr. red and green, large and fleshy. Habitat unknown. Probably a form of S. integrifolium.

Rantonnétii. Shrub to 6 ft., unarmed and nearly glabrous: lvs. ovate or oval, to 4 in. long, undulate: fis. dark blue or violet with paler eye, 1 in. across, in clusters: fr. red, heart-shaped, 1 in. long, drooping. Paraguay, Argen-

robústum (S. alatum). Spiny densely rusty-tomentose shrub to 5 ft., with winged sts.: lvs. broad-ovate, sinuately lobed, to 1 ft. long: fis.|white, 1 in. across, in axillary racemes: fr. orange, globose, ½ in. Brazil.

rûbrum: a listed name of uncertain botanical standing.

Seaforthianum. Shrubby climber to 10 ft., glabrous and unarmed: lvs. mostly pinnate, to 8 in. long, the lits. unequal: fls. star-shaped, blue or purple, to 1 in. across, in cymes: fr. scarlet, globose, ½ in. across. Trop. Amer.

sisymbrifòlium. Sticky-pubescent spiny ann. to 4 ft.: lvs. pinnate into sinuate or toothed lobes: fis. light blue or white, 1 ¼ in. across: fr. red, globose, about ½ in. across. Trop. Amer.; nat. in N. Amer.

sodomèum. Spiny pubescent shrub to 6 ft.: lvs. pinnate into undulate or entire lobes: fls. violet, about 1 in. across, in cymes: fr. shining yellow, globose, 1 in. across. Medit:

texanum: a spineless race of S. integrifolium.

Torreyi. Hairy per. to 3 ft.: lvs. ovate, to 6 in. long, 5-7-lobed: fls. violet, to 1 ½ in. across, in cymes: fr. yellow, globose, 1 in. across. Kans. to Tex.

triquêtrum. Vine-like per. with sts. to 4 ft. long, glabrous and unarmed. lvs. ovate to lanceolate, to 2½ in. long, entire or slightly 3-lobed at base: fls. purplish, ½ in. across. fr. globose, ½ in. across. Tex., Mex.

tuberòsum. Porato. Sts. weak, to 3 ft. long, unarmed, with underground edible tubers: lvs. pinnate, to 10 in. long, the lfts. ovate with smaller ones between: fls. white or bluish,

the lfts. ovate with smaller ones between: fis. white or bluish, about 1 in. across, in clusters: fr. yellowish or green, globular, to ¾ in. across. Probably Andes.

verbascifòlium. Tomentose shrub or tree to 30 ft., unarmed. lvs. ovate or oval, to 1 ft. long, entre or slightly undulate. fis. white, ½ in. across, in cymes: fr. yellow, globose, to ¾ in. across. Tropics.

Wállacei. Sticky-hairy shrub to 3 ft.: lvs. cordate-ovate, undulate. fls. violet, to 13/4 in. across, in cymes: fr. dark purple. Calif. and isls.

Warscewiczii. Rusty-tomentose shrub to 6 ft., with short stout spines: lvs. to 1 ft. or more long, lobed to half width of blade: fls. white, 1½ in. across, in racemes: fr. pale yellow, shining, ½ in. across. S. Amer.

Wendlandii. Shrubby climber, prickly and glabrous: lvs. pinnate, with a large terminal lft., or upper lvs. simple: fis. blac-blue, to 2½ in. across, in branched clusters: fr. globose. Costa Rica.

Xantii. Pubescent shrub with erect or decumbent sts. to 2 ft. long 1vs. ovate, to 1¾ in. long, entire or lobed: fls. violet, to 1 in. across, in cymes: fr. green or purplish, globose. Calif.

SOLDANÉLLA. Primulacex. Per. herbs native in mts. of Eu., sometimes grown in rock-gardens, with basal lvs., nodding blue or violet or rarely white fls., solitary or in umbels, the corolla with fringed lobes. Grown in shady situations in moist soil. Propagated by division or seeds.

alpina. To 6 in.: lvs. roundish, to 1½ in. across: fis. pale blue, ½ in. long, in 1-3 fld. umbels, in spring.

minima. To 4 ft.: lvs. orbicular-ovate: fls. pale bluish-purple with darker markings, solitary, corolla split about of the way, to the base, pedicels hairy.

montana. To 15 in.: lvs. roundish, to 2½ in. across: fis. blue, to ¾ in. across, in 3-10-fid. umbels, May-July.

pusilla. To 6 in.: lvs. roundish, to ½ in. across: fls. blue or violet, ½ in. long, usually solitary, in May.—Differs from S. minima in its rough, but non-pubescent, pedicels.

SOLENÁNTHUS. Boraginaceæ. Per. herbs, distinguished from Cynoglossum by the anthers exserted and not included within the tube of corolla, and from Lindelofia by the usually erect and rarely spreading short corolla-lobes; S. and E. Eu. and W. Asia. Propagated by division or seed. Useful in the hardy border or amongst shrubbery.

apenninus (Cynoglossum apenninum). To 3 ft.: basal lvs. ovate-oblong, coarse, st.-lvs. narrowly lanceolate: fls. blue, in dense axillary panicled racemes. S. Eu.

SOLIDAGO. GOLDENROD. Compositæ. Erect herbaceous perennials of many kinds, useful for borders and colonizing: lvs. simple and alternate: heads small, yellow or occasionally white, in thyrses, spikes, racemes or compound panicles, of ray- and disk-fls., blooming in late summer and autumn; pappus of bristles: native mostly in N. Amer. and characteristic of its late summer and autumnal flora. Any number of the species may be transferred to home grounds.

The goldenrods improve in the garden but some of them become weedy if the soil is too rich. They are easily grown from seed, blooming the second year; the mature plants may be divided in spring or in autumn.

álgida. To 1 ft., sts. tufted: lvs. oblanceolate, to 4 in. angium. 10 116, sis. tuited: 198. Odianceolate, to 4 in. long, entire or toothed, ciliate: heads in dense oblong or globose panicles. Mts., Wash.

alpéstris: S. Virgaurea.

altíssima. To 8 ft., pubescent: lvs. lanceolate, to 6 in. long, mostly toothed: heads in recurved one-sided racemes forming dense broadly pyramidal panicles. Me. to Ga. and

Arctica: a listed name.

arguta. To 4 ft.: lvs. ovate, to 16 in. long, coarsely toothed: heads in one-sided racemes in terminal panicles. Me. to Va. and Tenn.

bellidifòlia. To 1 ft., glabrous: lvs. oblong to obovate, to 2 in. long, wavy-toothed, ciliate: heads in dense clusters to 4 in. long. Mts., Wash.

bicolor. Silverrop. To 4 ft.: lvs. oblong, to 4 in. long, toothed, pubescent: heads crowded in a narrow spike to 7 in. long, rays white. P. E. I. to Ga. and Tenn.

Boottii. To 5 ft.: lvs. ovate or oblong-lanceolate, to 6 in. long, toothed or entire, heads in one-sided spreading racemes in the loose panicle. Va. to Fla. and Tex.

brachýstachys: hort. name.

Buckleyi. To 2 ft.: lvs. oblong, to 3 1/2 in. long, toothed, pubescent beneath: heads in small axillary clusters. Ala.

cæsia. Wreath G. To 3 ft., glabrous, often glaucous: lvs. lanceolate, to 5 in. long, toothed. heads in axillary clusters or lacemes. N. S. to Fla. and Tex.

canadénsis (S. reflera). To 5 ft.: lvs. linear-lanceolate, to 5 in. long, entire or toothed: heads in one-sided racemes forming large panieles. Newf. to Va. and Tenn.

capulinsis: listed as 2 ft. high with many heads of large

caroliniana: probably S. tenuifolia.

ciliòsa. To 10 nn., sts. pilose above: lvs. spatulate to linear-lanceolate, to 2 in. long, basal ones crenate-serrate, upper st.-lvs. narrow and entire, ciliate at base: heads yellow, in small dense thyrse. Alta. to Colo. west to B. C. and Ariz.

corymbòsa: probably only a southern form of S. rigida.

Curtisii. To 3 ft, glabrous or remotely pubescent: lvs. lanceolate, to 6 in. long, acuminate, sharply serrate: heads small, in loose axillary clusters and short terminal thyrses. Mts, Va. and W. Va. to Ga. and Ky.

Cútleri. To 1 ft: lvs. obovate, to 4 in. long, toothed: heads in short racemes. Mts., Me. to N. N. Y.

decúmbens. To 7 in , sts. decumbent, glabrous: basal lvs. spatulate, obtuse, distal half toothed: heads few, in short dense infl. Mts., Wyo. to New Mex.

elongàta. To 3 ft.: lvs. narrow-lanceolate, to 4 in. long, toothed, nearly glabrous: heads in dense thyrse-like panicles. B. C. to Mont and Calif.

erécta. To 3 ft., nearly glabrous: lower lvs. oval, to 6 in. long, toothed, upper lanceolate, entire: heads in a narrow terminal thyrse. N. Y. to Ga. and Ala.

fistulòsa. To 7 ft.: lvs. ovate-oblong to lanceolate, to 4 in. long, entire, rough on edges and midrib beneath: heads in one-sided raceines in the panicles. N. J. to Fla. and La.

flexicaulis. To 3 ft., nearly glabrous, with zigzag angled sts: lvs. ovate, to 7 in. long, sharp-toothed: heads in axillary clusters. N. S. to Ga. and Mo.

glabérrima. Differs from S. missouriensis in a more open somewhat one-sided infl. and broader bracts. Mich.

glabra: a name of uncertain application.

glomeràta. To 4 ft.: lvs. spatulate or oval, to 1 ft. long, toothed: heads in axillary clusters. N. C., Tenn.

graminifòlia (S. lanceolata. Euthamia graminifolia). To 4 ft.: lvs. linear-lanceolate, to 5 in. long, entire: heads in flat-topped compound corymbs. N. B. to Fla. and Neb.

hispida. To 3 ft., hairy: lvs. oval or oblong, to 5 in. long, mostly toothed: heads in dense terminal racemes. Newf. to Ga. and Mo.

Jóhnsonii: listed name.

júncea. To 4 ft., glabrous: lvs. lanceolate or oval-lanceolate, to 1 ft. long, toothed: heads in one-sided racemes forming a spreading panicle. N. B. to N. C. and Mo.

lanceolata: S. graminifolia.

latifòlia. To 3 ft.: lvs. ovate, to 7 in. long, sharp-toothed: heads in short axillary racemose clusters. N. S. to Ga. and Mo.

Lêavenworthii. To 4 ft.: lvs. linear-spatulate to linear-lanceolate, to 5½ in. long, toothed, margins ciliate: heads in one-sided racemes in the panicle. S. C. to Fla.

Lillei: listed name.

Lindheimeriàna. To 3 ft., stoloniferous, pubescent: lvs. broad-lanceolate to oval, entire, rough: heads in narrow thyrse. Kans. to N. Mex.

minor (Euthamia minor). To 3 ft., slender, glabrous, branched above middle: lys. nearly acicular, to 2 in. long and $\frac{1}{16}$ in. wide, punctate: heads in numerous small corymbs.

missouriénsis. To 11/2 ft., glabrous: lvs. linear-oblanceo late, to 6 in. long, entire or lower toothed: heads in a round-topped paniele. B. C. to S. D.—See Solidaster.

móllis. To 1 ft., stout and somewhat hairy: lvs. oblong to oblanceolate, to 3 in. long, entire, 3-nerved, canescent or rough: heads yellow, in thyrsoid panicles. Minn. to Man., south to Mex.

neglécta. To 4 ft.: lvs. lanceolate, to 1 ft. long, toothed: heads in one-sided racemes forming thyrsoid panicles. Swamps, Me. to Md. and Ill.

nemoralis. To 2 ft., gray-pubescent: lvs. oblanceolate, to 6 in. long, wavy-toothed: heads in one-sided racemes in the panicles. N. S. to Fla. and Ariz.

occidentàlis (Euthamia occidentalis). To 5 ft., glabrous: lvs. linear, to 4 in. long, entire: heads in corymbose clusters. B. C. to Rocky Mts.

odora. To 4 ft.: lvs. lanceolate, to 4 in. long, entire, anise-scented: heads in one-sided racemes in large panicles. N. S. to Fla. and Tex.

ohioénsis. To 3 ft., glabrous: lvs. lanceolate or oblong-lanceolate, to 1 ft. long, toothed toward tip: heads in ter-minal compound corymbs. N. Y. to Wis.

pállida. To 2½ ft.: lvs. obovate to lanceolate, to 6 in. long, entre, pale: heads in a dense elongated panicle. S. D., Neb., Colo.

pátula. To 7 ft.: lvs. oval or oblong, to 16 in. long, toothed or entire, rough above: heads in one-sided racemes in loose panicles. Swamps, Me. to Ga. and Tex.

pùbens. To 5 ft., pubescent: lvs. spatulate, to 6 in. long, toothed: heads in axillary raceme-like clusters. N. C., Tenn.,

puberula. To 3 ft.: lvs. oblong-lanceolate, to 2 in long, toothed or entire: heads in terminal thyrse. P. E. I. to Fla. and Miss.

rádula. To 4 ft., rough-hairy: lvs. oblanceolate, to 3 in. long, wavy-toothed or nearly entire: heads in one-sided racemes. N. C. to Tex.

refléxa: S. canadensis.

Riddellii. To 3 ft., nearly glabrous: lvs. lanceolate, to 1 ft. long, entire: heads in dense corymbs. Ont. to Mo.

rígida. To 5 ft., gray-pubescent: lvs. ovate or oblong, to 2 in long, usually entire: heads in dense compound corymbs. Mass. to Ga. and Tex.

rigidiúscula. To 4 ft.: lvs. lanceolate or ovate-lanceolate, to 5 in. long, entire or toothed: heads in dense narrow thyrse. Ohio to Colo and Tex.

rugosa. To 8 ft.: lvs. oval to oblong-lanceolate, to 4 in. long, toothed: heads in one-sided racemes in compound panicles Newf. to Fla. and Tex.

scopulòrum. To 1 ft.: lvs. oblanceolate to linear-lanceo late, to 6 in. long, toothed toward apex: heads in corymbs. Alta, to Colo, and Utah.

sempérvirens. To 8 ft., nearly glabrous: lvs. oblong or lanceolate, to 1 ft. long, entire, fleshy: heads in one-saded racemes in large panicles. N. S. to Fla. and Mex., along

serôtina. To 8 ft., nearly glabrous: lvs. lanceolate or oblong-lanceolate, to 6 in. long, toothed: heads in large panicles. N. Amer.

Shortii. To 4 ft., nearly glabrous: lvs. oblong-lanceolate, to 4 in. long, toothed: heads in one-sided racemes in large panicles. Falls of Ohio River.

specifies. To 16 th, nearly glabrous: lvs. ovate to oblong, to 10 in. long, toothed: heads in large terminal thyrse. Mass. to N. C. and Ark.

spectabilis. To 2½ ft.: lvs. oblong to linear, toothed: heads in dense compound thyrse. Nev., Calif.

squarrosa. To 5 ft., nearly glabrous: lvs. spatulate or oblong, to 10 in. long, toothed: heads in terminal narrow thyrse to 1 ft. long. N. B. to N. C. and Ohio.

stricta. To 8 ft.: lvs. oblong to linear, to 8 in. long, entire, glabrous: fls. in dense thyrse-like panicles. N. J. to Fla. and La., Cuba.

tenuifòlia (Euthamia tenuifòlia). To 1½ ft., glabrous: lvs. narrow-linear, to 3 in. long, entire: heads in dense flat corymbs. Mass. to Fla. and La.

trinervata. To 2 ft., gray-puberulent, sts. decumbent at base: lvs. oblanceolate, to 4 in. long, margins usually ciliate: heads yellow, in dense leafy panicles. S. D. to Utah south to Ariz. and New Mex.

uliginòsa. To 4 ft., glabrous: lvs. oblong-lanceolate or lanceolate, to 9 in. long, toothed: heads in dense terminal thyrse. Swamps, Newf. to N. C. and Wis.

vérna. To 3 ft., soft-pubescent: lvs. oblong-lanceolate, to

4 in. long, serrulate, hispidulous above, long-petioled: heads bright vellow, in lax infl. N. C. to S. C.

Virgaurea (S. alpestris). European G. To 3 ft.: lvs. obovate, to 7 in. long, toothed: heads in dense terminal thyrse to 10 in. long. Eu.

Wardii. To 3 ft.: lvs. lanceolate or ovate-lanceolate, to 3½ in. long, entire or with few teeth: heads in narrow leafy panicles. Mo. to Okla.

SOLIDÁSTER (Asterago). Compositæ. A bigeneric hybrid, presumably of hort. origin. between Aster ptarmicoides and an unknown species of Solidago. S. luteus (Aster hybridus luteus and Solidago missouriensis of hort.). Per. to 21/2 ft., scabrous: lvs. lanceolate, to 4 in. long, margins remotely serrate: heads numerous, ray-fis. canary-yellow, disk-fis. golden-yellow, in much branched corymbiform panicles.

SOLÍSIA. Cactacex. Segregate from Pelecyphora, being solitary rather than cespitose, juice milky, fls. small and lateral, tubercle axils naked. See Cacti.

pectinata (Pelecyphora pectinata). Globose, to 1 in. or slightly more diam., hidden by the overlapping clusters of 20-40 radial pectinate white spines: fls. yellow. Mex.—There is a cristate form.

pseudopectinàta: probably Pelecyphora pseudopectinata.

SOLITARY: borne singly or alone.

SÓLLYA. Pittosporaceæ. Australian evergreen climbing shrubs, with alternate simple lvs. small blue attractive nodding fls. in terminal cymes, and capsular frs.

One species is grown out-of-doors in the South where it makes a good cover for banks or fences, and in the green-house in the North. Propagated by seeds and cuttings under glass.

heterophfila. Australian Bluebell Creeper. To 6 ft. or more, twining lvs. variable, from narrow lanceolate to oblong, to 2 in. long, much paler beneath: fls. to ½ in. long.

SOLOMONS-SEAL: Polygonatum. False: Smilacina.

SÓNCHUS. Compositæ. Old World ann. and per. succulent herbs, some of them weedy, with alternate lvs. and heads of yellow ligulate fls. in corymbs or panicles; pappus of soft white bristles. One species is sometimes grown for ornament in S. Calif.

congéstus (S. Jacquini). Per. to 2 ft.: lvs. oblanceolate, to 1 ft. long, pinnatifid to about middle: heads to 3 in. across, in panicles. Canary Isls.

Jácquinii: S. congestus.

major: hort. name.

SONERILA. Melastomaceæ. Trop. herbs or subshrubs with simple 3-5-nerved lvs. that are often ornamental, showy fls. in racemes or spikes, and capsular frs.

One species is grown under glass in a temperature of about 75° and a humid atmosphere. Propagated by well-ripened cuttings under a bell glass, by division and also by

margaritàcea. Lvs. ovate-lanceolate, purplish below, having rows of pearly spots between the nerves: fls. rose.

SOPHORA. Leguminosæ. Mostly woody plants with pinnate lvs., papilionaceous fls. in terminal panicles or racemes, and usually cylindrical or 4-winged pods; often showy in bloom.

Sophoras are planted for ornament, the evergreen species hardy only in the southern states. Propagated by seeds, greenwood cuttings, layers or grafting.

affinis. Tree to 20 ft.: lfts. to 1½ in. long: fts. white or pinkish, ½ in. long, in axillary racemes to 6 in. long: pods to 3 in. long. Ark., Tex.

Dàvidii: S. vicirfolia.

japónica. Japanese Pagoda-Tree. Chinese Scholar-ree. Deciduous tree to 80 ft.: lfts. to 2 in. long: fls. yellowish-white, 1/2 in. long, in panicles to 15 in. long: pods to 3 in.

long. China, Korea; hardy N. Var. péndula has pendulous branches. Var. violàcea (S. violacea) has lfts. appressed-pubescent, fls. with wings and keel tinged purplish.

microphylla (S. tetraptera var. microphylla). Differs from S. tetraptera in the lits, only 1/2 in. long and fis. to 1 1/2 in. long. New Zeal.

platycárpa: Cladrastis platycarpa.

secundiflora (Broussonetta secundiflora). Mescal Bean. Evergreen shrub or tree to 40 ft.: Ifts. to 2½ in. long, shining: fls. violet-blue, 1 in. long, fragrant, in terminal racemes to 4 in. long: pods to 8 in. long. Tex. to N. Mex.

tetráptera (var. grandistora). Evergreen tree to 40 ft.: lfts. to 1 in. long: fis. golden-yellow, 2 in. long, in 4-8-fid. racemes: pods to 8 in. long, 4-winged. New Zeal.

vicifolia (S. Davidi). Deciduous shrub to 8 ft.: lfts. to ½ in. long; fis. blush-violet to nearly white, to ¾ in. long, in 6-12-fid. racemes: pods to 2 in. long. China; hardy N. violàcea: S. japonica var.

SOPHROLÆLIOCÁTTLEYA. Orchidacex. A group comprising hybrids between the genera Sophronitis, Cattleya, and Lælia.

Báldwinii (C. Warscewiczii × Sophrolaliocattleva Meuse). radians (C. Princess Royal X Sophrolaliocattleya Isabella).

SOPHRONITIS. Orchidaceæ. Small epiphytes, mostly native of Brazil, with 1-2-lvd. pseudobulbs and showy fls. either solitary or in few-fld. racemes; scpals and petals similar or petals broader; lip adnate to column at base, entire or 3-lobed. Grown mostly in shallow pans under the roof; see *Orchids*.

cérnua. Lf. solitary, about 1 in. long: infl. 2-5-fld.; fls. about 1 in. across, cinnabar-red with lip shading to orange or whitish at base. Oct.-Apr. Brazil.

coccinea (S. grandiflora). Lf. solitary, to 3 in. long: fl. solitary, scarlet with yellow near base of lip, to about 3 in. across. Blooming all year. Brazil.

grandiflòra: S. coccinea.

SORBÀRIA (Schizonotus). False-Spirea. Rosaceæ. Deciduous shrubs of Asia with alternate pinnate and toothed lvs., and small white fls. in large terminal panicles.

Sorbarias are cultivated for ornament; they spread rather rapidly by suckers. They thrive in moist rich soil. Propagated by seeds, by suckers, by cuttings of ripe wood or root-cuttings.

Altchisonii (Spiræa Aitchisonii). To 10 ft.: lfts. 15-21, less than ½ in. wide, glabrous: panicles to 10 in. long, upright. July-Aug. W. Asia.

arborea. To 18 ft.: lfts. 13-17, more than ½ in. wide, pubescent beneath: panicles to 1 ft. long, loose and spreading. July-Aug. China; hardy N. Var. glabrata has glabrous lfts.

assurgens. To 10 ft.: lfts. 13-17, more than ½ in. wide, pubescent on yeins beneath: panicles to 6 in. long, upright. July. China; hardy N.

Lindleyana: S. tomentosa.

sorbifolia (Spirea sorbifolia). To 6 ft., hardy: lfts. 13-23, more than ½ in. wide, nearly glabrous beneath: panicles to 10 in. long, dense and upright. June-July. Asia; sometimes spontaneous; hardy far N. Var. stellipila (S. stellipila), lvs. stellate-pubescent beneath.

stellipila: S. sorbifolia var.

tomentòsa (S. Lindleyana. Spiræa Lindleyana). To 18 ft.: Ifts. 15-21, more than ½ in. wide, pubescent on veins when young: panicles to 1 ft. long, loose and spreading. July-Aug. Himalayas; stands far S.

SORBARONIA. Rosacex. Hybrids between Sorbus and Aronia, with simple or partly pinnate lvs. Hardy N.

TRIBER (Sorbus heterophylla). Hybrid between S. Aucuparia and A. melanocarpa: similar to S. hybrida but nearly glabrous and with blackish fr.

hfbrida (Sorbus spuria). Hybrid between S. Aucuparia and A. arbuifolia: Ivs. to 3 in. long, with lobes or lfts. toward base, pubescent beneath: fis. white or pinkish: fr. dark purple.

SORBOPYRUS. Rosaceæ. Hybrids of Sorbus and Pyrus. S. auricularis is a tree to 40 ft., with

branchlets, under side of lvs., long pedicels and calyx tomentose or thickly pubescent: lvs. broad-elliptic, abruptly short-pointed, mostly rather broad at base, strongly serrate: fls. about 1/2 in. diam., pyriform, green or yellowish. A very old European plant considered to be a hybrid between Purus communis and Sorbus Aria, known under a variety of names as Pyrus auricularis, P. Pollveria, P. Bollwylleriana, Sorbus Bollwylleriana, Bollwilleria auricularis. It is sometimes planted for ornament and interest; hardy N.

SÓRBUS, MOUNTAIN-ASH, Rosaceæ, Various deciduous trees or shrubs native in the north temp. zone, and hardy N., with alternate simple or pinnate lvs., white fis. in terminal compound corymbs in late spring, and fr. a berry-like usually bright red pome.

Most of the species are hardy in the North and will thrive even in dry soil. Propagated by seeds sown when ripe or stratified, by layers, or rare kinds by budding or grafting on S. americana or S. Aucuparia.

alnifolia. To 20 ft., branchlets glabrous or slightly pubescent: lvs. simple, ovate to elliptic, to 4 m. long, usually glabrous beneath: infl. 6-10-fld., styles 2, fr.-calyx deciduous. E. Asia.

americana (Pyrus americana). American M. To 30 ft.: lvs. of 11-17 lfts. to 4 in. long; fls. about ½ in. across, the infl. glabrous. Newf. to N. C. and Mich.

amurénsis. Similar to S. Aucuparia but with acuminate more deeply toothed lifts. and orange-red fis. N. E. Asia.

Aria (Pyrus Aria). WHITE BEAM-TREE. To 50 ft.: lvs. simple, elliptic, to 5 in. long, doubly toothed, white-tomentose beneath: fls. ½ in. across, the infl. tomentose. Eu. Vars. with yellow Ivs. are aurea, chrysophylla and lutéscens. Var. Decaisneana (var. majestica) has larger Ivs. Var. latifòlia is S. latifolia and var. quercifòlia is S. hybrida.

S. Layoua and var. quercitolia is S. hybrida.

Aucupāria (Pyrus Aucupāria). EUROPEAN M. ROWAN. To 50 ft.: lvs. of 9-15 lfts. to 2 in. long: fis. ½ in. across, the infl. pubescent. Eu. Commonly planted. Some of the hortvars. are: edilis, fr. used for preserves; fastigiāta, of narrowpyramidal habit; lūteo-variegāta, lvs. variegated with yellow; pēndula, branches long and drooping; xanthocarpa (var. Fifeana), fr. orange-yellow.

Bollwylleriana: Sorbopyrus auricularis.

Chamæméspilus. To 10 ft.: lvs. elliptic or oblong, to 3 in. long, toothed: fls. pink, the infl. tomentose. Eu.

commixta. To 25 ft.: lvs. of 11-15 lfts. to 3 in. long: fls. 1/3 in. across, the infl. glabrous. Japan, Korea.

decora. To 30 ft.: lvs. of 11-17 lfts. to 3 in. long: fls. 1/3 in. across, the infl. pubescent: fr. bright red, to nearly ½ in. across. Lab. to N. Y. and Minn.

discolor (S. pekinensis). To 30 ft.: lvs. of 11-15 lfts. to 3 in. long, glaucous beneath: fis. ½ in. across, the infl. nearly glabrous: fr. white or yellowish. N. China.

doméstica (Pyrus domestica. P. Sorbus). Service-Tree. To 60 ft.: lvs. of 11-21 lifs. to 3 in. long, tomentose beneath: fls. ½ in. across, the infl. tomentose. S. Eu., N. Afr., W. Asia. Var. pomífera has apple-shaped fr. and pyrifera pear-shaped.

dumôsa. Shrub to 15 ft., winter-buds white-villous: lvs. of 11-14 lfs. to 2½ in. long, doubly serrate: infl. to 3 in. across, white-villous, fls. about ½ in. across. Alta. to Ore. south to Colo. and N. Mex.

europæa: listed name of unknown botanical standing; the plant may be S. Aucuparia.

Folgneri. To 30 ft., young sts. hairy: lvs. simple, to 31/4 in. long, elliptic-ovate, serrate, white-woolly beneath: infl. to 4 in. across: fr. red, to 1/4 in. diam. Cent. China.

heterophýlla: Sorbaronia fallax.

Hóstii. Hybrid between S. Chamæmespilus and Mougeotii: to 12 ft.: lvs. simple, tomentose beneath: fis. pinkish.

hybrida (S. quercifolia. Pyrus pinnatifida). Hybrid between S. Aucuparia and S. intermedia: to 40 ft.: lvs. lobed or sometimes divided, tomentose beneath: fis. ½ in. across, the infl. pubescent. Var. Meinichii (var. neullyensis) has distinct lits.

intermedia (S. scandica). To 30 ft.: lvs. to 4 in. long, pinnately lobed to 1/3 or less the width, gray-tomentose beneath: fis. 1/2 in. across, the infl. tomentose. N. Eu.

lanuginòsa: S. thuringiaca.

latifòlia. Hybrid between S. Aria and S. torminalis: to

50 ft.: lvs. ovate, to 4 in. long, with shallow lobes, tomentose beneath: fis. ½ in. across, the infl. tomentose.

majéstica: S. Aria var. Decaisneana.

Mougeòtii. To 60 ft.: lvs. ovate or ovate-oblong, lobed, white-tomentose beneath. Mts. of Cent. Eu.

occidentalis (S. pumila). Shrub to 10 ft.: lvs. of 7-11 lfts. to 2½ in. long, serrate near tip only, bluish-green: infl. to 3 in. across. B. C. to Ore, and Ida.

pekinénsis: S. discolor.

pohuashanénsis. Small tree: lvs. of 11-15 lfts. to 2½ in. long, pubescent beneath, with large persistent stipules: infl. tomentose. China.

pùmila: S. occidentalis. quercifòlia: S. hubrida.

sambucifòlia. To 8 ft.: lvs. of 9-11 lfts. to 3 in. long, shining above: fls. ½ in. across, the infl. pubescent. N. Asia, Japan.

scándica: S. intermedia.

scopulina. Shrub to 15 ft.: lfts. 11-14, oblong-lanceolate, about 2 in. long, acute: infl. villous. S. D. to B. C. south to New Mex. and Ariz.

sitchénsis. Shrub to 15 ft.: Ifts. 9-13, elliptic to oblonglanceolate, obtuse, coarsely serrate, glabrous: fr. bright red, to ¾ in. across. Alaska to Ida. and Ore.

spùria: Sorbaronia hybrida.

thuringiaca (S. lanuginosa). Hybrid between S. Aucupara and S. Aria: lvs. with 1-3 pairs of lfts.

torminalis (Pyrus torminalis). WILD SERVICE-TREE, To 50 ft.: lvs. ovate, to 5 in. long, with pointed lobes: fls. 1/2 in. across, the infl. tomentose. Eu., N. Afr., Asia Minor.

SÓRGHUM (Holcus, in part). Gramineæ. Tall coarse quick-growing broad-lvd. ann. and per. grasses native in warm parts of Old World, the spikelets borne in large terminal panicles which in some species mature into heavy grain-bearing heads or tassels; grown for grain and forage and for the syrup extracted from the stalks of S. vulgare var. saccharatum. The species are not clearly defined and there are many forms. See Grasses.

halepénse (Andropogon halepensis. Holcus halepensis). Johnson-Grass. Means-Grass. Aleppo-Grass. Per. to 6 it., very leafy, with strong creeping rootstocks: lvs. to 2 ft. long and 1 in. wide: panules loose, to 2 ft. long, the branches spreading. Medit. region but widely nat.—Grown for forage and pasture, mostly in the S.; becomes an invading weed.

nigrum: S. vulgare.

sudanénse: S. vulgare var.

virgatum (Holcus virgatus). Tunis-Grass. Ann.: panieles to 2 ft or more long, very narrow and slender, spikelets awned. Afr.

vulgare (Andropogon Sorghum. Holcus Sorghum. S. nugrum). Sorghum. Ann. to 12 ft. or more, often with juicy pith yielding syrup; lvs. to 2 ft. long and 2 in. wide; panicles variable, the spikelets large and broad and persistent at maturity. Probably Afr; long cult. and the source of many races, some of which yield important grain as well as forage; one is broom-corn and one the sweet or syrup sorghum. Var. caffròrum (Holcus caffrorum). KAFIR. Pith dry; panicles dense, oblong or cylindric, grains large. S. Afr. Var caudâtum (Holcus Sorghum var. caudatus). FETERITA. To 14 ft.; panicles very dense, oblong, grains large, white, yellow or red. Cent. Afr. Var. Drúmmondii (Holcus Sorghum var. Drummondii). Chicken-Corn. To 6 ft.; panicles to 16 in. long, the branches ascending, grains small, orange. Guinea. Var. Dútra (Holcus Durra. Holcus Sorghum var. Durra). Durra. Holcus Sorghum var. Rorburghii). Shallu. Panicles ovate, recurved, grains large. Nile region. Var. Róxburghii (Holcus Sorghum var. Rorburghii). Shallu. Panicles oblong, becoming loose, grains small. Afr., India. Var. saccharātum (Holcus saccharātus. Holcus Sorghum var. saccharātum). Soneno, Sweet or Sugar S. Pith juicy and sweet, employed in the making of syrup. Var. sudanénse (Holcus sudanensis). Sudan-Grass. To 10 ft.; lvs. to 2 ft. long and ½ in. wide: panicles to 1 ft. long and 6 in. across, the branches ascending. Afr. Var. téchnicum (Holcus Sorghum var. technicus). Broom-Corn. Panicles to 2 ft. or more long, spikelets usually awned.

SORREL: Rumex. Jamaica: Hibiscus Sabdariffa. -Tree: Oxydendrum arboreum. Wood-: Oxalis.

SORROWLESS TREE OF INDIA: Saraca indica.

SORUS: a heap or cluster; the fruit-dots or -clusters of ferns (plural sori).

SOTOL: Dasylirion.

SOUR-BERRY: Rhus integrifolia. -Wood: Oxydendrum arboreum.

SOURSOP: Annona muricata.

SOUTHERNWOOD: Artemisia Abrotanum.

SOYBEAN: Glucine Max.

SPADIX: a thick or fleshy spike of certain plants, as the Aracea, surrounded or subtended by a spathe.

SPANISH BAYONET: Yucca aloifolia. Dagger: Yucca gloriosa.

SPARÁXIS. WAND-FLOWER. Iridacex. Spring-blooming S. African cormous herbs, with narrow mostly basal lvs. and fls. in short spikes, the perianth-tube short. Cult. and treatment as for Iria.

bulbifera. To 1 ft.: lvs. lance olate, to 1 ft. long, usually 3-4: fls. yellow, solitary, perianth-tube to $\frac{1}{2}$ in. long.

grandiflòra. To 1 ft.: fls. yellow or purple, 1 in. or more long. Var. álba, fls. white. Var. atropurpurea, fls. dark purple.

Pillansii. Perhaps to 2 ft. or more: fls. soft rose with vellow center.

pulchérrima: Dierama pulcherrima.

tricolor. To 112 ft.: fls. dark purple or yellow tinged with brown-purple or white with purple, having a yellow throat and dark blotch at base of each segm., 1 in. or more lang.

tubiflòra: listed as light vellow.

SPARKLEBERRY: Vaccinium arboreum.

SPARMÁNNIA. Tiliaceæ. White-hairy trees and shrubs of Afr. with alternate toothed or lobed large lvs., white fis. in terminal umbels, and spiny capsular fr. See Rehmannia for another use of the name Sparmannia.

A few species are planted out-of-doors in the South and in the greenhouse, where they should be given a moderate temperature and plenty of air and light. Propagated by cuttings of the young shoots.

africana. To 20 ft, often with many trunks: lvs. 5-7-angled, to 9 in long, heart-shaped at base: fls. to 1½ in. across, white with yellow stamens: fr. ½ in. across. S. Afr. Var. flore-pleno has double fls.

palmàta ($Entelea\ palmata$). Shrub: lvs. deeply 5-7-lobed: fls purplish, in dense umbels. S Afr.

SPÁRTIUM. Leguminosæ. Ornamental shrub native in S. Eu., and grown out-of-doors as far north as Cent. U. S., and on the Pacific coast. Propagated by seeds and greenwood cuttings under glass.

jûnceum (Genista juncea). Spanish Broom. Weavers Broom. To 10 ft., with almost lendless tush-like branches: lvs simple, to 1 in. long: fis. yellow, papihonaceous, fragrant, 1 in long, in terminal racemes to 18 in. long: pods flattened, hairy, to 4 in. long. Var. nanum, a dwarf form, is listed.

multiflorum: Cytisus multiflorus.

scoparium: Cytisus scoparius.

SPARTOCYTISUS NUBIGENUS: Cytisus fragrans.

SPATHE: the bract or leaf surrounding or subtending a flower-cluster or a spadix; it is sometimes colored and flower-like, as in the calla (Zantedeschia).

SPATHIPHÝLLUM. Araceæ. Trop. American nearly trunkless herbs, having oblong lvs. with strong midribs and sheathing petioles, and bisexual fls. on creet densely-fld. spadices which are shorter than the spathes; grown as foliage plants in a warm greenhouse.

cándidum: S. Patinii.

cannæfðlium. Lvs. to 20 in. long and 7 in. wide, tapering at base, petioles 6-18 in. long: spathe green outside and whitish within, 3-8 in. long; spadix greenish-yollow. W. Indies.

Clèvelandii: listed name of unknown botanical standing. cochlearispathum (S. heliconnfolium). Lvs. to 2½ ft. long and 10 in. wide, thin, the margin often slightly wavy, the petioles to 2½ ft. long: spathes to 10 in. long, the spadix whitish. Mex., Cent. Amer.

floribundum. Lvs. to 6 in. long and 2½ in. wide, unequal sided, dark green above and paler beneath, the petioles to 6 in. long: spathes to 2½ in. long, white, the spadix greenish-yellow or white. Colombia.

heliconiifdlium: S. cochlearispathum.

Patinii (S. candidum). Lvs. to 10 in. long and 2½ in. wide, the petioles to 1 ft. long: spathes about 3 in. long, whitish. Colombia.

SPATHÒDEA. Bignoniaceæ. Evergreen trees of trop. Afr. with pinnate lvs., bell-shaped orangered or scarlet fls. in terminal racemes or panicles, the calyx split and sheath-like, and woody capsular frs

One species (S. campanulata) is grown as a street tree in the tropics and sometimes in southern United States. It requires fertile well-drained soil for best results but grows under many conditions. Propagated by seeds or cuttings.

campanulata. To 70 ft.: lvs. of 9-19 ovate-lanceolate entire nearly glabrous lfts. to 4 in. long: fis. scarlet, 4 in. long, with leathery calyx 2½ in. long: fr. 8 in. long and 2 in. across.—Showy tree.

nilótica. Much branched, to 20 ft., branchlets pubescent: lvs. of 9-15 lfts., ovate-oblong, to 4 in. long, densely pubescent beneath, entire, leathery: corolla as in above, calvx to 2 in. long.

SPATHOGLÓTTIS. Orchidacex. Old World terrestrial orchids with inconspicuous pseudobulbs bearing 1 to several plaited lvs. and infl. rising from below the pseudobulb: fls. rather large, in raceines, the petals often broader than the sepals; lip 3-lobed. Grown in a warm greenhouse: see Orchids.

Vieillårdii. Lvs. to 40 in. long: scape to 24 in. high, many-fld. above; fls. 2 in. across; sepals and petals whitish to pale lilac; lip with orange-brown side lobes and lilac mid-lobe. Sept.—Nov. Oceania.

SPATHYEMA: Symplocarpus. SPATTERDOCK: Nuphar. SPATULARIA: Saxifraga.

SPATULATE, SPATHULATE: oblong with the basal end attenuated; somewhat spoon- or ladle-shaped.

SPEARMINT: Mentha spicata.

SPECIES (the word is either singular or plural). A kind of plant or animal distinct from other kinds in marked or essential features, that has good characters of identification, and may be assumed to represent in nature a continuing succession of individuals from generation to generation.

The term is incapable of exact definition; it is only by long practice in systematic botany or zoölogy that a person arrives at a defensible conception of species-lines, and these persons become the authorities. Certain species, as sassafras, orchard-grass, Madonna lily, are well-marked and clearly definable, whereas others may be so variable that the species is difficult to diagnose with clearness. Plants that to one person constitute a single species may to another person represent two or more species; there is no absolute criterion.

The species is the primary or fundamental concept in the understanding of the forms of life. It is the unit in classification. Species are combined into genera (see Genus), and variations or subordinate forms of them are varieties (see Variety). Betanical binomial nomenclature begins with Species Plantarum (Species of Plants) of Linneus published in 1753. The name of a species is two words, one representing the genus or group and the other identifying the particular kind or member of the group. Thus there are some 300 species of violets, all of the genus Viola; the florists violet is named Viola odorata, the horned violet V. cornuta, the birds-foot violet

V. pedata; in this case odorata, cornuta, pedata are specific or species-names.

Authors differ on the limits or definition of genera, and thus it happens that a species may be placed in different genera by different writers, but the original specific name normally follows it in whatever genus it may rest; thus the peach was Amygdalus Persica to Linneus and this disposition of it is followed by some of the contemporary authors; other authors prefer to place it in the genus with the other orchard stone-fruits, and it is then Prunus Persica. Some authors keep the genus Azalea separate, others unite it with Rhododendron; the pinxter-flower may therefore bear the name A. nudiflora or R. nudiflorum.

The number of species of plants is unknown. Of course the count depends to some extent on the varying definitions by different authors. The earth is yet only partially explored for the species of plants and animals. Among the seed-plants or spermatophytes ("flowering plants") probably upwards of a million specific names have been published; many of these names are duplicates or synonyms, but it is probably fair to assume that more than half of them represent separate species in nature. The species of plants have originated under natural conditions, vet some of them have been recognized only after having been introduced to cultivation; it is not yet agreed whether any plants distinct and permanent enough to be called species have been produced as the direct results of the processes of cultivation: knowledge of this subject is yet scant and imperfect. See Cultigen, Indigen.

SPECULÀRIA. Campanulaceæ. Several ann. herbs, mostly in the northern hemisphere, differing from Campanula chiefly in the wheel-shaped corolla, long calyx-tube, and other technical floral characters. Grown in the flower-garden, rock-garden and for edgings. Propagated readily by seeds.

pentagònia (Campanula pentagonia). To 1 ft., hairy: lvs. obovate to linear-lanceolate, nearly entire: fis. blue, solitary, the calyx-lobes spreading. Asia Minor.

perfoliata. To 1 1/4 ft., hairy: lvs. round-cordate, 1/4 in. long, wavy-toothed, clasping: fls. blue. N. Amer.—Weedy plant but attractive in good moist land not too much exposed to sun.

Spéculum-Véneris (S. and Campanula Speculum). VENUS LOOKING-GLASS. To 15 in., nearly glabrous: lvs. oblong, to 1½ in. long, toothed fls. violet-blue or white, sometimes double, ¾ in. across, 1-3 together, the calyx-lobes reflexed. Eu., N. Afr., W. Asia.

SPEEDWELL: Veronica.

SPEGAZZÍNIA. Cactacex. A small S. American genus perhaps not wholly distinct from Parodia, but distinguished from it by its swollen rootstock which is separated from the plant-body by a slender constriction and its stouter spines.

Fidaiana. Solitary, becoming cespitose or branched by means of offshoots from upper areoles, globose to ovoid, about 2½ in. diam.; ribs usually 13-15, high, tubercled, areoles large and woolly; spines pale yellow to blackish, flexuous, radials 9, to 1¼ in. long, centrals 3-4, to 2 in. long: fls. deep yellow, to 1¼ in. long, segms. obtuse. Bolivia.

Neumanniàna. Differs from S. Fidaiana in its fis. orange-red and segms. acute. Bolivia.

SPELT: Triticum Spelta.

SPENCÈRIA (sometimes, but not originally, spelled Spencera). Rosaceæ. A small and perhaps monotypic genus from W. China, differing from Agrimonia in having about 30-40 stamens,

a spineless but pilose calyx-tube, a funnel-shaped involucre of 2 connate bracts, and stigmas filiform not capitate. S. ramalana. Per. herb to 1 ft. high, sts. many and erect from branched rhizomes, silvery-pilose throughout: basal lvs. pinnate, ifts. about 12, broadly elliptic, to $\frac{5}{8}$ in. long, 2-toothed; st.-lvs. of 1-2 pairs of lfts. or simple, acute: fls. bright golden- to reddishyellow, about 1 in. across, on pedicels to $1\frac{3}{4}$ in. long, in stiff loose racemes: fr. a subglobose hair-tufted achene to $\frac{1}{8}$ in. long.

SPÉRGULA. Caryophyllaceæ. Small ann. herbs in temp. regions of the world: lvs. awl-shaped, usually clustered in the axils: fls. white, in terminal cymes. Spurry is sometimes grown for forage and as a green-manure crop on poor sandy soils.

arvénsis. Differs from S. sativa in being bright green, not sticky, and seeds with whitish papillæ.

pilifera: Samna subulata.

sativa. Spurry. Dull green, sticky, to 1½ ft.: lvs. linear, in clusters of 6-8 at the nodes: fis. small, numerous; seeds not papillate. Eu.; sometimes escaped in E. U. S.

SPERGULÀRIA (*Tissa*). Caryophyllaceæ. Low ann. or per. herbs growing in salt marshes or shores, with linear or bristle-like lvs. and small pink or whitish fls. in terminal cymes.

azoroides: listed name of pink-fld. form to 10 in. high.

salina (S. and Arenaria marına). To 8 in., ann. or bien.: lvs. cylindrical, fleshy, to $1\frac{1}{2}$ in. long: fls. pink. N. Amer., Eu., N. Asia.

SPHÁCELE. Labiatæ. Shrubs or subshrubs native in Calif., Hawaii and S. Amer., one offered in Calif.: fls. solitary in axils of bracts, forming larger lobe. The name is pronounced in three syllables.

calýcina. To 5 ft., pubescent: lvs. ovate or oblong-ovate, to 4 in. long, toothed: fls. white or pinkish, about 1 in. long; calyx inflated in fr. Calif.

SPHERÁLCEA (Phymosia). Globe-Mallow. Malvaceæ. Herbs or sometimes woody, mostly of warm regions in Amer. and Afr., with alternate usually angled or lobed lvs., lilae to purple and red fls. solitary or clustered, and many carpels in a ring around an axis; grown in the garden, and sometimes under glass. Propagated by seeds or greenwood cuttings.

acerifolia (*Phymosia acerifolia*). Per. to 3 ft., gray-pubescent: Ivs. maple-like, deeply 5-lobed: fls. rose, 2 in. across, in spike-like clusters, calyx-lobes ovate, briefly acuminate. Wash. to Calif.

ambigua. Per. to 3 ft.: lvs. cordate or orbicular, often somewhat 3-5-lobed: fls. rose- or brick-red, 1½ in. across, in racemes. Deserts, Calif., Ariz., Utah.

angustifòlia. Per to 6 ft.: lvs. lanceolate, toothed: fls. pink or red, 1 in. across in clusters. Mex.

cisplatina (Malva miniata). Subshrub to 4 ft.: lvs. 3-lobed, the middle lobe the longest: fis. brick-red, to 1½ in. across, in axillary clusters. La Plata.

coccinea: Malvastrum coccineum.

cuspidata. Per. to 3 ft., pubescent: lvs. lanceolate or linear-lanceolate, slightly toothed: fis. pink or red, ½ in. across, in clusters. Colo. to Mex.

fasciculata: Malvastrum fasciculatum.

Munroana. Per. to 2 ft.: lvs. obscurely 3-lobed: fis. scarlet or rose, 1 in. across, in clusters. W. N. Amer.

remota (*Phymosia remota*). Per. to 4½ ft., bushy, densely pubescent: lvs. maple-like, 5-7-lobed: fls. rose, to 2 in. across, in spike-like clusters, calyx-lobes long and narrowly acuminate. Ill.

rivulàris (Phymosia rivularis). Per. to 6 ft.: lvs. maplelike, 5-7-lobed: fls. pink or white, 2 in. across. Alta. to Colo. and Nev.

rosea (S. vitifolia). Similar to S. umbellata but with

bractlets united below the middle rather than distinct, and longer fls. Guatemala.

subrhomboides. Per. to 1½ ft.: lvs. rhombic, 3-parted halfway down, grayish-green: fts. scarlet, ½ in. long, in dense panicles. Utah.

umbellata. Shrub or tree to 15 ft.: lvs. rotund, shallowly 7-lobed: fls. scarlet, white at base, 2 in. across, in clusters. Mex.

vitifòlia: S. rosea.

SPHÆROGYNE LATIFOLIA: Tococa platyphylla, SPHÆROSTIGMA: Œnothera.

SPHALMÁNTHUS. Aizoaceæ. Sts. creeping: lvs. opposite, sessile, semi-cylindrical: fls. in few-fld. cymes, stalked, petals numerous in several rows; stigmas 4-5. Allied to Mesembryanthemum; S. Afr.

longispinulus (M. longispinulum. Aridaria longispinula). Lvs. to 1 in. long and ½ in. wide, dotted: fls. yellow, 1½ in. across, on stalks to 2 in. long.

SPHENOGYNE: Ursinia.

SPHENOSCIADIUM: Selinum.

SPICE-BUSH: Lindera Benzoin.

SPIDER-FLOWER: Cleome spinosa.

SPIDERWORT: Tradescantia. Family: Commelinacex.

. SPIGÈLIA. Loganiaceæ. American herbs with opposite entire lvs., tubular red, yellow or purplish fls. in one-sided cymes, and capsular frs.; one species is sometimes transplanted to the border.

marilándica. Pink-Root. Per. to 2 ft.: lvs. ovate, to 4 in. long, sessile: fis. red outside, yellow inside, to 2 in. long. May-July. N. C. to Fla. and Tex.

SPIKE: compact more or less simple indeterminate mostly clongated cluster with flowers sessile or nearly so. SPIKENARD, AMERICAN: Aralia racemosa.

SPILANTHES. Composite. Mostly creeping or spreading herbs with opposite toothed lvs. and terminal long-stalked heads of yellow or white ray-fls. and yellow disk-fls.; pappus of awns. One species is grown for the lvs. which give a pungent flavor to salads.

oleràcea. Diffuse: lvs. broadly ovate, wavy-toothed: heads ovoid, without ray-fls., greenish-yellow, to 1 in. long, the involucre-bracts oblong. Aug.—Oct. Tropics.—This plant has apparently been grown as S. alba but that species has white fls. and the involucre-bracts are narrow.

SPINACH (Spinacia oleracea). A better understanding of the value of spinach in the diet is probably the most important factor responsible for the more than seven-fold increase in the acreage of this vegetable in the last twenty years. Texas now contributes about two-thirds of the present acreage grown for shipment in a fresh condition. See Spinacia.

Spinach is essentially a cool-season crop. The plants run quickly to seed at high temperatures and under a long daily light period. Close crowding in the row contributes to the early develop-

ment of the seed-stalks.

Culture of spinach is possible during the winter where the weather is mild; elsewhere, it is grown as a spring and fall crop. The seed is sown in drills 10 to 15 inches apart. Large scale commercial plantings are seldom thinned, the stand being adjusted by the rate of seeding. Stocky plants are obtained when they are thinned to a spacing of 4 to 5 inches in the row. The plants are harvested by cutting the stem near the ground level, before seed-stalk elongation commences.

New Zealand spinach (Tetragonia expansa) does well in hot weather. The seed should be soaked before planting. When the plants are

spaced 1 to 2 feet in rows 3 to 4 feet apart. the much branched growth spreads out to form a mat over the ground. The apical 3 to 4 inches of the branches are cut off and cooked like the true spinach.

SPINACH-RHUBARB: Rumex abyssinicus.

SPINACIA. Spinach. Chenopodiacex. Asian annuals with alternate lvs. and small unisexual fls., the pistillate axillary and the staminate in terminal spikes or panicles; one species commonly grown for greens. S. oleracea. PRICKLY-SEEDED To 2 ft.: lower lys, broadly ovate to orbicular, lobed at base and sometimes on sides, st.-lvs. narrower: fr. or "seed" inclosed in a spiny caps.-like body. S. W. Asia. Var. inérmis (var. glabra), ROUND-SEEDED S., has spineless seeds. See Smnach.

SPINDLE-TREE: Euonumus.

SPINE: a strong and sharp-pointed woody body mostly arising from the wood of the stein, representing a branch or a separate outgrowth.

SPINESCENT: more or less spiny.

SPINOVITIS: Vitis Davidii.

SPIRAA. SPIREA. Rosaceae. Attractive deciduous shrubs with alternate simple lvs., white or pink fls. in umbel-like racemes, corymbs or panicles, and fr. a dehiscent follicle; native in the northern hemisphere and popular ornamental subjects for lawn and landscape planting.

Spireas thrive in any good land but require plenty of

Spireas thrive in any good land but require plenty of mosture and sunny exposure. Propagated by seeds sown as soon as ripe or stratified, by cuttings of green wood in summer under glass, by cuttings of mature wood and some species by layers. There are many hortcultural forms and hybrids. The species are hardy to New York City and beyond unless otherwise stated.

The planter may find a wide range of adaptable white-flowered and pink-flowered shrubs among the spireas. If allowed to take their natural growth, without shearing, they soon make attractive masses with side branches arching or drooping to meet the ground in good flowing lines. A baker's dozen of them are S. printfolia, Thunbergia, Vanhouttei, trilobata, crenata, hypericifelia, chamelrifolia, japonica, salicifolia, cantoniensis, Billiardia, tomentosa, Bumalda, hardy and dependable over a wide range of country. Little pruning will be necessary, although S. Thunbergia and some others may be injured on the tips by winter and these parts may be cut back. The spring-flowering kinds, as S. printfolia, Vanhouttei, trilobata, crenata, may be pruned after blooming, if a all; the summer-flowering kinds, as S. Bumalda, Billiardia, japonica, salicifolia, tomentosa, may be pruned in spring (if at all) to stimulate flower-bearing shoots of the season.

Aitchisonii: Sorbaria Aitchisonii.

Àitchisonii: Sorbaria Aitchisonii.

álba. Meadowsweet. To 6 ft.: lvs. pubescent on veins beneath: fls. white, in elongated leafy pubescent panicles. June-Aug. N. Y. to Ga. and Miss.

albiflora (S. japonica var. alba). To 2 ft.: lvs. glabrous: fls white, in dense compound pubescent corymbs. July-Aug. Japan.

alpina. Shrub to 4½ ft., twigs puberulous, angled: lvs. oblong-obovate to oblanceolate, to 1 in. long, obtuse to mucronulate, glabrous, entire: fls. ivory-colored, to ½ in. across, in small dense umbels. N. E. Asia to W. China.

amcena. To 6 ft.: lvs. pubescent on veins beneath: fls. white or pinkish, in corymbs to 4 in. across. July. Himalayas; needs protection N.

argùta. Hybrid between S. Thunbergii and S. multiflora: fls. white, in many-fld. umbels, borne profusely in May.

ariæfòlia: Holodiscus discolor var. ariæfolius.

Arúncus: Aruncus sulvester.

assúrgens: probably Sorbaria assurgens.

astilboides: Astilbe astilboides.

aurea: hort. name applied to golden-foliaged forms of several species.

bélla. To 3 ft., diœcious: lvs. nearly glabrous, glaucous beneath: fls pink, in compound corymbs. June. Himalayas; not hardy N.

bethleheménsis: S. latifolia.

betulifòlia. To about 3 ft., sts. striped: lvs. elliptic, to

11/2 in. long, obtuse, crenate-serrate: fls. white, in terminal simple corymbs. Siberia to Japan.

Billiárdii (S. californica. S. Lenneana. S. eximia). Hybrid between S. Douglassi and S. salicifolia: to 6 ft: lvs. gray-tomentose beneath when young: fls. bright pink, in dense pubescent panicles. July-Aug. Vars. álba and rôsea are listed.

blanda. Hybrid between S. chinensis and S. cantoniensis: lvs. gray-tomentose beneath: fis. white, in pubescent umbels.

Blùmei (S. rupestris). To 5 ft.: lvs. blue-green beneath, glabrous: fls. unisexual, white, in many-fld. umbels. June Japan, Korea; not hardy N.—See S. trilobata.

brachébotres (S. pruinosa). Hybrid between S. canescens and S. Dougham. lvs gray-tomentose beneath: fls. pink, in dense tomentose panicles.

bracteata: S. nipponica.

bullàta $(S.\ crispifolia)$. To $1\frac{1}{2}$ ft.: lvs. nearly glabrous, thick and bullate: fls rose, in corymbs. July-Aug. Japan.

Bumálda (S pumila). Hybrid between S. japonica and S. albifora: to 2 ft.: lvs. glabrous: fis deep pink to white, in flat corymbs. Anthony Waterer, with bright carmine fls., is the common form. Var. Frebelli (S. Fræbela) is taller, with bright crimson fls. Other listed vars. are crispa and Wallufii.

cæspitdsa: Petrophytum cæspitosum.

califórnica: S. Billiardii.

callòsa: S. japonica.

camtschática: Filipendula camtschatica.

cana. To 3 ft. or more: Ivs grayish-pubescent on both sides: fls. white, in dense pubescent umbels. May. S. Eu.

canéscens (S. flagelliformis. S. rotundifolia). To 10 ft.: lvs grayish-green, pubescent beneath: fls white, in dense pubescent corymbs. July. Himalayas; may need protection N.

cantoniénsis (S. Reevesiana) To 5 ft.: lvs. bluish-green and glabrous beneath: fis white, in dense glabrous umbels. June China, Japan. Var. lanceata has lanceolate lvs. and double fls.

capitàta: Physocarmus camtatus.

carpinifòlia: S. latrfolia.

chamædryfòlia (S. flexuosa). To 5 ft.: lvs. bright green, nearly glabrous: fls white, in umbel-like glabrous corymbs. May-June. N. E. Asia. Var. ulmifòlia (S. ulmifòlia) has broader doubly toothed lvs.

chinénsis. To 5 ft.: lvs. yellow-tomentose beneath: fls. nite, in many-fld densely pubescent umbels. May. white, in many-fld China; not hardy N.

cinèrea. Hybrid between S. hypericifolia and S. cana: lys. pubescent, usually entire: fls. white, in umbels.

cineráscens: Petrophytum cinerascens.

confùsa: S. media.

conspicua. Hybrid between S. albiflora and probably S. latifolia: to 3 ft: lvs. pubescent only on veins beneath; fls. pink, in clusters forming a broad-pyramidal panicle.

corymbdsa. To 3 ft. or less: lvs. bluish-green beneath and nearly glabrous: fls. white, in slightly pubescent corymbs to 4 in. across. June-July. N. Y. to Ga. and Ky.

crenata. To 3 ft: lvs. grayish-green, becoming glabrous, 3-nerved: fis. white, in dense pubescent umbels. May. S. E. Eu, Asia.

crispifòlia: S. bullata.

dasyántha. Lvs. white-tomentose beneath: fls. whitish, infl. grayish-tomentose. China,

Dàvidii: probably Astilbe Davidii.

decimbens. Procumbent, to 10 in.: lvs. glabrous, elliptic-oblong, to 1½ in. long, ends acute, toothed: fis. white, in corymbs. June. S. Eu.

densifiora. To 2 ft.: lvs. pale beneath, toothed above middle: fls rose, in dense glabrous corymbs to 1½ in. across. June. B. C. to Ore. and Wyo.

digitàta nàna: hort. name.

discolor: Holodiscus discolor.

Douglasii. To 8 ft: lvs. white-tomentose beneath: fls. deep rose, in long narrow tomentose panicles. July-Aug. B. C. to Calif. Var. rosea is listed.

. Billiard i. exímia

Filipéndula: Filipendula hexapetala.

flagel'if ormis: S. canescens.

flexudsa: S. chamadryfolia.

Fontenaysii. Hybrid between S. canescens and S. salicifolia: to 6 ft.: lvs. pale and nearly glabrous beneath: fis. white, in pubescent panicles. June-July.

Fórtunei: S. japonica var.

Fóxii. Hybrid between S. corymbosa and S. japonica: lvs. glabrous: fls. white or pinkish, in pubescent corymbs.

Fræbelii: S. Bumalda var.

gemmata. To 10 ft.: lvs. gray-green beneath entire: fls. white, in glabrous umbels. May. China.

gigantèa: Fi pendula camtschatica.

Héndersonii: Petrophy um Hendersonii.

Hénryi. To 8 ft.: lvs. pubescent beneath: fls. white in loose pubescent corymbs. June. China. Var. notábilis has larger corymbs.

Hookeri: hort name of uncertain application.

Húmboldtii: Aruncus sylvester.

hypericifòlia. To 6 ft: vs. grayish-green, nearly gla-brous: fls. white, in sessile umbels. Apr.-May. S. E. Eu., Asia. Var. nàna (S. nana) is a low compact form. Var. obovàta (S. obovata) has obovate lvs.

idahoénsis. To 7 ft. or more: lvs. elliptic to ovate-elliptic, to 4 in long, sharply serrate and often doubly so, glabrous: fls. rose-pink, in elongate panicles. Ida.

japónica (S. callosa). To 6 ft.: lvs. pa e beneath, pubescent only on veins: fls pink, in compound pubescent corymbs. June-July. Japan. Var. á.ba botanically is S. albifora but pla.: is so named in the trade may be S. japonica var. ovalifolia. Var. Fórtunei (S. Fortunei) is taller, with glabrous lvs. and pink fls. Var. macrophyflia, lvs. to 6 in. long, bullate. Var. ovalifolia, fls. white. Var. rubértira flaton rest. rima, fls. deep pink.

lævigata: Sibiraa lævigata.

lanceolata: name referable either to S. alba or S. cantoniensis

latifòlia (S. bethlehemensis. S. carpinifolia). To 5 ft.: lvs. glabrous: fls. white or pinkish, in glabrous panicles. June-Aug. Newf. to N. C.

Lenneàna: S. Billiardii.

Lindlevàna: Sorbaria tomentosa.

lobàta: Filipendula rubra.

longigémmis. To 5 ft., twigs glabrous: lvs. ovate- to oblong-lanceolate, to 2½ in. long, acuminate, glabrous, margins doubly or incisely serrate, teeth gland-tupped: fis. white, to ½ in. across, in loose corymbs to 3 in. across. N. W. China.

lùcida. To 3 ft.: lvs. glabrous, shining above: fls. whit, in flat glabrous corymbs to 4 in. across. June-July. B. C. to Ore. and S. D.

macrothýrsa. Hybrid between S. Douglasii and S. latifolia: lvs. elliptic to obovate, finely pubescent beneath: fls. bright pink, in dense panicles.

Margaritæ. Hybrid between S. japonica and S. superba: to 5 ft.: lvs. pale beneath and pubescent only on veins: fls. bright rose, in leafy pubescent corymbs. July.

mèdia (S. confusa). To 5 ft.: lvs. slightly pubescent: fis. white, in many-fid. glabrous umbel-like racemes. May. Eu., Asia. Var. móllis has lvs. more pubescent.

Ménziesii. To 5 ft.: lvs. pale beneath, pubescent only on veins. fis. rose, in dense narrow pubescent panieles, June-Aug. Alaska to Ore. Var. macrothýrsa is S. macrothyrsa. Var. triúmphans is probably S. Bulliardu.

Miyabei. To 3 ft.: lvs. glabrous, to 2 in. long, ovate to ovate-oblong, acute, doubly incised-serrate: fls. white, in pubescent compound corymbs. June. Japan.

mollifolia. To 7 ft., twigs pubescent becoming glabrous, branches arching and angled: lvs. elliptic-oblong to obovate, to ¾ in. long, acute, silky-pubescent, 2-3-toothed at apex or entire: fls. white, to ⅓ in. across, in dense umbels to 1 in. across. W. China.

multiflora. Hybrid between S. crenata and S. hypericifolia: fls. white, before the lvs.

nana: S. hypericifolia var.

Newmannii: listed name for dwarf form.

Nicoudiértii S. pikoviensis.

nippónica (S. bracteata). To 8 ft.: lvs. blue-green beneath, glabrous: fls. white, in many-fld. umbel-like racemes. June. Japan. Var. rotundifòlia has larger lvs. and fls.

Nobleàna: S. sanssouciana.

Normandii: a dwarf form of S. Bumalda, turning brilliant scarlet in au umn.

noths. Hybrid between S. corymbosa and S. latifolia: s. nearly glabrous: fis. white or pinkish, in glabrous panicles.

nudiflòra. Hybrid between S. amæna and S. chamædry-folia var. ulmifolia: lvs. nearly glabrous: fls. pinkish-white, in pubescent corymbs

obovàta: S. hypericifolia var. opulifòlia: Physocarpus opulifolius. palmàta: Filipendula palmata.

paniculata: listed name, sometimes given to hort. forms of S. alba.

nectinate. Luetken nectinata

pentapétala: probably Filipendula Ulmaria.

pikoviénsis (S. Nicoudiertii). Hybrid between S. crenata and S. media: lys. nearly glabrous: fis. white, in glabrous umbels.

pruindes: S. brachubotrus.

prunifòlia. BRIDAL WREATH. To 6 ft: lvs. glabrous or pubescent beneath: fls. white, in few-fld. sessile umbels. Apr.-May. Korea, China. Var. plèna has lvs. shining above

pubéscens. To 6 ft.: lvs. gray-tomentose beneath: fls. white, in many-fld. glabrous umbels. May. China.

pùmila: S. Bumalda.

pyramidata. Hybrid between S. lucida and S. Menziesii: to 3 ft.: lvs. glabrous: fis. white or pinkish, in dense pyramidal panicles.

Reevesiana: S. cantoniensis.

reviréscens. Hybrid between S. amana and S. japonica: to 3 ft.: lys. vellow-tomentose on veins: fis. rose, in loose tomentose corymbs.

richménsis: listed as a plant 3-5 ft. high with deep pink in feathery plumes, and appears to be one of the S. Billiardii group

richmonénsis: hort, name,

rdsea: S. splendens.

Rósthornii. To 6 ft.: lys. pubescent on veins beneath: fls. white, in loose pubescent corymbs. June. China.

rotundifòlia: S. canescens.

rupéstris: S. Blumei.

salicifòlia. To 6 ft.: lvs. pale and glabrous beneath: fls. pink, m pyramidal pubescent panicles. June-July. S. Eu. *o Japan. Var. álba is listed as having white fls.

sanssouciàna (S. Nobleana). Hybrid between S. Douglasti and S. japonica: to 5 ft.: lvs. pale and pubescent beneath: fis. rose, in dense pyramidal pubescent panieles. July -Aug.

Sargentiana. To 6 ft.: lvs. pubescent beneath and slightly so above: fls. creamy-white, in pubescent corymbs 1½ in. across. June. China.

Schinabéckii. Hybrid between S. chamædrufolia and S. trilobata: lys. glabrous: fls. white, in umbels.

semperflorens. Hybrid between S. japonica and S. salicifolia: lvs. nearly glabious: fls. rose, in much branched pubescent panicles.

sorbifòlia: Sorbaria sorbifolia.

spléndens (S. rosea). To 4 ft.: lvs. glabrous, ovate to elliptic-oblong: fls. rose, in slightly pubescent corymbs. June. Ore., Calif.; probably not hardy in N. E.

Stèvenii. To 2 ft., outer bark of twigs puberulent and ultimately exfoliating. lvs. elliptic to ovate, to 1¾ in. long, crenate along terminal third, ends usually rounded: fis. white, to ½ in. across, in flat-topped infl. to 2 in. diam. Alaska and N. W. Territory.

supérba. Hybrid between S. albiflora and S. corymbosa: lvs. nearly glabrous: fls. pink, in terminal corymbs. June-

syringæfiðra. Hybrid between S. albiflora and S. salicifolia: lvs. nearly glabrous beneath: fls. pink, in pyramidal pubescent panicles.

Thunbergii. To 5 ft., twiggy: lvs. linear-lanceolate, abrous fis. white, in few-fid. sessile umbels. Apr.-May. glabrous fls. Japan, China.

tomentòsa. Hardhack. Steeplebush. To 4 ft.: lvs. yellow-tomentose beneath: fis. lose or purple, in dense narrow tomentose panicles. July-Sept. N. S. to Ga. and Kans. Var. álba has white fis.

trichocárpa. Korean Bridal Wreath. To 6 ft.: lvs. glabrous: fls. whi e, in pubescent umbels. June. Korea.

trilobata. T 4 ft.: lvs. pale and glabrous beneath, slightly 3-5-lobed: fls. white, in many-fld. umbels. May-June. Asia.—Sometimes cult. under the name S. Blumei.

Ulmaria: Filipendula Illmaria

ulmifòlia: S. chamædryfolia var.

Vanhoùttei. Hybrid between S. cantoniensis and S. trilobata: to 6 ft.: lvs. bluish-green and glabrous beneath: fls. white, in many-fld. umbels. May-June.

Vanicékii: hort. name.

Veitchii T 12 ft.: lvs. pubescent beneath: fls. white, in dense pubescent corymbs. June-July. China.

venústa: Filipendula rubra var. venusta.

virginiana. To 4 ft.: lvs. pubescent only on veins beneath: fls. white, in pubescent corymbs. June. Va. to N. C. and Tenn.

Wallufii: S. Bumalda var.

Wilsonii. To 8 ft.: lvs. pubescent on both sides: fls. white, in dense glabrous corymbs. June. China.

SPIRÁNTHES (Ibidium). Ladies-Tresses. Orchidaceæ. Usually terrestrial orchids, of wide distribution, with slender sts, bearing lys, mostly toward base and small fls. in more or less twisted terminal spikes; sepals free or united with petals; lip usually entire, and spurless. Grown in shady locations out-of-doors; see Orchids.

brevifòlia: S. longilabris.

cérnua. Nopping L. To 22 in. high: lvs. linear to linearlanceolate, to 10 in. long spike compact, to 6¾ in. long; fls. white, more or less nodding, to nearly ½ in. long. July—Dec. N. S. to Fla. and Minn. to New Mex.

grácilis. SLENDER L. To 30 in. high: lvs. basal, fugacious, to 2½ in. long and nearly 1 in. wide: spike spiral or one-sided, to about 10½ in. long; fis. white with green lip, about ¼ in. long. June-Sept. (Apr.-May in S.). N. S. to Fla., Man. to Tex.

latifòlia: S. lucida.

longilàbris (S. brevifolia). To 24 in. high: lvs. linear to lanceolate, to about 4 in. long: spike to 5½ in. long; fls. white, to nearly ½ in. long. Oct.-Dec., May. N. C. to Fla. and Tex.

lùcida (S. latifolia. S. plantaginea, in part). Wide-Leaved L. To 14 in. high: lvs. lanceolate, to 5 in. long: fls. white with pale yellow lip, 14 in. long, in dense spikes to 4½ in. long. Que. to Va. and Wis.

pícta: Sarcoglottis picta.

plantaginea: S. lucida.

Romanzoffiana. Hooded L. To 22 in. high: lvs. linear to oblanceolate, to 10½ in. long: spike dense, three-ranked, to 4½ in. long; fis. white to creamy-white, to almost ½ in. long. Newf. to N. Y., west to Alaska and Calif.

SPIREA: Spirwa. Blue: caryopteris incana. Sorbaria. Rock-: Holodiscus discolor.

SPIRODELA: see Lemma.

SPIRONÈMA. Commelinaceæ. Mexican per. herb sometimes grown under glass or in the open in warm regions. S. fragrans. Sts. fleshy, hanging: lvs. oblong-lanceolate, sheathing at base, parallel-veined: fls. white, fragrant, in clusters in terminal panieles.—Makes a good basketplant. Sometimes cult. as Tradescantia dracænoides.

SPLEENWORT: Asplenium.

SPÓNDIAS. Anacardiacex. Trees grown for the edible fr., and sometimes for ornament, with compound lvs., small polygamous fls. borne in racemes or panicles, 8-10 stamens, 4-5-celled ovary, and fleshy drupaceous fr.; about 12 species distributed in the tropics.

In regions free from frost almost any soil is suitable, although good loams give best results. Propagated by cuttings and S. cytherea by shield-budding.

axillàris: S. Mombin.

cytherea (S. dulcis). VI-APPLE. OTAHEITE-APPLE, Ambarella. Tree to 60 ft.: lvs. of 11-23 oval to oblong entire or slightly toothed lfts. to 3½ in. long: fls. whitish, in large terminal panicles: fr. orange-yellow, oval or obovoid, with large seed. Society Isls.

dúlcis: S. cytherea.

lùtea: S. Mombin.

Mômbin (S. lutea. S. axillaris). Yellow Mombin. Hog-Plum. Tree to 60 ft.: lvs. of 7-17 ovate-lanceolate nearly entire lits. to 4 in. long: fis. yellowish-white, in large terminal panieles. fr. yellow, ovoid, with large seed. Cosmopolitan in tropics.

purpurea. Purple or Red Mombin. Spanish-Plum. Tree to 30 ft.: lvs. of 7-23 oblong entire or slightly toothed lfts. to 1½ in. long: fls. purple or greenish, in small axillary panicles fr. yellow to deep red, obovoid, with large stone. Trop. Amer.

Solándri: Pleiogynium Solandri.

SPORANGIUM: a spore-case; a sac bearing spores.

SPORE: a simple reproductive body, usually composed of a single detached cell, and containing no embryo; term employed particularly (in systematic botany) in the pteridophytes and lower orders.

SPRAGUEA. Portulacacex. Per. herbs of W. N. Amer., with mostly basal fleshy lys. and fls. in umbels composed of scorpioid spikes borne on scape-like peduncles; suitable for the rock-garden.

múlticeps. Pussy-Paws. Similar to S. umbellata but smaller, to 6 in. high, the rose-purple fis. in dense heads Wash. to Wyo.

umbellåta (Calyptridium umbellatum). To 1 ft.: lvs. spatulate: fls. white or pinkish. Mts., B. C. to Calif.

SPREADING: standing outward, or horizontally away from the axis.

SPREKÈLIA, Amarullidacex, Mexican bulbous herb grown in the greenhouse and out-of-doors in warm climates; it is half-hardy. S. formosíssima (Amaryllis formosissima). Jacobean- or St.-James-Lily. To 1 ft.: lvs. linear, with fls.: fls. bright crimson, to 4 in. long, the 3 upper segms. erect and narrow, the 3 lower ones rolled into horizontal cylinder for part of their length; spring and summer. For cult. see Amaryllis.

SPRING BEAUTY: Claytonia. Gold: Lomatrum utriculatum.

SPRUCE: Picea. Bigcone-: Pseudotsuga macrocarpa. Hemlock-: Tsuga.

SPUR: a tubular or sac-like projection from a flower, as of a petal or sepal; it usually secretes nectar.

SPURGE: Euphorbia, Pachysandra.

SPURRY: Spergula sativa.

SPYRÍDIUM. Rhamnacex. Australian shrubs with alternate simple lvs. and fls. mostly in small sessile heads surrounded by imbricated dry brown bracts: intro. in Calif.

globuldsum. Tall shrub: lvs. ovate to oblong, to 11/2 in. long, leathery, white-tomentose beneath: heads almost globular, many in dense corymbs.

SQUASH. Word of American Indian origin, applied popularly to various kinds of edible fruits of the genus Cucurbita (which see). In the interest of clarity its application is sometimes limited to Cucurbita maxima, comprising the autumn and winter squashes such as Hubbard, Bay State, Mammoth or Chile, Warren, Essex, and the true turbans, although not so restricted by the aborigines. See *Pumpkin*; also Eggplant for Guinea squash.

SQUAW-BERRY: Mitchella repens. -Root: Carum Gairdners.

SOUILL: Scilla.

SOUTRREL-CORN: Dicentra canadensis.

STACHYS. BETONY. WOUNDWORT. Labiatæ. Widely distributed herbs or rarely shrubs with purplish, scarlet, pale yellow or white, 2-lipped fls. arranged in 2-many-fld. whorls, either axillary or in terminal spikes. A few species are grown for ornament in borders and one (S. Sieboldii) has been cult. somewhat for the edible subterranean tubers.

Alopecuros (Betonica Alopecuros). To 1½ ft., ascending, villous throughout: lvs. ovate to ovate-lanceolate, blade to 3½ in. long, petiole 1-8 in. long, margins crenate-serrate: fts. yellow, in dense whorls of 20-30 forming spikes to 4 in. long and 1 in. diam. Mts. of E. France, Italy and S. Cent.

alpina. Per. to purple-red. S. Eu. to 3½ ft.: lvs. cordate-ovate: fls. dark

annua. Branching ann. 1 ft. or less high: lvs. ovate to lanceolate, to 1½ in. long: fls. white, with yellowish under lip and throat spotted purple, about ½ in. long. Eu.

Betónica: S. officinalis.

ciliàta. Per. to 6 ft., slightly hairy: lvs. ovate to oblong, to 6 in. long, coarsely toothed: fls. red-purple, to 1 in. long. in spikes to 8 in. long. B. C. to Ore.

coccinea. Per. to 2 ft., pubescent: lvs. ovate-lanceolate, to 2 in. long: fls. scarlet, 1 in. long. Tex., Ariz.

córsica. Procumbent ann., pubescent: lvs. ovate, ½ in. long, very obtuse; fls. pinkish-white, to ¾ in. long. Medit. region.

floridana. Per. with tuberous slender rootstocks, to 18 in., slender: lvs. oblong, to 1 in. or more, mostly cordate or rounded at base, crenate: fls. light lilac, in separated whorls.

germánica. White-woolly per. to 4 ft.: lvs. ovate-lanceo-late to lanceolate, to 5 in. long, cordate at base: fls. rose-purple to white, small. Eu., Asia.

grandiflora (S. rosea. Betonica rosea, spicata and grandiflora). Hardy per. to 3 ft., pubescent: Ivs. broadovate, the lower very long-petioled: fls. violet, 1 in. or more long. Eu., Asia Minor. Var. robústa, fls. rosy-pink, in spikes 3 in. long. Var. supérba, fls. intense mauve or purple-violet, or white in the form known as Betonica superba alba. Var. variegata is listed.

ibérica. Per. to 15 in., pilose: lvs. oblong to oblong-linear, obtusely serrate toward acute apex: fls. rose-pink to purple, corolla longer than calyx, in whorls of 6-10. Asia Minor.

lanàta. Lambs-Ears. Hardy per. to 1½ ft., densely soft-white-woolly: lvs. oblong: fis. purple, small. Caucasus to Persia.—Valuable as a bedding plant.

lavandulæfðlia. Dwarf subshrub with ascending or procumbent branches: lvs. oblong-lanceolate, entire, graypubescent: fls. rose-purple. Asia Minor.

officinalis (S. Betonica. Betonica officinalis). Hardy per to 3 ft.: Ivs. ovate-oblong to oblong-lanceolate: fls. purple, ½ in. long, in dense whoils forming an oblong spike. Eu., Asia Minor.—S. Betonica alba, albifora and grandiflora are trade forms.

ròsea: S. grandiflora.

scárdica. Sts. erect or ascending: lvs. oblong-lanceolate: fls. cream-colored suffused with rose, anthers purple, scarcely longer than calyx. Greece.

sericea. Tall herbaceous per., silky-hairy: lvs. ovate or oblong, cordate, green above, white beneath: fls. pink spotted with purple, about $\frac{1}{2}$ in. long. Himalayas and N.

Sièboldii (S. tuberifera). Chorogi. Chinese of Japanese Artichoke. Knotroot. Crosnes du Japan. Erect, hairy, to 1½ ft., with slender knotty white tubers produced in great numbers just under the surface of the soil, edible: lys ovate to ovate-lanceolate: fls. small, white or light red. China, Japan -Once intro to this country for its edible tubers, but perhaps not now grown.

sylvática. Per. to 2 ft.: lvs ovate-cordate, to 4 in. long: fls. purple with lip white-spotted, $\frac{1}{2}$ in. long. Eu., N. Asia.

tmòlea. Per. to 1 ft.: lvs. lanceolate or oblong-lanceolate, to 3 in. long: fls. yellow. Mt. Tmolus region, Asia Minor.

tuberifera: S. Sieboldii.

STACHYTARPHÈTA. Verbenaceæ. Herbs or shrubs of warm regions, with opposite or alternate toothed lvs. and white, blue, purple or red fls. borne in spikes. The name Stachytarpheta is conserved by the International Rules as against Valerianoides.

indica: S. jamaicensis.

jamaicénsis $(S.\ indica)$. Ann. to 4 ft. or subshrubby: lvs. oblong or oval, to 3 in. long: fls blue, $\frac{1}{2}$ in. across, in spikes to $\frac{1}{2}$ ft. long. Widely dispersed in tropics.

STACHYURUS. The only genus of Stachy-Asian shrubs or trees with alternate toothed lys., yellowish fls. in drooping axillary racemes in early spring before the lvs., and berry-like frs.

chinénsis. Very similar to S. præcox but with more acuminate lvs., spreading fls., longer style, and smaller frs.

præcox. Shrub to 12 ft.: lvs. ovate or ovate-lanceolate, to $5\frac{1}{2}$ in. long; fls. bell-shaped, $\frac{1}{2}$ in. long, in racemes to 3 in. long; fr. greenish-yellow, $\frac{1}{2}$ in. across. Japan.

STAFF-TREE FAMILY: Celastraces

STAGGER-BUSH: Lyonia mariana.

STAGGERWEED: Delphinium tricorne.

STALK: the stem of any organ, as the petiole, peduncle, pedicel, filament, stipe.

STAMEN: the pollen-bearing or male organ.

STAMINATE: having stamens and no good pistils: male.

STAMINODE, STAMINODIUM: a sterile stamen or a structure resembling such and borne in the staminal part of the flower; in some flowers (as in Canna) staminodia are petal-like and showy.

STANDARD: the upper and broad more or less erect petal of a papilionaceous or pea-like flower.

STANHÒPEA. Orchidaceæ. Epiphytic orchids native in trop. Amer., having pseudobulbs with 1 large plicate lf. and large fragrant odd fls. borne on 2-10-fld. lateral scapes which go through the potting material and appear at bottom of the orchid-basket; sepals and petals reflexed; lip saccate at base, commonly with 2 lateral horns in center, the front lobe simple or 3-lobed at apex. For cult. see Orchids.

Amesiana: S. Lowii.

Bucephalus. Lvs. to about 20 in. long: fls. in 4-7-fld. drooping racemes, taway-orange spotted with crimson; sepals and petals reflexed; lip with 2 curved horns. Aug. Mex., Ecuador.

devoniensis. Lvs. to about 11 in. long and 3 in. wide: infl. 2-3-fid.; fis. 4 in. across; sepals and petals pale yellow spotted with brown-red; lip white spotted with purple, dark purple at base. July-Aug. Mex.

ecornùta. Pseudobulbs ovoid, to 2 in. tall: If. elliptical, to 20 in. long: infl. 2-3-fld., short; fls. about 3½ in. across; sepals and petals ivory-white; lip yellow deepening to orange at base within. May-Sept., Dec.-Mar. Cent. Amer.

insignis. Lvs. elliptic-lanceolate: scape commonly 2-fld. to 8 in. long; fis. about 5 in. across, yellowish-white spotted with purple. Oct., Jan. Brazil, Peru.

langlevénsis: listed name.

Lòwii (S. Amesiana). Sepals and petals creamy-buff, latter thickly spotted with brown; lip ivory-white with bands of dull maroon. Colombia.

oculata. Lvs. elliptic-lanceolate, to 21 in. long: scape 4–8-fld., to 14 in. long; fls. about 5 in. across; sepals and petals yellowish or whitish with numerous red-purple oculate spots; lip orange at base with 2 lateral dark purple spots, horns white, anterior part whitish often purple-spotted. Apr.-Oct. Mex. to Honduras.

Reichenbachiàna. Infl. 2-fld. sepals and petals white turning to ochre-yellow; lip rosy at base. Colombia.

tigrina. Infl. 2-4-fld.; fls. to 7 in. across; sepals and petals dark red blotched with yellow; lip with basal part orange-yellow blotched on sides with maroon-purple, the middle and anterior parts whitsh spotted with purple. May-July. Mex., Guatemala, Colombia, Venezuela.

Wardii. Infl. robust, to about 15 in. long, to 7-fld.; sepals and petals golden-yellow; hp with basal cavity orange with 2 marcon-purple blotches or wholly marcon, anterior part pale yellow spotted with red. Apr., Aug.-Jan. Cent. Amer., Venezuela, Colombia. Var. aurea has deep orange-yellow fis. with 2 purple blotches on base of lip.

STÂNLEYA. Cruciferæ. Glaucous and glabrous per. herbs of W. N. Amer., sometimes grown for ornament in regions like those to which they are native: lvs. lobed, entire or divided: fls. yellow, in terminal racemes, the petals and sepals very narrow: fr. an elongated pod or silique.

bipinnåta. To 2 ft., glabrous: lvs. mostly pinnatifid, segms. oblong to linear and sometimes lobed: fis. yellow, to ¾ in. across or less: pods to 2 in. long, strongly torulose and tortuose. Kans. to Wyo. and Colo.

glauca. To 2 ft.: lvs. glabrous, pinnatifid into linear-lanceolate or oblong lobes, upper entire: fts. lemon-yellow, petals ½ in. long: pods arcuate, not tortuose. N. D. to Wyo. and Colo.

pinnata. To 5 ft.: lvs. somewhat pubescent, pinnately divided into oblong or lanceolate segms, upper ones entire: fls. golden-yellow, to 1 in. across, in long terminal spike-like racemes: pods arcuate, not tortuose. S. D. to New Mex. and Calif.

STANLEYELLA: Thelypodium Wrightii.

STAPÈLIA. CARRION-FLOWER. Asclepiadacex. Leafless plants more or less cactus-like, with thick fleshy 4-angled sts., large grotesque wheelor bell-shaped fls. barred with dull colors and usually with offensive odor, and spindle-shaped frs.; African.

Stapelias are grown in greenhouses in open porous sandy soil which is well drained. They should remain

dormant in winter. Propagated by cuttings. Many kinds are known to collectors of succulents.

álbo-castànea (S. Caroli-Schmidti). Tufted, sts. to 3 m.: fls. fleshy, nearly white, spotted purplish-brown, 1½ in. across, several at base of sts.

anguinea: S. variegata var. picta.

Arnotii. Sts. to 8 in.: fls. bright purple, lower part of corolla covered with pale purple hairs, upper with long white hairs, 4 in. across, 2-3 near base of sts.

Astèrias. Starfish-Flower. Sts. to 10 in.: fls. dark purple-brown with transverse yellow lines, lobes star-like and spreading, margins with purple hairs, to 4 in. across, 1-5 near base of sts.

atropurpurea: S. variegata var.

Bayfieldii. Sts. to 8 m.: fls. purple-red, marked with yellow lines at base, to 2¾ m. across, 3-5 near base of sts.

bella. Erect to 7 m., sts. branching, to 34 in. square, minute teeth on angles: fls. deep purplish-ted becoming brownish toward tips, to 2 m. across, not glossy. Believed to be a garden hybrid of S. revoluta and S. deftera.

bicolor. Garden form with fls. $2l_2$ in. across, dark brown with few yellow spots, chate with brown hairs: sts. as in S. variegata.

Bufonis: S. variegata var. clupeata.

cantabrigensis. Hybrid resembling S. grandiflora, but differing in sts. less compressed, corolla-lobes with much shorter pubescence, and outer corona-lobes linear and awntipped, shorter than inner ones.

Caroli-Schmidtii: S. albo-castanea,

ciliàta: Diplocyatha ciliata.

clavicoròna. To 1 ft. fls. midway up st., light yellowish with transverse purple lines, becoming greenish, 2½ in. across, corona-lobes dark purple, the inner ones 2-horned and elub-shaped.

comparabilis. Sts. to 8 in., about ½ in. square, angles not promunent, toothed: fis. dull purple sometimes with yellowish narrow transverse lines, to 5 in. across, pubescent. Probably of hybrid origin.

conspurcata: S. variegata var.

Codperi: Stultitia Cooperi.

Corderdvi: Duvalia Corderovi.

defléxa. Sts. to 7 in. fls. purple-red, often with transverse greensh or yellowish lines, to $3\,!_2$ in. across, corollalobes strongly reflexed, 3–6 near base of sts.

depréssa: S. hirsuta var.

Desmetiana. Sts. to 1 ft.: fls. purple with darker tips and yellowish transverse lines near base, covered with pale purple hairs, to 6 ½ m. across, 3-10 together on short stalk near base of sts.

Dinteri. Sts. to 5 in.: fls. greenish-yellow densely redbrown spotted, corolla margined reddish-brown, to 11/4 in. across.

díscolor. Fls. dark purple-brown, 21/2 in. across. Hybrid, of which one parent is S. variegata.

divergens. Hybrid, one parent being S. variegata: corolla 2 in. across, pale yellow or yellowish-green, lower %'s of hobes lined with brownish-crimson, spotted toward tips, ciliate.

Engleriana. Sts. decumbent to ascending, to 1 ft. long fls. to 1½ in. across, dark purple-brown, sometimes with yellow lines, base of tube whitish and spotted, lobes strongly recurved.

flaviróstris. Sts. to 7 in.: fls. dark purple-brown marked at base with transverse yellow or pale purple lines, to 6½ in. across, usually solutary near base of sts.

flavopurpurea. Sts. to 4 in.: fls. dull yellow, to 1½ in. across, margins of lobes much recuived, outer corona purple, yellowish at base, inner corona whitish. Var. Fléckii (S. Fleckni), fls. greenish-yellow to yellow or reddish-orange.

Fléckii: S. flavopur purea var.

Gettléffii. Sts. to 10 in.: fls. greenish-yellow with transverse yellowish lines, disk covered with pale purple hairs, margins ciliate, 6½ in. across, 1-3 near base of sts.

gigantèa. Sts. to 9 in. long: fls. brown-purple and hairy with under color of buff and lines of brown-purple, 11 m. across, 1-2 together at base or middle of sts., in summer. Trop. and S. Afr.

glabricallis. Sts. to 8 in., loosely branched, angles compressed: fls. punkish to reddish-purple, to 3½ in. across, lobes long-citiate, not recurved; inner corona-lobes dark brown.—Sometimes confused with S. tsomeensis which differs in slightly smaller fls. and sts. minutely pubescent.

glabriflora. Sts. to 9 in.: fls. reddish-purple with darker tips, marked transversely with yellowish-white lines, glabrous, to 4½ in. across, corolla-lobes recurved, 1-2 at middle or lower part of sts.

grandiflora. Sts. to 1 ft.: fls. dark purple-brown, with-

out markings, with purple or whitish hairs, to 6 in. across, 1-3 at base of sts.

grándis: listed name.

Hanburyana. Sts. to 6 in.: fls. pale greenish-yellow marked and edged with purple-brown, to 2½ in. across. Hybrid.

hirsūta. Sts. to 1 ft.: fls. dark purple-brown with transverse lines of cream or purple, chiate with pale purple or whitish hains, to 5 in. across, corolla-lobes recurved, 1-3 near base of sts. Var. depréssa (S. depressa), fl.-buds with near base of sts. Va. 5 depressions at tip.

hispida: a form of S. variegata with few rather large spots.

incomparabilis. Sts. erect to 6 in.: fls. purple to purple-red, to 3½ in. across, occasionally with yellow transverse lines, long-ciliate.

kwebénsis. Sts. to 6 in. tall: fis. chocolate-colored to dull yellow, to 1½ in. across, lobes transversely rugose, acuminate. Var. longipedicellâta (S. longipedicellata) has long pedicels lifting the fis. above the st. tops.

Leendértziæ. Sts. decumbent to crect, to 4 in. tall: fls. bell-shaped, brownish- to blackish-purple, tube to 3 in. deep and 4 in. across, lobes about 2½ in. long, acuminate, non-ciliate.

longipedicellata: S. kwebensis var.

lóngies. Sts. to 8 in., obscurely 4-angled, slightly toothed: fls. white, outer half of corolla-lobes becoming intense purple-black, to 3½ in. across, chate with magenta hairs, pediecls to 8 in. long, decumbent.

lucilla: listed name of unknown botanical standing.

lunata. Hybrid, of which S. variegata is a parent: fls. dark purplish-brown, apex of each lobe with yellow crescent-shaped marking, somewhat yellow-spotted, minutely

Maccabeana. Sts. to 1 ft., velvety-puberulous: fls. pais green tinged purple, to 6 in. across, minutely ciliate.

maculòsa. Sts. erect to 4 in., glabrous: fls. pale greenish-yellow, to 4 in. across, annulus tinted purphsh-red, densely cihate, lobes recurved. Probably of hybrid origin.

maculosoides. Sts to 3 in.: fls. dark violet with paler pots and transverse lines, to nearly 3 in. across, chate. Probably a hort, hybrid.

Margarita. Sts. to 2¼ in., soft-pubescent: fis. cream-colored blending to pale purple, covered with cushion of pink hairs extending half length of lobes, to 4½ in. across.

mérmilis: listed name.

multiflora. A hort. hybrid, of which S. variegata is a

nóbilis. Sts. to 5 in.: fls. with corolla-lobes to 4 in. long, reflexed, reddish-purple on back, yellow on face, marked with crimson lines and covered with purple hairs, 1-5 near base or middle of sts.

Nopenáckyi: listed name.

normàlis: S. variegata.

olivacea. Sts. to 6 in., obtusely angled: fls. olive-green with brown transverse ridges to dull brownish-red, to 1 ¾ in. across, lobes recurved, chate.

pachyrrhiza. Sts. to 3 in., with very thick roots: fls. brownish-red outside, inside yellow finely spotted with red or all dark red, to 3 in. across, clustered at base of sts.

parvipunctata. Sts. to 5 in., obtusely angled: fis. cream-colored to pale greenish-yellow, minutely dotted, purplish-brown dots becoming larger toward lobe tips, to 1½ in. across, lobes ovate.

Pégleræ. Sts. to 6 in.: fls. dark purple-brown, glabrous except chate margins, 21/2 in. across, 3-4 together.

pícta: S. variegata var.

Pillansii. Sts. to 7 in. tall, soft-pubescent, obtusely angled: fls. glossy purplish-brown, not marked, to 6 in. across, lobes attenuate-acuminate, to nearly 2½ in. long, cliate. Var. attenuata, fls. to 8 in. across, lobes long-attenuate. ate and somewhat twisted.

planiflòra: S. variegata var.

portæ-taurinæ. Sts. to 8 in., pubescent: fls. pale yellow with brown warts and transverse ridges, to 1½ in. across, lobe margins recurved, not ciliate.

pulchélla. Sts. to 4 in : fls. sulfur-yellow dotted with purple-brown, glabrous and not chiate, to $2\frac{1}{4}$ in. across, usually 3 at base of sts.

púlchra: S. verrucosa var.

pulvinata. Sts. erect, to 4 in., soft-pubescent: fls. dark purple-brown with transverse yellow lines on lower 36's of lobes, cushion of long soft number heirs covariant 36's of lobes, cushion of long soft purple hairs covering central disk, lobes long-white-ciliate.

purpurea. Fls. dark violet-brown with yellow spots, $2\frac{1}{2}$ in across. Hybrid, one parent being S. variegata.

radiàta. Of hybrid origin, with light yellow fis. spotted purple-brown; one parent is S. variegata.

recurvàta: catalogue name.

ruféscens of gardens is a form of S. hirsuta.

rugdsa: S. variegata var.

Salmiàna. Fls. light yellow spotted purple-brown, to 3½ in. across. Hybrid; one parent is S. variegata.

Schinzii. Sts. to 3 in.: fls. dark brown, glabrous except the margins ciliate with purple hairs, to 8 in. across, the lobes very long-pointed, 1-2 at base of sts.

scutellata. Hybrid, one parent being S. variegata: fls. to 3 in. across, light yellow with purplish-brown transverse spots and wavy lines, somewhat confluent.

tomentòsa: S. tsomoensis.

trisúlca: S. varieguta var.

tsomoénsis (S. tomentosa). Sts. to 6 in.: fls. lilac-purple, transverse ridges yellowish, to 3 in. across, disk and lobe margins covered with appressed dark purple hairs, lobes ovate-lanceolate, recurved

uranus. Hybrid, one parent being S. mutabilis: fls. dark purplish-brown with bright yellow annulus.

variábilis: hort. name.

variábilis: hort. name.
variegàta (S. normalis). Sts. to 6 in. long: fls. greenishyellow with dark purple-brown spots, 3 in. across, 1-5
together at base of sts. Vur. atràta, fls. dull purplishbrown with large darker spots and some yellow markings,
to 3½ in. across. Var. atropurpurea (S. atropurpurea),
ground color blackish-purple. Var. bícolor of hort. is S.
bicolor. Var. clypeāta (S. Bufonis), spotted and lined with
purple-brown. Var. conspurcata (S. conspurcata), fls. 2 in.
across, spots running together. Var. picta (S. picta, S.
anguinea), fls. 2 in. across, spotted crimison-brown on pale
yellow ground. Var. planifòra has corolla-disk flat on the
back when expanded. Var. rugòsa (S. rugòsa), with small
spots and transverse lines of purple-brown. Var. trisúlca
(S. trisulca), fls. much spotted and lined at base, bud flattopped. topped.

verrucòsa. Sts. to 3 in. long: fls. pale yellow spotted with blood-red, inner face very rough with tubercles, to 2½ in. across, 1-3 near base of sts Var. púlchra (S. pulchra), fls. pale yellow spotted purple to purple-brown.

vétula. Sts. to 6 in , minutely pubescent: fls. purplish-black without markings, to 2¾ in. across, lobes ovate-acuminate, to 1¼ in. long, margins not ciliate, outer corona reddish-yellow.

STAPHYLÈA. BLADDER-NUT. Staphyleacex. Ornamental shrubs or small trees bearing opposite compound lvs., bisexual white fis. in terminal panicles, and bladder-like frs.; grown for ornament, the following species hardy in the N. (unless noted) and blooming in early summer.

Bladder-nuts prefer partial shade and moist rich soil. Propagated by seeds sown when ripe or stratified till spring, by suckers, layers and cuttings; greenwood cuttings taken from forced plants will root readily.

Bolánderi. Much like S. trifolia but lfts. broader and glabrous, fr. somewhat larger. Calif.

Bumálda. To 8 ft.: lfts. 3: fls. about 1/3 in. long, in erect panicles to 3 in.: fr. to 1 in. long. Japan.

cólchica. To 12 ft.: Ifts. 5 or sometimes 3: fls. to ¾ in. long, in erect or nodding panicles to 3 in. long: fr. to 4 in. long. Caucasus. Var. Coulombièri is more vigorous, with larger lys. and fr.

emòdi. Related to S. trifolia, not hardy N., with larger finely serrulate lits. that are less pubescent underneath, and larger fis, and frs. Himalayas.

holocárpa. To 25 ft. or more: lfts. 3: fr. ellipsoid or pyriform, to 2 in. long. China, Var. rosea has pink fis. and lvs. white-tomentose beneath when young.

pinnata. European B. To 15 ft.: lfts. 5-7: fls. ½ in. long, in nodding panteles to 5 in. long: fr. to 1½ in. long. Eu., W. Asia.

trifolia. American B. To 15 ft.: lfts. 3, pubescent underneath: fls. about ½ in. long, in nodding panicles to 2 in. long: fr. to 3 in. long. E. U. S.

STAPHYLEACEÆ. BLADDER-NUT FAMILY. Five widely distributed genera of trees and shrubs with compound lvs., bisexual regular fls. having 5 sepals, petals and stamens, usually 3-celled ovary, and capsular fr. sometimes much inflated. Staphylea is much planted in N. Amer. for ornament, and Euscaphis more rarely.

STAR-APPLE: Chrysophyllum Cainito. -Glory: Quamoclit. -Grass: Aletris, Hypoxis. Mexican: Milla biflora. -of-Bethlehem: Ornsthogalum umbellatum.

STARFISH-FLOWER: Stapelia Asterias.

STARFLOWER: Trientalis. Spring: Brodizea uniflora. STARWORT: Aster.

STÁTICE. Plumbaginacex. A generic name used originally for the thrifts (Armeria) and later for the sea-layenders (Limonium). Recent legislation on the part of the Committee of the International Botanical Congress ruled the name Statice as a nomen ambiguum (i.e. of uncertain and confusing application) and conserved for it the two generic names given above. The synonymy for the plants in cult. belonging to these two genera follows:

alpina: Armeria maritima var. arborea: Limonium fruticans. arboréscens: L. arborescens. árctica: see A. arctica.

Armèria: A. maritima var. elongata, but much material so named in trade is var. purpurea.

auriculæfòlia: L. binervosum. bellidifòlia: L. bellidifolium. binervosa: L. binervosum.

Bonduéllii: L. Bonduellii. brassicæfðlia: L. brassicæfolium. bupleuroides: A. plantaginea var.

cæspitdsa: A. juniperifolia. califórnica: L. californicum. canéscens: A. canescens.

cáspia: Limonium bellidifolium. cephalotes: A. pseud-armeria.

dianthoides: A. plantaginea yar, leucantha.

Dicksonii: listed name, probably of form of L. sinuatum.

dumòsa: a form of Limonium. elegantíssima: L. latifolium var. elongata: A. maritima var. exímia: L. eximium. fasciculata: A. pungens. filicaulis: A. filicaulis.

formòsa: see A. formosa, fruticans: L. fruticans.

globulariæfðlia: L. globulariæfolium.

Gmélinii: L. Gmelinii. Gougetiana: L. Gougetianum. Hálleri: A. maritima. imbricata: L. imbricatum.

incana: L. tataricum var. angustifolium.

júncea: A. juncea.

latifolia: L. latifolium or A. pseud-armeria. Laucheana: color form of typical A. maritima.

macrophýlla: probably L. macrophyllum, but possibly

leucocéphala: A. leucocephala. Limonium: L. vulgare.

A. macrophulla. macróptera: L. macropterum.

majellénsis: A. canescens var. brachy phylla.

marítima: A. maritima.

mauritánica: see A. mauritanica.

mínima: listed name of form of Limonium.

montana: A. maritima var. alpina.

Perèzii: L. Perezii.

perfoliata: L. perfoliatum. plantaginea: A. plantaginea.

Preauxii: L. Preauxii.

pseud-armèria: A. pseud-armeria. púngens: A. pungens.

purpùrea: A. maritima var. reticulata: L. reticulatum.

rupicola: L. rupicolum. sareptàna: L. tomentellum.

setàcea: A. juncea. sibírica: A. maritima var.

sinénsis: L. sinense. sinuata: L. sinuatum. spathulàta: L. Sieberi. spicàta: L. spicatum. spléndens: sec A. splendens.

stenonhella: A. plantaginea var. longibractecta.

supérba: L. superbum.
Suwordwii: L. Suwordwit.
tartárica: L. tataricum.
tomentélla: L. tomentellum.

undulata: A canescens var. leucantha.

virgàta: L. oleifolium.

vulgaris: probably A. maritima var. purpurea, but possibly L. vulgare.

Welwitschij: A. Weluntschij.

STAUNTÒNIA. Lardizabalaceæ. Evergreen woody climbers native in China and Japan, with digitately compound lvs., unisexual fls. in axillary racemes, and fr. a berry.

They thrive in moist shady locations in soil rich in humus, and hardy in southern Umted States. Propagated by cuttings of half-ripened wood under glass.

coriàcea: a listed name.

hexaphýlla. To 40 ft.: lvs. of 3-7 ovate lfts. to 4 in. long: fls. white tinged violet, fragrant, about 34 in. long. Japan.

STEEPLEBUSH: Spirwa tomentosa.

STEIRONÈMA. Loosestrife. *Primulaceæ*. Per. herbs with yellow fls. borne singly or in axillary clusters, the corolla wheel-shaped. Cult. as for *Lusimachia*.

ciliàtum (Lysimachia ciliata). To 4 ft.: lvs. opposite, ovate-lanceolate, to 6 m. long: fls. to 1 in. across. U. S.; nat. m Eu.

lanceolàtum. To 2 ft.: lvs. oval to spatulate, upper lvs. linear, to 4 in long: fls. about $\frac{1}{2}$ 2 in. across. Ont. to Mo., south to Ga and Miss.

pùmilum (S. etleatum var. occidentale). To 1½ ft.: lvs. ovate or ovate-lanceolate, to 3 m. long. fls. bright yellow, 1 m. across. Wash., Ore. to Minn.

STELLÀRIA. Caryophyllaceæ. Annuals and perennials usually diffuse and tufted, with simple opposite lvs. and white fls. in terminal leafy or naked cymes, rarely axillary or solitary; scattered over the world but mostly in temp. regions.

alpéstris of hort. 18 Silene alpestris.

graminea (Alsine graminea). Per. to 2 ft., from creeping rootstocks. Ivs. lanceolate, to 1 m. long: fls. ½ m. across, Eu., Asia; nat. m E. U. S. Var. aùrea, lower with pale yellow Ivs.

Holóstea (Alsine Holostea). Easter Bells. Per., erect from a creeping rootstock, to 2 ft. high, glabrous or somewhat downy. lvs. hanceolate, to 3 m. long, chate on midvem and margins. fis. to 34 m. across. May-June. Eu., N. Asia; escaped m E. U. S.

læta: S. longipes.

lôngipes (S. læla). Ann., erect or ascending, tufted: lvs. lanceolate to linear, to 1½ in. long, somewhat stiff, ascending, fls. to ½ in. across, usually solitary or few, on erect pedicles. Lab. to Que., west to Alaska, Colo. and Calif.

mèdia. Common Chickweed. Ann. to 12 in., sts. weak, decundent or ascending: lvs. ovate-oblong, to 2½ in. long: fls. to ½ in. across, in terminal leafy cymes. Eu.; nat. in all temp. regions as a common weed.

pinifòlia: probably Arenaria pinifolia.

pubera (Alsine pubera). To 1 ft.: lvs. ovate or elliptic, to 5 in. long. fls. 1/3 in. long. N. J. to Fla. and Ala.

STEM: the main axis of a plant; leaf-bearing and flower-bearing as distinguished from the root-bearing axis.

STEMMADÊNIA. Apocynaceæ. New World shrubs or trees planted for ornament in trop. and subtrop. regions, having opposite non-glandular lvs. and showy salverform or infundibuliform fls. in cymes; fr. a several-seeded leathery folicle. Differing from Tabernæmontana in the calyx-lobes and bracts large and conspicuously foliaceous or petaloid.

bélla: S. Galeottiana.

Galeottiana (S. bella). Shrub to 10 ft. or more: lvs. ovate

to obovate-elliptic, to 6 in. long, glabrous: fls. cream-colored, corolla infundibuliform, the throat tubular, to 2 in. long, the tube broader and about ½ in. long, lobes obovate, to 1 in. long, strongly imbricated and spreading: fr. about 1 in. long. Cent. Amer.

STEMMODONTIA: Wedelia trilobata.

STENACTIS: Erigeron speciosus.

STENÁNDRIUM. Acanthaceæ. Herbs native of trop. Amer. and grown as foliage plants in the greenhouse: lvs. basal, entire: fls. small, in spikes: fr. a caps.

Lindenii. Lvs. broad-elliptic, dark green above veined with white or yellow, purplish beneath: fis. yellow, in spikes to 3 m. long. Peru.

STENÁNTHIUM. Liliaceæ. Tall herbs with a somewhat bulbous base and long linear lvs. borne mostly at base of st., small polygamous greenish or purplish fls. in terminal diffuse racemes or panicles, the perianth-segms. united at base; occasionally planted in the border or wild-garden.

angustifdlium: S. gramineum.

gramineum (S. angustifolium). To 4 ft.: lvs. grass-like, to 1 ft. long and $\frac{1}{2}$ in. wide: fls. whitish, to $\frac{1}{2}$ in. across, in panicles to 2 ft. long. S. U. S.

occidentale. To 2 ft.: lvs. to 10 m. long, linear-lanceolate: fls. brownish-purple, to 34 m. long, on slender pedicels of simple or branched raceme. Rocky banks, Ore. to Ida. and B. C.

robfistum. Feather-Fleece. To 5 ft.: lvs. to 1 ft. long and ¾ in. wide. fls. greenish or white, to ½ in. across, in usually compound painties to 2 ft. and more long. Pa. to S. C. and Mo.

STENOCÁCTUS (Echinofossulocactus). Cactaceæ. A genus of Mexican eacti differing from Echinocactus in having the axils of the scales of ovary and fr. naked and not woolly nor hairy: the fr. dehisces by a lateral spht and not by means of a terminal pore. Cult. as for Echinocactus.

acroacánthus. Solitary, subglobose; ribs 27, areoles white-woolly, becoming naked; spines 7, to $1\frac{1}{4}$ in, long, the 4 lower ones to $\frac{1}{2}$ in, long. Mex.

albatus (Echinocaclus albatus). Solitary or rarely cespitose, depressed-globose to cylindrical, to 5 m. diam., spiny and white-woolly on top; ribs very numerous, narrow, acute, undulate; radials about 10, to ½ m. long, birstly; centrals 4, to 1¾ m. long, stouter: fls. white, to ¾ m. long.

anfractuosus (Echinocactus anfractuosus). Simple, 4-5 in. tall and half as thick, dull green; tibs many; radial spines 7 and central solitary, curved: fls. puiple, segms. white-margined. Mex.

árrigens (Echanocactus arrigens, sphærocephalus, xipha-canthus and ensifer). Solitary, globose, blue-green; ribs 30-40 or more, acute, undulate; spines alike, usually 5-7, to 34 in, long, yellowish, cuived fis, white, inner segms, with red midrib, to 1 in, across. Mex.

bicolor: possibly Thelocactus bicolor.

cárneus: listed name.

coptonogònus (Echinocactus coptonogònus). Perhaps cespitose, globular or somewhat depressed, to 4 in. high; ribs 10-14; spines 3-5 and stout: fis. about 1 in. long and broader when open, puiple, segms. white-margined. Mex.

crispatus (Echinocacius crispatus). Obovoid and somewhat depressed at apex, 5 m. or more high; ribs about 25; spines 10 or 11 and rigid: fis. rather small, purple or white with purple stripes. Mex.

densispinus: listed name.

durangénsis: see Echinomastus durangensis.

esperanzénsis: listed name.

flavispinus: probably synonymous with Ferocactus latispinus.

flexispinus: see S. crispatus.

Gásseri: see S. Lloydii.

gladiatus (Echinocactus gladiatus). Ovoid or oblong, to 5 in. high and 4 in. across; ribs 14-22 and prominent; spines 10 and to 2 in. long. Mex.

grandicórnis. Solitary, ovoid, to 5 in. high, spiny on top; ribs about 35, blue-green, undulate, acute; spines yellowish to gray, radials 8, lower ones to ½ in. long, others

shorter, centrals 3, to 2 in. long, very stout, upper one straight, others curved: fis. white within, inner segms. with brown midrib, to $1\frac{1}{4}$ in. long. Mex.

grisacánthus: listed name.

hastatus. Solitary, depressed-globose; ribs about 35, acute, wavy, areoles white-woolly; spines yellowish, radials 5-6, stout, central 1, to 1¾ in. long: fls. yellow. Mex.

heteracánthus (Echinocactus heteracanthus. E. tetrariphus). Globose or short-cylindric, light green, closely covered with spines; ribs 30-34; radials 11-13; centrals 4. fis. greensh-yellow. Mex.

lamellòsus. Solitary, globose to cylindrical, to 5 in. tall and 3½ in. diam., blue-gieen; ribs about 35, acute, wavy; spines white, tipped brown, radials 5, to ¾ in. long, flat, central 1, to 1¾ in. long: fls. carmine-red within, to 1¾ in. long. Mex.

lâncifer. More or less ovoid, flattened on top; ribs 25-55, very thin, wavy; spines 8, white, often tipped brown: fls. rose-pink, large. Mex.

latispinus: see Ferocactus latispinus.

Lifydii. Solitary, globose, to 6 in. diam., spiny on sides and top; ribs 25-55, compressed, wavy; radials 10-15, to % in. long, white; centrals 3, curved upwards with uppermost one to nearly 4 in. long, tan-colored: fis. pale rosepink, small. Mex.

longispinus: listed name of no botanical standing.

multicostatus (Echrnocactus multicostatus). Simple, mostly globose and sometimes depressed, 2-4 m. dam.; ribs 100 or more; spines usually 6-9; fls. 1 m. long, white with broad purple stripe Mex.

obvallatus. Similar to S. arrigens, differing in spines 7-9, red becoming brown: fis. pale pink with purphish-red stripe and more widely expanded, stamens white not pink and stigmas 9-lobed not 6-7. Mex.

Ochoterènaus. Usually solitary, globose, to 3 m. high and 4 in. diam.; ribs about 30, thin, wavy; radial spines usually 22-30, about ½ in. long, radiating, recurved, white; centrals 4, flat, uppermost one to 2½ in. long, tan-colored: fls. white to very pale rose-pink. Mex.

pentacánthus. Solitary, depressed-globose, to 3 in. diam.; ribs 30-40, thun, close together, wavy; spines 5, to 2 in. long, ringed, the lower two only to ½ in. long; fls pale yellow, to ¼ in. long, inner segms, striped purplish. Mex.

phyllacánthus (Echnocactus phyllacanthus). Depressed-globose, to 4 in. diam., dark green; ribs 30-45, compressed, undulate; spines usually 7-10, upper ones to 3 in. long, erect, flattened, often ringed, lower ones shorter, spreading, slenderer: fls. white to pale yellow, to ½ in. long, inner segms, with narrow red stripe. Mex.

polylophus: listed name.

rectispinus: see Ferocactus rectispinus.

robústus: see Ferocactus robustus.

sphacelatus: listed name, possibly Mammillaria sphacelata.

tricuspidatus. Globose to subcylindrical, to 3½ in. diam.; ribs 30-55; radial spines 4, gray to brown with black tip, flattened; central 1, to 1½ in. long: fls. yellowish-green, to ½ in long. Mex.

Vaupelianus (Echinocactus Vaupelianus). Solitary, depressed-globose to hemispherical, to 2\frac{1}{3} in. high and 3\frac{1}{2} in. dasm., woolly and spiny on top; ribs 30-40, to \frac{1}{3} in. high, much compressed, wavy; radial spines 12-25, to \frac{5}{3} in. long, spreading, white; centrals 1-2, to 2\frac{1}{3} in. long, brownish-red to nearly black; fls. pale yellow, to \frac{3}{4} in. long. Mex.

violaciflorus (Echinocactus violaciflorus). Solitary, globose to subcylindrical, to 4 in diam. and 5 in. high; ribs about 35, compressed, wavv; spines 7, upper one to 1½ in. long and flattened to ½ in wide, ringed: fls. white, to 1 in. long, inner segms. with violet stripe. Mex.

zacatecasénsis. Solitary, depressed-globose, to 2½ in. high and 3½ in. diam., somewhat woolly on top; ribs 50-60, compressed, wavy; radial spines 9-12, to ½ in. long, white; centrals 3, to 1½ in. long, flattened, one erect: fls. pink, to 1½ in. long. Mex.

STENOCÁRPUS. Proteaceæ. Trees with alternate or scattered lvs., bisexual red or yellow fis. in umbels, and fr. a leathery follicle; native in Australia and New Caledonia. Grown out-of-doors in S. Calif.

Cúnninghamii. Lvs. oblong-lanceolate, to 4 in. long: fls. yellowish, differing from S. sahgaus only in the glabrous ovary. N. Australia.—The plant grown in S. Calif. and figured in Bot. Mag. as S. Cunninghamii is S. snuatus.

salignus. Lvs. ovate-lanceolate, to 4 in. long: fls. yellowish, ½ in. long, in 10-30-fld. umbels. Queensland, New S.

sinuatus. Lvs. oblong-lanceolate or pinnately cut into

1-4 pairs of oblong lobes, to 1 ft. long: fls. bright red, 1 in. long, in 12-20-fld. umbels. Queensland, New S. Wales.

STENOCHLÆNA. Polypodiaceæ. Trop. climbing epiphytic ferns with 1-pinnate fronds, the fertile with contracted pinnæ covered with sori beneath; sometimes grown in greenhouses on tree-fern sts. and other supports. See Ferns.

palástris. Fronds leathery, shining to 4 ft. long, segms, of sterile fronds to 10 in. long and 1½ in. wide, toothed toward tip. India, S. China, Australia.

STENODRABA. Cruciferæ. A S. American genus of less than 10 species, differing from Draba chiefly in the larger and nearly linear frs.

andina: S. colchaguensis.

andma: S. cotchaguensis.

colchaguensis (S. andina, Draba andina). Tufted per.

to 3 m. high, sts. short, ascending and numerous: basal lvs.

in rosette, oblong-elliptic to obovate, to ¾ in long, apex

obtuse and usually 1-3-toothed, fleshy, remotely chlate;

st-lvs. narrower, entire, to ¼ in long: fls. white, often

obscurely blue-spotted, in compact racemes: pods to ¼ in.

long, usually without persistent style. Chile.

STENOGLÓTTIS. Orchidacex. Terrestrial orchids of Afr. with basal lvs. and small fls. in racemes, the petals smaller than the sepals, lip 3- or more-eleft. Grown in temperate greenhouse: see Orchids for cult.

longifolia. Lvs. oblong-lanceolate, to 7½ in. long: infl. to 24 in. high, racemes many-fld; fls. light purple, lip 5-7-cleft. Late summer and autumn.

STENOLÒBIUM. Bignoniaceæ. Erect shrubs Fla. to Mex. and S. Amer., with opposite simple or compound lvs., prominent showy fls. in racemes or panieles, corolla bell-shaped or funnelform and tube contracted at base and hairy inside toward bottom, stamens curved in two pairs, fr. a long narrow pod-like caps. bearing thin-winged seeds. One species is abundantly planted Fla. to S. Calif. and in tropics; cult. as for Tecoma and similar plants.

stáns (Branonia and Tecoma stans). Yellow-Bells. To 20 ft. or more, sometimes tree-like: lvs pinnate, of 5-13 lanceolate to oval lfts. that are to 4 in. long, acute or acuminate, serrate, glabrous: fis. bright yellow, to 2 in. long: fr. to 8 in long. Fla. to S. Amer. Var. angustàta, lfts. narrow and cut-toothed. Var. sambucifòlia is listed as having elder-like lvs. Var. velùtina (Tecoma velutna, T. mollis), lfts. pubescent underneath.

STENOSPERMATION. Araceæ. Shrubs climbing by roots from the nodes, native in the Andes of S. Amer.: lvs. with long-sheathed petioles: spathes boat-shaped, white, soon deciduous; spadix white; fls. bisexual. One species sometimes grown in greenhouses.

popayanénse. Sts. to 3 ft. long: lvs. oblong or oblong-lanceolate, to 1 ft. long and 2½ in. wide, leathery: spathe 4 in. long; spadix 2½ in. long. Colombia, Ecuador.

STENOTAPHRUM. Graminew. Per. creeping grasses, one of which is used for lawns in the S.: ivs. narrow: spikelets sunken in the flattened rachis of the spike; native in tropics and subtropics. See Grasses, Lawns.

americanum: S. secundatum.

secundatum (S. americanum). St.-Augustine-Grass. Stoloniferous, sts. to 1 ft. high, with flattened sts.: lvs. to 6 in. long and $\frac{1}{2}$ in. wide: spikes stiff, to 5 in. long. S. C. to Tex., trop. Amer. Var. variegatum has white striped lvs.

STEPHANÁNDRA. Rosaceæ. Deciduous shrubs of Asia with alternate toothed or lobed lvs., small white or greenish fls. in terminal panicles or corymbs, and fr. only partly dehiscent.

The following are hardy in the North although requiring protection in severe winters. Propagated by seeds, by cuttings of green wood under glass, by division, and sometimes by root-cuttings.

chinénsis. Sts. flexuous: lvs. ovate-lanceolate, to 21/2 in.

long, acute doubly-serrate, remotely or not at all incired: fis. white, in compound racemes. E. China.

flexuòsa: S. incisa.

inclsa (S. flexuosa). To 8 ft., with long drooping branches: lvs. to 2½ in. long, deeply lobed sometimes half way to midrib; stamens 10. Japan, Korea.

Tanákæ. To 6 ft.: lvs. to 4 in. long, shallowly 3-lobed: stamens 15-20. Japan.—Lvs. becoming bright yellow to scarlet in autumn.

STEPHANOCEREUS: Cephalocereus leucostele.

STEPHANOMÈRIA. Compositæ. Ann. and per. chicory-like herbs of W. N. Amer. with lvs. reduced on the flowering branches and rose or pink heads of ligulate fls. borne in panicles and opening only in early morning; pappus of plumose bristles. One species occasionally transferred to the garden.

cichoriàcea. Per. to 5 ft., with woody root: lvs. oblong to lanceolate, to 8 in. long: heads 34 in. across, sessile on the naked branches. Calif.

STEPHANOPHYSUM: Ruellia.

STEPHANÒTIS. Ascleniadacex. Woody vines of Madagascar and Malaya, with opposite leathery lvs., large funnel- or salver-shaped fls. in axillary clusters, and thick milkweed-like frs.; grown under glass or out-of-doors in the S., in loamy soil in a temperature of about 65°. Propagated by cuttings of half-matured wood over bottom heat.

floribunda. Madagascar-Jasmine. To 15 ft. and more, twining: lvs. elliptic, thick, to 4 in. long, with abrupt short apex and broad or subcordate base: fls. white, waxy, fragrant, 1-2 in. long. Madagascar.

STERCÙLIA. Sterculiaceæ. Trees of warm countries with alternate entire or palmately lobed and divided lvs., unisexual or polygamous fls. without petals usually in axillary panicles, and fr. of 5 woody carpels; planted for shade and ornament in trop. climates. Propagated by seeds and cuttings of ripened wood.

acerifolia: Brachychiton acerifolium.

alàta: Pterygota alata.

and a petala (S. carthaginensis). To 45 ft.: lvs. thick, 5-lobed, to 1 ft. broad, pubescent or tomentose underneath: fls. yellow spotted with pink or purple, rusty-tomentose: fr. to 4 in. long. Trop. Amer.

Bídwilli: Brachychiton Bidwilli.

carthaginénsis: S. apetala.

coccinea: a confused name, the plant in the trade may be Pterygota alata.

discolor: Brachychiton discolor.

diversifòlia: Brachychiton populneum.

fætida. To 60 ft.: lvs. divided into 5-9 lanceolate lfts. to 6 in. long: fis. red or purplish, with offensive odor: fr. red, to 4 in. long. Tropics of Old World.

Grégori: Brachychiton populneum var. occidentalis.

lùrida: Brachychiton luridum.

occidentalis: Brachuchiton populneum var.

platanifòlia: Firmiana simplex.

rupéstris: Brachychiton rupestris.

STERCULIACEÆ. STERCULIA FAMILY. Herbs, shrubs and trees, mainly trop., on both sides of the world, differing from Malvaceæ in technical characters: genera about 50, furnishing ornamental subjects and the cocoa, chocolate and cola-nut of commerce. The family is characterized by alternate lvs., regular mostly bisexual fls. having 5 sepals and petals or petals lacking, 5 or more stamens, superior 2-5-celled ovary, and fr. a caps. or follicle which sometimes separates into leaf-like carpels. The genera herein treated are: Brachychiton, Cola, Dombeya, Firmiana, Fremontia, Mahernia, Pterospermum, Pterygota, Sterculia, Theobroma. Thomasia, Waltheria.

STERNBÉRGIA. Amaryllidacee. Small bulbous herbs with narrow basal lvs. and bright yellow funnel-shaped fls., solitary or 2 terminating the short scape.

The following species is hardy and succeeds in a dry sunny position in rather heavy soil. Bulbs should be planted about 6 inches deep.

lùtea (Amaryllis lutea). Lvs. to 1 ft. long and ¾ in. wide: fis. 1½ in. long, the tube very short, in autumn. S. Eu., Asia Minor. Var. màjor, fis. much larger than type.

STETSÒNIA. Cactacex. Tall much branched cactus native in the deserts of Argentina. S. Coryne (Cereus Coryne). To 25 ft. with short trunk to 16 in. diam.; ribs 8-9; spines 7-9 and to 2 in. long: fls. solitary in upper areoles, funnelform, white, to 6 in. long.

STEVENSÒNIA. Palmacex. Monocious somewhat armed tree from the Seychelles Isls., with pinnate-ribbed lvs. not parted or cut to the rachis or midrib: related to Verschaffeltia but differs in absence of brace roots, lvs. with long sharp teeth or secondary segms., smaller drupe-like fr., seed not grooved, 2 spathes, and technical characters: spadices in axils of lower lvs., much branched, drooping; spathes 2, the outer one bristly; fls. in 3's, spiral on the branches, middle one pistillate; stamens 15–20, joined at base: fr. flattened on one side, about ½ in. long; albumen strongly ruminate. Probably tender in the U.S. S. Borsigiàna (S. grandifolia. Phænicophorium Borsigiàna (S. grandifolia. Phanicophorium sechellarum). To 40 or 50 ft., st. spiny in young plants but becoming spineless, the If-sheaths and petioles spiny when young: lvs. obovate or oblong, cuneate at base, blade several ft. long, shallowly bifid at apex, deeply cut along the sides mostly one-third or less to rachis, the parts or segms. cut, strongly ribbed, more deeply cut on old trees: fls. golden-yellow.

STEVIA. Compositæ. Herbs, sometimes woody at base, Tex. to Ariz. and to S. Amer., with mostly opposite lvs. and small narrow often brightly colored few-fld. heads, purple to white, in terminal clusters. Little grown for ornament.

Eupatoria. Per: lvs. lanceolate-oblong, to ¾ in. long, entire to finely serrulate, punctate, acute: fis. white inside, purplish on reverse, about ⅓ in. across, many in fastigiate corymbs. Mex.

ivæfòlia. Per. with stout roots and somewhat woody base, to 18 in. or more, ercet: lower lvs. broad-spatulate, about 1 in. long, finely serrate; upper lvs. narrow-oblong to linear; fis. dark rose. Mex. south.—Probably a form of S. serrata which is not in cult., the Stevia serrata of florists being Piqueria trinervia.

purpurea. Lvs. very narrow, the lower ones hardly spatulate. fls. purple. Mex.

serrata: see under S. ivæfolia.

STEWARTIA (sometimes but not by Linnæus spelled Stuartia). Theacex or Ternstroemiacex. Asian and N. American trees and shrubs with alternate simple toothed lvs., showy white fis. solitary in the axils, and capsular fr.

Stewartias are planted for ornament and are fairly hardy North. A mixture of peat and loam soil is best. Propagated by seeds, layers, and cuttings under glass in late summer.

koreana. Tree to 50 ft.: lvs. elliptical, to 4 in. long, usually pubescent beneath, margins somewhat serrulate: fis. terminal or nearly so. Korea.

Malacodéndron (S. virginica). Shrub to 12 ft.: fis. to 4 in. across, with purple stamens; styles united. Va. to Fla. and La.; not hardy in northern states.

monadélpha. Tree to 80 ft.: fis. $1\frac{1}{2}$ in. across, with violet anthers; bracts beneath calyx large and leaf-like; styles united. Japan.

ovata (Malachodendron pentagynum. S. pentagyna). Shrub to 15 ft.: fis. to 3 in. across, having white stamens

with orange anthers; styles distinct. Ky. to Ga. Var. grandiflora has fis. to 4 in. across with purple stamens.

pentágyna: S. ovata.

Pseudo-Caméllia (S. japonica var. grandiflora). Shrub or tree to 50 ft., branchlets glabrous: lvs. to 3 in. long, acuminate, entire, glabrous beneath: fls. to 2½ in. across, having white stamens with orange anthers; bracts small; styles united. Japan.

serata. Shrub or tree to 40 ft., differing from S. Pseudo-Camellia in its pilose branchlets, somewhat longer serrulate lvs., and slightly smaller fis. Cent. China.

sinénsis. Shrub or tree to 30 ft.: fls. 2 in. across, with whitish stamens; bracts longer than calyx; styles united. China.

virginica: S. Malacodendron.

STICK-TIGHTS: Bidens.

STIGMA: the part of the pistil that receives the pollen, commonly at the tip of the style and variously enlarged.

STIGMAPHÝLLON (Stigmatophyllon). Malpighiaceæ. Usually twining woody vines from trop. Amer., with opposite simple lvs., yellow fls. in umbel-like corymbs, and fr. of 1–3 samaras; grown out-of-doors in warm regions, also sometimes in the greenhouse where they are propagated by cuttings in heat.

cillàtum. Slender twiner: lvs. glabrous, the margins ciliate: clusters with 3-6 showy fls. St. Thomas (W. Indies), S. Amer.

littorale. Robust, with tuberous roots: lvs. glabrous above, pubescent beneath: clusters many-fld. Brazil.

STILBOCÁRPA. Araliaceæ. Large herbs of New Zeal. and adjacent isls., sometimes grown under glass or in the open in warm climates: lvs. large, simple: fls. unisexual, in compound umbels forming large globose heads.

Lyallii. To 4 ft.: lvs. orbicular-reniform, lobed and toothed, to 1½ ft. across, glabrous above, bristly-hairy beneath: fls. reddish-purple, in heads to 1 ft. across: fr. black and shining.

polaris. Differs from S. Lyallii in lvs. bristly on both surfaces, yellowish fis. with purplish center, and fr. hollowed at apex.

STILLÍNGIA. Euphorbiaceæ. Shrubs or herbs with alternate simple lvs., monoccious fls. without petals borne in terminal spikes, and capsular frs.; the following is grown for medicinal purposes.

sebifera: Sapium sebiferum.

sylvática. Queens Delight. Per. to 3 ft.: lvs. lanceolate to oblong, to 4 in long, toothed: fis. yellow, the spikes to 3 in. long. Va. to Fla. and Tex.

STINK BELLS: Fritillaria agrestis.

STIPA (Lasiagrostis). SPEAR-GRASS. FEATHER-GRASS. Graminex. Per. grasses with mostly convolute lvs. and small awned spikelets borne in panicles; widely distributed and grown for ornament and S. tenacissima for fiber. See Grasses.

argéntea. To $1\frac{1}{2}$ ft.: panieles to 4 in. long, with plumose silvery awns to 2 in. long. Argentina.

bulbòsa: listed name.

elegantissima. To 3 ft.: panicles to 8 in. long, open, with awns to 1½ in. long and plumose pedicels. Australia.

pennata. Tufted, to 3 ft.: panicles dense, with plumose awns to 1 ft. long. Eu., Asia.

spléndens. To 6 ft.: panicles to 1 ft. long, with awns to $\frac{1}{2}$ in. long, the glumes pearly and shining. W. Asia.

tenacissima. Esparto-Grass. To 3 ft.: panicles short, with plumose awns to 2 in. long. Spain, N. Afr.

STIPE: the stalk of a pistil or other small organ; also the petiole of a fern leaf.

STIPULE: a basal appendage of a leaf, usually on the petiole or at its insertion; the three parts of a complete leaf are blade, petiole, stipules (usually 2). Stipel is the stipule of a leaflet.

STIZOLÒBIUM. VELVET BEAN. Leguminosæ. Extensive twiners with lvs. of 3 large lfts., pa-

pilionaceous fls. in long racemes, and mostly thick hairy or velvety pods; grown for forage far S. and also for ornament; ann. or grown as such. Some authors prefer to place the species in Mucupa.

Velvet beans are adapted only to warm regions and will not stand frost. They should be planted with some supporting crop, such as corn. Propagated by seeds.

Deeringianum (Mucuna Deeringiana). FLORIDA VELVET B. Fls. dark purple: pods to 3 in. long, covered with dense black pubescence; seeds nearly globular, whitish spotted with brown and black. Probably S. Asia or Malaya.

Hássjoo. Yokohama Bean. Fls. dark purple: pods to 4½ in. long, with white pubescence; seeds somewhat flattened, ash-colored. Probably Japan.

niveum. Lyon Bean. Fls. white: pods to 5 in. long, with white pubescence; seeds flattish, ash-colored. Probably S. Asia and Philippines.

pruritum. Cowage. Cowitch. Fls. dark brownishpurple: pods to 4 in. long, bristly-hairy; seeds oblong, spotted. Tropics.

STOCK (Mathiola and Malcomia). Three unlike plants comprise the stocks of gardeners. The evening stock, grown for its very fragrant lilac or light purple small flowers that open toward night, is a straggling branchy annual with very narrow leaves, native in southeastern Europe, named Mathiola bicornis from the two conspicuous horns on the end of the mature pods; flowers sessile. The Virginian stock, annual, grown for its abundant small not fragrant flowers in lilac, red and white, is Malcomia maritima which see; pod not horned; flowers short-stalked.

The third kind is the common or Brampton stock of the florists and flower-gardens; it is biennial or perennial, Mathiola incana, with an annual race known as ten weeks stock, var. annua; there are intermediate races; it is native in southern Europe. It is a sturdy erect felty plant, 1-2½ feet high, with colors in cultivation running from white to pink, red, purple, terracotta, yellowish, very fragrant, usually double. There are dwarf compact races. It is grown for summer and autumn bloom in the open, and also under glass; a standard garden flower for beds, borders, bouquets and floral decorations.

The annual or ten weeks stock is grown for summer and autumn flowers from seeds started in late winter or very early spring or sometimes later for autumn use. Transplant as needed to maintain continuous growth and to produce stocky plants, letting them stand 8-10 inches apart. They make good house subjects in pots, from seeds sown in summer. Usually handled as

a half-hardy subject.

The intermediate stock requires a longer season; sown at the same time as the ten weeks, it succeeds that kind in bloom. The intermediate kinds are hardier and may be expected to bloom up to cold weather. For spring bloom, the hardy biennial strains are employed, the seeds being sown the spring or summer before and the plants carried over winter in a cool house or frame; or they may be lifted in autumn and potted for winter bloom. Special colors are sometimes perpetuated by cutting propagation. Stocks are often grown by florists in beds under glass, for spring sale. For this purpose, seeds may be started in late autumn and early winter. See Mathiola.

STOKÈSIA. STOKES ASTER. Compositæ. Per. herb native from S. C. to La. and planted in the garden. It thrives in well-drained sandy loam, but requires protection N. Propagated by seeds and division. S. lèvis (S. cyanea). Sts. woolly

or floccose above: lvs. oblong-lanceolate, to 8 in. long, spiny-toothed toward base: heads to 4 in. across, blue or purplish-blue, the marginal fls. enlarged; pappus of scales. July-Oct. Vars. álba, white, cærûlea, blue, élegans, lilácina, lilac, lûtea, creamy-yellow, and rôsea, pink, are listed.

STOLON: a shoot that bends to the ground and takes root; more commonly, a horizontal stem at or below surface of the ground that gives rise to a new plant at its tip.

STOMATIUM. Aizoacew. Stemless succulents: lvs. united at base, with teeth on edges: fls. sessile or short-stalked; petals linear; stigmas 5–6. A large group split off from Mesembry-anthemum.

agninum: Agnirictus agninus.

alboroseum. Branches with 4-6 spatulate lvs. to 1 in. long and $\frac{1}{4}$ in. wide, punctate: fls. white or rose, $\frac{1}{2}$ in. across, fragrant.

difforme. Densely tufted: lvs. of two kinds, to 1 in. long and 1/2 in. wide, white-punctate: fls. yellow tipped with red, fragrant.

Dúthieæ. Tufted: lvs. unequal, 1/2 in. long and 1/3 in. wide, glaucous suffused with rose, with prominent tubercles: fls. yellow.

Fúlleri. Plant about 1 in. high, branches crowded: lvs. to ¾ in. long and ½ in. wide, punctate.

Géoffreyi. Branches with 6-8 crowded lvs. to 3/4 in. long and 1/2 in. wide: fls. reddish or yellowish.

Jāmesii. Branches to 5 in. long, sometimes rooting: lvs orbicular or spatulate, to ½ in. long, glaucous, punctate: fls. yellow, fragrant

Meyeri. Densely tufted: lvs. 1 in. long and ¼ in. wide, punctate: fls. white, rose outside, fragrant.

murinum (M. murinum). Much branched: lvs. to 1 in. long and $\frac{1}{2}$ in. wide, with white pellueid dots: fis. solitary, yellow, fragrant, 1 in. across.

mustellinum (M mustellinum). Much branched with prostrate branches: lvs. rhomboid, to 1 in. long and ½ in. wide, with large pellucid dots: fls. solitary, yellow, fragrant.

níveum. Lvs. to 1 in. long and 14-14 in. wide, glaucous with prominent white spots: fls. snow-white, very fragrant.

Rónaldii Lvs. erect or incurred to 14 in. long and

Rônaldii. Lvs. erect or incurved, to 1/2 in. long and 1/4 in. wide, punctate: fls. with hair-like petals about 1/2 in. long.

suaveolens (M. suaveolens). Lvs. very fleshy, ¾ in. long and ½ in. wide, somewhat recurved, spotted: fis. yellow.

suricatinum. Branches with 4-6 truncate lvs. 1 in. long and $\frac{1}{2}$ in. wide, slightly punctate: fis. lemon-yellow, slightly reddish outside.

STOMOISIA: see Utricularia.

STONECROP: Sedum. STONEFACE: Lithops. STONE-FRUITS: Prunus.

STONE-ROOT: Collinsonia.

STORAX: Styrax.

STORKSBILL: Pelargonium.

STRANVAÈSIA. Rosacex. Evergreen trees and shrubs of Asia with alternate simple lvs., white fls. in terminal clusters, and fr. a small red or orange pome; grown in S. U. S. Propagated by seeds or cuttings of half ripe wood under glass.

Davidiàna. To 20 ft. or more: lvs. oblong, to 4 in. long, entire: fls. 1/3 in. across, the corymbs to 4 in. wide. China. Var. salicifòlia (S. salicifolia) has narrow lanceolate lvs. Var. undulàta (S. undulata) has lvs. wavy at margins.—Stands in D. C.

glaucéscens: S. Nussia

Nússia (S. glaucescens). Small tree: lvs. obovate, to 5 in. long, finely toothed: fis. 1/2 in. across, in corymbs to 5 in. wide. Himalayas.

salicifòlia: S. Davidiana var. undulàta: S. Davidiana var.

STRATIÒTES. WATER-SOLDIER. Hydrocharitacex. European per. aquatic herb, sometimes planted in ponds. S. aloides. Sts. very short: Ivs. submerged, linear-lanceolate, fleshy, edged with pointed spiny teeth: fls. unisexual, white,

on peduncles rising above water.—Propagated by side shoots from base of lys.

STRAWBERRY (Fragaria, probably mostly derived from F. chiloensis). Perennial herbs, grown for the large red fruit, which is structurally an enlarged fleshy receptacle with many seeds imbedded in it: these "seeds," however, are the true fruits in a botanical sense, or achenes, the seed being inside the thin dry ovary wall. See Fragaria.

In some varieties the stamens are not sufficiently developed to insure pollination; they are often listed as "pistillate" or imperfect although the denomination is not strictly correct. Varieties with such imperfect flowers should be planted not more than two rows together, the rows next them being strong pollen-bearers. Although perennial, strawberries do not bear good crops indefinitely. Usually they may be fruited two or three times, but on fertile land and with extra good care the first crop (the year after setting) may be very heavy and the patch may then be plowed or spaded up. To maintain a continuous good supply a new patch should be set not less than every other year.

In some of its varieties the strawberry can be grown throughout the United States, in most parts of Canada and in parts of Alaska. It thus has a wider distribution than any other temperate-zone fruit. Most varieties reach their best development on sandy soils, although some, such as Aroma and Gandy, are best suited to the heavier silt and clay loams. A good humus supply is of advantage, and good drainage is essential.

Propagation is by new plants formed on runners which, with most varieties, are produced abundantly in the growing season. In the nursery, plantations are set for the production of plants alone, the blossoms being removed. In the home garden, new plantings can be set with young plants from the old bed. Commercial growers usually set nursery-grown plants. The time of setting strawberry plants varies in different climates. In the northern states early spring is the usual time. In the South, fall planting is of advantage, being governed by the time of the desired fruiting season. The plants are set so that the crowns are just level with the surface of the ground, and the soil is well firmed about the roots.

As to the methods of culture, so much depends on the size of the plot, the purpose for which the fruit is wanted, and the amount of care one is willing to give, that no set rule can be stated. In most commercial plantings the matted row system of culture is used. The plants are set 15-30 inches apart in rows spaced at 3½-5-foot intervals. All the runner plants are allowed to grow but are confined in a strip 15-24 inches wide. With some varieties, e.g. the Dorsett, and when fancy fruit is desired, some type of spaced row is used. Here the new runner plants, before rooting, are placed in a definite pattern, either in a single row with plants spaced 7-10 inches apart, or in three rows, one on either side of the row of plants originally set. When all spaces are filled, the other runner plants are destroyed. In home plantings where fancy berries are wanted, and particularly with everbearing varieties, strawberries may be grown in hills spaced 12-18 inches apart in rows 2-3 feet apart. In this

system of culture all runner plants are removed. When so treated the crowns branch, producing very large plants which bear abundant fancy fruit.

Clean culture is necessary from the time the plants are set until they are mulched in autumn. The needed organic matter can be best supplied by heavy applications of manure with the crop. whatever it may be, the year preceding the setting of strawberries, or by turning under clover sod the previous year. On poorer lands a com-plete fertilizer with high nitrogen content applied when the plants are set may be profitable.

In the northern states the winter treatment of a strawberry bed should consist in covering the plants, in late autumn before hard freezes, with straw or hay. Salt marsh hay, if obtainable, is excellent, as few weed seeds are introduced. Cover the ground and the plants to the depth of 2 or 3 inches when straw has settled. As soon as growth begins in spring, rake the mulch off, allowing it to lie between the rows and lightly around the base of the plants to keep the berries clean.

Strawberries for shipment are picked with the stems attached, when well colored but still firm. The usual practice is to pick directly into the quart or pint berry boxes that will be used for shipment. For local or home use the berries are allowed to ripen on the plants. Berries should be cooled to 50° F. as soon as possible after picking and shipped in iced cars. Yields vary with variety and care. Three thousand quarts to the acre is a good average, although twice or three times that yield is possible.

Varietics should be chosen with reference to soil and climate. Varieties are named in order of

ripening.

Hardy varieties for planting in cold regions: Howard 17, Dunlap, Pocomoke, Crescent,

Varieties for the northern states and Atlantic coast: Howard 17, Clermont, Dorsett, Fairfax, Catskill, Glen Mary, Big Joe, Chesapeake, Gandy, Late Stevens.

Varieties for Florida and the Gulf states: Klondike, Missionary, Aroma, Blakemore, Southland.

Varietics grown on the Pacific coast: Clark. Dollar, Magoon, Marshall, Oregon, Wilson, Nick Ohmer.

Everbearing varieties: Progressive, Gem. Green Mountain, Mastodon.

The hautbois, alpine, and perpetual strawberries are forms of Fragaria moschata and F. vesca of Europe and are seldom grown in North America, being sometimes seen in gardens of amateurs.

Although many pests and diseases may cause serious damage, it is usually possible to grow strawberries for home use without spraying, particularly if the rotation is short. The commercial grower should spray to meet his special problems. It is important from the standpoint of disease and pest control to keep the plants vigorous by good cultural practice. Leaf-spot is generally the most troublesome disease. It is kept in check by bordeaux or other fungicides applied before blossoming and twice after harvest.

STRAWBERRY, BARREN: Waldsteinia fragarioides.
-Bush: Euonymus americanus and obovatus. Indian:
Duchesnea. Mock-: Duchesnea. Tree: Arbutus Unedo.

STRAWFLOWER: Helichrysum bracteatum.

STRELÍTZIA. BIRD-OF-PARADISE FLOWER. Musaceæ. Per. herbs of S. Afr. sometimes with woody trunks, banana-like lys, and irregular bisexual fls. borne in rigid boat-like bracts, 2 of the 3 petals united to form an arrow-shaped body or "tongue."

Several species are suitable for warm climates or under glass in tubs with a night temperature of 50°; plants make clumps. Propagated by suckers and division,

augústa. To 18 ft., with trunk: lvs. to 4 ft. long and 2 ft. wide, with deeply wing-channelled petiole: fls. white, the purphish bracts to 15 in. long.

Nicolai Resembling S. augusta but much larger and tree-like and fis, with blue tongue.

parvifòlia. Trunkless: lvs. to 9 in. long and 3 in. wide: red, to 6 in. long.

Reginæ. To 3 ft., trunkless: lvs. to 11/2 ft. long and 6 in. wide: fis. yellow with dark blue tongue, the purplish bracts to 8 in, long.

STREPTANTHÈRA. Iridaceæ. S. African cormous herbs of the Ixia relationship, with lvs. in fan-shaped basal rosettes and 2-3 fls. in a spike, perianth wheel-shaped with short tube.

cùprea. Lvs. to 4 in, long and 1_3 in, across: fis. copper-yellow with purple throat edged black and yellow spot in center, 1 in, long, on peduncles shorter than lvs.

STREPTANTHIIS: Caulanthus inflatus

STREPTOCÁRPUS. CAPE-PRIMROSE. Gesneriacex. Low herbs native in S. Afr. and Madagascar, with basal lvs., purple or blue scapose fls. with long tube and 2-lipped corolla-limb. and capsular frs.

Cape-primroses thrive in a cool greenhouse and are of easy cultivation. Seeds sown in February-March should produce blooming plants the following autumn or winter. Propagated also by leaf-cuttings and division.

achimeniflorus. Lvs. elliptic, to 8 in. long, several, bright green and fleshy. fls. bright blue to pink or white, about 2 in. across, usually solitary, lobes deeply cleft and toothed.—A garden hybrid, one parent believed to be S. polyanthus.

Dámii. Lvs. solitary, to 3 ft. long, soft-pubescent, margins uregularly and coarsely toothed, bullate above: fts. rose or reddish, 1½ m. long, m great abundance on scapes 1 ft. or more high.

hýbridus. Under this name may be represented any of a dozen Latin-named and innumerable vernacular-named hybrids of the species.

kewénsis. Hybrid between S. Rexii and S. Dunnii: lvs. 2-3, oblong, large, dark green: fis. mauve-purple with striped throat, 2 in. long and 1½ in. wide.

Réxii. Lvs. several, to 8 in. long: fls. blue or mauve. 112 in. long, usually only 1-2 on scapes to 1 ft. high.

Wéndlandii. Lvs. solitary, 2 ft. and more long, purple beneath: fls. violet-blue, 1 in. long and 1½ in. across, on scapes to 2½ ft. high.

STRÉPTOPUS. TWISTED-STALK. Liliaceæ. Per. herbs with creeping rootstocks, alternate sessile or clasping lvs., and small rose or whitish nodding axillary fls., the perianth-segms. distinct; of easy cult. in the wild-garden.

amplexicaulis: S. amplexifolius.

amplexifòlius. To 3 ft.: lvs. to 5 in. long and 2 in. wide, glaucous beneath, clasping at base: fls. greenish-white, $\frac{1}{2}$ in. long, 2 together: berries red, ellipsoid, to $\frac{5}{6}$ in. long. N. Amer.

curvipes. To 1 ft.: lvs. ovate to lanceolate, to 3½ in. long, sessile: fls. rose-pink, campanulate, to ½ in. long, lobes mottled within, not recurved: berries red, globose, nearly ½ in. diam. W. Canada.

ròseus. To 2½ ft.: lvs. to 4 in. long and 1½ in. wide, sessile, not clasping: fls. purple or rose, ½ in. long, usually solitary, lobes recurved: berries red. E. U. S.

streptopoldes. To 1½ ft.: lvs. ovate-lanceolate, broadly obtuse at base, sessile: fis. deep red, solitary, pendent, axillary, corolla rotate, lobes yellowish-green toward tip: berries bright red, globose. Var. atrocárpus has black berries.

STREPTOSOLEN. Solanacex. Rough-pubescent evergreen shrub to 6 ft. high, native in Colombia and Ecuador. S. Jamesonii (Browallia Jamesonii). Lvs. oval, to 1½ in. long, entire: fls. orange-red, with tube to 1¼ in. long, and spreading 5-lobed limb, borne in clusters at the end of flexuose branches: fr. a leathery caps.-A popular greenhouse plant and grown out-of-doors in S. U. S. Propagated by cuttings.

STRICT: straight and upright, little if any branched, often rigid.

STRINGYBARK: Eucalyptus.

STROBILÁNTHES. Acanthaceæ. Herbs or shrubs from trop. Asia: lvs. opposite: fls. tubular, constricted at base and swollen above, unequally 5-lobed, in spikes or panicles or solitary. Grown for fls. and foliage.

The following are grown under glass and require high temperatures and abundant moisture. Care must be taken or the plants may become weedy. Propagated by cuttings. anisophyllus. Differs from S. isophyllus chiefly in the broader lvs. and those of each pair being unequal in size.

India

Dyeriànus. Shrub: lvs. ovate-lanceolate, to 8 in. long, toothed, purple beneath, iridescent above: fis. violet, 1½ in. long, in spikes. Burma.

isophflus. Shrub to 3 ft.: lvs. willow-like, to 4 in. long, toothed: fts. pinkish or blue and white, 1 in. long, in axillary clusters. India.—See Ruellia malacosperma.

STROBUS: Pinus Strobus.

STROMÁNTHE. Marantacex. Per. herbs of S. Amer. with thick rootstocks, leafy sts. and fls. with colored bracts in racemes or panicles; foliage plants adapted to a warm greenhouse. For cult. see Calathea.

Porteana. To 6 ft.: lvs. to 1 ft. long and 6 in. broad, bright green above transversely barred with silvery-white, purple beneath: fis. blood-red. Brazil.

STROMBOCÁCTUS. Cactacex. Small low depressed nearly spineless cacti differing from Echinocactus in short imbricated scale-like tubercles which are not arranged on ribs; scales on fl.-tube with papery margins. See Cacti.

disciformis (Echinocactus disciformis and turbiniformis, Mammillaria disciformis). Top-shaped or somewhat globose, to about 2 in. across; young tubercles with 1-4 white needlelike spines to 3/4 in. long, but old one nude: fls. from center of plant, white, red outside, about 3/4 in. long. Cent. Mex.

macrochèle. Solitary, depressed-globose, to 1½ in. diam., gray-green, somewhat subterranean with flattened top nearly level with ground; ribs tubercled; spines 3-5, to 1½ in. long, hooked, yellowish to gray: fls. white, to ¾ in. across. Mex.

pseudomacrochèle: a little-known Mexican cactus.

Schmiedeckianus. Solitary to cespitose, depressed-globose; ribs 10-12, spiral, tubercles 4-angled; spines 1-4, to 1 in. long, stout, white to gray with black tip, those on top of plant curved conspicuously inward: fls. pale rose-pink, midrib of segms. violet. Mex.

STROMBOCARPA: Prosopis.

STROPHÁNTHUS. Apocynacex. Shrubs somewhat allied to Nerium (oleander), often climbing, native in Afr. and trop. Asia, one somewhat planted in S. Calif.: lvs. opposite or whorled: fls. usually showy, in terminal corymbs.

speciosus. Branches trailing or clambering: lvs. in whorls of 3-4, oblong-lanceolate, to 3½ in. long, leathery: fls. cream, yellow or orange spotted with red, having linear tails to 1½ in. long. S. Afr.

STROPHOLIRION CALIFORNICUM: Brodizea volubilis.

STROPHOSTYLES. Leguminosæ. Herbaceous vines allied to Phaseolus and Vigna, with lys. of 3 lfts. and pinkish or white fls. in heads at tips of long axillary peduncles.

umbellata. Per. with trailing sts. to 5 ft. longs lfts. ovate to lanceolate, usually entire: fts. pink fading yellowish, ½ in. long: pods linear, to 2 in. long. L. I. to Fla. and Tex.

STRUTHIOPTERIS: see Blechnum and Pteretia.

STRYCHNINE: Struchnos Nux-vomica.

STRÝCHNOS. Loganiacex. Shrubs and trees of trop. regions, with opposite lvs., white to yellowish small fis. in cymes, the corolla 4-5-cleft, stamens 5, and fr. somewhat berry-like but perhaps with a hard shell; grown as drug plants and one for curiosity and the edible fr.

Núx-vômica. Strychnine. Tree to 40 ft.: lvs. ovate, to 3½ in. long: fis. in terminal cymes 2 in. across: berry 1½ in. across, with many seeds yielding the poison strychnia.

spinosa. Natal-Orange. Shrub to 10 ft., with spines 1/2 in. or more long: lvs. nearly orbicular to obovate, to 2 in. long, 5-nerved from near the base: fls. in terminal compound cymes: berry 4 in. across, becoming yellow, the seeds embedded in sweet edible pulp. Trop. and S. Afr.

STUARTIA: Stewartia.

STULTITIA. Asclepiadaceæ. A small genus of S. African succulents closely allied to Stapelia and Caralluma, having the habit of the former and the corona of the latter but differing from both in the corolla with a broad cushioned annulus.

Cooperi (Stapelia Cooperi). Sts. erect or ascending to 2½ in., with spreading acute teeth to ½ in. long and having minute tooth on each side at middle, angles obtuse: fls. purplish with yellow rugosities to dull yellow with purplebrown lines, the annulus purplish-pink, corolla to ½ in. across, flat with spreading or recurving lobes: fr. fusiform, to 3½ in. long.

STYLE: more or less elongated and often slender part of the pistil between the ovary and stigma.

STYLIDIÀCEÆ. STYLIDIUM FAMILY. genera of herbs or rarely small shrubs of the or unisexual fis. having 3-7-lobed calyx, 5-10-lobed or -parted corolla, 2-3 stamens, inferior 2-3-celled ovary, and fr. a 1-3-celled caps. Fostera and Stylidium are treated here.

STYLÍDIUM. Stylidiacex. Herbs or subshrubs with basal or tufted lvs. and irregular fls. in racemes, panicles or cymes; rarely grown in Calif.; mostly Australian.

graminifòlium. Per. to 2 ft.: lvs. all basal, linear, to 10 in. long, acute: fls. yellowish, glandular-pilose outside: caps. ovoid-oblong.

reduplicatum. Scapes 1-134 ft. high: lvs. radical, linear, to 1 ft. long: fls. yellowish-white or pale pink, in a short loose raceme.

STYLOMA: Eupritchardia.

STYLOMÈCON. Papaveracex. One ann. herb native in W. N. Amer. S. heterophylla (Meconopsis heterophylla). Flaming-Poppy. Windnopsis heterophylla). Flaming-Poppy. POPPY. Sts. erect, leafy, to 2 ft., glabrous or only sparsely pubescent: lvs. irregularly pinnately divided, rarely sessile, somewhat fleshy: fls. brick-red with purple center, to 2 in. across, solitary on slender peduncles, ovary somewhat flattened at apex: fr. an obovate caps. which dehisces by means of 8 operculate lids.—Requires shade and good drainage.

STYLOPHORUM. Papaveracex. Per. herb with yellow juice, pinnately cut lvs. and yellow or red fls. solitary or clustered; sometimes transplanted from the wild and of easy cult. in rich soil in partial shade.

diphéllum. Celandine-Poppy. To 1½ ft.: fls. deep yellow, to 2 in. across, in 2-4-fid. clusters, Mar.-May: caps. to 1 in. long. Pa. to Wis. and Mo.

STYLOPHYLLUM: see Echeveria.

STÝPÁNDRA. Liliaceæ. Per. herbs of the asphodel tribe, native in Australia, with fibrous roots and blue fis. in loose terminal cymes, of 6 spreading perianth-segms.

glauca (S. grandsflora). To 3 ft., with leafy sts.: lvs. linear or lanceolate, to 4 in. or more long: fis. ½ in. long. grandiflora: S. glauca.

STYRACÀCEÆ. STORAX FAMILY. Trees and shrubs of wide distribution in Old and New World, containing 6 genera: lvs. alternate, simple: fls. regular and bisexual, having 4-5-lobed calyx, 4-8 petals united at base, 4-16 stamens, superior or partly inferior ovary: fr. a drupe or dry and dehiscent, sometimes winged. Genera grown for ornament are Alniphyllum, Halesia, Pterostyrax, Rehderodendron, Styrax.

STYRAX. STORAX. Styracacex. Woody plants with showy white fls. in racemes followed by small drupaceous but sometimes dry frs. Many species in trop. and warm temp. parts of world.

Storaxes succeed in light porous soil. Few of the species are hardy North without winter protection. Propagated by seeds, layers, with difficulty by cuttings, and by grafting on other species or on Halesia carolina.

americana. To 10 ft.: lvs oval or oblong, to 3 in. long, pubescent: racemes few-fid.: fr. 1/3 in. long. Va. to Fla. and La.; stands in N. Y.

califórnica (S. officinalis var. californica). To 8 ft.: lvs. ovate, to 2½ m long, pubescent beneath: fis. to 1 in. long, in few-fid. racemes. Calif., where it is sometimes planted.

calvéscens. Shrub or small tree: lvs. oblong to obovate, to 3½ in. long, densely tomentose when young: fls. about 3½ in. long, in about 10-fld. racemes, calyx gray-tomentose. Hupeh, China

grandiflòra: S. grandifolia.

grandifòlia (S. grandaflora). To 12 ft.: lvs. oval or obovate, to 7 m. long, gray-pulescent beneath: fls. fragrant, in many-fld racemes to 5 in. long: fr. ½ in. across. Va. to Fla.; not hardy N.

japónica. To 30 ft.: lvs. oval or obovate, to 3 in. long, becoming glabrous: fis. fragrant, drooping, long-stalked, in few-fld. racemes: fr. ½ in. long. Japan, China; hardy N.

Obássia. To 30 ft.: lvs. nearly orbicular to oval, to 10 in. long, pubescent beneath: fis. fragrant, in many-fid. racemes to 8 in. long; fr. ¾ in. Japan; hardy N.

officinalis. To 20 ft.: lvs. oval or ovate, to 2½ in. long, pubescent beneath: fls. ¾ in. long, in few-fld. racemes. Eu., Asia Minor; not hardy N. Var. califórnica is S. californica.

philadelpholdes. To 7 ft.: lvs. narrowly oblong, to $3\frac{1}{4}$ in. long, sparsely hairy when young: fls. to $\frac{3}{4}$ in. long, in 4-6-fld. racemes, calyx covered with yellow hairs. E. China.

platanifòlia. To 12 ft.: lvs. nearly orbicular, with wavy or slightly lobed margins, to 4 in. across, glabrous: fr. 1/3 in. long. Tex.

Wilsonii. To 10 ft., much branched: lvs. rhombic-ovate or oval, to 1 in. long, pubescent beneath: racemes few-fld.: fr. ½ in. long. China; not hardy N.

SUBTEND: to stand below and close to, as a bract underneath a flower, particularly when the bract is prominent or persistent; the flower is in the axil of the bract.

SUCCISA. Dipsacex. Herbs very similar to Cephalaria and Scabiosa and differing chiefly in having the scales of the receptacle about as long as fls.; native in S. Eu. and sometimes grown in the flower-garden.

austràlis (Scabiosa australis). Per. to 3 ft.: lvs. oblanceolate to lanceolate, to 1 ft. long: fis. pale blue, in hemispherical heads to ¾ in. across. Eu.; nat. in N. E. U. S.

praténsis (Scabiosa Succisa). Per. to 3 ft.: lvs. oblong, entire: fls. violet-blue, rarely white, in long-stalked heads to $1\frac{1}{2}$ in. across. Eu.

SUCCORY: Cichorium Intybus.

SUCCULENTS. A succulent plant, or a succulent, is strictly one that is full of sap (Latin succus, juice, sap); but in horticultural usage it is a thick fleshy plant, and such plants are commonly juicy or sappy.

What particular plants are to be included in the succulents is determined only by custom. For the most part, succulent plants are native in regions that are arid or semi-arid for at least part of the year, and the succulence has relation to water storage. It is in the study of habitats, therefore, that the gardener obtains the initial clue to the cultivation and handling of succulents.

The succulents are of many genera in many natural families. The regions they inhabit have widely different temperature characteristics. Some of the succulents, as a few sedums, are indigenous in regions of severe winter cold, with temperatures far below zero F. Mostly, however, they are natives in mild temperate and in tropical climates. They abound in the genus Mesembryanthemum (which see for culture) and segregates, in Crassulaceæ, African members of Euphorbia, in many asclepiads as Stapelia and its relatives, Liliaceæ, Amaryllidaceæ, Kleinia and a few other composites, Bromeliaceæ, Portulacaceæ. In a broader sense, cacti may be included although specialists do not so classify them. In the following remarks both succulents and cacti are in mind.

Succulents and associates are prized for oddity. They are given to condensed and often to grotesque forms. Many of them have a slow-growing more or less durable body, changing little from year to year. Often the flowers are brilliant and large. All these characteristics make them interesting to fanciers. Succulents, as a class, are special horticultural subjects, prized by collectors and enthusiasts; they are therefore notable and worth the particular care they may require.

As a class these plants are not difficult to grow. Most of them need a full sun exposure; also a porous gritty soil that relieves itself of superfluous water and yet sufficiently compact and retentive to hold the moisture the plant requires. Good drainage is essential. Much fresh organic material is to be avoided in the soil. Sand, pulverized brick or rock may be added to soil to give it the proper porosity and warmth. The trouble in growing succulents is mostly in trying to raise them in moist cloudy climates to which the major part of them are not adapted; it is then that particular attention is required to make sure that they do not rot at the root from soggy and sour soil. These succulents may thrive with a minimum of attention in a region naturally adapted to them, as in central and southern California. Yet many kinds are naturally at home in humid climates, as some of the sedums, kalanchoës, rochea and other Crassulaceæ. In their growing season the succulents require plenty of moisture, as is the case where most of them grow naturally; usually there is a semi-dormant period corresponding to the dry or the cold season of their native places, and at this time they may easily be injured by thoughtless soaking. On the other hand, it is a mistake to suppose that succulents, more than other plants, can withstand desiccation of the roots for any length of time. In North America the leading succulents will always be cacti; one has but to observe the conditions under which they grow to apprehend the proper treatment. See Cacti.

The softer non-woody kinds (to which the term succulents is sometimes restricted), as cotyledons, gasterias, and stapelias, are readily

grown in pots in a sunny greenhouse or conservatory, the essentials being the gritty or porous soil that disposes of excess moisture, care in watering to suit the needs of the plant, and patience to allow them to come slowly and naturally to their full stature. The gardener soon learns when to keep them "slow" and when to repot and stimulate new growth. All succulents in pots make interesting subjects in the open in summer; they are not turned out of the pots but are plunged to the rims. Sometimes the roots of succulents are ruined by nematodes which are nearly or quite microscopic worms. The preventive is sterilized soil. In cold countries soil may be thoroughly frozen before employed in potting.

As succulents do not belong to one class or type of plant, so there is no single method of propagating them. Many of them make natural offsets, and multiplication is then very simple. Seeds commonly grow readily; care must be taken to prevent damping-off of the seedlings, from too wet soil; sterilized earth or clean sand or other sterile medium is advisable. In the cacti, one kind may be grafted on another with ease.

Because succulents are such striking subjects, there is the temptation to make either permanent or summer plantings where they are quite out of harmony. A miscellaneous mess of succulents in the front yard may be anything but desirable or attractive; and yet the same plants placed at one side or in the rear with relationship to banks, boundaries and buildings, and properly harmonized among themselves, may be worthy of all admiration. Some of the low and tufted kinds lend themselves well to rock-gardening. The imitation of an arid or desert landscape is worth while in a dry or desert country when area is sufficient and surroundings are in keeping: this kind of landscaping is capable of distinct artistic development.

The kinds of plants known as succulents are so many and so peculiar, and the records of them have been so imperfect in herbaria, that the amateur finds a special satisfaction in making living collections and in trying to understand them. In regions like California and the Southwest succulent gardening is likely to become an important enterprise, and it will add many plants to the North American cultivated flora. Some of them now grown by fanciers are yet unknown to general horticultural literature. The interest in succulents is represented by the Cactus and Succulent Society of America, which publishes a journal in Los Angeles.

SUFFRUTICOSE: pertaining to a low and somewhat woody plant; diminutively shrubby or fruticose; woody at base.

SUGAR-APPLE: Annona squamosa. -Bush: Rhus ovata. -Cane: Saccharum officinarum.

SUGARBERRY: Celtis lævigata.

SUKSDÓRFIA. Saxifragaceæ. Glandular-pubescent saxifrage-like herb, the rootstock bearing bulbels. S. violàcea. To 1 ft.: basal lvs. kidney-shaped, 5-7-lobed, to 1 in. across: fls. pink, ¼ in. long, in few-fld. panicles. Wet rocks, Mont. to Wash. and Ore. S. ranunculifolia is Hemieva.

SULCATE: grooved or furrowed lengthwise. SULPHUR PLANT: Eriogonum subalpinum. SUMAC: Rhus.

SUMMER SWEET: Clethra alnifolia. SUNBERRY: Solanum nigrum.

SUNDEW: Drosera.
SUNDROP: Enothera.
SUNFLOWER: Helianthus. Desert: Geræa canescens.
SUPPLE-JACK: Berchemia scandens.
SURINAM-CHERRY: Eugenia unifora.

SHTERA: Changstoma.

SUTHERLÁNDIA. Leguminosæ. S. African shrub grown in the greenhouse and out-of-doors in the S. S. frutéscens. To 3 ft., grayish-pubescent: lvs. pinnate, the lfts. numerous and small: fls. scarlet, to 1 in. long, in short axillary racemes: pods bladder-like, to 2 in. long.—Propagated by seeds and cuttings.

SUTTÒNIA. Myrsinaceæ. Shrubs or small trees with alternate entire lvs., small bisexual or diocious fls., and fr. a small 1-seeded berry; the genus is separated from Myrsine chiefly because the petals are distinct or nearly so. Somewhat planted in Calif.

australis (Myrsine Urviller). Tree to 20 ft.: lvs. oblong, to 2 in. long, wavy-margined: fis. whitish, unisexual, clustered on the branches: fr. black. New Zeal.

salicina (Myrsine salıcına). Tree to 30 ft.: lvs. linearoblong, to 7 m. long: fls. bisexual, clustered on the branches: fr. red. New Zeal.

SUTURE: a line or mark of splitting open; a groove marking a natural division or union; the groove lengthwise a plum or similar fruit.

SVIDA: Cornus.

SWAINSONA. Leguminosæ. Herbs or subshrubs of Australia, with pinnate lvs., papilionaceous fls. in axillary long-stalked racemes, and swellen pods; an old greenhouse plant, and planted out-of-doors in warm regions. Propagated by cuttings when seeds are not available.

álba: S. galegifolia var. albiflora.

coronillæfðlia: regarded as a violet-fld. form of S. galegifolia.

galegifòlia. Shrub to 4 ft.: fls. deep red, not fragrant: pods to 2 m. long. Var. albiflòra (var. alba) has white fls., var. ròsea pink fls., and var. violàcea rose-violet fls.

grandiflòra: S. Greyana.

Greyàna (S. grandiflora). Subshrub to 3 ft., fls. pink, pods to 2 in, long.

SWALLOW-WORT, BLACK: Cynanchum nigrum.

SWARTZIA: Solandra. SWEERTIA: Swertia.

SWEETBELLS: Leucothoë racemosa. SWEETBRIER: Rosa Eglanteria.

SWEET CICELY: Myrrhis odorata. -Potato Vine, Wild: Ipomæa pandurata. -scented Shrub: Calycanthus. -Shrub: Calycanthus. Spire: Itea virginica. Sultan: Centurea moschata. William: Dianthus barbatus. William, Wild: Phlox divaricata.

SWEET HERBS are plants of fragrant memories. They are mostly aromatic and sweet-smelling subjects, variously employed in flavoring and seasoning and as domestic remedies. They are prevailingly of the mint and parsley families (Labiatæ, Umbelliferæ). Of the mints, the herbage is mostly the desired product; in the umbellifers, the seeds are wanted.

The sweet herbs do not constitute a single cultural group, except that they are usually only incidents to the kitchen-garden and an area 2 or 4 feet square generally yields a sufficient supply for the family. Three classes may be specified. (1) Some of them are annual and are therefore grown each year from seeds sown usually directly in the garden, as anise, coriander, saffron, summer savory, sweet basil. (2) Others are biennials and only short-lived perennials, as caraway,

clary, dill, fennel, sweet marjoram. (3) The larger number are perennial, persisting for many years; they are grown from seeds or division: balm, catnip, costmary, horehound, hyssop, lavender, lovage, marjoram, pennyroyal, peppermint, rosemary, sage, tansy, tarragon, thyme, winter savory, wormwood.

SWEETLEAF: Symplocos.

SWEET PEA (Lathyrus odoratus). One hardy tendril-climbing annual, much prized for its delightfully fragrant pea-like flowers, now available in many colors and shapes of flower and in different stature of plant. The plant is grown in the open garden for summer bloom, and also under glass for winter bloom from seeds sown in September and later.

Sweet peas require deep mellow soil, early planting, heavy mulching or other means of maintaining moisture. Sow the seeds as soon as the ground is fit to work in the spring, making a drill 5 or 6 inches deep. Sow thickly and cover with 1 or 2 inches of soil. When the plants have made 2 or 3 inches' growth above the soil, fill the drill nearly full, leaving a slight depression in which water may be caught. To have the ground ready in early spring, it is a good plan to trench it in the fall. The top then dries out quickly in spring and is left in good physical condition. In the middle and southern states, the seed may be planted in autumn, particularly in lighter soils. It is easy to get soils too rich in nitrogen for sweet peas; in such case, they run to vine at the expense of bloom.

If the finest flowers are wanted, do not let the plants stand less than 8–12 inches apart; provide ample support. Do not plant on the hot side of a wall or building. A succession of sowings may be made at intervals through May and June, and a fair fall crop obtained if care is taken to water and mulch; but the best results will be secured with the very early planting. After the ground is well soaked, a good mulch will hold the moisture. Do not water frequently, but thoroughly when needed. Frequent syringing with clear water will keep off the red-spider that often destroys the foliage, and attention to picking the seed-pods will lengthen the season of bloom. Provide running room, as a wire-mesh fence, and plant away from trees and bushes that have first call on moisture and fertility.

Under glass the sweet pea thrives in a cool or intermediate temperature, without particular requirements. Bloom should be obtained in winter in three months or less from the seed, depending somewhat on the proportion of sunlight and cloudiness. The seeds may be sown in rows across the bench or bed, and the vines provided with perpendicular cords or wires on which to climb.

SWEET POTATO (Ipomæa Batatas). A root tuber much grown in North America for food. It requires warm "quick" light but fertile land of good tilth. As a commercial crop it is largely grown in New Jersey and southward, but a home supply can be raised much farther north on warm sandy lands.

The sweet potato is grown from sprouts planted in rows, sometimes on ridges or hills, not by planting the tubers, as with the common or Irish potato. One method of obtaining these sprouts is as follows: In early spring, tubers are

planted in a partially spent hotbed by using the whole tuber (or if a large one, by cutting it in two through the long way), covering the tubers with 2 inches of sand or light soil. The sash should be put on the frames and only enough ventilation given to keep the potatoes from decaying. In ten or twelve days the young sprouts begin to appear, and the bed should be watered if drv. The sprouts when pulled from the tuber will be found to have rootlets at the lower end and along the stems. These sprouts should be about 6 to 10 inches long by the time the ground is warm enough to plant them out. If two or three crops are taken, one bushel of tubers should yield 3,000 to 4,000 sprouts. The ridges, if employed, should be prepared by turning two furrows together and leveling off the top about 6 inches above the level. On this ridge the plants are set, placing them well into the leaves, and about 12 to 18 inches apart in the rows, the rows being 4 to 6 feet apart.

Subsequent cultivation of sweet potatoes consists in tilling the soil between the rows until the vines interfere with further cultivation. When the tips of the vines have been touched by frost the crop may be harvested, the tubers left to dry a few hours, and then stored in a dry warm place. To keep sweet potatoes, store in layers in barrels or boxes in dry sand, and keep them in a dry room. For commercial purposes, specially constructed storage houses are built. See that all bruised or chilled potatoes are thrown out. About 100 bushels to an acre is an average yield of sweet potatoes, but three or four times this quantity is possible. Certain kinds of sweet potatoes are known as yams, but the true yam is quite a different tuber, produced by plants of the genus Dioscorea

There are serious diseases and insects of sweet potatoes, most of which are best controlled by careful seed selection, rotation of crops, sanitary methods of propagation whereby the plants do not become infected, and the roguing of fields for diseased plants.

SWEETSOP: Annona squamosa.

SWÉRTIA (also spelled Sweertia). Gentianacew. Mostly S. Asian herbs, closely allied to the N. American genus Frasera, distinguished by the style short or almost seemingly absent. Hardy members may be grown in the border or rockery while others are kept under glass.

albicaulis: Frasera nitida var.

multicaulis. Per. to 8 in., much branched: Ivs. narrowly spatulate-oblong, to 2 in. long: corolla 5-parted, lobes to 14 in. long with glandular pit at base whose margin is minutely fimbriated. Himalayas.

Párryi: Frasera Parryi.

perennis. Hardy per. to 1 ft.: basal lvs. oblong-elliptic, long-petioled, st.-lvs. ovate-oblong: corolla usually 5-parted, blue to white, lobes with 2 basal pits. Alpine regions of Eu., Asia, and Utah, Colo. northward.

radiata: Frasera speciosa.

speciosa. To 5 ft.: basal lvs. long-petioled, st.-lvs. elliptic, acuminate, about 5 in. long: corolla-lobes about $\frac{3}{2}$ in. long, fis. white with dark blue irregular blotches, in cymes forming a narrow paniele. W. Himalayas.

SWIETÈNIA. Mahogany. Meliaceæ. Evergreen trees of trop. Amer. with dark red wood which furnishes the mahogany of commerce, opposite or alternate pinnate lvs., small fis. in panicles, and fr. a very large woody caps. that splits from the base into usually 5 parts, the seeds winged at apex.

Mahógani. Evergreen, to 75 ft.: lvs. to 1 ft. long, of Manogani. Evergreen, to 73 htt 198, to 1 ht. long, of 4-10 entire lits.: fis. white. frs. to 4 in. long, the winged seeds 2 in. and more long. S. Fla. and W. Indies.—Sometimes planted for a shade and street tree.

SWINGLÈA (Chætospermum). TABOG. Rutacex. Small spine-bearing tree in Luzon, Philippines, grown as a possible stock for citrus fruits and for general interest: lvs. evergreen, 3-foliolate: stamens 10: seeds hairy. C. glutinosa, with a large oval terminal lft, and 2 smaller lateral ones: fls. solitary or in clusters, on slender pedicels: fr. oblong, 2-3 in. long, thick-rinded and ribbed.

SYÁGRUS. Palmacex. Mostly tree-like monœcious feather-palms of S. Amer., unarmed except perhaps on the edges of petiole, most of them in Brazil, formerly included in Cocos, distinguished from that genus and other segregates chiefly by technical characters of the fr. and seed. It agrees with Arecastrum in having the spathe deeply plicate-sulcate or grooved on the outside and in the non-ruminate albumen of the seed, but some of the species of it are small or dwarf palms much more delicate in foliage and infl. and the nutlet is prominently 3-striped, sterile cell a membranous vestige rather than a narrow area in the bony endocarp. It differs from Butia in the spathe, nutlet 1-seeded, and in the mostly naked trunk (at least below) and softer greener foliage. Except S. Weddelliana little known in our territory. See Palm for cult.

amara: Rhyticocos amara.

insignis (Cocos insignis. Glaziova insignis). Slender, tree-like, trunk 3-8 ft., foliage spreading-recurved: lvs. to 6 ft.; petiole and sheath unarmed but bearing dark brown wool or scurf; pinne not aggregate, central larger ones broad-lanceolate, narrowed at base and apex, green and somewhat paler underneath: fr. about ¾ in. long, greenish with pink at apex and abrupt short point; fruiting perianth short cup-like. Rio de Janeiro.

macrocárpa (Cocos macrocarpa, C. Procopiana). Trunk to 15 ft. or more, ringed and cleft: lvs. 6-10 ft., petiole white-tomentose and not spiny; pinnie green, in clusters of 4: fr. oblong and 1-seeded, lurge, 3½ in. long and 1½ in. thick, greenish-yellow, with fibrous exterior; fruiting perianth somewhat cup-like with long points. Brazil.

petræa (Cocos petræa. C. rupestris). Small stemless palm, the caudex mostly subterranean, in several varieties: lvs. erect-spreading; petiole unarmed, white- or rusty-tomentose; pinne linear (very narrow, but in var. plaruphylla somewhat broader), opposite and alternate and the lower ones 2 or 3 together: fr. oblong, about ¾ in. long, with a short point, broader), or 6 or less on the spadix; fruiting perianth cuplike with sharp points. Biazil.

Weddelliana (Cocos Weddelliana. Glaziova Martiana). Tree-like with slender trunk to 6 or 7 ft. and foliage nearly or quite reaching the ground: lvs. slender and foliage nearly or quite reaching the ground: lvs. slender and graceful; pinnæ linear, singly placed, long-pointed, green, paler underneath: fr. globose-oblong, about ½-½-½ in. long, with abrupt short point; fruiting perianth small, not cup-like. Rto de Janeiro.—Much used in the juvenile state as a potplant, the pinnæ then 3-6 in. long and ¼ in. or less broad; foliage gracefully drooping.

SYCAMORE: Ficus Sycamorus: see also Platanus.

SYMMETRICAL: said of a flower that has the same number of parts in each series or circle, as 5 stamens, 5

SYMPHORICÁRPOS. Caprifoliacex. Deciduous shrubs with opposite simple lvs., white or pink bell-shaped or tubular fls. usually borne in clusters or spikes, and fr. a 2-seeded white or colored berry; grown for the ornamental frs. as well as the foliage and attractive habit.

These shrubs are variously hardy in the North with the exception of S. microphyllus, and are not particular as to soil. Propagated by seeds, cuttings, suckers and division.

achtus: S. mollis var.

álbus (S. racemosus). Snowherry. Waxberry. To 3 ft.: lvs. oval, to 2 in. long, pubescent beneath, sometimes lobed on young shoots: fls. pinkish, bell-shaped, ¼ in. long,

June-Sept.: fr. snow-white. N. Amer. Var. lævigàtus, to 6 ft., lvs. to 3 in. long, glabrous. Var. ovàtus (S. ovatus) has lvs. broadly ovate, bluish-green, base nearly truncate. Var. paucifiòrus, low, lvs. gray-pubescent beneath, fis. few.

Chenaultii. Hybrid between S. microphyllus and S. orbiculatus: lys. pubescent beneath: fr. red spotted whitish.

conglomeràtus: S. orbiculatus.

fruticòsus: listed name.

glomeratus: S. orbiculatus.

microphyllus (S. montanus). To 10 ft.: lvs. ovate, to 2½ in. long, bluish and pubescent beneath: fls. pinkish, tubular, ½ in. long, Aug.-Sept.: fr. pink. Mex.

móllis. Procumbent or diffuse: lvs. nearly orbicular to moills. Procumbent or diffuse: Ivs. nearly orbicular to oval, to 2/5 in. long, pubescent on both sides: fis. pinkish or white, bell-shaped, 1/6 in. long, June-July: fr. white. B. C. to Calif. Var. acutus (S. acutus) is less pubescent. Var. frúctu-rôseus is lested with pink fr.

montanus: S. microphyllus.

occidentalis. Wordpregrey. To 5 ft.: lvs. oval or ovate, to 3 m. long, grayish and pubescent beneath: fls. pinkish, bell-shaped, ¼ in. long, stamens and style exserted, June-July: fr. whte. Mich. to Kans, and B. C. Var. Heyeri has lvs. thinner, more obscurely veined and shorter stamens.

orbiculàtus (S. vulgaris. S. parvillorus. S. conglomeratus. S. glomeratus). Indian Currant. Coral-Berry. To 7 ft.: lvs. oval or ovate, to 2½ in. long, glaucous and usually pubescent beneath: fls. white, bell-shaped, ½ in. long, June: fr. purplish-red. N. J. to Ga. and Tex. Var. variegàtus has lvs. variegated with yellow. A white-fruited form is var. leucocarpus.

oreophilus. To 5 ft.: lvs. oval, to 3 in. long, gray-pubescent beneath or becoming glabrous: fls. pinkish, tu-bular, ½ in. long, June-July: fr. white or pinkish. Ore. to Ariz

ovatus: S. albus var.

parvifldrus: S. orbiculatus.

racemòsus: S. albus.

rotundifòlius. To 3½ ft.: lvs. suborbicular to ovate, to 1 in. long, pubescent, grayish beneath: fls. pink, tubular-funnelform, to ½ in. long, in dense clusters: fr. white, ellipsoidal, about ½ in. long. Wash. to New Mex.—Perhaps not hardy N.

sinénsis. To $4\frac{1}{2}$ ft.: lys. elliptic to obtusely rhombic, to 1 in. long, cuneate, glaucescent beneath: fls. pınkısh, solitary, campanulate, to $\frac{1}{2}$ in. long: fr. bluish-black, ovoid, to $\frac{1}{2}$ in. long. Cent. Chma.

utahénsis. To 3 ft.: lvs. broad-ovate, to 1¾ in. long: fls. pink, oblong-campanulate, ⅓ in. long: fr. white. Utah to Colo.

vaccinioides. Low, much branched: lvs. oval, to ¾ in. long, glaucous beneath: fls. pinkish, campanulate, ⅓ in. long: fr. white. Wash. to Wyo. Var. decumbens is decumbent.

vulgăris: S. orbiculatus.

SYMPHYÁNDRA. Campanulaceæ. A few species in S. E. Eu. and W. Asia of bien. and per. herbs resembling Campanula but differing in having the anthers united into a tube around the style; stigmas 3: caps. 3-celled, dehiscing by lateral or basal pores: fls. white or violet, usually nodding or hanging, more or less bell-shaped. Cult. as for Campanula.

armèna. Per., 1 ft. or less tall, erect or lopping: lvs. cordate-ovate and long-petioled, dentate, the upper ones minute and nearly sessile: fls. nodding, narrowly bell-shaped, about ¾ m. long, pubescent, blue or violet. Cau-

Hófmannii. To 2 ft., hairy: lvs. obovate, to 7 in. long, toothed: fls. white, to 1½ in. long and broad, drooping, in leafy terminal panicles, calyx without appendages. Bosnia.

péndula. To 1 ft., hairy: lvs. cordate-ovate to oblong, coarsely toothed, the lower long-stalked: fls. yellowish-white, 1½ in. long, in racemes, the calyx with short appendages. Caucasus.

Wanneri. To 6 in., hairy: lvs. oblong-lanceolate, sharp-toothed or somewhat cut: fls. blue-violet, 1 ¼ in. long, nodding, in a branched thyrse, calyx without appendages. S. E. Eu.

S'ÝMPHYTUM. Comfrey. Boraginaceæ. Coarse per. herbs of the Old World, with alternate or subopposite and large basal simple lvs. and blue, purplish or yellowish fls. in coiled racemes or forked cymes; corolla tubular, expanded above, the throat crested.

Comfreys are sometimes planted in the border. Of easy cultivation, Propagated by seeds, division and root-cuttings, aspérrimum: S. asperum.

åsperum (S. asperrimum). PRICKLY C. Per. to 5 ft.: lvs. ovate, petioled, covered with prickly hairs: fls. rose changing to blue, about ½ in. long. Russia to Persia.—Sometimes used as forage. Vars. variegātum and abreovariegātum have lvs. variegated and margined with yellow.

officinale. COMMON C. Per. to 3 ft.: Ivs. oblong-ovate to oblong-lanceolate, decurrent at base, covered with prickly hairs: fis. yellowish, purple, rose or white, about ½ in. long. Eu., Asia; escaped in N. Amer. Var. variegatum has Ivs. margined with white; ornamental.

tauricum. Per. to 2½ ft.: lvs. ovate-lanceolate: fls. pure white, to ¾ in. long, calyx very small. Cent. and S. E. Eu.

SYMPLOCÀCEÆ. SYMPLOCOS OF SWEETLEAF Family. Trees or shrubs, sometimes evergreen, with alternate simple lvs., mostly bisexual regular fls. having 5-lobed calvx, 5-10-lobed corolla, 15 or many stamens, inferior ovary, and drupaceous fr. Allied to Ebenaceæ and Styracaccæ. There is only one genus, Symplocos.

SYMPLOCÁRPUS (Spathyema). Araceæ. One strong-smelling per. herb native in swamps and wet soil in E. N. Amer., and sometimes transplanted from the wild for the great lf.-clumps; spathes appearing before the lvs. and also ornamental but the odor disagreeable. S. fætidus. SKUNK-CABBAGE. Lvs. to 3 ft. long and 1 ft. wide, entire, the petioles 1 ft. or more long.

SÝMPLOCOS. SWEETLEAF. Symplocaceæ. Characters as for the family: of wide distribution, a few grown for ornament.

Only S. paniculata is hardy North. Propagated by seeds which are slow to germinate, by layers, and by cuttings of young wood under glass.

cratægoides: S. paniculata.

paniculata (S. cratægoides). To 40 ft., deciduous: lvs. obovate, to 3 in. long, finely toothed: fis. white, fragrant, ½ in. across, in panicles to 3 in. long: fr. blue. Himalayan region, China, Japan.

tinctòria. To 30 ft., partially evergreen: lvs. oval, to 6 in. long, scarcely toothed. fis. yellowish, fragrant, 24 in. across, in dense clusters: fr. orange or brown. Del. to Fla. and La.

SYNADÈNIUM. Euphorbiacex. African shrubs with thick fleshy branches, milky juice, alternate simple lvs., fls. in cyathia (see Euphorbiacex), and capsular frs.; sometimes planted for ornament in the tropics and warm regions. For cult. see Succulents.

Grántii. African Milk-Bush. To 12 ft.: lvs. narrow-obovate, to 4 in. long, fleshy: fls. red. Trop. Afr.

SYNCÁRPIA. Myrtacex. Evergreen trees in Australia, with opposite simple lvs., white fls. in globose heads and capsular frs. inclosed in the calyx; grown in S. U. S. for a shade tree and the wood is used for building purposes.

glomulffera (S. laurifolia). Turpentine Tree. To 200 ft.: lvs. broadly ovate, to 3 in. long, very thick and tomentose beneath.

laurifòlia: S. glomulifera.

SYNDESMON: Anemonella.

SYNECHÁNTHUS. Palmacex. Palms differing from Chamædorea in being monœcious in each spadix and the fls. not spirally arranged, spadices always among the lvs., stamens either 3 or 6, and in technical characters of fls.: low unarmed gregarious feather-palms, 3 or 4 species in Cent. Amer. and Colombia; suitable for growing under glass, and also under lath or in protected woods in S. Fla. For cult, see Palm.

fibrosa. St. to 4 ft., strongly ringed: lvs. pinnate, to 4 ft. long, ascending and spreading; pinnæ 30-40, more or less pendulous, 1-1½ ft. long, pointed: fr. oblong, orangered. Cent. Amer.

SYNGÒNIUM. Aracex. Trop. American climbing or creeping vines having milky juice; lys. long-petioled, sagittate or becoming palmately lobed; spathe pale green to yellowish and longer than spadix. Propagated by cuttings. Not hardy to frosts.

podophýllum. Creeping: lvs. becoming 5-6-palmately lobed, to 6 in. long, on petioles to 20 in. long: spathe white within and greenish outside, to 1 ± 6 in. long. Mex. More commonly cult. is var. albolineátum having lvs. with whitish primary midribs and lateral veins.

SYNNÒTIA. Iridacex. A small genus of S. African cormous herbs allied to Gladiolus and Sparaxis, differing from the former in the membranous and lacerated spathe-valves and from the latter in the irregular corolla. Propagated by seed or by cormlet offsets and cult. as for Gladiolus, succeeding best in a light sandy soil.

bicolor. To 1½ ft.: lvs. usually 6, ensiform, in basal rosette, to 6 in. long: fls. yellow tinged violet, tube to ½ in. long, segms. about 1 in. long, the upper one erect and broadly oblong with others reflexed and much narrower, spike lax, simple or branched, 2-6-fld.

Metelerkámpiæ. To 10 in.: lvs. broadly linear, in basal rosette, to 4 in. long, acute or obtuse: fls. deep violet, tube filiform, to 1½ in. long, segms. about ½ in. long, spike lax, branched, 9–12-fld.

SYNTHERISMA: Digitaria.

SÝNTHYRIS. Scrophulariacex. Per. herbs native in N. Amer. and Eu., with basal longstalked lvs. and small oblong to wheel-shaped 4-lobed fls. in close racemes or spikes; sometimes grown in the border.

alpina (Besseya alpina). To 6 in.: lvs. ovate or elliptic, to 2 in. long, wavy-toothed, glabrous: fis. purplish-blue, 1/2 in. long. Mts., Colo., Wyo.

Cánbyi. To 8 in: lvs. deeply pinnately 7-cleft, to 1 in. long, glabrous, blade cordate-ovate, scarcely longer than wide, irregularly dentate: fis. blue-violet, to ½ in. long, in dense spike-like racemes to 2½ in. long; caps. ½ in. long, finely pubescent. June-July. Mont.

cordata: a form of S. reniformis having more strongly heart-shaped lvs. and by most authors not considered distinct from that species.

cymopteroides. Erect to 6 in., white-tomentose usually becoming glabrate: lvs. finely bipinnatifid, to 2 in. long and 1½ in. wide, ultimate segms. linear-attenuate: fls. violetblue, to ½ in. long, becoming glabrous. May-July. S. W. Mont. to Cent. Ida.—Forms with pubescent foliuge are known. cent foliage are known.

dissecta. To 8 in.: lvs. oval, 2-3-pinnatifid, to 4 in. long, petioled, quite hairy: fis. blue or purple, fading with age, to 3/6 in. long, on villous scape. Mts., Mont. to Wyo.

empetrifòlia: listed name of unknown botanical standing.

Héndersonii. To 3 in., white-tomentose becoming glabrate: lvs. coarsely bipinnatifid, to 2 in. long and % in. wide, ultimate segms. ovate-acuminate: fls. sky-blue, to ¼ in. long. July. Ida.

lanuginòsa: S. pinnatifida var.

major (S. reniformis var. major). To 8 in.: lvs. reniform, to 3 in. across, lobed, glabrous, shining: fis. purple, 1/2 in. long. Wash., Ore., Ida.

petiolàta: listed name.

pinnatfilda. To 6 in.: lvs. to 4 in. long, 2-3-pinnate into linear segms., pubescent: fls. whitish or pink, ½ in. long. Mts., Utah, Ida. Var. lanuginosa, lvs. white-tomentose, palmately 3-7-parted. Olympic Mts., Wash.

plantaginea (Besseya plantaginea). To 1 ft.: lvs. oblong, to 6 in. long, toothed, pubescent: fls. purple or pink. Wyo. to New Mex.

reniformis. To 9 in.: lvs. orbicular-reniform, to 2 in. across, deeply toothed, glabrous: fis. blue or purple, 1/2 in. long. Wash. to Calif. Var. major is S. major.

Suringa

Ritteriana (Besseva Ritteriana). To 1 ft.: lvs. elliptic or oblong, to 4 in. long, toothed, pubescent: fis. white or yellowish, 1/2 in. long. Mts., Colo.

rotundifòlia. To 5 in.: lvs. ovate-cordate, to 2 in. long, toothed, rough: ffs. white, 1/6 in. long. Ore. to Calif. Var. Sweètseri, taller with long more deeply cut lvs. and bluer

rùbra. To 8 in., white-woolly and tinged reddish: basal lvs. orbicular to lanceolate, blade to 2 in. long, cauline lvs. lanceolate, to 1 in. long: corolla absent. B. C. to E. Ore. and

schizántha. To 1 ft.: lvs. reniform-orbicular, cut-toothed: fls. blue, sepals and petals cut into narrow lobes. Mts., Wash.

stellata. stellulata: listed names. Sweetseri: S. rotundifolia var.

SYRÍNGA. LILAC. Oleaceæ. Deciduous shrubs or small trees of Eu. and Asia, with opposite mostly simple lvs., small white, lilac or purple tubular fls. in showy panicles or thyrses in spring and early summer, often very fragrant, and fr. a leathery caps. As a vernacular name, Syringa is sometimes applied to the mock-orange or Philadelphus.

Lalacs are amongst the most popular ornamental shrubs and most of them are hardy North. They thrive in fertile rather most soil, although growing readily on most lands. Transplanting is easily effected in fall or spring. Propagated by seeds stratified and sown in spring, by cuttings of green wood, ripe wood and roots, by layers and suckers, and varieties by grafting or budding on other lilacs or on privet. Lalacs may also be forced for winter bloom under glass. Plants should be potted in early spring and plunged outdoors in summer, giving ample water. Three to five weeks are required to bring the plants into bloom, under a temperature from 60-80°. For white blossoms the plants must be forced in darkened rooms.

be forced in darkened rooms

Adamiana: S. tomentella.

affinis: S. oblata var. alba.

amœna: S. vulgaris var.

amurénsis (S. sibirica). To 12 ft.: lvs. ovate, to 5 in. long, glabrous: fls. yellowish-white, in loose panieles to 6 in. long, with very short corolla-tube and exserted stamens. Manchuria, China. Var. japónica (S. japonica) grows to 30 ft., with lvs. broad-ovate to ovate-oblong and pubescent beneath, the fls. in panicles to 12 in. long. Japan.

Bretschneideri: S. villosa.

chinénsis (S. rothomagensis. S. varina). Hybrid between S. pereica and S. vulgaris: to 15 ft.: lvs. ovate-lanceolate, to 3 in. long, glabrous: fls. likac or purple. Var. álba has white fls.; důplex, double purplish-lilac; meténsis, rosy-hlac; Saugeana (var. rubra), lilac-red.

dilatàta: S. oblata var.

emòdi. Himalayan I. To 15 ft.: lvs. oval or oblong, to 8 in. long, glabrous, glaucous beneath: fls. lilac or whitish, in dense terminal panicles to 6 in. long, with corolla-tube 16 in. long. W. Asia; not hardy far N.

exímia: S. Josikwa var.

formosissima: S. Wolfii.

Giráldii: S. oblata var.

Hénryi. Hybrid between S. villosa and S. Josikæa: lvs. pubescent on midrib beneath: fls. pale violet-purple, in panicles to 10 in. long. Var. exímia is S. Josikæa var.

hyacinthifiòra. Hybrid between S. oblata and S. vulgaris: lvs. broad-ovate. Var. plèna with double fis. is the form cult.

japónica: S. amurensis var.

Josikæa. Hungarian L. To 12 ft.: lvs. oval, to 5 in. long, shining above, glaucous and nearly glabrous beneath: fls. llac, in terminal panicles to 7 in. long, with corolla-tube 1/2 in. long. Hungary. Var. eximia, large panicles of rosered fls.

Julianse. To 6 ft.: lvs. ovate, to 2½ in. long, pubescent on both sides: fis. lilac, fragrant, in lateral panicles to 4 in. long, with corolla-tube ½ in. long, anthers purple or bluish.

Koehneana: S. velutina.

Komarowii (S. Sargentiana). To 15 ft.: lvs. ovate-oblong to oblong-lanceolate, to 6 in. long, pubescent beneath: fis. lilac, in nodding terminal panicles to 6 in. long. China.

lavelliénsis: a listed name of no botanical standing; the plant under this name in the trade is probably the garden form of S. vulgaris known as DeLouvain.

Lemòinei: hort. name applied indiscriminately to a group of vernacular-named garden hybrids and color forms.

macrostàchva: S. vulgaris var.

marlevénsis is S. vulgaris var. purpurea.

Maximowiczii. Garden hybrid, having blue-purple fls.

Meyeri. Small shrub: lvs. oval, to $1\frac{1}{2}$ in. long, pubescent on veins beneath: fis. purple-hlac, in dense lateral panicles to 3 in. long, with corolla-tube $\frac{1}{2}$ in. long. China.

micrántha: S. velutina.

718

microphylla. Small shrub: lvs. ovate, to $1\frac{1}{2}$ in. long, pubescent beneath: fis. hlac, in lateral panicles to 3 in. long, with corolla-tube $\frac{1}{2}$ in. long. China.

nigricans: hort. form of S. vulgaris.

oblata. To 12 ft.: lvs. ovate or reniform, cordate at base, oblata. To 12 it.: ivs. ovate or reniform, cordate at base, to 4 in. long, glabrous: fis. lilac, in dense lateral panicles to 5 in. long, with corolla-tube ½ in. long. China. Var. álba (var. afinis, S. afinis) has smaller lvs. and white fis. Var. dilatata (S. dilatata) has long-acuminate lvs. Var. Giráldii (S. Graldii) has lvs. often pubescent beneath and panicles 6 in. long.

Palibiniana: S. velutina.

pekinénsis (S. amurensis var. pekinensis). To 15 ft.: lvs. ovate or ovate-lanceolate, to 4 in. long, glabrous: fls. yellowish-white, in panicles to 6 in. long, with short corolla-tube. China. Var. péndula has drooping branches.

pérsica. Persian L. To 6 ft.: lvs. lanceolate, to 21/2 in. long, glabrous: fis. illac or whitish, fragrant, in loose lateral panieles to 3 in. long, with corolla-tube ½ in. long. Persia to China. Var. álba has white fis. Var. laciniáta has pinnately lobed or cut lvs. Var. ribra, fis. red.

pinetorum. Differs from S. Julianx in lvs. not exceeding 1½ in. long and pilose beneath only on veins; anthers yellow. S. W. China.

pinnatifòlia. To 10 ft.: lvs. of 7-11 ovate or ovate-lanceolate lfts. to 1 in. long: ffs. white or pale lilac, in lateral panicles to 3 in. long, with corolla-tube ½ in. long. China.

Préstoniæ. Hybrids, S. reflexa × S. villosa: lvs. resembling those of S. villosa: fis. pale pink to pinkish-lilac. Very hardy. Produced in Canada.

pubescens. To 6 ft.: lvs. broad-ovate, to 3 in. long, pubescent beneath: fls. pale lilac, fragrant, in dense lateral panieles to 5 in. long, with corolla-tube ½ in. long. China.

refléxa. To 12 ft.: lvs. oblong, to 6 in. long, pubescent beneath: fls. pinkish, white inside, in terminal drooping panicles to 7 in. long, with corolla-tube ½ in. long. China.

rothomagéngia. S chinensis

Sargentiana: S. Komarowii.

Saugeana: S. chinensis var.

sibírica: S. amurensis.

Sweginzòwii. To 10 ft.: lvs. oblong or ovate, to 4 in. long, pubescent on veins beneath: fls. lilac, fragrant, in terminal panteles to 8 in. long, with corolla-tube ½ in. long. China. Var. supérba is similar.

Thúnbergii: hort. name.

tomentélia (S. Adamiana. S. Wilsonii). To 10 ft.: lvs. oval to oblong-lanceolate, to 4 in. long, pubescent beneath: fis. lilac or whitish, in loose terminal panicles to 7 in. long, with corolla-tube ½ in. long. China.

varina: S. chinensis.

velùtina (S. Koehneana. S. micrantha. S. Palibiniana). To 10 ft.: lvs. oval or ovate-oblong, to 4 in. long, pubes-cent both sides: fls. llac, in pubescent panicles to 5 in. long, with corolla-tube 1/2 in. long. China, Korea.

villòsa (S. Bretschneideri). To 10 ft.: lvs. oval to oblong, to 7 m. long, pubescent on veins beneath: fls. hlac or pinkishwhite, in terminal panicles to 1 ft. long, with corolla-tube 1/2 in. long. China.

yulgāris. Common L. To 20 ft.: lvs. ovate, to 5 in. long, glabrous: fls, lilae or white, fragrant, in lateral panieles to 10 in. long, with corolla-tube ½ in. long. S. E. Eu. Latinnamed forms of S. vulgaris in the trade are: álba, fls. white; amēna, large clusters of fls, pink outside and violet within; cærilea, blue; gigantêa, large spikes of dark blush-purple fls.; Lemôinei, fls. double; macrostāchya, fls. pale pink, in long pyramidal clusters; marleyēnsis, the same as var. purpurea; nīgricans, foliage and fls, dark; pièna, double blue; purpūrea, purplish-red; ròsea grandiflora, fls. rosylilac, double, early; spectābilis, clusters large, hlac; violācea, violet-lilae; virginālis or álba virginālis, fls. white.

Wisconii: S. tomentella

Wilsonii: S. tomentella.

Wôsfii (S. formosissima). To 20 ft.: lvs. oval-oblong, to 6 in. long, pubescent on veins beneath: fis. lilac, fragrant, in terminal panicles to 1 ft. long, with corolla-tube ½ in. long. Manchuria, Korea. Var. hirsuta is more densely pilose on twigs, lvs. and infl.

yunnanénsis. To 10 ft.: lvs. oval to oval-lanceolate, to 3 in. long, glaucous beneath: fls. pink, in terminal panicles to 6 in. long, with corolla-tube 1/4 in. long. China. Var. rosea is listed as having slightly darker fls. than type.

SYRMATIUM: Lotus eriophorus.

SYZÝGIUM. Myrtacex. Old World trop. trees and shrubs, differing from Eugenia in the united petals, usually truncate calyx and no staminal disk: fls. small: frs. small 1-seeded berries. For cult. see Eugenia.

Cûminii (Eugenia Cuminii and Jambolana. S. Jambolana). Jambolana-Plum. Tree to 80 ft.: lvs. oblong to oval, to 8 in. long, acuminate and sometimes emarginate on same tree with others: fls. white, about ½ in. across, in branching cymes: fr. purplish-red, to 2 in. diam., edible. E. Indies, Burma.

Jambolàna: S. Cuminii.

oblanceolatum. Tree to 35 ft., twigs 4-angled and often narrowly winged: lvs. oblanceolate to obovate, to 1 ft. long, acuminate, leathery, lateral veins usually 16-25: fls. in terminal or upper axillary cymose panicles to 3 in. long. Philippines.—Some of the material in the trade is 8. polycephaloides, distinguished in part by its shorter abruptly acuminate lvs. with fewer lateral veins and fls. on branches below the lvs.

operculatum (Eugenia operculata). Tree to 50 ft.: lvs. elliptic to broadly ovate, to 8 in. long: fls. small, white, 3 together: fr. purphsh-black, edible. Himalayas.—Some of the material cult. under this name is S. Cuminii.

polycephaloides. Tree to 70 ft., twigs 4-angled or slightly winged lvs. oblanceolate to elliptic, to 8 in. long, very abruptly acuminate, lateral veins 14-18: fls. in cymes to 4 in. long, on branches below the lvs., usually in 3's. Philippines.

TABEBÙIA. Bignoniaceæ. Evergreen trees or shrubs of trop. Amer., with simple or digitately compound lvs., funnelform 5-lobed fls. in showy terminal racemes or panicles, and linear capsular frs.; 1 or 2 species sometimes grown in S. U. S. where they thrive in rich soil. Propagated by cuttings and air-layers, as well as by seeds.

argentea (Tecoma argentea). To 25 ft. lvs. of 5-7 oblong lfts. to 6 in. long, densely silvery-scaly on both sides: fls. yellow, 2½ in. long. frs. gray lined with black, to 4 in. long. Paraguay.

pallida (T. pentaphylla). To 50 ft. or more, somewhat scaly: Ifts. mostly 3-5, elliptic to narrow-obovate, to 6 in. long, entire: fls. white with colored veins, or pink or rose, nearly 3 in. long, with or preceding the lvs. W. Indies, Cent. and N. S. Amer.—Sometimes called "white-cedar;" planted in S. Fla.

pentaphýlla: T. pallida.

serratifolia (Bignonia and Tecoma serratifolia). Tree to 30 ft. or more: lvs. of 4-5 oblong-ovate lfts. to 5 in. long, toothed at tips: fls. yellow, 2½ in. long. W. Indies.

TABERNÆMONTÀNA. Apocynacex. Trees and shrubs of trop. regions planted for ornament: lvs. opposite: fls. salver-shaped, in terminal cymes, white or yellow: fr. of 2 follicles or berries. Propagated by cuttings.

citrifòlia. To 6 ft.: lvs. oblong, to 5 in. long: fls. white, to 1 in. across, fragrant. W. Indies, Mex.

coronària: Ervatamia coronaria.

grandifiòra. To 6 ft.: lvs. oblong-ovate, to 5 in. long: fls. yellow, 1½ in. across, fragrant. Venezuela, Guiana.

grandifòlia: apparently a form of Ervatamia coronaria.

TABOG: Swinglea.

TACAMAHAC: Populus Tacamahaca.

TÂCCA. Taccaceæ. Odd per. herbs of warm countries, with large basal lvs. and brown or greenish fls. in dense umbels terminating the scape, subtended by leaf-like or colored bracts, bearing conspicuous long thread-like sterile pedicels mixed with the fls.

Taccas are suitable for greenhouse cultivation. They require rich open well-drained soil and should be rested in winter. Propagated by division of the roots.

Chantrièri. Devil-Flower. Lvs. oval, $1\frac{1}{2}$ ft. long and 10 in. wide, shining, the petioles reddish-brown and $2\frac{1}{2}$ ft. long: fis. brownish-purple, $1\frac{3}{4}$ in. across. Malaya.

cristata. Lvs. oblong, to 2 ft. long and 6 in. wide, dark purplish-green, shining above, fis. brownish-purple, 1½ in. across. Malaya.

pinnatifida. Tubers 1 in. through, often grown in the tropics for arrowroot: lvs. to 4 ft. across, 3-parted and the segms. pinnatifid: fls. greensh and purplish, ¾ in. across. Trop. Asia, Afr., Australia.

TACCACEÆ. TACCA FAMILY. Two trop. monocotyledonous herbaceous genera, mostly of the eastern hemisphere, with characters of Tacca which see. Allied to Dioscoreaceæ.

TACSONIA: Passiflora.

TÆNÍDIA. Umbelliferæ. Per. herb native from Que. to Miss., sometimes transferred from the wild. **T. integérrima**. To 3 ft.: lvs. 2-3-ternately compound into ovate to lanceolate entire segms. to 1 in. long: fls. yellow, in compound umbels: frs. oval, ½ in. long.

TAGÈTES. MARIGOLD. Compositæ. Strongscented mostly ann. herbs with usually opposite lvs. finely dissected, and solitary or clustered heads of yellow, orange or red ray- and disk-fls.; pappus of scales or bristles; native from New Mex. to Argentina. The name Tagetes is pronounced

in three syllables. Races without strong foliage odor have been developed.

Marigolds are popular as cut-flowers and are of simple cultivation. Propagated by seeds sown where plants are to stand or started early in the house.

erécta. Bio or Aztec M. African M. (once supposed to be native in Afr.). Stout ann., erect, to 3 ft.: lvs. pinnate: heads solitary, to 4 in. across, yellow to orange, the rays numerous and long-clawed, sometimes 2-lipped or quilled.

lùcida. Sweet-scented M. Per., cult. as ann., to 1½ ft.: lvs. simple, oblong-lanceolate, finely toothed but not divided: heads ½ in. across, 2-3-rayed, golden or orange-yellow, in dense terminal clusters. Mex.—Not common in cult

patula. French M. Ann., much branched from base, to 1½ ft.: lvs. punnate: heads solitary, to 1½ m. across, rays numerous, yellow with red markings. Mex.

signàta: T. tenuifolia.

tenuifòlia (T. sıgnata). Ann. to 2 ft.: lvs. finely cut: heads solitary, about 1 in. across, rays few, yellow. Mex. Var. pùmila is dwarf, 1 ft. or less high.

TAINIA: Ascotarnia viridifusca.

TAIWANIA. Taxodiacex. Tall evergreen tree from Formosa (Taiwan) and W. China, allied to Cryptomeria, suitable for cult. in Calif. and Fla. T. cryptomerioides. Young lvs. linear, ½ in. long, adult lvs. scale-like, imbricated, to ½ in. long: cones ½ in. long, with leathery scales.—It is a new plant to cult., the genus having been founded by Hayata as late as 1906. For cult. see Comfers.

TALAÙMA. Magnoliaccæ. Tender evergreen broad-lvd. trees from E. Asia and S. Amer., closely allied to Magnolia, differing in having indehiseent and deciduous carpels. Propagated by seeds or cuttings, but seeds shipped from Orient often lose viability before arrival here.

Hódgsonii. To 60 ft.: lvs. obovate-oblong, to 20 in. long and 9 in. wide, glabrous, leathery. petals usually 6, ivorywhite and fleshy, sepals 3, purplish-blue, fls. terminal, to 6 in. across and 4 in. deep, cup-shaped vith spice-like odor: fr. to 6 in. long.

TALÌNUM. Fame-Flower. Portulacaceæ. Per. more or less fleshy small herbs sometimes woody at base, with alternate or nearly opposite lys., small ephemeral fls. mostly in erect terminal cymes or panicles, and capsular frs. Useful in borders and rock-gardens, and sometimes as tub plants for the foliage. Native in both hemispheres.

calfcinum. To 8 in.: lvs. to 2 in. long: fls. pink, 1 in. or more across. Ark. to Mex.

Ménziesii. Similar to *T. teretifolium*, differing in its somewhat larger habit and fls. to 1 in. across with 40 or more stamens which are much exceeded by the style. Tenn. to Ga. and Ala.

okanoganénse. Low cespitose per. to 1 in. high: lvs. deciduous, fleshy, somewhat cylindrical, to 3% in. long, grayish-green: fls. white, usually solitary, saucer-shaped, to % in. across, on short peduncles to 1½ in. long, stamens yellow. Wash.—Fls. short-lived but produced in succession for several weeks. Requires drainage and withstands drought conditions.

paniculatum. To 2 ft. or more: lvs. elliptic or obovate, to 3 in. long. fls. red to yellowish, in a panicle to 10 in. long. S. U. S. and south.—A form with white-edged lvs. is a tub or pot-plant.

parviflorum. To 8 in.: lvs. to 2 in. long: fis. pink, about 1/3 in. across. Minn. to Tex.

parvifòlium: listed name.

patens. Plant erect, woody at base, to 2 ft.: lvs. opposite, ovate with cuneate base. fts. carmine, small, in cymes. W. Indies and E. S. Amer. Var. variegatum has foliage and sts. marked with white or pink.—A pot-plant surviving much heat and drought. For foliage purposes flowering branches should be cut off as soon as they appear.

rugospérmum. To 10 in.: lvs. basal, linear, cylindrical, to 2 in. long: fis. pink, ½ in. across. Ind. to Minn. and Wis.

spinéscens. Sts. covered with small spines: lvs. cylindrical, ½ in. long: fls. rose. Mts., Wash.

teretifolium. To 1 ft.: lvs. linear, cylindrical, to 2 in. long: fls. pink, ½ in. across, stamens 20 or less, equalling or exceeding the style. Pa. to Ga. and Tex.

triangulare. Stout and fleshy, to 1½ or 2 ft.: lvs. obovate or narrower, about 3 in. long: fis. red to whitish or yellowish, in racemes. Trop. Amer., and widely spread as an ornamental and pot-herb.

Wayæ: listed name of unknown botanical standing.

TALLOW-TREE, CHINESE: Saprum sebiferum. Vegetable: Saprum sebiferum. -Wood: Ximenia americana.

TAMALA: Persea.

TAMARACK: Larix laricina.

TAMARICACEÆ. TAMARISK FAMILY. Four genera of shrubs or trees from the Medit. region to Japan, having alternate mostly small and scale-like lvs., regular bisexual fls. with 4–5 sepals and petals, 8–10 stamens, superior 1-celled ovary and capsular fr. Myricaria and Tamarix are planted for ornament.

TAMARIND: Tamarindus. Manila: Pithecellobium dulce.

TAMARÍNDUS. Leguminosæ. Evergreen tree widely grown in the tropics for ornament and for the frs. which are eaten in various forms, made into drinks, and also have medicinal properties. Tamarinds thrive on deep soil with abundant rainfall or irrigation. Propagated by seeds and by shield-budding. T. indica. Tamarind. Tamarindo. To 80 ft., making a massive picturesque tree: lvs. pinnate, the lfts. to 34 in. long: fls. pale yellow, 1 in. across, in few-fld. racemes: pods to 8 in. long, cinnamon-brown. Probably trop. Afr. and S. Asia.

TAMARISK: Tamarix. False: Myricaria.

TÂMARIX. TAMARISK. Tamaricaceæ. Deciduous or evergrowing trees or shrubs, Eu. and Asia, the graceful slender branches bearing small heath-like lvs. and pink or white fls. with the parts in 5's or in 4's, in prominent racemes or panicles.

Tamarisks are grown for ornament, as windbreaks and along the coast as they withstand salt spray. Propagated by seeds, hardwood cuttings, or greenwood cuttings under glass.

æstivalis: T. pentandra.

africana. To 10 ft.: fls. pinkish, nearly sessile, in racemes to 3 in. long which are lateral on last year's branches, in spring. Medit. region; hardy only far S.—The plant cult. under this name is usually *T. parviflora*.

algérica: probably T. gallica.

amurénsis: T. pentandra.

ánglica. To 10 ft.: fls. white or pinkish, in terminal panicles in early summer, petals falling from the frs. W. Eu.; for central or southern states.

aphfila (T. articulata). Athel T. To 30 ft., with jointed branchlets and munute sheathing lvs. like a Casuarina: fis. pink, sessile, in terminal panicles. W. Asia.—Intro. as windbreak in desert regions of S. Calif.; the naked green twigs make it "evergreen."

articulata: T. aphylla.

chinénsis. Chinese T. To 15 ft., with fine often drooping spray: fis. pink, in loose terminal panicles in summer, petals persistent on frs. China; only far S.

gallica. French T. To 30 ft.: fls. white or pinkish, in panicled racemes in early summer, petals deciduous from the frs. W. Eu. to Himalayas; probably hardy in central states. Var. indica has longer and slenderer racemes.

germánica: Myricaria germanica.

hispida. Kashgar T. To 4 ft., branchlets and lvs. pubescent: fls. pink, in dense panicled racemes in late summer. Caspian region; hardy in central or southern states. Var. æstivålis is T. pentandra. Var. Collidge is a compact form of T. pentandra. Var. plumosa is listed.

índica: T. gallica var.

iapónica: T. juniperina.

juniperina (T. japonica. T. plumosa). To 15 ft.: fls. pinkish, in lateral racemes in spring, parts of the fl. in 5's, petals remaining on fr. China, Japan; probably not hardy N.

odessåna. To 6 ft.: fis. pink, in slender panieled racemes in summer, petals persistent on frs., bracts awl-shaped. Caspian region; hardy in New England.

parvifiòra (T. tetrandra var. purpurea). To 15 ft.: fls. pink, in short lateral racemes in spring, parts of the fl. in 4's, the petals persistent on frs. S. Eu.; hardy in S. New England.

pentandra (T. hispida æstivalis. T. amurensis). To 15 ft.: branchlets and lvs. glabrous: fls. pink, in dense racemes forming large panicles, in late summer, petals persistent on frs., bracts broadly lanceolate. Eu., Asia; hardy in S. New England.

plumòsa: T. juniperina.

tetrándra. To 12 ft.: fls. pale pink or white, in lateral racemes in spring, petals deciduous from fr. Eu., Asia. Var. purpūrea of the trade is T. paraflora.

TAMUS (Tamnus). Dioscoreacew. Twining tuberous-rooted dioccious perennials, one sometimes planted for ornament, with the look of Dioscorea but differing in bearing a few-seeded berry. T. commanis, Black Bryony, of Great Britain and distributed on the Continent, has slender angular sts. many ft. long, long-petioled and more or less obscurely lobed pointed lys. and fts. mostly in axillary racemes or fascicles: berry small, red.

TANACÈTUM. Tansy. Compositæ. Ann. and per. strong-scented herbs with alternate pinnately cut lvs. and small yellow clustered heads of disk-fls.; pappus none or a crown; native in northern hemisphere.

Tansy is grown in the garden for ornament and medicinal purposes. It thrives in all common situations and in soils not too wet. Propagated usually by dividing the old clumps; also by seed.

Balsamita: Chrysanthemum Balsamita.

boreale. Per. to 3 ft., closely allied to *T. vulgare* from which it differs in achene without pappus. Caucasus.—Some of the plants so named in cult. are believed to be *T. burgares*.

capitatum. Per. to 5 in., cespitose, woody at base: lvs. spatulate to oblanceolate, 3-5-parted or palmately lobed, upper ones linear and entire: heads small in spherical corymbose infi. Rocky Mts.

huronénse. Hunon T. Per. to 3 ft., pubescent: lvs. 2-pinnate: heads to ¾ in. across, usually few. Alaska to Ore. and Me.

macrophyllum: Chrysanthemum macrophyllum.

vulgare (Chrysanthemum vulgare). Common T. Per. to 3 ft., nearly glabrous: lvs. punnate: heads to ½ in. across, yellow, numerous, in flat-topped cymes; achene with short 5-lobed pappus. Eu.; escaped in U. S. Var. crispum has finer more crisped foliage.

TANAKÆA. Saxifragaceæ. Monotypic genus from Japan, T. radicans. Diocious or monocious stoloniferous hardy per. with scapes to 8 in. high: lvs. basal, oblong- to ovate-lanceolate, to 8 in. long, long-petioled, acute, doubly-serrate, base rounded to cordate: fls. minute, greenish-white and petal-less, solitary in axils of bracts, sepals 5, stamens 10.

TANGERINE: see Citrus nobilis var.

TANIER: Xanthosoma.

TANSY: Tanacetum.

TANYOSHO: Pinus densiflora var. umbraculifera:

TAPE-GRASS: Vallisneria.

TAPIOCA-PLANT: Manshot esculenta.

TARA: Cxsalpinia spinosa. -Vine: Actinidia arguta. TARAJO: Ilex latifolia.

TARAKTOGÈNOS. Flacourtiaceæ. Malayan trees one of which yields chaulmoogra oil: lvs. alternate, entire: fls. bisexual or unisexual, in

axillary few-fld. cymes, the stamens numerous: frs. globular or ovoid, hard. One species has been intro. into S. Calif. and Fla.

Kúrzii. To 50 ft.: lvs. lanceolate, to 10 in. long, shining: stammate fls. 3 in. across, with 4 sepals and 8 petals: fr. brownish-yellow, tomentose, size of orange. Burma.

TARATA: Pittosporum eugenioides.

TARÁXACUM. DANDELION. Compositæ. Per. stemless herbs with irregularly cut lvs. in a basal rosette and heads terminating hollow sts., of yellow ligulate fls.; pappus of bristles; mostly of the northern hemisphere. See Dandelion.

Déns-lednis: T. officinale.

officinale (T. Dens-leonis, Leontodon Taraxacum). Common 1). Lvs. to 10 in. long, pinnately cut or toothed: heads golden-yellow, 2 in. across. Eu., a weed in most parts of the world, but grown for "greens."

TARAXIA: (Enothera subacaulis.

TARE: Vicia satura.

TAR-FLOWER: Befaria racemosa.

TARO: Colocaria esculenta.

TARRAGON: Attemisia Dracunculus.
TARTOGO: Jatropha podagrica.
TARWEED: Madia, Cuphea petiolata.

TASA IO: see Opuntia.

TASSEL-FLOWER: Amaranthus caudatus, Brickellia grandıflora, Emilia sagıttata.

TAVARÈSIA. Asclepiadacev. Stapelia-like leafless plants with angled sts. bearing bristles on the tubercles: fls. funnel-shaped, large, borne at base of young sts.

Bárklyi. Sts. to 4 in. tall and ¾ in. thick, 10-12-angled, dark green or purplish, angles tubercled, each tubercle with 3 white bristles: fis. pale yellow, spotted purplish-red, densely papillate, to 4 in. across; corolla-tube to 2 in. deep and 1 in. wide, purplish-red. Trop. and S. Afr.

grandiflora. Sts. to 8 in. tall and ¾ in. thick, usually 14-angled, central bristle of tubercle longer than 2 laterals: fls. as in T. Barklyi, but corolla-tube to 4 in. deep and 1¾ in. across; corolla about 4½ in. across. S. W. Afr.

TAWHIWHI: Pittosporum tenuifolium.

TAXÀCEÆ. YEW FAMILY. Two genera, Taxus and Torreya, of evergreen trees and shrubs with needle-like lvs.: plants usually diocious, the stammate fls. cone-like, the pistillate of a 1-2-ovuled carpel: fr. berry- or drupe-like, consisting of a seed with a bony shell surrounded by a fleshy aril. The family was established by Lindley in 1836, but for many years was included in the Conifere. Until recently it has been thought to include about a dozen genera, most of which are now placed in the Podocarpaceæ or the Cephalotaxaceæ.

TAXODIACEÆ. TAXODIUM FAMILY. About a dozen genera of resinous, coniferous, evergreen or deciduous trees having linear needle-like lvs., fls. in cones, and fr. a hard globose or subglobose woody cone. The family has, until recently, been treated as a subfamily of the Pinaceæ, but several fundamental differences warrant its recognition as a separate family. Taxodiaceæ is technically distinguished by the cones which differ from those of the Pinaceæ in scales without distinct bracts and with 2-9 seeds: lvs. arranged in spirals, solitary not fascicled. The family contains many valuable timber trees and ornamental subjects as Athrotaxis, Cryptomeria, Cunninghamia, Glyptostrobus, Sciadopitys, Sequoia, Sequoiadendron, Taiwania, Taxodium.

TAXODIUM. Taxodiacex. Trees with short linear deciduous or evergreen lvs., staminate

fls. in catkins, and globose cones with woody scales; 3 species in E. N. Amer. and Mex. For cult. see *Conifers*.

ascéndens (T. distichum var. imbricarium). Pond Cypress. Lvs. deciduous, awl-shaped, about ½ in. long, appressed: cones 1 in. across. Va. to Fla. and Ala. Var. ndtans (var. pendulum) has drooping branchlets.

distichum. Bald Cypress. Lvs. deciduous, linear, to 34 in. long, spreading, light green: cones 1 in. across. Del. to Fla. and La; hardy in northern states but remains small. Var. fastigiātum, slender erect form; var. nānum, dwarf and shrubby; var. pēndens (var. pendulum). branchlets drooping, cones to 1½ in. long; var. pyramidālis, nairow pyramidal form.—It is not certain whether these hort. forms belong here or with T. ascendens.

mucronatum. Montezuma Cypress. Differs from T. distichum in the persistent shorter Ivs. and larger cones. Mex.; planted in Calif.; said to become deciduous when planted too far N.

TÂXUS. YEW. Taxacex. Evergreen trees and shrubs with linear dark green lvs. paler or yellowish beneath, inconspicuous diocious fls., and berry-like red frs.; native in the northern hemisphere. See Conifers for cult.

phore. See Conifers for cult.

baccata. English Y. Tree to 60 ft.: lvs. to 1½ in. long, gradually acuminate, pale beneath, fr. brown, in Sept.—Oct. Eu., N. Afr., W. Asia; hardy in N. Y. and parts of New England, but some of the vars. stand better than the species itself in the colder climates. There are numerous named forms, such as the following vars.: adpréssa (T. brevifolia, T. tardiva), shiub or low tree with lvs. to ½ in. long and its forms area with yellow lvs. and stricta and erécta of columnar habit; argéntea is var. variegata; aurea, lvs. yellow; Bárronii, shoots orange changing to copper; chestuntensis, branches ascending, lvs. blush-green below; compácta, compact, foliage shining dark green; dénsa, habit dense, lvs. short, dark green; Dovastônii, branchlets pendulous, and its form aureo-variegata with lvs. variegated yellow; elegantíssima, compact form with young lvs. striped pale yellow; epacrioides, rather dwaif with light green lvs.; erécta (var. pynamidalis), upright bushy var. and its forms aurea and Crowderi; ericoides (T. Michelii, T. microphylla), dwaif, with vety narrow lvs.; expánsa, low bush with pendulous branches; fastigiata is var. stricta; glauca, lvs. blush-green below; grácilis péndula is var. pendula; hibérnica is var. stricta; horizontalis, branches spreading horizontally; imperialis, penhaps synonymous with T. baccata; Jácksonii, spreading branches pendulous branches; procúmbens, prostrate much branches hendius tutes (var. luteo-baccata), fr. yellow; nana, of dwarf dense habit; neidpathénsis, unidentified hort. name; péndula (var. graelis pendula), spreading with slender pendulous branches; procúmbens, prostrate much branches repándens, neally prostrate with blush-green lvs.; semperaûrea, low habit, lvs. keeping yellow color the second year; stricta (var. statigata and habernica), Inish Y., columnar with very dark green lvs., and its forms aurea and variegāta; tardīva is var. adpresa; variegāta (var. argentea), lvs. variegated with white or whitish; Wáshingtonii, widespreading wit

brevifolia (T. Lindleyana). Western Y. Tree to 45 ft. or more: lvs. 1 in. or less long, abruptly pointed, dark yellowish-green: fr. Aug.-Sept. Mont. to B. C. and Calif. Var. Núttallii is listed as having more drooping branches. A var. nâna is listed.—The material commonly cult. under this name is T. baccata var. adpressa or T. cuspidata var. nana.

canadénsis. Ground-Hemlock. Straggling shrub sometimes 6 ft. high: lvs. 1 in. long, abruptly pointed, dark yellowish-green above: fr. in Aug. E. N. Amer., as far north as Newf. Var. aûrea, foliage slightly variegated yellow. Var. str cta is dwarf.

chinénsis. Chinese Y. Tre- to 50 ft.: lvs. to 1¾ in. 'ong, abruptly pointed, grayish-green below: fr. Sept.-Oct. China; hardy N.

China; hardy N.

cuspidata (T. Sieboldni). Japanese Y. Tree to 50 ft.: lys. to 1 in. long, abruptly pointed, with 2 yellow bands below: fr. Oct-Nov. Japan, Korea Manchuria; hardy N. and popular. Hort. forms are: Ande sonii, probably T. media var.; airea, foliage slightly variegated yellow; auréscens, low form with young lvs. deep yellow, requiring sheltered place; Brownii may be T. media var.; capitâta, synonymous with T. cuspidata; columnāris, of cylindrical habit; dénsa, low dens? bush; erécta is listed; fastigiâta, dwarf columnar plant, lvs. yellowish; Hicksii is T. media var.; mínima, very dwarf with shining lvs.; nana (var. brevifolia, var. compacia), shrubby form; nigra, very dark green foliage; ovâta is listed as having wider lvs. than type; pyramidâlis, of pyramidal habit; tardiva is T. baccata

var. adpressa; Thayeræ, wide-spreading, with horizontal or slightly ascending plumose branches.

Dutuilérdii: listed name of unknown botanical standing.

hibérnica: T. baccata var. structa.

Hicksii: T. media var.

Hunnewelliana. Hybrid between T. cuspidata and T. baccata

intermèdia: listed name for a "hybrid vew."

japónica: catalogue name, perhaps for T. cuspidata.

Lindlevana: T. brevifolia.

mèdia. Hybrid between T. cuspidata and T. baccata. Vars. are: Andersonii, erect, free-branching; Brownii, an erect contcal form to 8 ft. with dense short lvs.; Hátfieldii erect conteal form to 8 ft. with dense short Ivs.; Hattledit is similar but Ivs. more strongly 2-ranked in appearance; Hicksii, erect with ascending branches, bright dark green Ivs.; Kélseyi, upright, dense, listed as futting heavily; pyramidàlis, erect loose branching, to 15 ft.; Thàyeræ is T. cuspidala var.; Wárdii, erect, compact, to 8 ft., Ivs. dark green; Wéllesleyi, broad erect shrub.

Michelii: T. baccata var. ericoides.

microphylla: T. baccata var. ericoides.

péndula: T. baccata var. Dovastonii and pendula.

Sièboldii: T. cuspidata.

tardiva: T. bacca a var. adpressa.

TEA: Thea. Crystal-: Ledum palustre. Jersey-: Ceanothus americanus. Labrador-: Ledum grænlandicum. Mexican-: Ephedra, Chenopodium ambrosioides. Oswego: Monarda didyma. Philippine-: Ehretia microphylla. -Tree, Australian: Leptospermum lavigatum.

TEABERRY: Gaultheria procumbens.

TEAK: Tectona grandis. TEASEL: Dipsacus.

TÉCOMA. Bignoniacex. Shrubs with mostly pinnate lys. and toothed lfts. fragrant vellow or orange and tinted funnelform fls. in terminal racemes or panicles, and linear leathery capsular frs.; native from S. U. S. to Argentina.

Tecomas are grown in southern United States and will stand only a few degrees of frost. Propagated by seeds and by cuttings of green wood under glass.

argentea. Tabelmia argentea austràlis: Pandorea pandorana. capénsis: Tecomaria capensis. capreolata: see Bignonia capreolata.

grandiflòra: Campsis grandiflora.

Garrôcha. Shrub to 5 ft. or more: lvs. of 7-11 oblong-ovate acummate lfts. to 2 in. long, glabrous: fls. yellow or salmon with scarlet tube, 2 m long and 1 in. across, grad-ually narrowed to base. fr. to 4 in. long. Argentina.

jasminoides: Pandorea jasminoides. Máckenii: Podranea Ricasoliana. möllis: Stenolobium stans var. velutina. pentaphýlla: see Tabebura pallida. Princei: Campsis Tayliabuana. radicans: Campsis radicans. Reginæ-Sabæ: Podranea Brycei,

Ricasoliàna: Podranea Ricasoliana. sambucifòlia: the plant cult. under this name is Stenolobium stans vai. angustata.

serratifòlia: Tabebura serratifolia.

Smithii. Erect shrub: supposed hybrid between Stenolo-bium stans var. relutina and Tecomaria capensis: Ivs. of 11-17 oblong or acutish lits. to 2 in. long; ffs. yellow tinged orange, to 2 in. long, gradually narrowed toward base. Raised in Australia.

stáns: Stenolobium stans.

Tweediana: Doxantha Unquis-cati. velùtina: Stenolobium stans var.

TECOMÀRIA. Bignoniaceæ. Evergreen shrubs in Amer. and S. Afr., partially climbing, with pinnate lvs., funnelform curved yellow to scarlet fls. in dense terminal racemes or panicles, the stamens exserted, and linear flattened frs.; one species is grown in the S. as a hedge and division plant and sometimes under glass. Propagated by seeds and cuttings under glass.

capénsis (Tecoma capensis). CAPE-HONEYSUCKLE. Lvs. of 7-9 ovate toothed lits. to 2 in. long; fis. orange-red or scarlet, 2 in. long; fr. to 2 in. long. S. Afr.

TECOMÉLLA. Bignoniaceæ. One shrub or bush-like small tree, T. undulata, planted in S. Fla., native Arabia to W. India: branches gray, spreading: lvs. thickish, glaucous, oblong, entire, nearly or quite obtuse: fls. large and open, redorange, 2 in, or more long, deeply lobed.

TECOPHILÆA. Hæmodoraceæ. Two species of small tender cormous plants from Andes Mts. in Chile, one of which is cult.: lvs. linear-lanceolate, few inclosed in scarious sheath: scape arising from sheath at base of lvs., with usually solitary blue fls. having a regular campanulate perianth with 3 perfect stamens and 3 staminodes, ovary inferior and 3-celled: fr. a conical caps. Propagated by seeds and cormlet offsets.

cyanocròcus. To 6 in.: lvs. 2-3, somewhat undulate, to 5 in. long, bright green, glabrous: fls. deep blue vemed or suffused white in throat, segms. to 1½ in. long, lateral ones sometimes white-margined, pedicels about ¾ in. long and often weakly arching.—Not hardy N. but perhaps may be grown in open from N. C. southward in situations where soil will be moist during blossoming in early spring, but dry throughout remainder of season.

TÉCTONA. Verbenacex. Trees, one of which furnishes the teak-wood of commerce, with large opposite or whorled simple lvs. and small white or bluish fls. in terminal panicles.

grandis. Teak. To 150 ft.: lvs. ovate, to 1 ft. and more long, tomentose beneath fr. globular, 1 in. across. India, Malaya.—Sometimes planted far S. and in the tropics for crnament and int rest.

TEFF: Eragrostis abussinica.

TELANTHERA: Alternanthera.

TELEGRAPH-PLANT: Desmodium motorium.

TELEKIA: Buphthalmum.

TELÈPHIUM. ORPINE. Caryophyllacex. Much branched herbs from the Medit. region, with alternate lvs. and white fls. in terminal clusters; rarely cult. in the rock-garden.

Imperati. Per., with prostrate leafy sts. to 1 ft. long: lvs. oblong, thick, to 1/2 in. long: fls. July-Aug. Eu.

TELESONIX: Boykinia Jamesii.

TELLÌMA. Saxifragacex. Per. hairy herbs from W. N. Amer. similar to Mitella but differing in the 2-beaked caps.; suitable for the wild-garden.

affinis: Lithofrayma affinis.

grandiflora. To 2 ft: lvs. cordate-ovate, lobed, to 4 in. across: fls. greenish turning pink or red, the petals pinnately cut. Alaska to Calif.

odorata. To 2 ft., plant coarsely pilose below and glandular-pubescent above: lvs. broadly ovate, to 3 in. long, acute, base heart-shaped, crenately toothed and sometimes lobed: fls. red, fragrant, petals pinnately cut. Wash. to S. Ore.

parvifldra: Lithofragma parviflora.

TELÒPEA. Proteacex. Shrubs in Australia with alternate leathery lvs., red fls. in dense terminal head-like racemes surrounded by an involucre of colored bracts, and fr. a leathery follicle; intro in Calif.

speciosissima. Waratah. To 8 ft.: lvs. oblong, to 10 in. long, toothed in upper part fls. 1 in. long, in globular heads to 3 in. across, bracts to 3 in. long.

truncâta. To 8 ft., branchlets reddish-pubescent or villous: lvs. obovate, oblong-cuncate to linear, to 4 in. long, glabrous, margins mostly entire and often recurved: fls. in short dense racemes to 2½ in. diam.: follicles about 2 in. long. Tayannia long. Tasmania.

TEMPLETÒNIA. Leguminosæ. Shrubs with simple lvs., papilionaceous fls. solitary or few in the axils, and flattened pods; Australian; grown under glass or out-of-doors in the S. Propagated by cuttings.

retûsa. Coral-Bush. Lvs. leathery, 1 in. or less long, notched or mucronate at tip: fis. red, to $1\frac{1}{2}$ in. long: pod to 2 in. long.

TENDERGREEN: Brassica perviridis.

TENDRIL: a rotating or twisting thread-like process or extension by which a plant grasps an object and clings to it for support; morphologically it may be stem or leaf or extension of inflorescence.

TEOSINTE: Euchlana.
TEPHROCACTUS: Opuntia.

TEPHRÒSIA (*Cracca*). Leguminosæ. Herbs or shrubs with pinnate lvs., red, purple or white papilionaceous fls. in racemes, and flat pods; the first species grown as a low windbreak in tropics.

cándida. Shrub to 10 ft.: lfts. 2 in. long, silky-pubescent beneath: fls. white, 1 in. long: pods to 4 in. long. India; nat. in W. Indies.

grandiflöra. Shrub to 2 ft.: lfts. cuneate-oblong, usually 10-14: fts. red, in fascicled corymbs. S. Afr.

piscatòria: T. purpurea.

purpurea (T. piscatoria). Per. to 2 ft.: lfts. oblanceolate, to 1 in. long, usually 13-17: fts. reddish-purple, usually 6-20 in terminal and lateral racemes: pods narrow, to 2 in. long. Trop. Afr.

virginiana. Per. to 2 ft.: lfts. to 1 in. long, silky-pubescent. fis. yellowish-purple, to ¾ in. long: pods to 2 in. long. Me. to Fla. and N. Mex.

TERETE: circular in transverse section; imperfectly cylindrical because the object may taper both ways.

TERMINALIA. Combretaceæ. Large trees, mostly in trop. Asia, with simple lvs. usually crowded toward ends of branchlets, small bisexual or polygamo-diccious fls. in spikes or racemes, and fr. an angled or winged 1-seeded drupe or drupe-like; planted for ornament in trop. climates and edible fr.; bark sometimes yields dyes and tannin. Propagated by seed.

Arjuna. To 80 ft.: lvs. oblong, to 6 in. long: fls. green or white, in short spikes or panicles: fr. dark brown, 5-winged, to 2 in. long. India.—Planted in S. Fla. for interest.

austràlis. Small glabrous tree to 10 ft.: lvs. lance-ovate to ovate, to 2 in. or more long, entire, pointed, petioles very short. fls. few and small, in peduncled axillary slender spikes that about equal the lvs., greenish. S. Brazil.—Probably planted in our territory.

Catáppa. Tropical- or Indian-Almond. Myrobalan. To 80 ft., deciduous, with houzontal branches: lys. obovate, to 1 ft. long, becoming nich red before they fall twice a year: fls. greenish-white, the spikes to 6 in. long: fr. greenish or reddish, flattened, the 2 angles winged, to 2 in. long, with edible oil-bearing seed. Malaya.—Widely planted in trop. countries, and in S. Fla. as a street tree.

Mûelleri. Small tree: lvs. rather narrowly obovate, to 4 in. long, obtuse or abruptly pointed, leathery, sparsely short-hairy underneath: fls. small, in axillary spikes: fr. to 34 in. long, bluish. Queensland; planted in S. Fla.

myriocarpa. To 100 ft., the young parts rusty-tomentose: lvs. oblong, tapering-acute, to 8 in. long, short-stalked, the many parallel veins at first rusty, margins serrate: fis. pink to white, changeable, in panieles: fr. about ½ in. long, with broader wings, yellow. India, Burma.

Saffordii. Tree: lvs. very broadly obovate and thick, to 5 in. long and nearly as broad, obtuse to emarginate, nearly glabrous underneath, glossy above: fls. in simple racemes: fr. oblong, about ¾ in. long. Guam; planted in S. Fla.

tomentòsa. To 100 ft.: lvs. nearly opposite, elliptic, to 8 in. long, variable, mostly thin-tomentose underneath: fis. in spikes: fr. to 2 in. long, with 5 broad wings. India.

TERNATE: in threes:

TERNSTRŒMIA. Theaceæ. Warm-temp. and trop. evergreen trees and shrubs of Asia, Indian Archipelago and Amer., with alternate simple lvs., solitary or clustered fls. and indehiscent berry-like frs.; grown under glass or in S. U. S.

gymnanthèra: listed name.

indica: listed name.

japónica. Tree to 20 ft.: lvs. oblong, to 3 in. long, entire: fis. pale yellow, ¾ in. across: fr. to ¾ in. Japan to India.

TERNSTRŒMIACEÆ: Theaceæ.

TERRARIUM. A small unheated greenhouse in which plants are kept or grown in the living room, laboratory or school. Ordinarily it is made four-sided with panes of glass about 8×10 inches fastened together at the corners with strong adhesive tape, a similar pane for cover, and the box set on a board or in a flat oven pan. The bottom is covered about an inch deep with coarse gravel, over which is placed an inch or two of soil; or sods from the woods containing the desired plants may be cut to size and placed in the bottom but with care for drainage. Many kinds of plants can be grown in a terrarium, the box being kept closed to control moisture. It may be set in or near a window but not directly exposed to hot sun. The box will need little watering. A terrarium is essentially a small Wardian case for more or less temporary use.

TESSARANTHIUM: Frasera speciosa.

TESTUDINÀRIA. Dioscoreaceæ. Twining vines with tuberous rootstocks above ground and herbaceous sts., alternate lvs., small diœcious fls. borne in axillary racemes, and capsular frs.; grown as a curiosity in cool greenhouse.

elephántipes. HOTTENTOTS-BREAD. ELEPHANTS-FOOT. Sts. to 10 ft.: root to 3 ft. diam., half above ground, eaten by natives when cooked: lvs. orbicular: fls. greenish-yellow or whitish. S. Afr.

TETRACÉNTON. Magnoliaceæ. One deciduous Chinese tree, hardy N. T. sinénse. To 100 ft.: lvs. alternate, ovate, to 5 in. long, toothed: fls. very small, yellowish, in drooping racemes to 6 in. long: fr. brown, ½ in. long.

TETRACLINIS. Cupressaceæ. Evergreen tree to 20 ft. tall, native in N. Afr. T. articulata (Callitris quadrivalvis). Arar-Tree. Lvs. scalelike, minute: cones 4-sided, ½ in. across, of 4 scales.—Adapted only to the warmer parts of the country; by some authorities it is retained in the genus Callitris. For cult. see Conifers.

TETRAGONIA. Aizoaceæ. Herbs or subshrubs, one grown as a pot-herb, having alternate lvs. and small fls. without petals solitary or few in the axils. For cult. see Spinach.

crystállina. Glaucous herb: lvs. ovate, sessile: fr. without horns and with 4 seeds. Peru.

expánsa. New Zealand Spinach. Prostrate somewhat succulent ann.: lvs. ovate or triangular-ovate, to 5 in. long, petioled: fis. yellowish-green: fr. with 4 horns and 6-8 seeds. Japan, Australia, New Zeal., S. Amer.

TETRAGONOLOBUS: Lotus.

TETRAMICRA: Leptotes bicolor.

TETRANEMA: Allophyton mexicanum;

TETRANEURIS: Actinea.

TETRÁPANAX. Araliaceæ. Shrub or small tree native in Formosa, grown out-of-doors in warm regions, and in the Orient used for the making of rice-paper. T. papyríferum (Aralia papyrifera. Fatsia papyrifera). Lvs. ovate, to 1 ft. across, with 5-7 toothed lobes to about middle, heart-shaped at base, densely white-tomentose beneath: fls. in round umbels forming a panicle, tomentose. For propagation see Fatsia.

TETRAPATHÆA. Passifloraceæ. Woody climber native in New Zeal. T. tetrándra (Passiflora tetrandra). Lvs. alternate, oblong- or ovatelanceolate, entire, shining: fls. unisexual, greenish with a crown of yellowish filaments, in axillary cymes or solitary: fr. orange, to 1½ in across.

TETRASTIGMA. Vilaceæ. Climbing shrubs from warm parts of Asia, with alternate palmately compound lvs., diocious fls. in axillary cymes or umbels, and fr. a 2-4-seeded berry. The following is grown in S. Fla., making a dense attractive canopy or cover.

Hármandii. Ayo. High climbing by twining tendrils: lfts. 3-5 or sometimes 7, narrow-lanceolate, to 3 in. long, toothed: fis. in short-stalked cymes: fr. edible. Philippines.

TETRATHÈCA. Tremandraceæ. Heath-like shrubs of Australia, with fls. solitary in the axils and capsular frs.; sepals and petals 4; grown under glass or in the open in warm regions. A soil of fibrous peat and silver sand is desirable.

ericifòlia. To 1 ft.: lvs. mostly whorled, linear: fls. pink, to 1/4 in. long. New S. Wales.

TEÙCRIUM. GERMANDER. Labiatæ. Various herbs, subshrubs or shrubs, some kinds grown in the greenhouse or in the open in the extreme S., others adapted to the rock-or wild-garden in the N.: fls. rather showy, solitary in leafy axils or in 2-many-fld. whorls in raceme-like spikes or heads. Grown from seed and by division of the plants or the slender rhizomes.

argenteum: hort. name for T. fruticans.

Arduinii. Per. with erect or ascending sts.: lvs. ovate, coarsely toothed, gray-pubescent beneath, rounded at base: fls. whitish, in dense ovate or oblong racemes, stamens long-exserted, calvx bilabiate. S. E. Eu.

aureum. Per. to 1 ft., yellow- or gray-woolly: lvs. ovaloblong, wavy-toothed: fis. yellowish or whitish, in ovoid or globose heads. S. Eu.

campanulatum. Per., sts. prostrate or slightly ascending, glabrous: lvs. ovate to rhomboid, incised-toothed to pinnatifid, segms. entire: fls. blue, calyx much shorter than corolla. S. Eu.

canadénse. American G. Per. to 3 ft.: lvs. ovate-lanceolate to lanceolate, to 5 in. long, sharply serrulate to serrate, pubescent beneath: fls. purple to cream-color, ¾ in. long, in dense spikes 6 in. or more long. N. Amer.

Chamèdrys (T. pseudo-Chamedrys). Procumbent shrub, the sts. ascending to 1 ft.: lvs. ovate, ¾ in. long, toothed, pubescent: fls. red-purple or bright rose with red and white spots, ¾ in. long, in few-fld. whorls in loose spikes. Eu. Var. prostratum is listed as dwarfer than type.—Sometimes appearing moorrectly in the trade as T. canadense.

flavum. Per. to 2 ft., woody at base: lvs. ovate, thick, pubescent, crenate-toothed, pale beneath: fls. yellow, in long interrupted leafy spikes. Medit. region.

fruticans. Shrub to 4 ft., white- or yellowish-woolly: lvs. ovate, to 1½ in. long, entire and revolute: fls. blue. ¾ in. long, solitary, long-pedicelled, in terminal racemes. Eu.

hircánicum. Per. to 2 ft., erect, pubcscent: lvs. ovatecordate, to 3 in. long, obtuse, margins crenate. fls. purple or led, in dense spikes 3-8 in. long, corolla villous outside, calyx bilabiate. Caucasus, Persia.

incanum. Subshrub to 2 ft., gray-tomentose, sts. slender, erect or ascending. Ivs. obovate-oblong, to ½ in. long, somewhat thickened, apex rounded, base wedge-shaped, distal margin crenate. fis. dull white, to ¾ in. long, corolla nearly twice as long as pilose and somewhat inflated calyx. Afghanistan.

Mārum. Small much branched shrub, white-tomentose: lvs. ovate, 1/5 in. long, entire, margins revolute: fls. purplish, 1/5 in. long, in racemes to 2 in. long. Medit. region. Var. roseum has paler fls.

massiliénse. Per. to 1 ft., gray-pubescent: lvs. ovate, about ½ in. long, wavy-toothed: fis. rose, in terminal and axillary leafy spikes, calyx bilabiate. S. Eu.

montanum. Prostrate subshrub, the sts. ascending to 1 ft.: lvs. oblong to linear-lanceolate, to ¾ in. long, entire and revolute, tomentose beneath: fls. white becoming yellow, ¼ in. long, in hemispherical terminal heads. S. Eu., Orient.

orientale. Per. to 1 ft., sts. erect, softly hispidulous: lvs. to 2 in. long, pinnately divided into linear entire or cut segms.: fls. violet or blue. W. Asia.

pseudo-Chamædrys: T. Chamædrys.

pyrendicum. Per. to 10 in., hairy: lvs. suborbicular, coarsely toothed, ½ in. across: fis. yellow, in small terminal heads. Mts., Spain. Var. filifórmis is listed.

Scorodònia. Per. to 2 ft., stoloniferous, pubescent: lvs. ovate, to $2\frac{1}{2}$ in. long, toothed, cordate or truncate at base:

fls. yellow, 1/2 in. long, in racemes to 5 in. long, calyx bilabiate. Eu.: escaped in E. N. Amer.

THÀLIA. Marantaceæ. Tall aquatic or marsh herbs with basal long-petioled lvs. and fls. borne in bracts on spikes or panicles.

Plants should be grown in wet soil or shallow water. Propagated by division of the root.

dealbata. Plant covered with white powder, scape to 10 ft. or more: lvs. to 20 in. long and 10 in. wide: fls. dull violet, small. S. C. to Fla. and Tex.—Sometimes grown about ponds.

divaricata. Scape to 10 ft.: lvs. to 2 ft. long and 8 in. wide. fls. violet. Fla.

THALICTRUM. MEADOW-RUE. Ranunculaceæ. Per. herbs, with ternately compound or decompound lvs. and small unisexual or bisexual fls. borne in panicles or racemes, without petals and with numerous stamens; native mostly in the north temp. zone.

Thalictrums are of easy culture in well-drained loamy soil. Propagated by division of roots in early spring, and also by seeds. In most species the flowers are not striking except for the hanging stamens, but the large open panieles make an attactive mass effect. In some species, as T. dipterocarpum, the sepals are large and showy, and in others, as T. aquilegifolium, the stamens are enlarged: many of them display good violet and purple shades. The native American species are excellent in the wild-garden; the big ones frequent low ground.

adiantifolium: this name many apply either to T. minus or T. manus.

akanense. To 2½ ft., glabrous: lvs. long-petioled, biternate, segms. all petiolate, suborbicular to obovate, 3-lobed: fls. in terminal panicles, styles distinctly hooked. Japan.

alpinum. To 1 ft., sts. simple and scape-like: lvs. basal, biternate, segms. obovate or orbicular, 3-5-lobed at tips, margins revolute: fls. perfect, with vellow stamens about length of greenish sepals: fr. sessile. Arctic Amer., Eu., Asia.

anemonoides: Anemonella thalictroides.

angustifòlium: T. lucidum.

aquilegifòlium. To 3 ft., mostly diccious: lvs. decompound, segms. orbicular or oblong with few broad teeth at apex: stammate fts. with erect purple or pink stamens much longer than white sepals: fr. 3-winged, stalked and hanging. Eu., Asia. Color forms are álbum, atropurpureum, aurantiacum, ròseum.

baicalense. To 1½ ft.: lvs. decompound, segms. nearly orbicular, toothed at apex: fls. few, erect, with long stamens: fr. striate, flattened, very short-stalked. Siberia.

Chélidonii. Dwarf, much branched: segms. orbicular, more or less cordate, glaucous underneath: fls. large and showy, llac or purple. Himalayas; not hardy N.

clavatum. To 2 ft., glabrous, branched: lvs. all biternate, segms. ovate to obovate, 3-5-lobed: fls. perfect, with petal-like filaments: fr stalked. Va. to Ga. and Ala.

Cornùtii: T. polygamum.

corynéllum: T. polygamum.

dasycárpum. To 7 ft., diœcious or polygamous: lvs. decompound, segms. oblong or obovate, 3-lobed at tips: fls. with stamens longer than purplish sepals: fr. 3-8-winged, short-stalked. N. J. to Sask. and Arız.

Delavayi. To 3 ft., diæcious: Ivs. decompound, segms. 3-5-lobed, long-stalked: stammate fis. with purple or lilac sepals about length of stamens: fr. 3-winged, stalked. E. China.

diolcum. To 2 ft., dioccious: lvs. decompound, segms. orbicular, 5-9-lobed: stammate fls. with stamens much longer than greenish sepals: fr. strongly ribbed, sessile. Me. to Mo.

dipterocarpum. To 2 ft. or more: lvs. decompound, segms. nearly orbicular, notched toward top, glaucous beneath: panncles narrow-pyramidal; fls. nodding, polygamous, with rose or lilac sepals about length of stamens: fr. 2-winged, unequal-saded, short-stalked. W. China. Vars. album, magnificum and minus are listed.

élegans. Per. to 1 ft.: lvs. 2-3 in. long, glaucous beneath, decompound, lfts. suborbicular, 3-fid, segms. obovate: fls. greenish-purple, very small, in sparsely branched panicles: achenes long-stalked. Subalpine llimalayas.

Féndleri. To 3 ft., diœcious: Ivs. decompound, segms. roundish, toothed or lobed: stammate fis. with wnitish sepals shorter than the stamens: fr. 3-nbbed, obliquely obovate, sessile. Colo. to Calif.

flavum. To 4 ft.: lvs. decompound, segms. obovate

and 3-lobed: fls. bisexual, the pale yellow sepals shorter than the bright yellow stamens: fr. 8-ribbed, sessile. Eu.

flexudsum: T. minus.

fétidum. To 3 ft. glandular-pubescent, strong-smelling: lvs. decompound, segms. roundish, small, notched at apex: fls. nodding, greenish-red, the sepals shorter than yellow stamens: fr. many-ribbed, sessile. Mts of Eu.

folidsum: listed name.

glacum. To 4 ft, glaucous: lvs. decompound, segms. ovate, 3-lobed and toothed; fls bisexual, in dense clusters in the panicle, yellow, the sepals shorter than stamens; fr striate, sessile S Eu.

intermedium: hort name for a form with pale vellow fls. iapónicum: Contis brachupetala.

keménse: T. minus.

kiusiànum. To 3 in , stoloniferous: lvs. 1-2-ternate into broad-ovate toothed lits purplish above: sepals purple, shorter than stamens: fr. ribbed, stalked. Japan.

lûcidum (T angustifolium). To 4 ft.: lvs. decompound into linear or lanceolate shining segms, entire or 2-3-lobed at apex: fls. fragrant, the yellowish-white sepals shorter than stamens, in upright panicles: fr. striate, sessile. Eu.

majus. Very similar to T. minus but much larger, to 4 ft., with sts. leafy to base, and branches of paniele spreading or drooping. Eu., Asia.

minus (T. flexuosum, T. kemense, T. saxatıle, T. ruthenicum, T. purpureum, T. persicum). To 1½ ft: lvs. decompound, segnis, roundish, small, 3-lobed; fls. bisexual, greenish-yellow; fr. 8-ribbed, spindle-shaped, sessile. Eu, N. Afr., Asia.

occidentale. To 3½ ft., dicecious: lvs. 3-4 times ternate into orbicular 3-lobed toothed very thin segms.: fr flattened, 2-edged, sessile—B. C to Calif. and Utah.

orientâle. To 6 in : lvs. triternate, ovate, 3-lobed, pale beneath: ils perfect, white, to 34 in across, few in panicles: fr. linear-oblong, to 14 in long, sessile. Greece, Asia Minor.

paniculatum; a hort, name of uncertain application,

pérsicum: T. minus.

petaloideum. To 1½ ft:lvs. decompound, segms. ovate, entire or 3-lobed: fls bisexual, in corymbs, with white sepals, pink filaments and yellow anthers: fr. striate, sessile. N. Asia.

polycárpum. To 3 ft. and more, dicceious: lvs. decompound, segms ovate, toothed or lobed: fls whitish or greenish, with long stamens: fr in dense heads, slightly inflated, short-stalked. Calif. to Ore.

polygamum (T. Cornutu: T corynellum). To 8 ft. and more: Ivs decompound, segms, oblong to orbicular, 3-lobed; ffs polygamous, the white sepals about length of stamens; fr. with 6-8 wings or ribs, short-stalked. E. N. Amer.

purpuráscens: the plant grown under this name is $T.\ dasycar pum.$

purpureum: T. minus.

Rochebrunianum. Glaucescent per.: lvs bipinnate to ternate, lits, entire or terminal one sometimes 3-lobed, ovate, obtuse, petiolules filiform: fls. in panieles. Japan.

rugdsum: a confused name.

ruthénicum: T. minus. saxátile: T. minus.

simplex. Glabrous, strict, 2-3½ ft., sts. angled: upper lvs. with very long narrow divisions: infl. very narrow, little branched; fls. small: fr. striate, sessile. Eu., Asia.

squarròsum. Lvs. decompound, the lits. ovate, 3-parted or entire: fls. white or yellow, drooping. Siberia.

sulphureum: listed name.

tsukushinense: listed name of plant said to come from Japan, growing to 4 in. high with rose-colored fls.

venulòsum. To 11g ft., diœcious: lvs 3-4 times ternate into 3-5-lobed toothed strongly veined segms., bluishgreen: fls. small, in narrow dense panicles: fr. thick-walled, nearly sessile. Man. to Utah.

THAMNOCÁLAMUS. Gramineæ. Bamboos often considered a section of Arundinaria, differing in the lvs. not conspicuously tessellate and in technical floral characters; native in the mts. of Asia. See Bamboo.

aristatus (Arundmaria aristata). To 12 ft., with yellow sts.; lvs to 4 m. long and $^{1}2$ m. wide, glabrous, rugose, rough on edges, the sheaths with a staff point. Himalayas.

Fálconeri (Arundinaria Falconeri, A. nobilis). To 60 ft.: lvs. to 4 in long and 12 in. wide, glabrous, finely toothed, the sheaths truncate at tip. Himalayas.

Hindsii: Plevoblastus Hindsii.

THAMNOSÒMA. Rutacex. Low much branched strong-scented shrubs from W. Amer., having small simple early-deciduous alternaté lys. and fls. in racemose cymes, with 4-lobed persistent calyx, 8 stamens and 2-celled ovary: fr. a leathery 2-lobed caps.

montana. Turpentine Broom. To 2 ft, sts. yellowishgreen, glandular, broom-like: Ivs. narrowly oblanceolate-linear, obtuse, to $\frac{5}{2}$ in. long: fis. purplish, petals $\frac{1}{2}$ in. long. Dry slopes and deserts, Colo., Utah, New Mex. to Calif.

THÈA. Theaceæ (Ternstroemiaceæ). Asian evergreen shrubs and trees with alternate simple which are usually solitary, and capsular fr.; distinguished from Camellia (with which the genus is sometimes united) chiefly by the pedicelled nodding fls. and persistent sepals. From the lys. of T. sinensis is made the tea of commerce; also grown for ornament. For cult. see Camellia.

assámica: T. sinensis var.

Bohèa: T. sinensis var.

cuspidata (Camellia cuspidata). Shrub to 6 ft.: lvs. to 3 in. long: fls. white, 1 1/21n. across. China.

japónica: Camellia japonica.

oledsa. referred by most authors to T. sinensis, of which it is probably a form.

Sasángua: Camellia Sasangua.

Sasanqua: Camella Sasanqua.
sinénsis (Camella Thea) Tea. Shrub or tree to 30 ft.:
lvs to 5 in long: fls white, fragrant, to 1½ in. across.
China, India; can be grown in southern states Var.
assámica (T. assamica) has fls. 1-4 together; in var. Bohèa
(T. Bohèa) the lvs. are dark green and fls usually solitary;
var cantoniénsis has solitary terminal fls.; the lvs. of var.
víridis (T. viridis) are light green and fls. 1-4 together.

víridis: T. sinensıs var.

THEÀCEÆ or TERNSTRŒMIÀCEÆ. TEA Family. About 16 genera of trees and shrubs, sometimes evergreen, native in warm regions, with commonly alternate simple lys., regular bisexual fls. having mostly 5 sepals and petals, numerous stamens, superior 2-10-celled ovary, and fr. a caps. or drupe. The family furnishes the tea-leaf of commerce and the following genera of ornamentals: Camellia, Eurya, Gordonia, Schima, Stewartia, Ternstrœmia, Thea.

THELESPÉRMA. Compositæ. Herbs or subshrubs, ann. or per., of about 10 species in W. N. Amer. and S. S. Amer., one of them grown in the flower-garden; differs from Coreopsis in technical characters, as the inner involucral bracts united to the middle or above.

ambiguum. Per. to 1½ ft.: heads with broad yellow rays ½ in. long and purple disk turning brown. Colo.

Burridgeanum (T. hybridum. Cosmdum Burridgeanum).

Ann. to 1½ ft., branching: Ivs. divided into thread-like lobes: heads long-peduncled, to 1½ in. across, the rays red-brown or deep orange with yellow margin. Tex—Formerly erroneously considered to be a hybrid between a Thelesperma and Corcopsis. Of easy cult. as a garden ann. in an open exposure, as for Coreopsis.

hýbridum: T. Burridgeanum.

THELOCÁCTUS. Cactaceæ. Mexican or Texan globular or somewhat depressed spiny cacti of medium size, of which all the older species have been named in Echinocactus: ribs low or often indefinite (or apparently absent) and few in number and divided into large prominent tubercles: fls. from near center of plant, bell-shaped, diurnal. See Cacti.

bicolor (Echinocacius bicolor). Simple, globose to conic, to 4 in. diam., glaucous, very spiny; ribs commonly 8; spines colored, the radials 9-18 and centrals mostly 4: fis. purplish-pink, 2 in or more long. S. Tex., Mex. Var. bolánsis (T. bolansis) has stouter white spines. Var. trícolor usually has red and white to all red spines which are closer together than in type.

bolánsis: T. bicolor var.

Buèkii. Differs from *T. tulensis* in its smaller habit, its more angular tubercles and its reddish somewhat arching and spreading spines Mex.

conothèlos (Echinocactus conothelos). Solitary, ovoid to subcylindric, to 4 in. high and 3 in. diam.; ribs slightly spiralled, notched toward base; radials 14 to 16, to ½ in. long, white; centrals 2-4, often to 1 in. long or more. Mex.

Éhrenbergii (Echinocactus Ehrenbergii). Globose to short-cylindric, to 6 in. high and 3 in. diam, gray-green; ribs 8-13, spiralled, tubercles ½ in. high; radial spines usually 6, to ¾ in. long; central 1, stouter: fis. rose, to 1¾ in. long. Mex.

fossulatus. Solitary, usually depressed-globose, to 6 in. diam.; ribs about 13, somewhat glaucous, tubercles very conspicuous, soft, compact; radials 4-5, to 1½ in. long, unequal, brown; central 1, to 1¾ in. long, stout, ringed: fls. white or tinged pink. Mex.

Gielsdorfianus (Echinocactus Gielsdorfianus). Solitary or occasionally cespitose, globose to subcylindric, blue-green to gray-green, to 3½ in diam; ribs about ½ in high; spines all radial, usually 6-7, to ¾ in. long, dark at tip; fis. creamwhite, to 1 in long. Mex

hástifer. Solitary, cylindrical to club-shaped, to 6 in. tall and 2½ in diam; ribs 18-20, tubercled, to ⅓ in. high; radials 20-25, to ⅓ in. long, recurved, white; centrals usually 4, lower ones to 1¼ in. long, curved: fls. violet-pink within, to 2¾ in. long. Mex.

heterochromus: T. Pottsii.

hexædróphorus (Echinocactus hexædrophorus). Globose or somewhat flattened or hollowed on top, glaucous, not ribbed but strongly tubercled; radials 6-9; central 1 and stouter; fls. purplish, about 2 in. long. Cent. Mex.

Knuthianus (Echinocactus Knuthianus). Solitary or cespitose, globose, to 2½ in. dam.; ribs 13-21, tubercled; radials 18-20, about ½ in long, white; central 1, stouter than radials; fls. pale pink, to 1 in. long. Mex.

leucacánthus (Echinocactus leucacanthus). Densely cespitose, individuals short-cylindric to 6 in. long; ribs 8–13; radials 7–20 and at first yellow; central 1, to 2 in. long; fis. yellow, tinged rose-pink, 2 in. long. Mex.

longispinus: hort. name.

lophothèle (Echnocactus lophothèle). Cespitose in the wild, individuals globose, depressed or short-cylindric to 10 in. high, glaucous; ribs indefinite, tubercles flattened; radials 3-5, central 1 or none: fls salmon or yellow, about 2 in across. Mex

Mandrágora (*Echinocactus Mandragora*). Root fusiform, st. globose, to $2\frac{1}{2}$ in. diam., completely covered with spines; tubercles compact, 4-sided; radials 12, awl-shaped, incurved, white; centrals usually 2, to $3\frac{1}{4}$ in long, erect, white; fis. white within, striped rose-pink, to 1 in. across. Mex.

megalothèlos: Gymnocalycium megalothelos.

nidulans (Echnocactus nidulans). Depressed-globose, to 4 in high and 8 in diam, usually glaucous; ribs 20-25; spines about 15 and to 2½ in. long: fis. yellowish-white, 1½ in long. Mex.

pectinatus: probably Echinocereus pectinatus.

phymatothèle (*Echinocactus phymatothele*). Depressed-globose, to 2 in. tall and 4 in. dnam., woolly on top; ribs 13, about ½ in high, tubercled, spiralled; spines similar, usually 3-4, to ½ in long, ascending, often deciduous: fls. pink, segms. margined yellow, to 2 in. long. Mex.

porrectus (Echinocactus porrectus). By some considered a variety of T. leucacanthus, from which it differs in its shorter radial spines, in having 4 centrals and fis. clear yellow. Mex.

Póttsii (Echinocactus Pottsii and heterochromus). Globular or depressed, to 6 in. diam., yellowish; ribs 8 or 9; radials 7-10; centrals several: fls. light purple, about 2 in. long. Mex.

rinconénsis (Echinocactus rinconensis). Globose, to 3 in. high and 5 in diam.; ribs strongly tubercled; spines 3 and ½ in. long: fls. white, 1½ in. long. Mex.

Roseânus (Echinocactus Roseanus). Solitary or cespitose, ovoid, to 2 in. tall and 1½ in. diam.; ribs 8-13, tubercles low and broad; radials about 15, to ½ in. long, needle-like, yellowish; centrals 4-6, to ¾ in. long, stouter: fls. pale pink. Mex.

Sauèri (Echinocactus Saueri). Solitary, depressed-globose, to 1½ in. high and about 2 in. diam., white-woolly on top; ribs 13, tubercles 6-sided; radials 14-18, mostly ½ in. long with 3-4 to ½ in. long, white; centrals 1-2, blackish tipped: fls. white with rose-pink throat, to 1 in long. Mex.

Saussièri (Echinocactus Saussieri). Depressed-globose, to 8 in. across; ribs strongly tubercled; radial spines 9 and grayish-white; central spines 4 and to 1½ in. long: fls. purplish, 1½ in. across. Mex.

tulénsis (Echinocactus tulensis). Often cespitose, globu-

lar or short-cylindric, to 10 in. high; ribs 8-13 and strongly tubercled; radial spines 6-8 and ½ in. long; central 1-2; fls. rose. 1 in. long. Mex.

Valdeziānus (Echrnocactus Valdezianus. Pelcyphora Valdezianus). Usually solitary, plobose to subcylindrical, to 1 in. diam.; tubercles angular, blue-green, glossy; spines all radial, 25-35, very short and bristly-pectinate: fls. violet-pink, to 34 in. long. Mex.

Wagnerianus (Echinocaetus Wagnerianus) Solitary or cespitose, sts. usually cylindrical, to 8 in. tall and 2½ in. diam; ribs 13, tubercled; radials about 20, usually pectinate, reddish-yellow; centrals 1-4, to ¾ in. long, base bulbous.

THELYPÒDIUM. Cruciferæ. Ann., bien. and per. erect herbs of N. Amer., glabrous or nearly so, one sometimes transferred to grounds: lvs. simple, entire or toothed, sometimes pinnatifid: fls. white or purplish, in racemes: fr. a linear pod or silique.

Wrightii (Stanleyella Wrightu). Slender branched ann. or bien. to 214 ft: lvs. lanceolate to linear, toothed to pinnatifid, the upper ones sometimes entire: fls. white. Colo. and Utah south.

THELYPTERIS: Dryopteris.

THENÁRDIA. Apocynaccæ. Mexican woody climbers with opposite stalked lvs. and umbellike clusters of pedicellate fls. that bear a wide open or nearly rotate corolla with twisted lobes and exserted stamens: fr. a pair of long follicles. T. floribúnda is grown in Calif. for its fragrance; it is a slender-branched strong vine: fls. whitish tinged purple, about 1 in. long.

THEOBRÒMA. Sterculiaceæ. Trop. American trees with alternate simple entire lvs., small fls. in axillary clusters or borne on the branches and trunk, and large woody frs. from the seeds of which are obtained commercial cocoa and chocolate.

Cacao requires tropical temperatures and trees are planted in groves 10-15 feet apart each way. Propagated by seeds, the seedlings set permanently when 1-2 feet high. Trees will bear in about four years.

Cacao. Cacao. To 25 ft, evergreen: lvs leathery, to 1 ft. long; fls yellowish: fr. red to brown, ribbed, to 1 ft. long, the seeds to 1 in. across. Cent. and S. Amer.

THEOPHRASTÀCEÆ. THEOPHRASTA FAM-ILY. Five trop. genera of evergreen trees or shrubs: lvs. simple: fls. bisexual or unisexual, gamopetalous, with 5-lobed calyx and corolla, 5 or rarely 4 stamens, 5 staminodia, and superior 1-celled ovary: fr. indehiseent, leathery or fleshy. Clavija may be planted in S. U. S.

THERMÓPSIS. Leguminosæ. Per. herbs with lvs. of 3 digitate lfts., leaf-like stipules, papilionaceous fls. in racemes, and flattened or inflated pods; native in N. Amer. and N. and E. Asia.

They are suited to deep well-drained soil; planted for ornament. Propagated by seeds sown in fall or spring over heat; also by division.

caroliniàna. To 5 ft.: fls. yellow, in erect terminal racemes: pods flat, 2 in. long, tomentose. N. C. to Ga.

fabacea. To 3 ft.: fls. yellow, in erect axillary racemes: pods flat, to 3 in. and more long Siberia

fraxinifòlia. To 3 ft.: fls. yellow, in loose racemes: pods linear, to 4 in. long, glabrous. N. C. to Ga.

lanceolata. To 1 ft.: lfts. ovate-lanceolate, to 1½ in. long, base narrowly cuneate: fls yellow, in compact racemes: pods to 2 m. long, strongly recurved. Siberia and Alaska.

macrophýlla. To 2 ft.: lfts. obovate, to 4 in. long, silky becoming glabrate: fls. yellow, in dense racemes to 6 in. long: pods straight, silky. Calif.

móllis. To 2 ft. fla.

móllis. To 3 ft.: fls. yellow, the racenies mostly terminal: pods flat, slightly curved, to 4 in. long, glabrous. S. Va. to Ga. montâna. To 2 ft.: fls. yellow, in terminal racemes: pods lineur, 2 in. or more long, pubescent. Mont. to Wash.

pinetorum. To 11/2 ft.: Ifts. oblong to ovate, to 11/4 in.

long, glabrous: fls. yellow, few in short racemes to 2 in long pods linear, straight, sparingly pubescent. Utah, Colo., N. Mex.

rhombifòlia. To 1 ft: lfts ovate-rhombic, to 1 in. long, base broadly cuneate: fls. yellow, in terminal or axillary racemes: pods to 2½ in. long, recurved, pubescent. Sask. to Colo.

THEROFON: Boykinia.

THERORHODION: Rhododendron camtschaticum.

THESPÈSIA. Malvacex. Trees and shrubs or tall herbs in trop. Afr., Asia and Pacific Isls., with alternate mostly entire or angle-lobed lvs. and large showy yellow or red fls. with 3–5 small or deciduous bractlets; fr. a woody mostly indehiscent caps.; one is planted for ornament in the tropics and S. Fla. The wood is also used for making furniture. Propagated by seeds.

grandiflora: Montezuma speciosissima.

popúlnea. Portia-Tree. To 60 ft., more or less finely scaly: Ivs. cordate-ovate and acuminate, somewhat poplar-like, to 5 in. long: fls. yellow changing to purple, to 3 in. across. Tropies of Old World.

THEVÈTIA. Apocynaceæ. Shrubs and trees in trop. Amer., with alternate lvs., large funnelform fls. in terminal cymes, and fr. a fleshy drupe.

One is grown under glass, and out-of-doors in the South. It thrives in rich sandy soil and can stand a few degrees of frost if banked with dry sand. Propagated by cuttings.

nereifòlia (Cerbera Thevetra). YELLOW OLEANDER. To 30 ft, evergreen: Ivs. to 6 in. long and ½ in. wide: fls. yellow, fragrant, 2-3 in. long: fr. black, 1 in. across, hard and angled.

THIMBLEBERRY: Rubus occidentalis.

THISTLE, BLESSED: Cnicus, Silybum Marianum. Bull: Cvssum lanceolatum. Fishbone: Cvssum Diacantha. Globe: Echinops. Golden: Scolymus hispanicus. Holy: Silybum Marianum. Plumed: Cvrsum. Plumeless: Cardaus Russian: Salsola pestifer. St. Marys: Silybum Marianum. Scotch: Onopordum Acanthum. Swamp: Cvssum muticum.

THLADIÁNTHA. Cucurbitaceæ. Per. tuberous-rooted tendril-climbing diœcious herbs of Cent. and E. Asia and Philippines, distinguished from related genera by seeds horizontal in the fr. rather than pendulous: fls. yellow, bell-shaped; staminates mostly clustered, pistillates often solitary: fr. and seeds small.

dùbia. Tall climber, pubescent: lvs. cordate-ovate, not lobed, toothed: fls. 1 in. or less across: fr. oblong, 10-ribbed, mostly less than 1 in. long. N. China; little planted in our territory, but tending to be spontaneous in some parts.

THLÁSPI. PENNY-CRESS. Cruciferæ. Ann. and per. herbs of temp. and cold regions, for the most part glabrous and glaucous, erect: lvs. oblong to broad-ovate, entire or toothed, basal ones forming rosette, on st. auriculate: fls. white, rose or purplish, in racemes: fr. mostly a flat short winged silicle or pod.

A few species are grown in the rock-garden and others for the large flat ornamental pods often useful in dry bouquets. The cultivation is simple from seed, and some of the perennials by division.

alpéstre. Glabrous per. to 12 in. in fr., in tufts: basal lvs. obovate and stalked: fls. white, mostly reddish tinged, in rather open infl High mts, Eu.—The Rocky Mt. plant formerly referred here is T. coloradénse, to 6 in.: fls. white, in dense head.

alpinum. Per. to 6 in., glabrous: basal lvs. spatulate, entire or dentate, st.-lvs. ovate-cordate: fis. white, petals twice as long as sepals: pods oblong-obovate, style filiform and exceeding lobes. Mts, Cent. Eu.

arvénse. Rather weedy ann. to 18 in., strong plants branching above: st.-lvs. oblong to lanceolate, dentate, only the upper ones clasping: interesting for its flat nearly orbicular pois to ½ in. across. Eu., also nat.

bellidifòlium. Tufted per allied to T. rotundifolium, but has oblong-spatulate lvs and violet fls.; differs from T. stylosum in pod apex retuse. Macedonia.

bellidioldes: catalogue name.

bulbôsum. Bien. to 4 in.: basal lvs. ovate-orbicular and stalked: fis. deep violet, in fr. the racemes to 4 in. long. Greece.

cepæifòlium: T. rotundifolium var.

cilicicum (Carpoceras cilicicum) Per, dwarf: lower lvs. ovate, entire, upper clasping: pods linear. Asia Minor.

coloradénse: see T. alpostre.

hésperum: listed name.

Jánkiæ: T. præcox.

limosellifòlium: T. rotundifolium.

montanum. Per. to 8 in., with stolons at base: lvs. entire or dentate, basal ones obovate, others oblong: fis. white. Mts.. Cent. and S. Eu.

præcox (T. Jankiæ). Per. to 1 ft.: basal lvs in rosettes, oblong or orbicular, stalked, entire or nearly so, often purplish beneath: fls. white, the calyx purplish edged with white. S. Eu.

rotundifolium (*T. limosellifolium*). Per., cespitose, with stolons, to 8 in.: lvs. thick, entire or dentate, basal ones roundush to obovate, others oval. fis. ltlac. Mts., S. Eu. Var. cepæifolium (*T. cepæifolium*) has smaller notched basal lvs. and more numerous st.-lvs.

stylosum. Little alpine per.: lvs. tufted, spatulate, 1/4 in. long, entire: fls. rose, in dense racemes 1 in. or so high. Italy.

violáscens. Bien. to 6 in., glaucous: basal lvs. ovateoblong, st.-lvs. oblong, entire, clasping: fis. violet with violet anthers. Asia Minor.

THOMÁSIA. Sterculiaceæ. Shrubs of Australia with alternate entire or lobed lvs., purple or white fls. without pebals borne in racemes, and capsular frs.; the first species grown as a ground-cover in S. Calif.

purpurea. Small subshrub: lvs. oblong or linear, to 1 in. long, stellate-harry particularly beneath: fls. small, in racemes longer than lvs.

rugòsa. Lvs. cordate-ovate, lobed, to 3 in. long, wrinkled and stellate-hairy above, densely tomentose beneath: fis. rather large.

THOMSÒNIA. Araceæ. Trop. Himalayan genus differing from Amorphophallus in top of spadix covered with conical tubercles. One species, T. nepalénsis, may be cult. To 2 ft. or more high, with subterranean basal tuber 4-5 in. diam.: If. pinnatisect, to 20 in. or more long, lfts. ovate to oblong-lanceolate, to 5 in. long, long-acuminate: spathe green, to 18 in. long; spadix to 10 in. long, stout.

THORNAPPLE: Cratagus.

THORN, BOX: Lycum. Camel: Acacia Graffæ. Christ: Paliurus Spina-Christi. Cockspur: Cratægus Crusgallu. Hedge: Carissa Arduna. Jerusalem: Palurus Spina-Christi, Parkinsonia aculeata. Kangaroo: Acacia armata. Karroo: Acacia horrida. Lily: Calesbæa spinosa. Mysore: Cæsalpinia sepiaria. Washington: Cratægus Phænourum.

THOROUGH-WAX: Bupleurum.

THOROUGHWORT: Eupatorium.

THRIFT: Armeria. Prickly-: Acantholimon.

THRÌNAX. Peaberry Palms. Palmaceæ. About 10 small or slender unarmed hermaphrodite fan-palms native in S. Fla., W. Indies, Yucatan and British Honduras, with infl. among the nearly or quite orbicular lvs., the solitary trunk naked or clothed with old lf.-stalks: spadix longer than petiole and sometimes surpassing the blade, bearing many rather short side branches on a long continuing axis; stamens mostly 6: fr. globose, pea-like, white or light colored, flesh white, often on slender pedicels that remain when the drupe falls; albumen homogeneous and the small seed smooth and even, but a central cavity (centralium) extending partially or wholly through it. For cult. see Palm.

altissima: probably Coccothrinax alta.

argêntea: Coccothrinax argentea.

barbadénsis: indefinite name.

élegans, elegantíssima: unidentified names.

excélsa. Stout tree to 20 ft. or perhaps more, with lvs. whitish or glaucous underneath: fr. 1/2 in. diam., pedicellate, fleshy when fresh and mature, yellowish to white, flattened endwise; central cavity extending length of seed. Jamaica.—Apparently one of the species confused in cult.

floridana: T. parviflora. keyénsis: T. microcarpa.

microcarpa (T. keyensis. Simpsonia microcarpa). To 30 ft. or more: lvs. about 2 ft. across, silvery-white underneath and tomentose when young, pale green abovery short thick disk-like pedicels: fr. about ½ in. diam., sessile, with thin flesh; central cavity extending only part way through seed. S. Fla., Bahamas, W. Indies.

Mórrisii. Low. 3-4 ft., making a mound-like specimen. Morrisii. Low, 3-4 it., making a mound-like specimen, the trunk sometimes elongating: lvs. nearly orbicular, to 3½ in. across, glaucescent but not silvery-white underneath, deeply cleft into about 30 segms.: spathelets glabrous or nearly so; fls. on very short pedicels or sessile: fr. spherical, about ½ in. diam., sessile: central cavity only part way through seed. Anguilla and Anegada Isls.

parviflora (T. floridana. T. Wendlandiana). Slender, to 25 ft.: lvs. light green, not white or glaucous-white underneath, segms. 50 or more and about 1 in. broad: fr. globular, about ¼ in. diam., drying to a thin brittle shell, pedicellate; seed with central cavity extending through it. Fla. keys, Bahamas, Cuba, Jamaica, Haiti; reported in Yucatan and British Honduras.

radiàta: dubious name. Wendlandiana: T. parviflora. THRINCOMA: Coccothrinax alta. THRINGIS: Coccothrinax alta.

THRÍXSPERMUM. Orchidacex. Epiphytes in the Old World with leafy sts. and fls. in racemes usually one opening at a time; sepals and petals nearly equal; lip 3- or more-lobed, saccate at base, distinguished from Sarcochilus by the lip being rigidly attached to the column. See Orchids for cult.

Calceolus (Sarcochilus Calceolus). Sts. to 12 ft. long: lvs. numerous, districhous, to over 4 in. long: infl. racemose, few-fid.; fis. about 2 in. across, snow-white with orange-yellow on the 3-lobed lp. Malaya, Sumatra.

THROAT: the opening or orifice into a gamopetalous corolla or perianth; the place where the limb joins the tube. THROATWORT: Trachelium.

THRYALLIS. Malpighiaceæ. Shrubs or somewhat tree-like, in trop. Amer., with opposite simple lys., yellow or reddish fls. in panicles, and fr. a caps. separating into 3 parts; grown under glass (propagated by cuttings in heat) or out-ofdoors in the S.

brasiliénsis: see T. glauca.

gladea (T. gracilis. Galphimia glauca). Neat floriferous glaucous bush to 5 ft.: lvs. oblong, to 2 in. long: fls. yellow, in. across, in many-fld. panicles. Mex. to Panama, and nat. elsewhere.—Sometimes grown as T. brasiliensis, but that species is smaller-fld. and probably not in cult.

grácilis: T. glauca.

THÙ JA. Arbor-Vitæ. Pinaceæ. Evergreen trees of N. Amer. and E. Asia, having frond-like branchlets, scale-like lys. or when young needleshaped, and erect ovoid-oblong small cones with few scales. For cult. see Conifers. Although the thuias may make tall trees in nature, in plantations they are usually prized for their slow compact growth, and the dwarf garden forms are very many.

beverleyénsis: T. orientalis var.

Bidta: T. orientalis.

bonita: T. orientalis var.

caucásica: T. occidentalis var. robusta.

dolabrata: Thujopsis dolobrata.

elegantissima: plants so listed may be a var. of T. occidentalis or of T. orientalis.

gigantèa: T. plicata. japónica: T. Standishii. koraiénsis. Spreading shrub or rarely tree to 25 ft.: lvs. glaucous beneath, glandular: cones 1/4 in. long. Korea.

Lóbbii: T. plicata.

obtùsa: Chamæcyparis obtusa.

glaucous beneath, glandular: cones ½ nn. long. Korea.

Lóbbii: T. picata.

obtibas: Chamæcyparis obtusa.

occidentàlis. American A. To 60 ft.: lvs. yellowishgreen beneath, glandular: cones ½ in. long. N. S. to N. C. and Ill. There are many hort. vars., as: álba, Queen Victoria A., tips of young branchlets white; argéntea is var. variegata; aùrea, of bushy habit, lvs. deep yellow; aìreo-variegata, lvs. variegated with golden-yellow; Batemannii is listed; Bódmeri, monstrous form with thick clumpy growth; Boòthii, low and compact with rather large lvs.; Buchánanii, narrow-pyramidal grayish-green form; Búrrowii, lvs. yellow; caucásica is vur. robusta; Colúmbia, lvs. variegated with silver; columnàris is var. fastigiata; compácta, of dense habit; cónica, cone-shaped; cristàta, dwarf with stout crowded branchlets; densifórma, very dense; Doúglasii aìrea, lvs. bronzy-yellow; Doúglasii pyramidàlis, dense pyramidal form with fern-like branches, perhaps not distinct from var. filiformis; dumòsa, dwarf dense form; elegantissima is var. lutar; Ellwangeriàna, low form with both adult and juvenile lvs. and in aìrea lvs. yellow; ericodes, dwarf or bushy form with needle-shaped lvs.; fastigiàta (var. pyramidalıs, var. stricto, var. columnarie), columnar, branches short; filicodes, of narrow-pyramidal habit and pinnately arranged branchlets; filifórmis, bushy form with long slender branchlets; Frõebelli is var. globosa; globosa (var. Froebeltı var. Sphlmannii, var. Tom Thumb), dwarf globose form, lvs. bright green; Háncii, hort. name; Hóllandii, a semi-globose form with bright yellow lvs.; lutéscens, yellow-lvd. form of var, robusta; Māstersii (var. plicata), pyramidal form with much fiattened branchlets; nana, dwarf and compact; litea (var. elegantissima), George Peabody A., of pyramidal habit, with bright yellow lvs.; lutéscens, yellow-lvd. form of var, robusta; Māstersii (var. plicata), pyramidal form with much fiattened branchlets; nana, dwarf and compact, see mortis pyramidal habit, dwarf broad form; Ríversii, of compact p Other listed names are Brinkerhoffii, gallica, monumentalis,

Other listed names are Brinkerhofit, gattica, monumentaits, Reevesti.

orientalis (Biota orientalis). Oriental A. To 60 ft.: lvs. bright green, glandular: cones to 1 in. long. China, Korea; less hardy than the American arbor-vitæ. Some of the garden vars. are: argénteo-variegata (B. orientalis var. argentea), tips of young shoots creamy-white; aîtrea, golden-yellow in spring; azūrea, foliage glaucous blue-green; Bākeri, foliage pale green, adapted to hot dry locations; beverleyénsis, of pyramidal habit, lvs. golden-yellow; bonita, cone-shaped, lvs. tipped golden-yellow; cæsia, foliage said to be blue-gray; chinénsis, of variable habit from dwarf globose to pyramidal and with variable foliage forms, possibly of hybrid origin; columnaris, of narrow-columnar habit, lvs. green; compácta is Siebolhi; conspícua (var. aurea conspícua), compact golden-yellow suffused with green; cupressifolia, of pyramidal habit, thread-like bluish-green foliage, listed as a hybrid between a Chamæ-cyparis and this species; decussata, dwarf juvenile form with acute bluish-green lvs.; elegantíssima, compact, bright yellow in spring; excélsa, dwarf compact pyramidal form with bright green lvs.; fliformis is var. flagelliformis; flagelliformis (var. pendula, B. orientalis var. flaformis), branches drooping and thread-like; Frültandili is listed as a dwarf globose form with dark green foliage; funiculāta, branchlets drooping, lvs. of two kindas glades. pyramidal tapranchlets drooping, lvs. of two kindas glades. pyramidal pranchlets drooping, lvs. of two kindas glades. pyramidal pranchlets drooping lvs. of two kindas glades. pyramidal branches drooping and thread-like; Früitlandii is listed as a dwarf globose form with dark green foliare; funiculta, branchlets drooping, Ivs. of two kinds; glauca, pyramidal habit with blue-green foliage; globosa, dwarf globose habit; grācilis, slender pyramidal form; gracillimus, narrow globose form with compact dark green Ivs.; Howardii is listed as a pyramidal form to 10 ft.; intermēdia, branchlets drooping, Ivs. of two kinds; Maurieāna, very slender columnar form, green Ivs.; Mayhewiāna, compact pyramidal habit, branchlets tipped yellow; meldēnsis, narrow-pyramidal form with bluish-green needle-like Ivs.; nana is var. Sieboldii; nāna compācta, dwarf columnar or conical habit; newarkēnsis, listed name; pēndula is var. flagelliformis; pygmēa, said to be dwarf form; pyramidālis is var. stricta; semperauréscens, dwarf, Ivs. golden-yellow; Sieboldii (var. nana, var. compacta), low and globose; stricta (B. orientalis var. pyramidals), of dense pyramidal

habit; tatárica, branchlets yellow tipped; texàna glaùca, pyramidal habit, blue-green foliage. Other listed forms are: Berckmanniana, Hudginsii, Ramseyi and Sikesii.

pachyphylloides: listed name.

plicâta (T. gigantea. T. Lobbu). Giant A. To 200 ft.: lvs. with whitish marks below, usually not glandular: cones ½ in. long Alaska to Calif.; in the N should not be exposed to strong winter winds. Var. atrôvirens has dark green lvs, var. aûrea yellowish lvs, var. elegantíssima is listed, var. fastigiâta columnar habit, and var. pêndula drooping branches.

pyramidalis: form of T. occidentalis or T. orientalis.

sibírica: T' occidentalis var. robusta.

Stándishii (T. japonica). Japanese A. To 50 ft: lvs. with triungular white marks below, not glandular: cones to ½ in. long. Japan.

THUJÓPSIS. Pinaccæ. Evergreen pyramidal tree to 50 ft., allied to Thuja, native in Japan. T. dolabráta (Thuja dolabrata). Hiba Arbor-Vitæ. False Arbor-Vitæ. Branchlets flattened and frond-like: Ivs. appressed, glossy above, with broad white band beneath: cones ovoid, about ½ in. long, with flat woody seales. Var. Hôndai is taller with smaller Ivs. Var. nana, dwarf, Ivs. lighter green. Var. variegàta, tips of branchlets creamy-white. Hardy in central states, and in S. New England can be grown in sheltered situations near the coast. T. borealis is Chamacyparis nootkatensis. For cult. see Confers.

THUNBÉRGIA. CLOCK-VINE. Acanthaceæ. Herbs or shrubs of warm countries, often climbing, with opposite lvs. and funnelform 5-lobed fls. subtended by 2 large bracts, in shades of blue, purple, yellow or white, and blooming mostly in late summer and autumn.

Thunbergias are popular in southern United States for covering porches, trellises and arbois, and are also grown in the North under glass. Propagated by seeds, cuttings of young growth, and by layers in summer.

young growth, and by layers in simmer.

alàta. Black-s-yeb Susan. Twining per, herb sometimes grown as an ann. from seeds: lvs. triangular-ovate, to 3 in. long, toothed, with winged petiole: fils. creamy with dark purple throat, 1½ in. long, solitary on long peduncles. Trop. Afr.; widely nat. in tropics. Var. alba, fils. white with dark center. Var. aurantiaca, fils. orange-yellow with dark center. Var. Bakeri, fils. pure white.

coccinea. Woody twiner: lvs. ovate, to 5 in. long, thick, 3-5-nerved from base, toothed fis. scarlet with yellow throat, 1 in. long, in drooping racemes. India.

erécta (Mayenia erecta). Elect shrub to 6 ft.: lvs. ovate, to 3 in. long, nearly entire: fls. blue-purple with yellowish-white tube, to 23/4 in. long, solitary. Trop. Afr. Var. álba has white fls.

frågrans. Woody twiner: lvs. lanceolate to triangular-ovate, to 3 in. long, nearly entire: fls. white, fragrant, 1 1/4 in. long and 2 in. across, solitary. India.

Gibsonii. Twining per. herb: lvs. ovate, to 3 in. long, toothed, with winged petioles: fls. orange, 1½ in. long and broad, solitary on long hairy peduncles. Trop. Afr.—Readily grown as an ann. from seeds.

grandiflora. Woody twiner: lvs. ovate, to 8 in. long, 3-nerved from base, very rough, angle-toothed: fls. blue (or white), somewhat 2-lipped, to 3 in. long and broad, usually in diooping racemes. India; nat. in tropies, and common in cult. for arbors and porches. Var. álba, fls. white.

Hárrisii: T. laurifolia.

laurifòlia (T. Harristi). Woody twiner: lvs. lanceolate or ovate-lanceolate, counceous, to 5 in. long, nearly entire, 3-netved from base, fls. light blue with white or yellowish throat, 3 in. across, in racemes. India.

THÙNIA. Orchidaceæ. Epiphytic orchids native of Asia, with tufted sts. which are disticted sts. which are disticted stated in drooping 3–12-fld. racemes; sepals and petals similar, elliptic-oblong; lip subtrilobed, with the lower part surrounding the column, shortly spurred and crested. See Orchids for cult.

fibs. To 3½ ft.: lvs. oblong-lanceolate, to about 1 ft. long: fls. white, up to 2¾ in. long; lip marked with yellow or purplish fringed keels. May-Aug. India, Burma, China.

Var. Marshalliana (T. Marshalliana), fis. white, lip yellow in the upper part marked with fringed orange keels. June-July.

Bénsoniæ. Habit similar to T. alba: fls. 3 in. long; sepals and petals reddish-purple shading to white at base; lip purple shading to white below, with conspicuous yellow crests. July. Burma.—Often treated as a var. of T. alba.

Marshalliana: T. alba var.

THURBÈRIA. Malvaceæ. Herbs or subshrubs of the warmer regions of W. N. Amer., differing from Gossypium in the caps. of 3 rather than 5 cells and the lvs. usually more deeply lobed. Probably only 1 species, occasionally grown for ornament in S. W. U. S.

thespesioides. Arizona Wild Cotton. To 10 ft., usually glabrous. Ivs. mostly 3-5-palmately lobed, segms. often extending nearly to base, lanceolate, entire, to 3 in. long, glandular-dotted: fis. white turning purplish, to 2 in. across, axillary or in corymbs: caps. to 34 in. long, seeds woolly. S. Ariz. to Mex.

THYME: Thymus. Spanish: Coleus amboinicus.

THYMELÆÀCEÆ. MEZEREUM FAMILY. Nearly 40 widely distributed genera of trees and shrubs or rarely herbs, temp. and trop. in both hemispheres, with simple lvs., regular bisexual or diœcious fls. having 4–5-lobed petaloid calyx like a corolla, no petals, 2–many stamens, and superior 1–2-celled ovary. Some genera have medicinal and economic uses and Dais, Daphne, Dirca, Edgeworthia, and Pimelea are planted for ornament.

THYMOPHÝLLA. Compositæ. Low ann. or per. herbs or subshrubs from S. U. S. and Cent. Amer., usually pleasantly scented, with alternate or opposite lvs. and radiate heads of yellow fis. having a cup-shaped involucre: achenes mostly terete, striate and with a scaly pappus.

tenulloba (Hymenatherum tenuslobum). Dahlberg Daisy. Golden-Fleece. Ann., perhaps sometimes per., to 1 ft., diffusely branched lvs. to 3/2 in. long, pinnately parted into 7-11 subulately-filiform bristle-tipped segms.: heads to 1/2 in. across, usually borne in profusion, involucres about 12-lobed: pappus of about 10 scales. Tex. and Mex.—An excellent bedder, having a flowering period of several months in the S., blossoming from seed in four months, preferring a well-drained sandy soil in full sun and best adapted to use in warm regions.

THYMUS. Thyme. Labiatæ. Aromatic little herb-like shrubs or subshrubs, evergreen or partially so, classed with sweet herbs, with small entire lvs., and somewhat 2-lipped fls. in few-fld. whorls which are axillary or in terminal clusters; used in borders, rock-gardens and as a seasoning. Propagated by division or seeds.

Adamovícii. Prostrate, sts. many, unbranched, fl.-sts. terminal, erect, densely leafy, all very densely velutinous: lvs. elliptic, red-glandular on both surfaces, veins not prominent nor anastomosing. fls. rose, in small compact heads, corolla minutely red-hairy-glandular. Serbia.

álbus: T. Serpyllum var.

alsinoides. Tufted suffrutescent per. to 2½ in., puberulous to velutinous: lvs. linear to linear-lanceolate, rarely to ½ in. long, sometimes canaliculate, obtuse: fls. rose-pink, in dense globose to oblong heads. Galicia.

angustifòlius: T. Serpyllum var.

argénteus: T. Serpyllum var.

aureus: T. Serpyllum var.

azóricus: T. Serpyllum.

bálticus: listed name for a woolly plant.

Broussonètii. Tufted, suffruticose, erect or ascending, to 6 in., sts. puberulous: lvs. to ½ in. long, ovate-lanceolate, upper ones narrower, all glabrous, sparsely glandular-punctate: fls. rose, glandular-harry, in dense ovate-cylindrical heads. Morocco.

carnòsus. Subshrub to 9 in., white-pubescent: lvs. oblong, nearly cylundrical, minute, revolute, fleshy, floral lvs. ovate: fis. white, in dense heads. Portugal.

Chamsedrys: T. glaber.

cimícinus. Sts. woody, much branched, procumbent: lvs. oblong, obtuse, glaucous when young, base cuneate, chiate: fis. pink to purplish, usually axillary, calyx-teeth ovate-lanceolate, those in front the longest. S. Russia.

citrinum: hort. name, perhaps for T. Serpyllum var.

citriodorus. This name correctly belongs to a hybrid between T. pulegioides and T. vulgaris and may not be in cult. See T. Serpyllum var. vulgaris.

croaticus: see Micromeria croatica.

eréctus: hort. name. ericæfòlius: listed name. Éricksonii: listed name.

fragrantissimus: hort. name, possibly for T. Serpyllum var. rulgaris.

glaber (T. Chamædrys). Plants with sterile axillary runners which are terminated by an infl. the succeeding season: Ivs. oblong, to ½ in. long and half as wide, glabrous: fis. rose-purple, infl. subglobose and elongating in fr. Eu.—Differs from T. Serpyllum in its thin lvs. and peculiar method of branching.

glabréscens. Low, mat-forming: lvs. oblong-lanceolate, ½-½, in. long, usually obtuse, glabrous, margins chiate at base: fis. purple, in elongated spikes or condensed heads. Cent. and E. Eu. Var. Loveyanus (T. Loveyanus). Lower sts. retrorse-hairy: lvs. narrowly linear to oblong or spatulate, sparsely puberulent beneath, to ½ in. long: infl. usually an elongated head. S. E. Eu.

Hérba-bardna. Procumbent substrub, the floral branches to 5 in.: lvs. ovate-lanceolate, acute, sticky: fls. purplish, the calyx white-hairy, in heads. Corsica.

hirsūtus. Per, cespitose or procumbent: lvs. linear-subulate, obtuse, hoary-tomentose, ciliate: fls. rose, in oblong heads, on ascending tomentose sts. S. E. Eu.

hyemalis. Erect shrub to 1 ft., branchlets gray-hairy: lvs. linear-lanceolate, to 1/6 in. long, margins ciliate and strongly revolute: fls. deep rose, in dense suborbicular head, calyx sparsely villous, glandular-punctate. W. Spain.

lanicaulis. To 4 in., hairs of pubescence as long or longer than st. diam.: basal lvs. linear, to ½ in. long, st.-lvs. elliptic, to nearly ½ in. long, glabrous above, ciliate on basal half or more: fis. rose-pink, in globose head-like infl., calyx ½ in. long, villous. Balkans.

lanugindsus: T. Serpyllum var. Lovevanus: T. glabrescens var.

maculatus: listed name.

Marschallianus: a name of uncertain application.

máximus: hort. name.

membranaceus. Cespitose plant having small lanceolate glaucous lvs. and white fis. subtended by large paper-white bracts. Spain.

micans: T. Serpyllum.

montanus: a form of T. Serpyllum with larger lvs. and more erect sts.

nítidus. Shrub: lvs. ovate or oval-oblong, shining above; calyx purple at tips. Sicily.

nummularius: T. Serpyllum.

odoratíssimus: T. pectinatus.

pectinàtus (T. odoratissimus). Very fragrant per.: lvs. linear-subulate, punctate: fls. pale purple, in heads. S. Russia, Asia Minor.

Przewálskii. Allied to T. Serpyllum, differing only in stout woody sts., glabrous lvs., and larger fis. Japan.—Probably not distinct from T. Serpyllum var. vulyaris.

Serpfilum (T. micans. T. azoricus. T. nummularius). MOTHER-OF-THYME. CREEPING T. Prostrate subshrub, the sts. rooting: Ivs. ovate to oblong, to ½ in. long, short-petioled: fls. purplish, ¼ in. long, June-Sept. Eu, Asia, N. Afr.; nat. in N. Amer. There are many hort. vars. as: álbus, fls. white; angustifolius (T. angustifolius) has narrower linear-oblong Ivs; argénteus, Ivs variegated with silver; aûreus, Ivs. variegated with silver; aûreus, Ivs. variegated with silver; aûreus, Ivs. variegated with silver; aûreus, Ivs. variegated with silves of calvx purple; rôseus, fls rose; spléndens, fls red; variegatus, Ivs. variegated with white; vulgăris (T. cutrodorus), Lemon T., Ivs. small and lemon-scented. Other vars. listed include carmíneus, cárneus, minus, odoràtus, ovàtus, Púrdyi, purpureus and ribrum.

vulgaris. Common T. Erect subshrub to 8 in., the branches usually white-pubescent: lvs. ovate to linear, to ½ in. long, nearly sessile, revolute: fls. lilac or purplish, ¼ in long. May-June. S. Eu. Vars. argénteus, fragrantíssimus and rôseus are listed.

Zygis. Per. to 4 in.: lvs. linear: fis. whitish, large, in distant clusters. Spain. Var. grácilis is offered.

THYRSACANTHUS: Odontonema.

THYRSE: compact and more or less compound panicle; more correctly a panicle-like cluster with main axis indeterminate and other parts determinate.

THYSANOLÆNA. Gramineæ. One grass to 12 ft. high, native in trop. Asia. T. máxima. Lvs. to 2 ft. long and 4 in. wide, leathery: spikelets pale yellow, borne on thread-like branches in panicles to 2 ft. long.—Intro. in S. Calif.

THYSANÒTUS. Liliacex. Australian perennials with fibrous or tuberous roots, grass-like basal lvs. and fls. usually in umbels, the perianth-segms. distinct, the 3 inner fringed on edges. Propagated by offsets.

dichôtomus. To 2 ft., rarely somewhat twining: lvs. short, soon withering: fls. purple, ½ in. long, in 1-3-fld. terminal umbels.—Intro. in Calif.

TIARÉLLA. FALSE MITREWORT. Saxifragaceæ. Erect mostly small hardy herbaceous woods perennials for colonizing, for the wild or rock-garden or any shady situation, especially attractive in the autumn for the brilliant color of the foliage: lvs. radical, simple or 3-foliolate: fls. reddish or whitish, in simple or compound racemes; stamens 10: N. Amer. and Asia. Propagated by division and by seed when obtainable.

cordifòlia. Foam-Flower. To 1 ft, tufted: lvs. broadly cordate, to 4 in. across, lobed and toothed: racemes simple. N. S to Ga. and Ala. Var purpùrea (T. purpurea), fls. purple and its variations mājor, salmon-rose or wine-red, marmorāta, very attractive bronze foliage passing to blackish-green, marbled with purple, fls. numerous, maroon.

laciniàta: T. trifoliata.

polyphfila. To 1½ ft.: lvs cordate-ovate, to 3 in. across, wavy-toothed: fis. in racemes. Himalayas.

purpurea: T. cordifolia var.

trifoliàta (T. loriniata). Stemless: lvs. of 3 lfts., the middle one rhombic, 3-lobed and toothed, to 3 m. long, lateral lfts. 2-cleft: fls. white, in narrow pamcles. Alaska to Ore, E. Asia.

unifoliàta. To 2 ft.: lvs. cordate-ovate, to 4 in. across, 3-5-lobed; fls. in panicles. Alaska to Calif.

TIBOUCHINA (Lasiandra). Glory-Bush. Melastomaceæ. Tree-like shrubs or rarely herbs of trop. Amer., with simple 3-5-nerved lvs., large fls. in terminal panicles or solitary, and capsular frs.: grown under glass or out-of-doors in the S. where they will stand a few degrees of frost. Propagated by cuttings under glass.

élegans (Pleroma elegans). To 6 ft.: lvs. oblong: fis. purple, 1½ in. across, calyx bristly. Brazil.

láxa. Bushy and climbing branches hairy: lvs. ovate and somewhat cordate: fls. few in a cluster, violet-purple. Ecuador, Peru; planted in Calif.

ròsea: listed as a form with large rosy-pink fls.

semidecándra (Pleroma macranthum and splendens). To 10 ft.: lvs. ovate or oblong-ovate, to 4 in. long, densely hairy on both sudes and pale beneath: fls. purple, to 5 in. across. Brazil. Var. grandiflora is listed.

TICANTO: Cæsalpinia Crista.
TICKSEED: Bidens, Coreopsis.
TIDY TIPS: Layia elegans.
TI-ES: Lucuma nervosa.
TIGER-FLOWER: Tygridia.

TIGRÍDIA. TIGER-FLOWER. Iridacex. Bulbous herbs native from Mex. to Chile having narrow st.-lvs. and leaf-like spathes bearing 1 or more erect fls. without perianth-tube, the segms. forming a broad cup at base.

Bulbs should be planted 2-3 inches deep in late spring and will bloom in July or August. They should be lifted before frost and stored in a dry place over winter. Propagated by offsets and seeds.

conchifidra: T. Pavonia var.

Pavonia. To 2½ ft.: fls. red oddly spotted with yellow and purple, to 6 in. across, showy, lasting a day and suc-

ceeded by others. Mex., Guatemala. Varieties are: alba, fis. white, spotted with red in throat; aarea, see lutea; canariénsis, fis. pale yellow; carminea, fis. salmon-red with darker spots; conchiflôra, fis. bright golden-yellow; grandiflôra has larger vari-colored fis.; lûtea immaculata, fis. pure yellow; rôsea, fis. rose with yellow variegated center; speciôsa, fis deeper red; Watkinsônii, a hort. hybrid between T. Pavona and var. conchiflora having deep orange-vallow fis. often streaked and spotted scarlet. yellow fis. often streaked and spotted scarlet.

Watkinghnii: T Panania var

TÍLIA. LINDEN. LIME. BASSWOOD. Tiliacex. Many trees with alternate usually heart-shaped toothed lvs., small, fragrant, white or yellowish fls. in drooping clusters, and nut-like frs. whose peduncles are partially united to a broad membranaceous bract; good ornamental subjects, also furnishing valuable timber and fiber from the inner bark. The species are confused.

The lindens are not particular as to soil but do not withstand drought. Propagated by seed in autumn or stratified and sown in spring, by layers, mound-layering, and cuttings. The named kinds are commonly grafted in spring or budded in summer on available common stocks.

Alba: a name of inexact application.

americana (T. glabra). American L. To 120 ft.: lvs. broad-ovate, to 6 in. or more long, abruptly acuminate, teeth long-pointed, glabrous beneath except in vein-axils, turning yellow in autumn. N. B. to Mo. Var. dentata (T. long/folta dentata), lvs. coarsely irregularly toothed. Var. macrophylla (var. mississippiensis, T. laxifora) has larger lvs.

argéntea: T. tomentosa.

cordata (T. ulmifolia. T. parvifolia). SMALL-LEAVED L. To 100 ft.: lvs. to 2½ in. long, glaucous beneath and also glabrous except in axils of veins. Eu.

dasýstyla. Lvs. broad-ovate, aristate-toothed, to 6 in. long, shining above, harry in axils beneath. W. Asia. Most of the material cult. under this name is T. euchlora.

euchlòra. Crimean L. Hybrid between T. cordata and T. dasystyla, with dark green glossy lvs. paler beneath and glabrous underneath except for axillary tufts.

europæa (T. vulgaris. T. intermedia). Hybrid between T. platyphyllos and T. cordata lvs. to 4 in. long, glabrous and bright green beneath except for axillary tufts, dull green above.—Excellent street tree.

flavéscens. Hybrid between T. cordata and T. glabra: lvs. 3 in. long, glabrous beneath.

floribúnda: a form of T. flavescens.

glàbra: T. americana.

Henryana. Tree to 50 ft.: lvs. ovate, to 4% in. long, briefly acuminate, denticulate, pubescent beneath, petiole to 1½ in. long: fls. whitish-green, in pendulous cymes. Cent. China.

heterophýlla. To 60 ft.: lvs. ovate, gradually tapering, aristate-serrate, shining above at maturity, to 7 in. long, white-tomentose or pubescent underneath. Ind. to Fla.—Perhaps it would be better treated as T. americana var. heterophylla.

intermèdia: T. europæa.

japônica. Japanese L. To 60 ft.: lvs. to 3 in. long, closely sharp-serrate, not lobed, glabrous beneath at maturity but bluish-green and pubescent on veins when young. Japan.

laxifidra: T. americana var. macrophylla.

longifòlia dentàta: T. americana var. dentata.

macrophylla: T. americana var.

mandshirica. To 60 ft.: lvs. round-ovate, short-acuminate, teeth with long points, to 6 in. long, gray- or white-tomentose beneath and little pubescent above. N. E. Asia.

mississippiénsis: T. americana var. macrophylla.

Móltkei (T. spectabilis). Hybrid between T. glabra and T. petiolaris: lvs. round-ovate, to 7 in. long, gray-tomentose beneath.

mongólica. Mongolian L. To 30 ft.: lvs. to 2½ in. long, coarsely seriate and mostly 3-lobed, shining above, glabrous beneath except in axils of veins, somewhat glaucous. Mongolia, N. China.

neglécta. Tree to 100 ft., young sts. glabrous, red: lvs. ovate, to 8 in. long, acuminate, serrate, smooth above, pubescent beneath: fls. in loose cymes. Canada to N. C. west to Minn.

Oliveri. Tree to 50 ft.: lvs. nearly orbicular-ovate, to 4 in. long, dentate, glabrous above, white-pubescent beneath: fis. small. Cent. China.

parvifòlia: T. cordata.

petiolaris. WEEPING WHITE L. To 80 ft., the branches pendulous: lvs. round-ovate, sharp-serrate, to 4½ in. long, white-tomentose beneath and slightly pubescent above, petiole longer than half the blade. Probably S. Eu., W. Asia.

petiols longer than half the blade. Frobably S. Eu., W. Asia. platyphyllos. Large-Leaved L. To 120 ft.: lvs. to 4 in. long, light green and lightly pubescent beneath at least on veins. Eu. Var. aurea has golden-yellow branchlets when young and var. rūbra (var. corallina) red. In var. laciniāta (var. asplenifolia) the lvs. are deeply cut. Var. pyramidālis is of pyramidal habit. Var. vitifolia has slightly 3-lobed lvs.

Spaethii. Hybrid of T. cordata with larger lys.

spectábilis: T. Moltkei.

tomentòsa (T. argentea). WHITE OF SILVER L. To 100 ft.: lvs. very broad-ovate, sharp-serrate, to 5 in. long, white-tomentose beneath and slightly pubescent above when young, petrole short. E. Eu., Asia Minor. Var. péndula is

ulmifòlia: T. cordata.

vulgăris: T. europæa.

TILIÀCEÆ. LINDEN OF BASSWOOD FAMILY. More than 30 widely distributed genera of trees, shrubs or rarely herbs, with usually alternate simple lys., regular fls. having commonly 5 sepals and petals, or petals lacking, numerous stamens, superior 2-10-celled ovary, and fr. a drupe, caps. or berry. The following genera are cult. for ornament, fiber and timber: Corchoropsis, Corchorus, Entelea, Grewia, Sparmannia, Tilia.

TILLÁNDSIA. Bromeliacex. Mostly epiphytic American herbs with entire basal lvs. crowded or in rosettes, and blue, purple, red, orange or white fls. in spikes, heads or panicles; grown in the greenhouse and the Spanish-moss common on trees in the southern states where it is also used as a packing material and in manufacture. Cult. as for *Bromeliacex*; some species are large and stiffly erect and others drooping or hanging.

acaulis: Cryptanthus acaulis.

Duvaliana: Vriesia Duvaliana.

fasciculata. Lvs. linear-lanceolate, to 1½ ft. long, grayish-green: fis. blue, in many-fid. spikes to 6 in. long, on branched scapes to 2 ft. high, the bracts greenish tinged with red. W. Indies, Cent. Amer.

júncea: T. setacea.

Lindeniàna. Lvs. to 1 ft. long and ¾ in. wide: fls. bluish-purple, in large spikes, the bracts carmine. Ecuador,

Lvs. lanceolate: fls. nigréscens. Lvs. lanceolate: fls. w bordered and tipped with red. Colombia. white, the bracts

settee (T. juncea). Lvs. to 1 ft. long, erect, rigid, somewhat subulate: fls. in dense spikes, floral bracts yellow edged red, closely imbricated and abruptly mucronate, corolla white with purple areas on uppermost portion. Jamaica.

usneoides (Dendropogon usneoides). Spanish-Moss. Sts. slender and hanging, often 20 ft. and more long, hoary-gray, festooned over the trees: lvs. scattered, to 3 in. long and very narrow: fis. yellow, small, solitary or 2 in axils of lvs. Fla. to Tex. and trop. Amer.

utriculata. To 3 ft.: lvs. broad at base, forming pockets that hold water, subulate at tips: fis. cream or ivory-white, 1% in. long, far apart on the branched infl. S. Ga. to S. Amer., on trees, perishing after fruiting.

TIMOTHY: Phleum pratense.

TINANTIA. Commelinacex. Erect herbs native in trop. Amer., with alternate lvs. and fls. in terminal cymes; occasionally grown under glass or planted out in summer; has something of the habit of a tradescantia.

anômala: Commelinantia anomala.

fügax. To 1½ ft.: lvs. ovate-lanceolate, to 4 in. long: fis. blue, about ½ in. long. July-Aug. Mex., S. Amer.

TIPUANA. TIPU-TREE. Leguminosæ. Trees of S. Amer., with pinnate lys., showy papilionaceous fls. in terminal panicles, and samara-like 1-3-seeded winged pods; planted for ornament in trop, regions and also a source of rosewood.

speciòsa: T. Tipu.

Tipu (T. speciosa. Machærium Tipu). To 30 ft. and more: lfts. oblong, 1½ in. long: fts. yellow: pods to 2½ in. long.

TIPULÀRIA. Orchidaceæ. Terrestrial orchids with solid bulbs, a solitary basal lf. appearing in autumn, and terminal racemes of small fls.; sepals and petals similar; lip 3-lobed, long-spurred; akin to Aplectrum.

discolor (T. unifolia). CRANE-FLY ORCHIS. To 26 in. high: If. cordate to ovate-elliptic, slender-petioled, to almost 4½ in. long: raceme loose, many-fld., to about 11 in. long; fls. greenish, yellow or purplish, about ½ in. long. July-Aug. Mass. to Fla., Ind. and Tex.

unifòlia: T. discolor.
TIPU-TREE: Tipuana.
TISSA: Spergularia.

TITANÓPSIS. Aizoaceæ. Segregate from Mesembryanthemum: like Nananthus but lvs. more erect, spatulate and very obtuse, the apical part covered with crowded white tubercles: calyx sub-equally 6-lobed; stigmas, valves and cells of fr. 6, the cells roofed with membranous wings, ovary inferior.

Astridiæ: T. Hugo-Schlechteri.

calcarea (M. calcareum). Lvs. resembling stones, to 1½ in. long and ¾ in. wide, grayish-green: fis. light yellow, to 1 in. across.

Hùgo-Schléchteri (M. Hugo-Schlechteri, M. Astridiæ). Differs from T. Schwantesti in having fewer tubercles on lvs. which are grayish-green or brownish.

Schwantesii (M. and Verrucifera Schwantesii). Rosettes to 1½ in. across: lvs. to ¾ in. long, ½ in. wide, ¼ in. thick and warty at tip, rounded on back fls. yellow, ¾ in. across.

setffera. Lvs. erect or sometimes spreading, spatulate, about 1 in. long and wide and ½ in. thick, with hair-like or bristle-like papillæ: fls. orange-pink, yellow inside, 1½ in. across.

Trièbneri: listed name.

TITHÒNIA. Compositæ. Large herbs or shrubs with alternate lvs. and large yellow sunflower-like heads on thickened stalks, of ray- and disk-fls.; pappus of scales or none; native in Mex., Cent. Amer. and W. Indies and grown under glass or out-of-doors in the S.

arbòrea: listed name.

diversifolia (Mirasolia diversifolia). Per. or shrub to 30 ft.: lvs. ovate or triangular, to 8 in. long, usually 3-5-lobed: heads to 6 in. across, orange-yellow. Mex., Cent.

rotundifòlia (T. speciosa). Shrub to 6 ft.: lvs. broadovate, to 6 in. or more long, mostly crenate, sometimes 3-lobed: heads 3 in. across, orange-yellow. Mex., Cent. Amer. Var. grandiflòra is an improved form.

speciòsa: T. rotundifolia.

tagetifolia. Coarse herb to 8 ft. or more: lvs. to 15 in. long, all but upper ones usually 3-lobed: fls. deep orange to orange-yellow, to 4 in. across, on stout naked peduncles to 1 ft. long. Mex.

TITHYMALOPSIS: Euphorbia.

TITHYMALUS: Euphorbia.

TITI: Cliftonia monophylla.

TITOKI: Alectryon excelsum.

TIUM: Astragalus.
TOADFLAX: Linaria.

TOBACCO: Nicotiana. Indian: Lobelta inflata.

TOCOCA. Melastomacex. Shrubs of S. Amer., with large simple 5-nerved lvs., showy white or rose fls. in terminal panicles, and fr. a berry.

Grown in a warm greenhouse in a moist shaded position. Leaf-mold mixed with fibrous loam is a good soil. Propagated by single-eye cuttings in January struck in sand and covered with glass; also by cuttings from the base of the shoot with a piece of stem attached.

platyphýlla (Sphærogyne latifolia). Sts. bristly: lvs. broadly ovate, to 1 ft. long: fis. rose or red. N. S. Amer., Costa Rica.

TODDALIA: Vepris lanceolata.
TODEA: see Leptopteris.

TOFIÈLDIA. Liliacex. Per. herbs with fibrous roots, linear basal lys. and small fis. in terminal racemes, on the Zigadenus order; sometimes transplanted to the garden.

glàbra. White-Featherling. To 2 ft.: basal lvs. linear: fls. white, in racemes to 4 in. long, petals acute. caps. about 1½ in. long. N. C. to Ga.

intermèdia. To 1 ft., st. sticky-hairy lvs. to 8 in. long and 1/3 in. wide: fls. yellow, in dense racemes to 3/4 in. long. Alaska to Calif.

occidentalis. To 20 in., st. sticky-pubescent: lvs. linear, to 8 in. long and ½ in. wide, acute: fls. yellow, sepals and petals narrower than in *T. intermedia*, raceme 1-2 in. long: caps. ½ in. long. B. C. to Ida. and Calif.

racembsa (Triantha racemosa). To 2 ft., st. pubescent and minutely glandular: lvs. linear, to 1 ft. long: fls. whitish, in panicles, petals to ½ in. long: seed with white appendage. N. J. to Fla. west to Ala.

TOLMIÈA. Saxifragacex. Per. herb grown in the rock-garden; much like Tiarella but stamens only 2 or 3. Propagated by adventitious buds which are produced at tips of petioles. T. Ménziesii. To 2 ft.: lvs. mostly basal, cordate-ovate, to 3½ in. across, lobed and toothed: fls. green, ½ in. long, nodding, in long racemes. Alaska to Calif.

TÓLPIS. Composite. Herbs of the Medit. region with mostly radical lvs. and yellow heads of ligulate fls.; pappus of bristles; one species sometimes grown for ornament. Propagated by seed.

barbata (Crepis barbata). Ann. to 1 ft.: lvs. lanceolate, toothed: heads about ½ in. long, the outer involucial bracts thread-like and similar bracts on the st. near the head. S. Eu.—The plant has been sold as "Golden Yellow Hawkweed."

TOLUIFERA: Myroxylon.

TOMATILLO: Physalis ixocarpa.

TOMATO (Lycopersicon esculentum and L. pimpinellifolium). Tender herbs grown as annuals for the much-prized fruits, both out-of-doors and under glass. The husk-tomato and strawberry-tomato are Physalis and the tree-tomato Cyphomandra betacea. The tomato is closely allied to potato, and it is possible to graft one on the other: see Potomato.

Tomatoes are started under glass or in protected seed-beds for the purpose both of producing early fruit and prolonging the bearing season. Seeds are sown in light fertile soil in pots, pans, or shallow boxes four to six or eight weeks before time for planting in the field. If started too early and not shifted the plants become pot-bound or else too long and weak from overcrowding. When plants have reached the height of 2 or 3 inches in the bed or seed-box they should be transplanted into 3-inch pots, old berry-boxes or other receptacles, and allowed to grow slowly and firmly until time to set them out, which is when all danger of frost is past. The young plants should not be allowed to become stunted. They should be in a vigorous growing condition when set out, full green and stocky, not slender and yellowed and with a blossom at the top. One ounce of seed should produce 1,500-2,000 good plants. The soil for tomatoes should be "quick,"—one in which the fertility is at once available.

Tomato plants may be set in rows 4 or 5 feet apart, the plants being 3-4 feet apart in the rows. Tomatoes are grown on many kinds of soils from the sandy loams to silt and clay loams; for an

early crop and in regions having a short growing season, a light soil is desirable. The soil should be well fertilized and maintained in good physical condition by the use of manure or soil-improving crops. In home gardens and in commercial plantings in some regions tomato plants are pruned and tied to stakes or wire trellises. A showy method is that of a frame made like an inverted V, which allows the fruits to hang free. This support is made by leaning together two lath frames. When tomatoes are tied or trained they may be set 18–24 inches apart in the row. The late fruits may be picked green and ripened on a shelf in the dark or in diffused light. If the family is fond of tomatoes, two or three sowings may be made in succession. The first sowings may be of the earliest varieties.

A good range of varieties is always available from seedsmen, and it is interesting to provide the home garden with yellow as well as the usual red kinds, also the small plum and cherry kinds for conserves. The currant tomato (*Lycopersicon pmpinellyfolium*) is grown more for curiosity and ornament than for service because the many fruits are so small.

In field operations tomatoes are spaced for horse or power tillage, commonly about 4 feet apart in either direction, and are allowed to take their natural course without tying or training. Of canning tomatoes in field culture 5–8 tons to the acre is a good crop, but 12 or more tons are possible. The fruits are picked into crates, and for the green-grocery market they are sold in baskets or lug boxes, the better trade requiring the product to be graded. The tomato is now a staple product in North America, being grown in great quantities under general field conditions both for direct table use and for canning, the making of catsup and soups. Latterly the little cherry and plum tomatoes have been much grown for the fancy fruit and table trade.

Under glass the tomato is an important crop for late autumn, winter and spring trade. Seeds may be sown in June for the fall crop and in December to February for spring. Two to three shifts from seed-bed to permanent planting should provide vigorous unchecked stocky plants. From 4-inch pots the plants may go into the bed, which is usually solid. How tomatoes are to be handled under glass depends greatly on the previous and subsequent crops to which the house is devoted. The soil should be fertile, and the essential plant-food quickly available. The rows under glass may be 30-36 inches apart, and the plants 12-18 inches in the row. The plants are ordinarily grown to single stems, supported on perpendicular wires or strings. The night temperature may be 65°F., but not below 60°. Overwatering is a common fault under glass, particularly in dull weather. When the plants are dry and the house is sunny, pollination may be insured by jarring the plants once or twice a day to discharge and scatter the pollen; some growers distribute the pollen with a camel-hair brush. Four to six pounds of fruit is a good winter crop from each plant; the spring crop may go higher. There are varieties particularly adapted to forcing.

Diseases of tomatoes may be controlled to considerable extent by employing clean seed, by burning all the crop refuse and thoroughly cleaning the area in autumn and by choosing resistant varieties or races. Leaf-spot and similar infections are treated by bordeaux and resin fish-oil applied with spray under pressure.

TOMENTOSE: with tomentum; densely woolly or pubescent: with matted soft wool-like hairmess.

TONÉLLA. Scrophulariaceæ. A small genus of annuals differing from Collinsia in the corollalobes not strongly bilabiate but rotately spreading and some of the cauline lvs. ternately divided or parted. One species, T. tenélla (T. collinsioides), is cult. To 6 in.: lowest lvs. orbicular to ovate, entire or apically notched, to ½ in. long, upper lvs. 3-parted or divided into oblong segms.: fls. white or very pale blue, petals scarcely exceeding calyx and sometimes purpledotted on lobes.—Some of the material listed as Collinsia parviflora may belong here.

TONESTUS: Haplopappus Lyallir.

TONTANEA: Coccocypselum

TOOART-TREE: Eucalyptus gomphocephala.

TOOG: Bischofia javanıca.

TOONA: Cedrela.

TOOTHACHE-TREE: Zanthoxylum Clava-Herculis.

TOOTHWORT: Dentaria.

TORÈNIA. Scrophulariacex. Small herbaceous annuals and perennials usually somewhat decumbent and freely branching, with short fewfild. racemes, the fis. tubular, 2-lipped, produced freely from spring to frost; native in trop. Asia and Afr., a few grown in greenhouses for winter bloom but usually in the garden as annuals; in Fla. they are successfully used as a substitute for pansies.

Torenias require no special culture but prefer some shade and plenty of moisture. They are easily propagated by seed sown either inside or in the open early in the spring, or from cuttings.

asiática. Ann.: fls. to $1\frac{1}{2}$ in. long, corolla-tube dark purple, limb pale purple with a dark blotch on 3 of the 4 lobes. India.

Baillonii: T. flava.

flava (T. Baillonn). Ann. or grown as such: fls. to 1½ in. long, corolla-tube yellow, red-purple above, limb yellow with purple eye. India, E. Asia.

Fournièri. Ann. to 1 ft.: lvs. toothed, to 2 in. long: corolla-tube pale violet, yellow on the back, upper lip pale blue, lower lip with 3 purplish-blue lobes, yellow blotch at base of central one. Cochin-China. Var. 4iba has white corolla with yellow blotch at base of central lobe of lower lip. Var. compâcta is listed as of a dense habit. Var. grandiflora has larger fls. Var. speciõsa is a showy hort. form.

pedunculàris. Ann.: fls. ¾ in. long, pale blue. Malaya.

TORNILLO: Prosopis pubescens.

TORRÈYA (Tumion). Taxacex. Evergreen trees native in N. Amer. and Asia having narrow yew-like lvs. with 2 narrow glaucous bands beneath, diccious fls. and drupe-like frs. For cult. see Conifers. Hardy in central and southern states and T. nucifera farther north. Distinguished from Taxus by the glaucous lines on under surface of lvs. and the drupe-like fr., as well as characters of anthers.

califórnica. California-Nutmeo. To 70 ft. and more: lvs. linear, to 2½ in. long, glossy dark green above: fr. green streaked purple. Calif; can be grown N. E. in sheltered places but may become deciduous.

Fárgesii. Differs from *T. grandis* in the darker green lvs. more gradually pointed. China.

grándis. To 75 ft.: lvs. linear, to 1 in. long, yellow-green above: fr. brownish. China.

nucifera. To 75 ft.: lvs. lanceolate, to 1¼ in. long, glossy dark green above: fr. green tinged purple. Japan; hardy in sheltered places N. E.

taxifòlia. STINKING-CEDAR. To 40 ft.: lvs. linear, to

1½ in. long, glossy dark green above, of fetid odor when bruised: fr. purple. Fla.

TORULOSE: cylindric with swollen portions at close intervals, as in some capsules or leguminous fruits when swelling is due to seeds within.

TORUS: receptacle.

TOTAI: Acrocomia Totai. TOUCH-ME-NOT: Impatiens.

TOÙMEYA. Cactaceæ. A monotypic genus allied to Pediocactus from which it primarily differs in its flattened and papery spines. T. papyracántha. St. ovoid to subcylindrical, about 2 in. tall and 1½ in. diam., usually solitary, but occasionally cespitose; ribs 8-13, spiralled, with Mammillaria-like tubercles; spines flat, flexuous, papery, and white, radials usually 7-9, to ½ in. long, centrals 3-4, to ¾ in. long, curved: fls. white, to ¾ in. long. N. Mex.

TOURRÈTIA. Bignoniaceæ. A monotypic genus of the Andes Mts. in Peru. T. volubilis (T. lappacea). Subshrub or climbing herb to 6 ft.: lvs. opposite, di- or trichotomously divided, serrate, membranous: fls. purple-violet with unequally bilabiate limb, in long terminal spicate racemes.—Best treated as an ann., starting early in spring from seed and planting outside over a trellis after the last frost.

TOUS-LES-MOIS: Canna edulis.

TOVÀRA. Polygonaceæ. Herbaceous species separated from Polygonum on technical characters of fls. and infl. T. virginiana (Polygonum virginianum). Per. to 6 ft.: lvs. ovate, to 6 in. long, slightly glaucous beneath: fls. greenish or rose-colored, in clusters on an infl. to 1 ft. long. E. N. Amer., E. Asia. Var. filiformis (Polygonum filiforme) differs in obovate lvs. and fls. dark red at maturity.

TOWNSÉNDIA. Compositæ. Per. or bien. herbs of W. N. Amer. with alternate entire lvs. and many-fld. usually solitary heads of white, pink or purple ray-fls. and disk-fls.; pappus of bristles. A few species may be transferred to the wild-garden.

exscapa (T. sericea, T. Wilcoxiana). Stemless: lvs. linear-spatulate, to 2 m. long: heads to 2 in. across. Alta. to Ariz.

florifer. Bien., st. to 4 in. high, strigose: lvs. linear to oblanceolate. heads to $1\frac{1}{2}$ in. across, ray-fls. pink to rose-colored. N. W. U. S.

grandiflora. To 8 in. with st.: lvs. linear, to 2 in. long: heads to 2 in. across. S. D. to New Mex.

sericea: T. exscapa. Wilcoxiana: T. exscapa.

TOXICODENDRON: Rhus radicans. TOXICOPHLŒA: Acokanthera. TOXICOSCORDION: Zigadenus.

TOXYLON: Maclura.

TOYON: Heteromeles arbutifolia.

TRACHELIUM. THROATWORT. Campanulaceæ. Per. herbs or small shrubs of the Medit. region, having purplish or blue small fls. in dense terminal heads and not campanulate, alternate simple lvs., and capsular frs. Propagated by seeds or cuttings.

cærùleum. To 3 ft., with the look of a valerian: lvs. ovate, to 3 in. long, toothed: fis. deep blue varying to white, $\frac{1}{2}$ - $\frac{1}{2}$ in. long, slender, in large terminal corymbs, the styles long-exserted. S. Eu.—Grown under glass or in the open far S.

rumelianum (Diosphæra dubia). To 6 in., pubescent: lvs. elliptic, sessile, sharp-toothed: fls. blue, ½ in. long, in dense head-like corymbs, styles exserted. Greece.

TRACHELOSPÉRMUM. A pocunaceæ. Twining or clambering woody evergreen vines with opposite lys., salver-shaped rather small fls. in terminal or axillary cymes, and fr. of 2 long follicles; native from E. India to Japan, one grown under glass and in the open S. Propagated by cuttings in spring.

asiáticum (T. divaricatum). Differs from T. jasminoides in broader lvs., yellowish-white fis. and slightly exserted stamens. Japan, Korea.

divaricatum: T. asiaticum.

fragrans. Tall climber: lvs. elliptic-lanccolate, to 5 in. long: fis. white, to 5% in. long: pods to 9 in. long. India.

jasminoldes (Rhynchospermum jasminoides). Star- or Convederate-Jasmine. Evergreen. Ivs. oval to ovatelanceolate, to 3 in. long: fis. white, fragrant, to 1 in. across. China. Var. variegatum has green and white lvs. often tinged red, said to be hardier.—A light vellow-fld, form has been listed as Rhynchospermum Mandaianum.

TRACHYCÁRPUS. Palmacex. Several monœcious (or polygamous) Asian fan-palms of small or intermediate stature, comprising some of the hardiest kinds planted in the U.S., unarmed except perhaps on the petioles, with shaggy often fiber-bearing trunks: spadices several or many, shortly branched, among the lys. and shorter than them; fls. solitary or in 2's: fr. of 3 more or less united dry small angled carpels, but some-times 1 or 2 of the carpels fail to mature. These palms are still often called Chamarops, a practice that should be discontinued; from Chamarops the genus Trachycarpus is distinguished by valvate rather than imbricate perianth-lobes, the small dry 3-parted or 2-parted or at least carpel-like fr., and homogeneous rather than ruminate albumen of the seed, the small callous points or teeth on the petioles rather than long sharp spines. For cult, see Palm.

cæspitôsus. Differs from other species in the few or several trunks arising from the same base, the trunks to 15 ft. and leafy throughout or bearing remains of old lys. and also much fibrous material. Ivs. $1!_{2-2}!_{2}$ ft. across, cleft $\frac{2}{3}$ or nearly to the base into narrow stiffish segms,; petiole slender, equalling or exceeding the blade, finely irregularly sharp-serrate on the edges particularly near the base; ffs. very small and in technical structure differing from other species; fr. almost as in T. Fortuner, and slightly hary under a lens. First described from plants growing in S. Calif.; supposed to be native in Japan.

excélsus of hort .: T. Fortuner

excélsus of hort.: T. Fortuner.
Fortunei (T. excelsus, hort. Chamarops excelsa).
Windmill. Palm. Trunk solitary and slender, to 10-30 or 40 ft., conspicuously covered with dark hau-like fiber, the old lvs. persistent and eventually hanging and sometimes developing a "petticoat" or shag like a Washingtonia: lvs. nearly or quite orbicular, 2-4 ft. across, dull and sometimes lightly glaucous, variously divided to middle or almost to base into stiffish horizontal or drooping segms.; petiole long, with irregular fine hard setratures or callous points: fr. globose-reniform, 3-lobed, or uregular from the abortion of 1 or more of the 3 carpels, bluish, size of pea or bean; seed umbilicate. Cent. and E. Chma, perhaps also Japan.—The commonly planted Trachycarpus of this country, standing as far north as N. C., and on west coast to Ore.

khasianus: T. Martianus.

Martianus (T. khasianus). Trunk slender, mostly naked martanus (T. khastanus). Trunk siender, mostly naked and ringed with sears, bearing a hemispheneal head, the old lvs. shedding: lvs. nearly orbicular and regularly circular with many segms. extending uniformly to the middle: fr. olive-form, ½ m or less long; seed deeply sulcate or furrowed. Cent. and E. Humalayas, Assam, N. Burma.

nepalénsis: T. Wagnerianus.

Takil. Robust, trunk ascending from an inclined or oblique base, clothed with lf.-sheaths but lacking hair-like fiber, the old lvs. shrivelling-persistent: lvs. nearly orbicular, irregularly parted (to different depths) into about 50 short-bifid segms.: fr. rentorm, ½ in. or less long; seed umbilicate. W. Himalayas (Mt. Takil, etc.).

Wagneriànus (T. nepalensis). Mostly low, with erect solitary trunk covered with rough fibers: lvs. orbicular-ovate, irregularly parted to half or nearly to the base into many very stiff outstanding segms, that are entire or shortly bifid at apex; petiole very slender, with many irregular callous teeth toward base: fr. much as in T. excelsus. Species founded on cult. plants: probably Japa-

TRACHÝMENE. Umbelliferæ. Herbs with mostly ternately compound lvs., white or blue fls. in simple umbels, and compressed frs.

A few kinds are grown for ornament. For summer bloom seeds should be sown in spring where plants are to stand. Seeds may be sown in autumn under glass for spring bloom

cærùlea (Didiscus cærulea). Blue Lace-Flower. Ann. to 2 ft.: lvs. 1-2-ternately compound into narrow lobes: fls. blue, the long-stalked umbels to 3 in. across. Australia.

pilòsa. Ann. to 6 in.: lvs. divided into linear lobes: fls. in small short-stalked umbels. Australia.

TRACHYSTÈMON (Psilostemon).nacex. Per. herbs of the Medit. region of which one is rarely cult. for ornament. T. orientale (Borago orientalis). Hairy: basal lvs. cordate, T. orientale long-stalked, st.-lvs. ovate-lanceolate: fls. bluishpurple, with tube and 5 revolute lobes, borne in many-fld. panicles, the stamens long-exserted. Propagated by seeds and division.

TRACYANTHUS: Zigadenus angustifolius.

TRADESCÁNTIA. SPIDERWORT. Commelinacex. Per. herbs in western hemisphere with blue, rose-purple or white fls. in umbels or rarely solitarv.

Spiderworts are grown under glass, in baskets, and in the open. Of easy culture. Propagated by cuttings of the growing shoots, seeds and division.

albiflora: T. fluminensis.

anômala: Commelinantia anomala.

aureo-striata: hort, name for a plant with yellow-striped lvo

bengalénsis: hort, name for a plant with red fleshy lvs. and blue fls.

bicolor: T. gracilis.

bracteata. To I ft.: lvs. linear or linear-lanceolate, to 8 in. long: fls. blue or reddish, with 2 involucral bracts broader thun lvs., sepals densely sticky-hairy. Minn. to Mo. and Tex. Var. rosea, fls. rose-pink.

brevicaulis. An old name of somewhat ambiguous application applied to plants which are now considered to be diminutive forms of *T. virginiana* having harry sts. to 4 in. high and linear-lanceolate lvs. to 1 ft. long.

canaliculata (T. reflexa). To 3 ft.: lvs. linear-lanceolate, to 1½ ft. long, glaucous, blade narrower than unfolded sheath: fls. blue, rose or white, sepals glabrous or tipped with tuft of hairs. Ohio to Fla. and Tex.; cult. in the open. Var. álba, fls. white with blue stamens.

discolor: Rhao discolor.

dracænoides. To 2 ft., the roots tuberous: lvs. to 6 in. long and 11/4 in. wide, ciliate: fls. rose. Mex.—Some of the material cult. under this name is Spironema fragrans.

dracenæfòlia: listed name of plant said to have deep green dracena-like lvs. marked with chocolate-brown.

green dracena-like Ivs. marked with chocolate-brown. Imminénsis (T. albiflora. T. striata. T. tricolor. T viridis). Wandering Jew. Prostrate, sts. rooting: Ivs. ovate, to 2½ in. long, glabrous beneath, sheaths glabrous outside and often with upper margin ciliate: fls. white. S. Amer.; nat. in S. U. S.—Common under benches in greenhouses. Sometimes confused with Zebrina pendula which has Ivs. dark red beneath with If.-sheaths villous without and rose-pink fls. on short stout pedicels. Lvs. normally lively green but they are striped with yellow and white in var. variegate; also yellow- and white-lvd. sports as in álbo-vittata and alrea.

fuscata. Stemless: lvs. to 8 in. long and 2 in. wide, brown-tomentose; fls. blue or bluish-purple. S. Amer.

geniculata (T. hypophæa). Sts. procumbent, zig-zag at the joints: lvs lanceolate, to 5 in. long and 2 in. wide, villous beneath and sheaths densely villous outside: fis. white, on capillary peduncles and pedicels. Trop. Amer.—Material so listed may be T. fluminensis.

grácilis (T. bicolor). Sts. green, procumbent, glabrous: lvs. ovate, to ¾ in. long, glaucous blue-green beneath, acute, usually glabrous, ciliate, sheath ciliate, to ¼ in. long, inflated: fls. white, 4–7 in terminal umbels having pubescent peduncles, leafy bracts subtending calyx small, purplish. Chile.

hirsuta. Per. to 11/2 ft., ascending, st. somewhat pubes-

cent, at least about the nodes: lvs. oblong-lanceolate acuminate and usually undulate, margin ciliate on lower third: fis. bright purple, on short peduncles. S. Amer. Var. brachyphylla is listed.

hùmilis. To 1 ft., rough-pubescent: lvs. oblong-linear, short: fis pale blue or pink. E. Tex.

hypophea: T. geniculata.

lækenénsis: hort, name for a plant with pink and green

lanceolata: hort, name for a plant with large downy lys.

micrántha. Small creeper, or prostrate, with narrow lvs. 1½ in. or less long, and many small rose-purple fis. Tex. and adjacent Mex., sometimes in greenhouses and gardens in the region.

montana: T. subaspera var.

multicolor: Zebrina pendula var. quadricolor.

multiflora. Lvs ovate, to 2 in. long: fls. white, small, in clustered umbels Jamaaca, N. S. Amer.

occidentalis. To 23% ft, st. glabrous, branching, bright green: lvs linear, to 1 ft. long, involute: fls. blue or reddish, 3% in: long, sepals glandular-pubescent. Ia. to Tex. Var. rubra has red fls.

pilòsa: T. subaspera.

quadrícolor: Zebrina pendula var.

refléxa: T. canaliculata.

Reginse. Lvs. lanceolate, to 6 in. long, purplish-crimson in center, silvery toward edge, purple beneath. Peru.

somalienénsis: listed name of unknown botanical standing.

striata: T. fluminensis.

subáspera (T. pulminensis.
subáspera (T. pulminensis.
subáspera (T. pulminensis.
To 3 ft, st. zig-zag and shaggypilose to glabrate: Ivs linear to elliptic-lanceolate, to 15 in.
long and 2 in. wide, dark green, not glaucous: fls. light to
deep blue, rarely white, about 1 in. across, sepals hairy
and often glandular. S. Pa to Fla. and Mo. Var. montana
(T. montana) has sts. straight and uppermost cymes
pedunculate, not sessile. S. W. Va. to N. Fla. and Ala.—
The older name of T. subaspera has only recently been
recognized as representing the same plant heretofore known
as T. milosa as T. pilosa.

supérba. Lvs. sessile, oblong-acuminate, dark metallic-green above with white line on each side of midrib and purple beneath. Peru.

thuringia: hort, name for a plant with green and white lvs.

tricolor: T. fluminensis.

versicolor: Rhæo discolor.

virginiana. Common S. To 3 ft.: lvs. to 15 in long and 1 in. wide: fls. violet-purple. N. Y. to S. D. and Ark.; an outdoor garden plant. Hort. varieties are: álba, fls. white; cærûlea, fls. bright blue; cárnea, fls. pinkish; coccínea, fls. bright red; Hútchinsonii, fls. pale blue; lilácina, fls. pale hlae; májor, fls. double; nàna, dwarf form; ròsea, fls. rosepink; rūbra, fls. purplish-red.

viridis: T. flummensis.

vittata: hort. name, probably for a form of T. fluminensis.

zebrina: Zebrina pendula.

TRAGOPÒGON. GOATS-BEARD. Compositæ. Erect biennials and perennials with a tap-root, narrow grass-like lvs., and large yellow or purple heads of ligulate fls.; seed or fr. long and sticklike; pappus of plumose bristles; native in S. Eu., N. Afr. and Asia.

The first species is cultivated for the edible root. The seeds are sown in spring where plants are to stand They should be thinned to 3-6 inches apart in the row. The roots may remain in the ground all winter. The plant blooms and seeds the following year.

porrifolius. Salsify. Vegetable-Oyster. Oyster-Plant. Hardy bien. to 4 ft., with roots to 1 ft. long: heads purple, to 4 in. across, exceeded by involucral bracts, opening in morning, closing by noon. S. Eu.; nat. in N.

pratensis. Hardy bien. to 3 ft.: heads yellow, to 21/2 in. across, rays longer than involucial bracts. Eu.; nat. in N. Amer.—Seldom grown for ornament.

TRAJANS-COLUMN: Pachycereus Columna-Trajanii.

TRAPA. WATER-CHESTNUT. Onagraceæ (or Trapaceæ). Floating herbs with the submerged lvs. opposite and pinnatifid and the floating lvs. clustered, rhombic-orbicular and toothed. the petioles inflated, small white fls. borne among the lys., and leathery or bony indehiscent nut-like frs. with prominent horns; grown in ponds and aquaria and also vielding edible frs. Propagated by seeds which must be kept moist.

bispinosa. Singhara-Nut. Petioles and under sides of lys. hairy: fr.-body ¾ in. across, with usually 2 horns. Cevlon.

natans. Petioles and lvs. glabrous except veins beneath: fr. to 2 in, across, 4-horned. Eu., Asia; nat. in E. U. S.

TRAUTVETTÈRIA. Ranunculacex. Per. herbs with broad palmately lobed lvs. and small white fls. in panicles, having 3-5 caducous sepals, no petals and numerous stamens; native in N. Amer. and Asia, the species variously interpreted. Propagated by division of roots; wild border.

carolinénsis (T. palmata). To 3 ft.: lvs. to 8 in. across, with 5-11 toothed lobes: fls. about ½ in. across. Pa. to Fla. and Mo.

grândis. Differs from T. carolinensis in the more deeply lobed lvs. and longer somewhat curled styles. B. C. to Mont. and Calif.

palmàta: T. carolinensis.

TRAVELERS-JOY: Clematis Vitalba. -Tree: Ravenala madagascarrensis.

TREAD-SOFTLY: Cnidoscolus.

TREE: a woody plant that produces one main trunk and a more or less distinct and elevated head. -of-Heaven: Atlanthus altissima. -of-Sadness: Nyctanthes Arbor-tristis.

TREFOIL: Lotus. Tick: Desmodium. Yellow: Medicago lupulina.

TRÈMA. Ulmacex. Trees and shrubs bearing alternate toothed lvs. 3-nerved from base, small unisexual fls. in axillary clusters, and drupaceous frs.; native in trop. and warm regions of both hemispheres.

bracteolata. To 20 ft.: lvs. to 5 in. long and 2 in. wide, pubescent or becoming glabrous: fr. black, about 17 in. across. Afr., Arabia.—Grown in S. Calif.

TREMANDRÀCEÆ. TREMANDRA FAMILY. Three genera of heath-like shrubs with small lvs., red or purple fls. solitary in the axils, having usually 4-5 sepals and petals, 8-10 stamens, superior 2-celled ovary, and fr. a caps. Tetratheca is occasionally cult.

TREMASTELMA PALÆSTINUM: Scabiosa brachiata.

TREVÈSIA. Araliaceæ. Shrubs or small trees in trop. Asia, with compound or lobed lvs. and fls. in panicled umbels; grown in the greenhouse with a moist atmosphere.

palmata (Gastonia palmata). To 20 ft.: lvs. palmately 5-9-lobed, to 1½ ft. across, on petioles 1 ft. or more long: fls. yellowish-white, 1 in. across. Himalayas.

Sánderi. Lvs. to 2 ft. across, digitately compound. Cochin-China.

TREVOA. Rhamnacex. Small much branched spiny trees native in S. Amer., with opposite 3-nerved lvs., fls. in axillary clusters, and small drupaceous frs.; one species cult. in S. Calif. for ornament.

trinérvis. Spines about 1/2 in. long: lvs. to 1 in. long. toothed. Chile.

TRIADENUM: Hypericum virginicum.

TRIANTHA: Tofieldia racemosa.

TRÍBULUS. Zygophyllacex. Ascending or prostrate herbs of the subtropics and tropics, having abruptly pinnate opposite lvs. in unequal pairs and solitary fls., usually white or yellow. Propagated by seeds or cuttings.

terréstris. Puncture Vine. Prostrate or decumbent ann. or per., sts. to 3 ft. long, hairy: larger lf. of each pair to 2½ in. long, lfts. of 5-8 pairs, oblong to linear-oblong, to

nearly ½ in. long, acutish, sessile, villous beneath: fls. usually yellow, axillary, petals to ¼ in. long: fr. to ¾ in. across, separating into 5 woody carpels each armed with 2 sharp and stout divergent spines to ¼ in. long and several smaller ones. Old World tropics and nat. in warmer regions of the world, becoming a roadside weed in S. W. U. S. and Mex. extending north to Mo.

TRICALÝSIA. Rubiaceæ. Shrubs in Afr. with opposite lys., small axillary fls. having funnelform 4-8-lobed corolla, and fr. leathery and berry-like; one species sometimes cult. in S. Calif., with the look of Pentas.

floribunda: T. Kraussiana.

Acaussiana (T. floribunda. Kraussia floribunda). Lvs. ovate-oblong or lanceolate, to 3 in. long: fis. white, 1/4 in. long: fr. 1/4 in. across. Natal.

TRICHÍLIA. Meliacex. Trees and shrubs of trop. Amer. and Afr.: lvs. ternate or odd-pinnate, alternate: fls. not showy, in panicles, the calyx 4-5-lobed and petals 4-5: fr. a dry mostly leathery caps, of 2 or 3 cells, opening and exposing the seeds.

spondioldes. To 20 ft.: lvs. pinnate: lfts. 6-20, opposite. ovate-oblong and pointed, entire, 1½ in. or more long: fr. more or less rugose, about ½ in. diam., seeds yellowish. Trop. Amer.—Planted in S. Fla. for ornament.

TRICHÍNIUM. Amaranthaceæ. Herbs or subshrubs of Australia, grown out-of-doors in warm regions or under glass in the N.: lvs. alternate, entire, narrow: fls. in globose to oblong heads or in dense spikes, white, straw-colored to rosepink, perfect, stamens 5, perianth 5-parted.

spathulātum. Per., sts. prostrate, spreading, to 8 in. long, glabrous: basal lvs. spatulate to ovate, to 1 in. long, obtuse, decurrent; st.-lvs. narrower, more acute: fls. yellowish, to ½ in. long, m cylindrical spikes to 4 in. long, segms. plumose.

TRICHOCAÙLON. Asclepiadacex. Succulent leafless African perennials with thick cylindrical sts. covered with tubercles and rather small fls. having 5-lobed corolla and double crown; of the Stapelia tribe.

Delaetianum. Sts. to 8 in., with purplish-brown bristles: fis. broad-bell-shaped, ½ in. across, red-brown outside, brownish-yellow inside.

Dinteri. Sts. 1-6, to 2½ in. tall and 1½ in. thick, covered with blunt tubercles: fis. bell-shaped, to ¼ in. across, buff with reddish-brown dots.—A closely related across, buff with reddish-brown dots.—A crossy form, T. Marlothii, has a flattened saucer-shaped corolla.

Engleri. Sts. to 7 in. tall and 3½ in. thick, club-shaped, spineless. fls. broadly bell-shaped, to ½ in. across, yellowishgreen to cream-colored with blackish- or reddish-brown dots.

karasmontanum. Sts. shortly cylindrical, 16-20 rows of spiny tubercles: fls. inconspicuous, not well known.

keetmanshoopénse. Sts. to 6 in. tall and $1\frac{1}{2}$ in. thick, tubercles rounded, grayish-volet to yellowish-brown: fls. rotate-campanulate, to $\frac{1}{2}$ in. across, whitish-green to greensh-yellow, spotted reddish-brown.

meloforme. Sts. to 3 in., spineless: fls. at top of sts., 1/2 in. across, dark red outside, maroon inside with yellow base spotted maroon.

piliferum. Sts. to 8 in. or more tall and 2 in. thick, about 25 rows of spiny tubercles: fls. to ¾ in. across, purplish-

TRICHOCÈREUS. Cactaceæ. More or less branched columnar S. American cacti, erect or procumbent, with ribs few to many and commonly very spiny: fls. nocturnal, funnelform. Plants formerly named in Cereus. See Cacti.

Bertramianus. Solitary or cespitose, cylindrical, to about 5½ ft. tall and 1 ft. diam.; ribs 20, to ¾ in. high, pale green; spines pale yellow, radials 12, spreading laterally and basally, to 1 in. long, unequal, centrals 4, one to 3 in. long: fls. yellowish-white, to ¾ in. long. N. Bolivia.

Bridgesii (Cereus Bridgesii). To 15 ft., more or less branching, somewhat glaucous; ribs 4-8 and obtuse; spines yellowish and 2-4 in. long: fls. 2 in. and more long, probably white or whitish. Bolivia.

cándicans (Cereus candicans and gladiatus). Making

large clumps to 10 ft. across, joints erect or spreading to 2 ft.; ribs 9-11; spines awl-like, the radials 10 or more, centrals several and to 4 in. long: fls. white, fragrant, to 6 in. long. Argentina.

cephalomacróstibas (Cereus cephalomacrostibas). To 7 ft. tall, clump-forming; ribs 7-8, broad, areoles close together, radials 6-8, about 1½ in. long; centrals usually 3, to 5 in. long, pungent: fls. white, to 5 in. long, their areoles very woolly. S. Peru.

cephalopasacana. Similar to *T. pasacana* from which it differs in its smaller and more profusely branched habit and with tops of the fl.-sts. densely woolly. N. Argentina.

chiloensis (Cereus chiloensis and Funkti). Commonly with erect right-angled branches, to 25 ft., columnar; ribs 16 or 17 and divided into tubercles; radials 8-12; central 1: fls. white, tinged red outside, 5 in. or more long. Chile.

coquimbanus (Cereus coquimbanus). To 3 ft. or sometimes prostrate, branches 3 in. dnam.; ribs 12-13; spines 20 and to 3 in. long, central spines several: fls. white, 4 in. long. Chile.

cuzcoénsis (Cereus cuzcoensis). To 18 ft., much branched; ribs 7-8; spines numerous and stiff and to 2½ in. long: fis. white, fragrant, 5 in. long. Peru.

fascicularis (Cereus fascicularis and Weberbaueri), Forming large clusters to 12 ft. high; ribs 16; spines numerous and to 2 16 in. long: fls. greenish or brownish, pinkish outside, 4 in. long. Peru, Chile.

huáscha (Cereus huascha). Erect or ascending, branching from base, to 3 ft. tall and 4 in. diam.; ribs 12-18, about ½ in. high, obtuse, arceles very close together; spines numerous, radials to ½ in. long, the 4-6 centrals to 2½ in. long; fls. red to yellow, to 4 in. long. N. Argentina.

Knuthianus: listed name.

lamprochlorus (Cereus lamprochlorus). Columnar, single, or branched at base, to 6 ft. high and 3 in. thick; ribs 10-17; radials 11-14; centrals 4: fls. white, red outside, 8 in. or more long. Argentina.

litoralis (Cereus lutoralis). Differs from T. chiloensis in the prostrate habit of the sts. which form large clumps, short spines, and tube of fl. covered with long dark hairs. Chile.

macrogònus (Cereus macrogonus). Tall, bluish-green, rather slender; ribs commonly 7; spines needle-like and brown and several from an arcole: fls. white. S. Amer.

Pachandi. To 18 ft., branches upright; ribs 6-8; spines few or none and ½ in. long: fls. white, reddish-brown outside, to 10 in. long, very fragrant and night-blooming. Ecuador.

pasacana (Cereus and Cephalocereus pasacana). To 30 ft. and more, columnar, simple or sparingly branched; ribs 20-38 and low; spines yellow, to 5 or 6 in. long; fs. 4 in. long, white. Bolivia, Argentina. Vars. albicephala and long, white. Bo senilis are listed.

peruviànus. To 12 ft., with branches 8 in. diam.; ribs -8; spines 10 and to 1½ in. long and stiff: fls. white, large. Peru.

pòco. Similar to T. pasacana, differing in its smaller habit and spines, and in having red fis. Bolivia and Argen-

Schickendántzii (Echinopsis Schickendantzii). To 10 in. high and 2½ in. dianu., often cespitose; ribs 14-18; radial spines 9 or more and to ½ in. long; centrals 2-8: fls. white, 8 in. long. Argentina.

Shåferi. Cespitose, to 20 in. tall and 5 in. diam.; ribs about 14, to ½ in. high, light green; spines usually 10, to ½ in. long, slender, light yellow: fls. white, to 7 in. long. Argentina.

Spachianus (Cereus Spachianus). Upright, eventually branching at base, branches parallel with main st., to 3 ft. high; ribs 10-15; radials 8-10; central 1: fls. white, about 8 in. long. W. Argentina.

strigdsus (Cereus strigosus). Forming clumps to 3 ft across, branches 2 in. diam. and very spiny; ribs 15–18; spines numerous and to 2 in. long: fls. white, 8 in. long. Argentina. Var. longispinus has very long spines, red when

tarejénsis: listed name.

tephracanthus (Cereus, Eriocereus and Roseocereus tephracanthus). Erect, to 5 ft. tall and 2½ in. diam., branching at base; ribs 8, obtuse, wide; radials about 7, to ½ in. long, stout, whitish; central 1, to ¾ in. long: fis. greenish-white, to 7 in. long. Bolivia.—Slow growing.

Terschéckii (Cereus Terschecku). To 40 ft., with woody trunk and many branches to 8 in. diam.; ribs 8-14; spines 8-15 and to 3 in. long: fls. white, 8 in. long. Argentina. Var. montânus is listed.

thelegonoides (Cereus thelegonoides). Trunk to 18 ft. high and 7 in. diam., branches curved and 3 in. diam.; ribs 15; spines 8-10 and bristle-like: fis. white, greenish outside, to 10 in. long. Argentina.

thelegonus (Cereus thelegonus). Procumbent or with thelegonus (Cereus thelegonus). Procumbent or with erect branches, sts. to 3½ ft. long and cylindric and to 3 in. dam.; ribs 12 or 13, divided into 6-sided tubercles; radials 6-8; central 1: fls. white, about 8 in. long.

uyupampénsis. Cylindrical, usually branching, to 7 ft. long and 1½ in. diam.; ribs 9, flat; radial spines 8-10, irregularly arranged, somewhat swollen at base; centrals usually 2, to ½ in. long: fls. white inside, reddish outside.

Vollianus. Ercet, to 4 in. diam.; ribs 13, obtuse, about ½ in. high, bright green, areoles about 1 in. apart; radial spines 8-11, to ½ in. long, slender, pungent; central 1, to 1 in. long, yellowish: fls. white, to ½ in. long. Bolivia.

Werdermannianus. Sts. to 2 ft. diam., branches to 6 in. thick; ribs about 13, arcoles white-felted; radial spines 8; central 1: fls. white. S. Bolivia.

TRICHODIADÈMA. Aizoaceæ. Formerly included in Mesembryanthemum (which see): S. Afr.: shrub-like small plants, with somewhat cylindric lys. that are barbed at end with surface cells slightly prominent and elongated: fls. solitary, short-stalked, medium size or small; stigmas 5-8.

barbatum (M. barbatum). To 4 in. high, branches to 1½ ft. long, decumbent and tortuous: lvs. scattered, ½ in. long: fls. reddish, 1 in. across, axillary and terminal, petals much exceeding calyx.

bulbosum (M. bulbosum). To 8 in., forming thick clumps with prostrate branches, lys. to 1/4 in, long and 1/4 in, thick, papillose, crowned with white hairs: fls. 1ed, 34 in. across.

dénsum (M. densum). To 3 in.: lvs. to ¾ in. long and ¾ in. thick, crowned with long radiating white hairs: fis. violet-red, 2 in. across.

intônsum (M. intonsum). Lvs. to $\frac{1}{2}$ in. long and $\frac{1}{6}$ in. thick, papillose, edges ciliate, with brown bristles at tip: fis. pink or whitish, $\frac{3}{4}$ in. across.

mirábile (M. mrabile). To 3 in., sts. white-bristly: lvs. to 1 in. long and ¼ in. thick, with dark brown bristles: fis. white, petals ¾ in. long.

setulfferum (M. setuliferum). Branches prostrate, 1 ft. long: lvs. to 1½ in. long and ½ in. thick, papillose, with tuft of white hairs at apex: fls. violet-red.

stellatum (M. stellatum). To 4 in.: lvs. ½ in. long and ½ in. wide, papillose, with stiff white bristles at apex: fis. bright violet-red, 1 in. across.

stelligerum (M. stelligerum). Shrubby, much branched: lvs. to ½ in. long and ¼ in. thick, shining, papillose, with white or brownish bristles at tip. fis. purple-red.

vittātum: perhaps Nananthus vittatus.

TRICHOLÆNA. Graminex. Mostly per. grasses with silky-hairy spikelets on slender stalks forming panicles; native in warm parts of Old World and one grown in the S. for forage and ornament and nat. See Grasses.

atropurpurea: T. rosea var.

rosea (T. violacea. Panicum tonsum). NATAL-GRASS. RUBY-GRASS. To 4 ft., grown as ann. i lvs. to 8 in. long and 1/2 in. wide: panicles to 10 in. long, open, pink or reddishbrown, attractive, shining. S. Afr. Var. atropurpurea brown, attractive, shining. S. Afr. Var (T. atropurpurea) has purplish-red panicles.

violàcea: T. rosea.

TRICHOPETALUM GRACILE: Bottionea thysanoloides.

TRICHOPÍLIA. Orchidaceæ. Epiphytes of trop. Amer., with 1-lvd. pseudobulbs and fls. on lateral nodding or erect scapes, the sepals and petals similar, the lip entire or 3-lobed, rolled around the column. Grown in a temperate greenhouse; see Orchids.

coccinea: T. marginata.

crispa. Lvs. to 8 in. long: infl. usually 2-fid.; fis. nearly 5 in. across when expanded; sepals and petals similar, linear-lanceolate, wavy but not twisted, red, often with a yellowish-white border; lip purple-crimson in throat and lighter above. Apr.-June. Cent. Amer.

fragrans. Pseudobulbs slender, to 6 in. high: If. oblong-elliptic or oblong, acute, to 11 in. long: infl. erect or pendent, to 1 ft. long, usually 2-5-fld; sepals and petals white or greenish-white; ilp pure white with an orange-yellow blotch at base, fragrant. Dec.-Jan., May-July. W. Indies, at base, fragrant. Colombia, Venezuela.

Galeottiana. Lvs. to about 7 in. long: infl. 1-2-fld.; sepals and petals similar, flat, pale yellowish-green; lip fight yellow with a darker yellow throat often dotted with reddish spots. July-Sept. Mex.

gigantès: listed name.

marginata (T. coccinea). Lvs. elliptic-oblong, to about 12 in. long: infl. 1-3-fld.; sepals and petals similar, more or less twisted, pale brown or reddish, margined with green or white; lip whitish on outer surface, crimson within. Costa Rica, Panama.

suàvis. Lvs. elliptic to elliptic-oblanceolate, to 16 in. long and 4 in. wide: infl. 1-5-fld.; sepals and petals similar, cream-white sometimes spotted with pale rose, more or less wavy on margin; lip white spotted with lilac, throat spotted with orange-yellow. Dec.-May, Oct. Cent. Amer.

tortilis. Lvs. to 8½ in. long and about 1¾ in. wide: infl. 1-2-fid.; sepals and petals similar, much twisted, purplish-brown or dull rose with greenish-yellow border; lip white with central part yellowish and spotted with purplish-brown. Feb.-June, Sept.-Dec. Cent. Amer.

TRICHOSÁNTHES. Cucurbitaceæ. Tendrilbearing ann. and per. monœcious or diœcious herbs of trop. Asia and Australia and Polynesia, one much grown in some countries: fls. white, pistillate usually solitary and staminate usually racemose: fr. fleshy, indehiscent, of various shapes.

Anguina (T. colubrina). Serpent, Snake or Club Gourd. Climbing or long-running monocious ann.: Ivs. broad-ovate to triangular-ovate, to 9 in. long, sometimes shallowly 3-lobed: fls. deeply and finely lacmiate, the staminate long-stalked: fr. 1-6 ft. long and very slender, mostly curved or coiled unless hanging from a support. India, and there grown for the edible fr., with us as a curiosity.

colubrina: T. Anguina.

cucumeroides. Dioccious: sts. 10-15 ft. long from a tuberous root: lvs. ovate, 3-5-lobed or sometimes nearly entire, villous at least underneath, margins undulate or crenulate staminate fls. in racemes; pistillate on very short slender peduncles: fr. ovoid, 2-3 in. long, cinnabar-red. Japan.

japónica. Sts. slender, long, branching, plant glabrous: lvs. ovate, shallowly 3-5-lobed, margins entire or denticulate: staminate fis. few in a raceme; pistillate on peduncles 1-2 in. long, fr. ovoid but tapering either way, about 3 in. long, yellowish-green. Japan.

TRICHOSMA SUAVIS: Eria coronaria.

TRICHÓSPORUM (Eschynanthus). Gesneriaceæ. Woody climbers with mostly opposite lvs., 2-lipped tubular fls. solitary or in clusters, and linear capsular frs.; native in trop. Asia.

These plants should be grown in pans or baskets hung to the ratters of a warm greenhouse. They require loose open soil with fibrous material. Propagated by stem-cuttings about 2 inches long having two leaves and another joint.

Boschiànum. Lvs. ovate or oval, entire: fls. scarlet, 2 in. long, pubescent, twice as long as calyx. Sumatra.

Lobbianum. Lvs. ovate, nearly entire: fls. scarlet with yellow throat, pubescent, twice as long as purple calyx. Java.

marmoratum (\mathcal{A} . zebrina). Lvs. oblong-lanceolate to ovate, to $3\frac{1}{2}$ in. long, reddish-purple beneath: fis. green spotted with brown, ciliate. Habitat unknown.

púlchrum. Lvs. broad-ovate, toothed: fls. scarlet with yellow throat, glabrous, three times as long as calyx. Java.

TRICHOSTÈMA. BLUE-CURLS. Labiatæ. Herbs in N. Amer. with entire lvs. and blue or purple fls. in axillary cymes or racemes; sometimes planted in the wild- or rock-garden.

dichotomum. Ann. to 2 ft., sticky-pubescent: lvs. oblong-lanceolate, to 3 in. long, base cuneate: fls. blue, pink or white, to ½ in. long, not densely woolly, paniculate. Me. to Fla., Mo. and Tex.

lanatum. Per. to 4 ft., shrubby at base: lvs. linear-lanceolate, to 2 in. long, revolute, tomentose beneath: fis. 1/2 in. long, densely covered with blue or purple wool. S. Calif.

TRICUSPIDARIA: Crinodendron.

TRICTRTIS (Compsoa). TOAD-LILY. Liliaceæ. E. Asian per. herbs with short or sometimes creeping rootstocks, alternate sessile or clasping lvs. and bell-shaped spotted fls., the perianth-

segms. distinct; grown in pots or partially hardy out-of-doors in the N. Propagated by division.

affinis. Erect, 1-4 ft., hirsute: Ivs. oblong to ovateoblong, nearly or quite sessule, ciliate and pubescent. fls. white with purple spots or only rarely without spots, ¾ in. or less long. Japan.

flava. Dwarf, slightly hairy: lvs. oblong-lanceolate: fls. yellow, not spotted, in racemes. Japan.

hirta (T. japonica). To 3 ft., hairy all over: lvs. ovate, to 6 in. long: fls. whitsh spotted inside with purple and black, 1 in. long, several together in axils. Japan.

iapónica: T. hirta.

macrópoda. To 3 ft.: lvs. oblong, to 5 in. long, slightly pubescent beneath: fls. pale purple minutely spotted with purple, ¾ in. long, in terminal corymbs. China, Japan. Var. striata has lvs. striped green and white.

stolonffera. To 2 ft., stoloniferous, st. hairy becoming glabrous: lvs. elliptic-lanceolate, to 8 in. long, ciliate, ends tapering, glabrous except on nerves beneath: fis. purple with cream-colored blotches within, 1 in. long, in lax terminal corymbs. Japan.

TRIDAX. Composite. Small herbs of trop. Amer., with opposite lvs. and long-stalked heads of white, pink or yellow ray-fls. and yellow disk-fls.; pappus of scales or awns. Occasionally grown in the flower-garden.

trilobata. Ann. to 1 ft.: lvs. 3-lobed or toothed: heads vellow, about 1 in, across. Mex.

TRIENTALIS. STARFLOWER. Primulaceæ. Small per. herbs of the northern hemisphere, sometimes grown in the wild-garden: lvs. mostly clustered at top of st.: fls. white or pink, wheelshaped, 1–3 on slender pedicels.

americana: T. borealis.

árctica: T. europæa var.

borealis (T. americana). To 9 in.: lvs. in a whorl of 5-10, lanceolate, to 4 in. long: fls. $\frac{1}{2}$ in. across, on stalks to 2 in. long. Lab. to Va. and Ill.

europæa. To 8 in.: lvs. scattered, obovate, to 2½ in. long: fis. to ¾ in. across. Eu., Asia. Var. árctica (T. arctica), low form with smaller lvs. and white fis. Var. latifòlia (T. latifolia), lvs. in clusters of 4-7, fis. white to rose-red.

latifòlia: T. europæa var.

TRIFÒLIUM. CLOVER. Leguminosæ. Ann., bien. and per. herbs with mostly digitate lvs. of 3 lfts., small papilionaceous fls. in dense heads or spikes, and small pods usually inclosed by the calyx; fls. red, purple, pink, yellow, white.

The genus furnishes valuable forage and cover-crop plants in the species T. alexandrınum, hybridum, ıncarnatum, medium, pratense, repens, some kınds may be grown for ornament. Propagated by seed sown broadcast, ın early spring. See Clover. Alyce clover is Alysicarpus.

agrarium. Ann. to 1½ ft.: lfts. obovate or oblong: fls. yellow, in oblong heads. Eu.; nat. in E. U. S.

alexandrinum. Berseem. Egyptian C. Ann. to 2 ft.: lfts. oblong: fis. white or yellowish-white, in globular heads. Egypt, Syria.

alpéstre. To 1 ft. or more: lvs. oblong-lanceolate: fls. purple, in globular heads. Eu., W. Asia.

alpinum. Per. to 4 in.: lfts. lanceolate: fls. red, rarely yellowish-white, in loose heads. Mts. of Eu.

arvénse. Ann. to 1½ ft.: líts. linear or oblanceolate: fis. whitish, in oblong heads. Eu., N. Asia; nat. in N. Amer. atropurpùreum: T. repens var.

dasyphilium. Tufted per. to 4 in.: lfts. linear-oblong: fls. with pale yellow standards and dark purple wings and keel, in globose heads. Mts., Colo.

filiforme. Diffuse ann. about 6 in. high: lfts. obovate: fls. yellow, in few-fld. heads. Eu.

hýbridum. Alsike C. Per., with erect or lopping sts. to 2 ft. high: lfts. ovate: fls. pink, in globular heads. Eu.; nat. in U. S.

incarnatum. Crimson C. Ann. to 3 ft.: Ifts. broadly obovate: fls. crimson, in oblong spike-like heads. Eu.; nat. in U. S.

mèdium. Zigzag C. Per. to 1 ft., with creeping rootstock, the sts. zigzag: Ifts. elliptic to oblong; stipules narrow at base and pointed: fls. deep purple, in globular heads; calyx glabrous outside. Eu.

minus: a form of T. repens.

montanum. Per. to 11/2 ft.: Ifts. linear-lanceolate: fls. white Eu

nanum. Tufted per. to 3 in.: lfts. linear-oblanceolate, to 3½ in. long, usually 3, minutely denticulate: fls. rose to reddish-purple, usually 1 3 in head, peduncles to 1½ in. long. Mont., Colo and Utah.

Párryi. Low tufted per.: Ifts. oval, sharply denticulate, to 1¾ in. long: fls. purple, with conspicuous bracts, peduncle 2-6 in. long. Wyo., Colo. and Utah.

praténse. Red C. Per. to 2 ft. without rootstock: Ifts. oval to obovate; stipules broad at base and awned: fls. rose-purple or rarely white, in globular heads; calyx hairy outside. Eu.; nat. in U. S. Var. foliòsum, Oriel C., is a very leafy race. Var. perénne, a more or less indefinite name for forms of T. pratense. Var. seròtinum, МАММОТН RED C., late-flowering robust race.

rèpens. White C. Per, sts. creeping to 1 ft.: Ifts. obcordate: fls. white, in globular heads. Eu.; nat. in U. S. Var. atropurpureum (T. atropurpureum), Ifts. deep bronzy red with green margin. Var. purpureum, Ifts. bronzy-purple.

resupinatum (T. suareolens). Ann., trailing or diffuse: lfts obovate: fls. purple, in globular heads. Greece to Persia.

rûbens. Per. to 2 ft.: lfts. narrowly oblong: fls. purplishred. in spike-like usually twin heads. Eu.

suaveolens: T. resupinatum.

uniflorum. Tufted creeping per.: Ifts. ovate: fls. with blue standard and purple wings and keel, solitary. S. E. Eu.

TRIGONÉLLA. Leguminosæ. Herbs occasionally grown for forage or ornament, with trifoliolate lvs., papilionaceous fls., and beaked pods. Propagated by seeds.

cærdlea (Melilotus cærulea). Ann. to 2 ft.: fis. blue and white, in long-stulked heads: pods short with long beak. Eu.

Fœnum-Græcum. Fenugreek. Ann. to 2 ft: fls. whitish, 1 or 2 together: pods long and slender with long beak, the seeds having medicinal value: employed in Medit. region for forage. S. Eu., Asia.

TRIGONIDIUM: Lælia monophylla.

TRÍLISA. Compositæ. Erect per. alternate-lvd. herbs of E. N. Amer., sometimes transferred to grounds, separated from Liatris largely on the character of involucre and the corymbose or paniculate infl.

odoratissima (Lastris odoratissima). Carolina Vanilla.
To 3 ft, with fibrous root: Ivs oblong to spatulate, entire or toothed, to 10 in. long; heads rose-purple, without rays, in autumn. N. C. to Fla. and La.—Herbage vanilla-scented when bruised.

paniculata (Liatrus paniculata). Differing from the above chiefly in the sticky-pubescent sts.: fis. purple or white. Va. to Fla.

TRÍLLIUM. Liliacex. Attractive low per. herbs of woods, with short thick rootstocks and simple sts. bearing at the top 3 broad whorled lvs. and a solitary white, pink or purplish fl., the perianth-segms. distinct, the 3 outer green and persistent; planted in the wild-garden or border for the early spring bloom. Odd forms occur in nature.

Trilliums require fertile moist soil in partial shade. Roots may be transplanted from the wild, preferably after flowering. Propagated also by seeds.

Cátesbæi. To 1½ ft.: lvs. elliptic or oval: fls. pink or rose, on nodding pedicels to 2 in. long. N. C. to Ga. and Ala.—T. declinatum of Fla. to Ala. is closely allied to this species, has more oblong lvs. and is not known to be cult.

cérnuum. To 1½ ft.: lvs. broadly rhombic-ovate, to 5 in. long, sessile: fls. white, 1 in. long, drooping on peduncles to 1¼ in. long. Newf. to Ga. and Mo.

chloropétalum (T. sessile var. californicum). To 1½ ft.: law. round-ovate, to 6 in. long, mottled: fis. maroon to greenish-yellow or white, to 4 in. long, sessile. Wash. to Calif.

declinatum: the material in cult. under this name is T. Gleasonii; see also T. Catesbæi.

 ${\bf discolor.}\ {\bf To}\ 1$ ft.: lvs. oval, mottled: fls. greenish, the petals broad-spatulate, sessile. N. C. to Ga.

eréctum. To 1 ft. or more: lvs. broadly rhombic-ovate, to 7 in. long: fls. brown- or greenish-purple, 1 in. long.

nearly erect on peduncles to 4 in. long. N. S. to N. C. and Tenn. Var. 41bum has white fis.

erythrocárpum: T. undulatum

Glèasonii (T. declinatum of authors). To 15 in.: lvs. broad-rhombie, to 5 in. long: fls. white, to 2 in. long, on declined or spreading pedicels to $2\frac{1}{2}$ in. long. N. Y. to Minn. and Mo.

grandiflorum. To 1½ ft.: lvs. broadly rhombic-ovate, to 6 in. long; fls. white fading to rosy-pink, to 3 in. long, erect on peduncles to 3 in. long. Que. to N. C. and Mo.—Double-fid. forms are known.

Hügeri. To 10 in.: lvs. orbicular or ovate, mottled: fls. dark maroon or brown, sessile. N. C. to Fla. and Miss.

lûteum. A form of T. sessile with greenish-yellow petals. N. C., Tenn.

nivale. To 6 in.: lvs. ovate, to 2 in. long: fls. white, 1 in. long, erect or drooping on peduncles to 1 in. long. Pa. to Ky. and Neb.

ovatum. To 1½ ft.: lvs. rhombic-ovate, to 6 in. long:

fls. white fading to rose, 2 in. long, erect on peduncles to 3 in. long. B. C. to Calif.

petiolatum. To 6 in., the st. scarcely rising above the ground: fls. purple, to 2 in. long, sessile. Ida., Ore.

pusillum. To 8 in.: lvs. oblong or lanceolate: fls. pink, 1 in. long, erect on peduncles 1/2 in. long. N. C., S. C.

recurvàtum. To 1½ ft.: lvs. ovate to oblong: fls. brown-purple, 1 m. long, creet, sessile. Ohio to Miss. and Ark.

rivale. To 8 in.: lvs. ovate-lanceolate: fls white marked with purple, to 1 in. long, erect on peduncles to 1½ in. long. Ore., Calif.

rûbrum: hort, name, probably for T. sessile var.

séssile. To 1 ft.: lvs. ovate: fls. purple or green, 2 in. long, erect, sessile. Pa. to Fla and Miss. Var. álbum, with white fls., is listed. Var. califórnicum is T. chloropetalum. Var. rùbrum has red-purple fls.

simile. To 2 ft.: lvs. oval: fis. cream or white, to 2 in. long, on erect pedicels to $2\frac{1}{2}$ in long. N. C., Ga.

stylòsum. To 1½ ft.: lvs oval: fls. pink or rose, to 2½ in. long, drooping on pedicels to 2 in. long. N. C. to Ga. and

undulatum (T. erythrocarpum). To 2 ft.: lvs. ovate: fis. white veined purple, $1\frac{1}{2}$ in. long, erect or somewhat drooping on peduncles to $2\frac{1}{2}$ in. long. N. S. to Ga. and Mo.

Vaseyi. Sweet T. To 2 ft.: lvs. ovate-acuminate: fls. reddish-purple, to 6 in. across, petals to 2 in. wide, filaments to 3/6 in. long. Tenn. to S. C --A white-fld. form is known.

viride. To 15 in.: lvs. oblong or ovate, to 4 in. long, often mottled: fls. pale or purplish-green, 2 in. long, sessile. Tenn., Miss. to Kans.

TRIMÈZA (Trimezia). Iridaceæ. Bulbous herbs of trop. Amer., one intro. in S. Calif.: perianth-segms. distinct, the 3 inner much smaller than the 3 outer.

martinicénsis (Cipura martinicensis). To 2 ft.: lvs. linear-lanceolate: fis. in terminal clusters, yellow with brown at base, ¾ in. long. W. Indies, S. Amer.

TRIOSTEUM. Horse Gentian. Feverwort. Caprifoliaceæ. Per. herbs of weedy habit sometimes transferred to grounds: lvs. opposite, entire, sessile: fls. yellowish or purplish, gamopetalous, solitary or clustered in the axils, not showy: fr. a leathery drupe.

aurantiacum. To 4 ft.: lvs. ovate to oblong-lanceolate, to 10 in. long: fts. dull red, ¾ in. long: fr. orange-red. N. B. to N. C. and Mo.

perfoliatum. To 4 ft.: lvs. ovate or oval, to 9 in. long, often connate at base: fls. purplish, ¾ in. long: fr. orange-yellow. Mass. to Ky. and Kans.

TRIPETALÈIA. Ericacex. Japanese deciduous shrubs, differing from Elliottia in fls. with 3 separate petals and 6 stamens; fr. a caps.; 2 species are known.

paniculata. To 7 ft.: lvs. alternate, rhombic to rhombic-ovate, to 2½ in. long, tapering toward base, margins entire: fls. white tinged pink, to ½ in. across, in terminal panicles to 4 in. long.

TRIPHASIA. Rutacex. Spiny evergreen shrub or small tree grown far S. for ornament and hedges. T. trifòlia (T. aurantiola). LIME-BERRY. To 15 ft.: lvs. nearly sessile, 3-foliolate, the

lateral lfts, small, the terminal to 1½ in, long, all blunt or emarginate and more or less finely crenate: fls. white, fragrant, solitary in axils; stamens 6, not united: fr. a dull red berry ½ in. diam. Origin unknown; probably Malayan.-Propagated by seeds. T. monophulla is Severinia.

TRÍPLARIS. Polygonaceæ. Trees or large shrubs, native in trop. Amer., diœcious: lvs. large, alternate, simple, on the ovate, oblong, lanceolate order: fls. relatively small, sessile or nearly so between bracts in a spicate or racemose infl.: fr. a 3-angled nut.

americana. Tree to 30 ft. or more, with hollow branches: lvs. oblong to elliptic, to 15 in. long, acuminate: fls. in great panicles, the pistillate ones red and showy: fr. falling with a spinning motion. Cent. Amer.—Known as hormigo and volador. Planted in S. Fla.

TRÍPTERIS. Compositæ. Herbs or small shrubs, mostly from S. Afr., having glandular-sticky and strong-scented herbage, heads of both ray- and disk-fls., the achene without a pappus but produced into a beak and broadly 3-winged.

hyoseroides. Probably ann., to 1½ ft, somewhat branched toward top: lower lvs. elliptic-oblong, to 5 in. long, obtuse, obtusely sinuate, cuneate, st.-lvs. alternate, oblong-linear, subentire, acute, finely pubescent: ray-fls. 2-3 times as long as involucre. S. Afr.

Vaillántii. Subshrub to $1\frac{1}{2}$ ft., glandular-hairy: st.-lvs. oblong-lanceolate, toothed, half-clasping: heads yellow, small. Arabia to Palestine.

TRIPTERÝGIUM. Celastracex. E. Asian deciduous shrubs with large alternate petioled lvs., polygamous small white fls. in terminal panicles, and fr. a 1-seeded 3-winged samara.

Régelii. To 6 ft. or more, the branches long and lithe: lvs. celastrus-like, wide-elliptic to ovate, blunt-serrate, to 6 in long: panicles to 10 in. long: fr. nearly orbicular in outline and ¾ in. or more across. Manchuria to Japan; hardy N.

TRISÈTUM. FALSE OAT. Graminex. Per. tufted grasses resembling oats and one species sometimes planted for ornament: lvs. flat: spikelets borne in panicles, the florets awned: widely distributed in temp. regions. See Grasses.

flavéscens (Avena flavescens). To 2½ ft.: Ivs. to 5 in. long and ¼ in wide: panicles to 5 in. long, yellow turning brown, florets with long twisted awns. Eu., Asia; nat. in Mo. and Kans.

spicatum. To 2 ft: differs from above in panicles dense and usually spicate and pale to dark purple in color. Arctic Amer. south to Pa., Minn., mts. of New Mex., and Calif.; also alpine regions of Old World and S. Amer.

TRISTANIA. Myrtacex. Trees and shrubs native in Malaya and Australia with simple lvs. alternate or whorled at ends of branchlets, small yellow or white fls. in axillary cymes, and capsular fr.; grown out-of-doors in warm regions. Propagated by seeds or half-ripened cuttings under glass.

conférta. Brisbane Box. To 150 ft.: lvs. ovate-lanceo-late, to 6 in. long: fls. white, ¾ in. across: fr. ½ in. across. Australia.

laurina. Small tree or shrub: lvs. lanceolate or elliptic, to 4 in. long: fls. yellow, 1/6 in. long: fr. 1/4 in. across. Australia.

TRITELEIA: Brodiæa.

TRITERNATE: three times three; the leaflets or segments of a twice ternate leaf again divided in three parts.

TRITHRINAX. Palmacex. A few species of low or middle-sized hermaphrodite fan-palms of trop. and S. Brazil, Bolivia, Paraguay, Argentina, often cespitose, characterized by very strong long spines terminating the stiff network of the old If.-sheaths on the trunk: lvs. more or less orbicular in outline, firm, cut into many deep segms.; the petiole unarmed, except perhaps a few hard fibers at the base: spadix among the lvs., branched, the fls. solitary and sessile; stamens 6: fr. globese, 1 in. or less diam., the perianth somewhat enlarged but not prominent; seed 1. The Trithrinaxes are somewhat planted in the open in S. Calif. and probably elsewhere as single specimens, interesting for their good habit and vicious spines. See Palm.

acanthécoma. Trunk single and several ft. high, densely clothed with deflexed slender but stiff spines 3-6 in. long from the network base: lvs. to 3 ft. across, green both sides but lighter underneath, deeply cleft into some 40 finely striate segms. which are bifd for an in. or two at apex and which droop on the lower lvs. fr. about \(\frac{3}{4} \) in. thick, with short stigmatic point not centered. S. Brazil.

brasiliènsis. Trunk single, to 12 ft. or more, clothed with spines much as in the above species: lvs. to 3 ft, stiff, divided to about the middle, and the 30 or so segms. not or scarcely drooping, green above and glaucescent underneath, the finely striate segms. bifid at the end 5–8 in. deep. S Brazil to Paraguay.

campéstris. Trunk to 10 or 12 ft. but in cult. often long remaining a mass of sword-like points with st. covered in foliage, the sharp spines very stiff and strong and often above 6 in. long: lvs. 2-3 ft. across, gray-green, divided nearly to base into 20 or more rigid spine-tipped segms that are bifid, 5-8 in.: fr. nearly 1 in. across, with a flexible exterior. Argentina.

TRÍTICUM. Graminex. Tall ann. or bien. grasses with flat lvs. and spikelets borne in terminal close spikes; native in Medit. region and W. Asia, and grown for the grain which is the principal source of bread flour. By some authors the species treated below are considered to be varieties of *T. æstivum*. See *Grasses*.

estivum. Wheat. Ann. to 4 ft.: lvs. to 15 in. long and ½ in. wide: spikes to 4 in. long, awned or awnless: grains ¼ in. long, grooved. Cultigen; winter and spring wheat.

dicoccum. Emmer. Differs from T. æshum in having dense awned or hearded spikes and each floret permanently inclosing the grain.

monococcum. EINKORN. Spikelets long-awned and flattened in slender spikes.

polónicum. Polish Wheat. Glumes papery, as long as spikelets.

Spélta. Spikes awned, slender, more or less 4-sided.

TRITOMA: Knivhofia.

TRITÒNIA (Montbretia). Iridacex. Cormous herbs of S. Afr. having narrow lvs. toward base of st. and yellow, orange, red or white fls. in simple or panicled spikes on sts. to 3 ft. high, the perianth with long or short tube.

Culture as for gladiolus; hardy in the North, and may be left permanently or replanted each year from corms well ripened and stored after the blooming period; plant 3 or 4 inches deep and 3-6 inches or more apart.

crocata. Fls. tawny-vellow or orange-red, 2 in. across. Var. miniata, fis. bright red or scarlet; in Calif. gardens.

crocosmæflora. Fls. orange-crumson, to 2 in. across, with tube shorter or longer than segms. Hybrid of T. Pottsii and Crocosmia aurea. Var. aurantiaca has deep orange fls. deústa. Differs from T. crocata in having a purple-black blotch on claw of outer segms.

hyálina. Differs from T. crocata in perianth-segms. narrowed below into claw with inflexed hyaline margin.

lineata. Fls. white or pale pink, 11/4 in. long, anthers protruding.

Póttsii. Fls. bright yellow-red, 1 in. long, the tube twice longer than segms.

ròsea. Fls. bright red spotted yellow at base, 1 in. long, the tube as long as segms.

securigera. Fls. bright red, lower perianth-segms. with large callus at throat, 1½ in. long.

squálida. Fls. white or pinkish with yellow blotch at base of perianth-segms.

undulata. To 1 ft.: lvs. to 4 in. long, linear, glabrous, margins strongly undulated: fis. pink, in lax spikes.

TROCHODENDRÀCEÆ. TROCHODENDRON FAMILY. Two genera from E. Asia, trees or shrubs with alternate toothed lvs. without stipules, bisexual fls. without perianth, carpels 5 or more, and fr. a samara or follicle. The family is closely associated with Cercidiphyllaceæ, and once included in the Magnoliaceæ. Euptelea and Trochodendron are grown for ornament.

TROCHODÉNDRON. Trochodendraceæ. Japanese and Korean evergreen tree sometimes planted in S. U. S. T. aralioides. To 60 ft.: lvs. obovate to lanceolate, to 6 in. long, wavy-toothed, long-stalked, shining above: fls. bright green, 1/2 in. across, in racemes to 3 in. long: fr. brown. 1/2 in across.

TRÓLLIUS. Ranunculacex. Per. herbs native in the north temp. zone mostly in swampy or low places, with thick fibrous roots, palmately lobed or divided lvs., usually solitary terminal fls. in spring and early summer, having 5–15 petal-like sepals, 5 or more small petals. and many stamens; spring.

Trollius requires moist soil. The species make attractive spring-flowering clumps, in yellow and orange; useful for borders. Propagated by seeds or division.

acaulis. To 6 in.: fls. lemon-yellow, 2 in. across, with 6-8 preading sepals, the 12-16 petals shorter than stamens. Himalayas.

albiflòrus. To 1 ft.: fls. white, to $1\frac{1}{2}$ in. across, with 5-7 spreading sepals, the petals shorter than sepals and stamens. B. C. to Colo.

asiáticus $(T.\ giganteus)$. To 2 ft. or more: fls. orange, with 10 spreading sepals, the petals longer than stamens but shorter than sepals. Siberia.

caucásicus. To 3 ft.: fls. yellow, with 5-8 spreading sepals, the 10 petals about length of stamens and shorter than sepals. W. Asia.

chinénsis (T. sinensis). Tall: fis. yellow, with 12-13 spreading sepals, the 20 petals longer than stamens and sepals. N. China.

dschungáricus. Differs from T. europæus in the sepals spreading, incuved and mucronate, also in fls. reddish outside and golden-yellow within, and from T. assaticus it is distinguished by petals not longer than stamens. Turke-

europèus. Globe-Flower, To 2 ft.: fls. lemon-yellow, to 2 m. across, globular, with 10-15 incurved obtuse sepals, the petals about length of stamens and shorter than sepals. Eu. Var. Lóddigesii has deep yellow fls. Var. napelliformis (T. napelliformis) has many-fld. sts. and deeply divided lys. Improved forms are listed as grandiflorus and supérbus.

Fortunei: listed name, probably T. japonicus.

genuinus: a hort, varietal name under T. patulus but including several other species.

gigantèus: T. asiaticus.

hébridus: hort, name for improved strains of garden

japônicus. To 8 in.: fls. yellow, with 5-6 spreading sepals, the petals longer than stamens. Japan. Var. flòre-plèno has double fls.

láxus. To 2 ft., the sts. weak: fls. yellowish-green, to 2 in. across, with 5-7 spreading sepals, the 15-25 petals much shorter than stamens. E. U. S., in bogs and swamps.

Lédebouri. To 2 ft.: fis. yellow, with 5 spreading sepals, the 10-12 petals longer than stamens but shorter than sepals. Siberia.

napellifórmis: T. europæus var.

pátulus. To 1 ft.: ffs. golden-yellow, with 5–7 spreading sepals, the 1-5 petals about length of stamens and shorter than sepals. W. Asia.

pumilus. To 1 ft.: fls. yellow, 1 in. across, with 5-6 spreading sepals, the 10-12 petals about length of stamens but shorter than sepals. Himalayas. Var. yunnanénsis is taller, with 6-8 sepals and petals shorter than stamens. taller, wit W. China.

sinénsis: T. chinensis,

yunnanénsis: T. pumilus var.

TROPACOLUM. NASTURTIUM. The only genus of Tropxolacex. Quick-growing soft herbs, often climbing by means of coiling petioles, sometimes with tuberous roots, having alternate lvs., showy mostly yellow, orange or red irregular fls. solitary on long axillary sts., one sepal produced into a slender nectar-spur, and fr. of 3 1-seeded carpels: native Mex. to Chile.

Nasturtiums are grown as annuals in warm sunny situations. Seed may be sown where plants are to stand or in early spring in boxes and pots and transplanted in May. They are useful for cut-flowers and the abundant foliage covers rocks and brushy places acceptably. The plants are frost-tender. The flower-buds and young seeds are sometimes picked and used as seasoning, under the name Indian

Bódgeri: hort, name for double-fid, race of T. maius. canariénse: T. peregrinum.

coccineum: plants in trade under this name are probably T. majus var., although it is also a botanical synonym for T. treeder.

Lobbianum: T. peltophorum.

majus. Garden N. Climbing: lvs. round or somewhat kidney-shaped, peltate, on long petioles: fls. to 2½ in. across, of various colors, usually with a yellow or orange background striped and spotted with red and brown. S. Amer. Var. Bürpeei. Golden Gleam N. A patented race of double-fld. plants. Var. nanum. Tom Thums N. A dwarf strain. Some of the named color forms are: atropurpüreum, dark red; coccineum, scarlet; Helmemanni, chocolate; hemisphéricum, light yellow; lüteum, yellow; Regelianum, purple-violet; Scheuerianum, straw-colored.

minus. Dwarf, not climbing but more or less scrambling, smaller than T. majus: fls. 1½ in. or less across. S. Amer.

nanum: T. majus var.

peltóphorum (T. Lobbianum). Climbing, hairy: lvs. round, peltate: fls. 1 in. long, orange-red. S. Amer.

pentaphfilum. Climbing, with tuberous root: lvs. divided into 5 lfts.: fls. 1½ in. long, with large red spur. Argentina.

peregrinum (T. canariense). Canary-Bird-Flower. Climbing: lvs. deeply 5-lobed, peltate: fls. to 1 in. across, canary-yellow with green curved spur. Probably Peru and

polyphyllum. Per., prostrate or climbing: lvs. peltate, orbeular, deeply divided into 7-9 narrow segms.: fls. yellow streaked with red, smaller than T. majus. Chile. Var. Leichtlinii is listed with longer more trailing sts. and orange fls.

speciosum. Per., climbing: lvs. divided into 6 lfts.: fls. to 1½ m. long, vermilion-red. Chile.

tricolor. Per., climbing, with fleshy root: lvs. divided into 6 lfts.: fls. 1 in. long, with vermilion spur, purplish lobes and yellow petals. Chile.

tuberosum. Climbing, with large underground tubers: lvs. 5-lobed, peltate: fls. to 34 in. long, with long red spur and yellow petals. W. S. Amer., where the tubers are prepared for eating.

TRUMPET-CREEPER: Campsis. -Flower: Bignonia capreolata. -Vine: Campsis radicans.

TRUNCATE: appearing as if cut off at the end; the base or apex nearly or quite straight across.

TSÙGA. HEMLOCK. HEMLOCK-SPRUCE. Pinacex. Evergreen trees with slender horizontal branches, linear usually flattened lvs. with 2 white bands beneath, and small cones having woody persistent scales; native in N. Amer. and Asia. Numbers of variations are perpetuated by asexual propagation and under names, not all of which may be in commerce.

Hemlocks are valuable lawn trees, particularly as young specimens; they are best when not too much exposed to winter winds and winter sun. *T. canadensis* is the hardiest, but most of the others stand in climates like that of central New England. For cultivation see *Conifers*.

canadénsis (Abies canadensis). Lvs. finely toothed, obtuse or acutish: cones to ¾ in. long, stalked. N. S. to Ala. Hort, vars. are: álbo-spica, tips of young branchets white; atrovirens, very dark green foliage; aŭrea, foliage tinged yellow; compacta, dwarf conical form; Dawsonians, slow, graving and compact foliage dark green; fastishète tinged yellow; compacta, dwarf conical form; Dawsoniana, slow-growing and compact, foliage dark green; fastigiata, narrow or columnar; Frémdii, pyramidal and slow-growing, foliage dark green; globosa, rounded and compact; grácilis, branches drooping at ends, lvs. very small; Hússii, very dwarf with short twiggy branches; Jénkinsii, narrow-pyramidal with graceful declined branches and short lvs.; macrophýlla, lvs. larger; microphýlla, lvs. ½ in. or less long;

nana, dwarf form to 7 ft. high, branch spread greater than hana, dwan form to 7 t. fligh, foranth spread greater than height; parvifolia, densely bushy, top of many ascending sts. and open central crown, lvs. small; péndula (var. Sargentii pendula), branches drooping, forming a dense broad bush; several named forms are offered.

caroliniana (Abies caroliniana). Lvs. entire, obtuse or slightly notched at apex, glossy dark green above: cones to 1½ in. long. Mts. of Va. to Ga. Var. compacta is a denser round-topped form.

chinénsis. Lvs. entire, notched at apex, glossy dark green above, the bands beneath inconspicuous: cones to 1 in. long. W. China.

diversifòlia. JAPANESE H. Branches reddish-brown: lvs. entire, obtuse or notched: cones to ¾ in. long. Japan.

dumòsa. Lvs. finely toothed, acute: cones 1 in. long. Himalayas.—To be planted far S.

heterophýlla. Western H. Lvs. finely toothed, obtuse or acutish: cones to 1 in. long. Alaska to Calif.

Hüssii: T. canadensis var.

Jéffreyi. Hybrid between T. Mertensiana and T. heterophulla.

macrophélla: T. canadensis var.

Mertensiàna. Mountain H. Lvs. rounded or keeled, bluish-green, acutish: cones to 3 in, long. Alaska to Calif. Var. argentea has bluish-white lvs.

microphylla: T. canadensis var.

Sárgentii: a weeping form, T. canadensis var. pendula.

Sièboldii. Branchlets glabrous: lvs. entire, notched at

stepoiui. Isranchiers giabrous: Ivs. entire, notched at apex: cones to 1½ in. long. Japan. yunnanénsis. Twigs densely pubescent: Ivs. entire, obtuse: cones to 1 in. long. W. China.

TSUSIOPHÝLLUM. Ericaceæ. A monotypic half-evergreen genus distinguished from Rhododendron by the regular tubular corolla with stamens not exserted. T. Tanákæ. Prostrate shrub to 20 in., branchlets setose: lvs. obovateelliptic, to ½ in. long, apiculate, setose above, glabrous and glaucous beneath except on midrib: fls. white to pale pink, nearly ½ in. long, corolla pubescent, with short spreading lobes. Cent. Japan.

TUBEFLOWER: Clerodendrum Siphonanthus.

TUBER: a short congested part; usually defined as subterranean (as of a rootstock), although this is not

TUBERCLE: a small tuber, or rounded protruding body. TUBEROSE: Polianthes tuberosa.

TULBÁGHIA. Liliacex. Per., sometimes cormous, herbs of trop. and S. Afr. having numerous fls. in a terminal umbel, differing from Agapanthus in the fls. urn-shaped or salverform with perianth-tube much longer and often cylindrical with a corona present which may be ring-like or formed of 6 distinct scales, the fr. a loculicidally dehiscent caps.

Propagated by seeds and offsets, adapted to pot culture in the North or may be grown in open in South in a light sandy soil.

cepàcea. To $1\frac{1}{2}$ ft.: lvs. linear, to 8 in. long and $\frac{1}{2}$ in. wide, usually only 4-6: fls. bright lilac, to $\frac{1}{2}$ in. long, on slightly shorter pedicels and in umbels of 6-12. S. Afr.

violaces. To $2\frac{1}{2}$ ft.: lvs. erect, linear, to 1 ft. long, acute, canaliculate at base, usually only 4-8: fls. bright lilac, about $\frac{1}{2}$ in. long, in umbels of 8-16, pedicels violet, to $\frac{1}{2}$ in. long, segms. lanceolate with deeper colored medium stripe. S. Afr.

TULIP: Tulipa. Globe-: Calochortus. chortus monophyllus. -Tree: Liriodendron. Star -: Calo-

TÙLIPA. Tulip. Liliacex. Hardy springblooming bulbs planted out-of-doors and forced in the greenhouse, having basal and st.-lvs. and bell-shaped or saucer-shaped mostly erect fls. which are commonly solitary but sometimes 2-5 at top of st., the perianth-segms. distinct.

Common garden tulips are supposed to be of the species Tulipa Gesneriana, native in Russia and Asia. The very early tulips of the Duc Van Thol kind are T. suarcolens, of southwestern Asia and the Caspian region. The dragon

or parrot tulips are fringed and crisped forms of the common tulip, T. Gesneriana var. Dracontia. The Darwin tulips are a tall late-flowering robust race with clear colors, T. Gesneriana var. Darwinia. The Rembrandts are a sub-class of Darwin tulips with variegated or particolored flowers. The cottage tulips are an early or midseason class, in many colors; the term is usually applied to the common tulips that do not fall into other classes. The "breeder" tulips are strains with self or unbroken colors although the base of the segments may be vari-colored; "broken" tulips have parti-colored segments throughout; "bybloems" have white under-color with markings of rose, lilac or purple; "bizarres" have yellow under-color and red or brownish or purplish over-colors. Tulips have wide range of color in all except true blues, as also of shape of blossom, of stature, and of the flower-cup inside is likely to have darker blotches,

over-colors. Tulips have wide range of color in all except true blues, as also of shape of blossom, of stature, and of season, allowing a wide choice to the planter. The bottom of the flower-cup inside is likely to have darker blotches, forming an "eye" when the flower is widely expanded. Special bulb catalogues are useful in making selections.

Other species than T. Gesneruana and T. suveolens are more or less grown in borders or as curiosities, and they are likely to be catalogued as "botanical tulips." They are native from Europe to north Africa and Japan. Among them are choice and interesting ornamental subjects, some of them adapted to rock-gardens.

Tulips are planted in autumn as are other Holland bulbs, usually in October in the North. The soil should be deep, fertile and well drained. The bulbs may sit 4 to 6 inches below the surface (depending somewhat on size and soil) and 4 to 6 or 8 inches apart (conditioned on the size and variety). For uniform results in height and blooming season, see that the bulbs are graded to one size and are set in one kind of soil at the same depth; in making pattern beds, is is well to remove the earth, firm the under-soil, place the bulbs carefully, then cover with earth without disturbing them. Mulch freely for winter. After two or three years the tulp plot becomes crowded and it is well to take up the bulbs after the leaves have ripened and replace the best ones. For pattern beds, the bulbs are set each year. Tulips open fully in sunshne, but as the outside of the flower is colored and the cup is attractive in shape at any stage, the plants are serviceable at all hours.

replace the best ones. For pattern beds, the bulbs are set each year. Tulips open fully in sunshine, but as the outside of the flower is colored and the cup is attractive in shape at any stage, the plants are serviceable at all hours.

Tulips force readily. Strong bulbs are placed in pots or boxes in autumn, set in a frame or other outdoor area and covered a few inches with mulch of leaves, litter or even light earth until the pots are well filled with roots which will be in four to six weeks. Five or six bulbs of the usual single forcing kinds may be placed in a 6-inch pot or pan, and six to eight in a 7-inch pot; the bulbs are covered to the tip. When well rooted, pots may be brought to a fairly warm building until growth is well started, when they may be placed in the conservatory or living-room; it is well to have a sufficient supply so that pots may be brought in every ten days or two weeks for succession. The best season for bloom is after the holidays till spring. Early tulips are sometimes bloomed in water glasses, for which see hyacinth, although they are not so popular as that flower for this method of culture. After blooming in the house, the bulbs are discarded, although they are sometimes transferred to the border and may recover after a year or two.

Propagation of tulips is usually effected by the natural increase of the bulbs by means of offsets or young bulbs; these planted by themselves produce a blooming bulb in one or two years. Expert propagators stimulate the formation of offsets by cutting the bulb. Seeds may be employed, if one desires to produce new kinds; two or three years are required.

years are required.

acuminata (T. cornuta. T. stenopetala). Turkish T. Medium height, 12-18 in.: lvs. rather narrow, undulate: fl. expanded, light yellow with red lines, segms. very long narrow-pointed. Probably Turkey.—Perhaps a form of the T. Gesneriana group. Midseason.

austràlis (T. Celsiana). Medium: lvs. channelled: fl. yellow, reddish outside, nodding in bud, segms. acute. France to Algeria.—Midseason.

Batalinii. Low, 5 or 6 in.: lvs. very narrow: fl. pale yellow, segms. obtuse or nearly so and sometimes cut near apex: lvs. very narrow. Bokhara.—Early.

bifflora. Small plant with 2 or 3 very narrow lvs.: fls. 2, small, pale yellow or whitish inside tinged reddish or purplish outside, segms. acute. Asia.—Early to midseason. Var. turkestanica. Larger, lvs. broader: fls. often 4 or 5 to stem. Var. major is listed.

Billiettians. Robust with broad lvs.: fl. bright yellow, flushed, segms. sharp. Italy.—Late.

Boissièri: T. montana.

Borszczówii: probably T. Kolpakowskiana.

carinata. Fl. dark red with lighter base, segms. acute: lvs. about as long as scape and somewhat undulate. Probably of hort. origin.—Midseason.

Celsiana: T. australis.

chrysantha. To 6 in.: lvs. glaucous and recurved, the upper ones very narrow: fl. medium, bright yellow, the outer segms. acuminate. Persia.—The name is also likely to be applied to a golden-fld. garden tulip.

Clusiàna. Medium: bulb small and hairy: lvs. narrow: fl. small, white or yellowish with purple base, fragrant, segms. more or less acute. Portugal to Persia.—Midseason.

cornùta: T. acuminata.

dasystèmon. Small and small-fld., 3-6 in. high: fls. usually several, yellow, segms. edged white and greenish on back, narrow: lvs. glaucous. Turkestan.

Didièri. Medium: lvs. undulate: fl. large, bright crimson with blotch in bottom, outer segms, reflexed. S. Eu.—Runs into several forms. Var. Mauriàna has narrower and slightly undulate lvs.: fls. brilliant red with yellow blotch.

Eichleri. Low, 6-10 or 12 in. with broad long-pointed lvs.: fl. large, deep scarlet with blue-black bottom, segms. obtuse but mucronate. S. W. Asia.

élegans. To 18 in., st. pubescent: lvs. lorate-lanceolate, arising from lower half of st.: fl. scarlet with yellow base, to 3½ in. long, uniform segms. gradually narrowed to acute point. A garden plant not known from the wild and reported to be a hybrid between T. acummata and T. suaveolens. Var. álba is lated as a white-fld. form.

flava: hort. tulip said to be very robust with yellow fis. florentina: T. sulvestris.

formòsa: listed name of unknown botanical standing.

Fosteriàna. Robust: lvs. very broad: fl. very large, intense crimson and darker in bottom. Turkestan.

fúlgens: T. Gesneriana.

galática. To 8 in., tunic of bulb silvery-hairy inside: lvs. 4, linear-lanceolate, to 8 in. long, acuminate: fl. pale yellow, campanulate, inner segms. rounded, spatulate, outer ones elliptic to oblong-elliptic, anthers golden-yellow. Asia Minor.

Gesneriana (T. fulgens). Common T. Stout plant, to 18 or 24 in., and mostly broad ample lvs.: fl. white, red, yellow, often variously marked, segms. broad and obtuse but often with a mucro. Armenia, Persia. Var. ixiodes is listed as having fls. of soft canary-yellow with black center. Var. lûtea, fl. yellow. Var. rôsea, fl. rose. Var. spathulata, fl. larger, brilliant red with purple blotch at base of segms.

Grèigii. Low, 12 in. or less, with broad dark colored undulate lvs.: fl. orange-scarlet with dark yellow-margined blotch in bottom, the segms. broad, often cuspidate. Turkestan.—Early.

Grúllemannii. A strain resulting in a cross between a Darwin tulip and T. Kaufmanniana.

Hageri. Low, about 6 in., with narrow acute lvs.: fls. 1 or 2, usually red with darker bottom, segms. narrow and acute. Greece.—Early.

hùmilis. To 5 in. or less: lvs. 2 or 3, linear: fl. small, pale purple inside but yellowish in bottom, outside reddishgreen, segms. narrow and acute. Persia.

fingens. Low, 12 in. or less, with broad hairy lvs.: fl. very large, vermilion with dark bottom, segms. obtuse but mucronate. Bokhara.—Early.

Kaufmanniana. Beautiful tulip usually 5-10 in. high with very broad short acuminate lvs. fl. large and open, creamy-white or light yellow with yellow center and carmine marks, segms. obtuse. Turkestan. Var. airea, fl. golden-yellow, banded crimson, segms. long-acuminate.—Early.

Kolpakowskiana. Low, with narrow pointed lys.: fl. yellow, often reddish or purple outside, segms. narrow and mostly acute. Turkestan.—Early. T. Borszczowii probably belongs here.

kuschkénsis. To 14 in.: fl. vermilion-red with large black blotches. Turkestan.

lanata. Dwarf: fl. goblet-shaped, rich vermilion with large black spot at base of segms. Bokhara.

linifòlia. Low, 10 in. or less, with very narrow grass-like lvs.: fl. medium size, crimson with bluish bottom, segms. short, acute. Bokhara.—Early.

lùtea. To 1 ft. or more: lvs. somewhat falcate, to 14 in. long, erect, pale green, margins undulate and somewhat ciliate: fl. yellow, campanulate, perianth erect, segms. oblong-ovate, on slender glabrous scape. Galatia. Var. måjor is offered.

Marjolettii. Slender, 18-24 in., with narrow and acuminate lvs. fl. yellowish with broad purple-margined short-acute segms. Savoy.—Midseason.

Mauriana: T. Didieri var.

Micheliana. To 1 ft., with wavv very glaucous lvs. often striped brown: fl. large, vermilion-scarlet tinged outside with lilac, black spots at base of segms. S. W. Asia.

montana (T. Boissiers). To 8 in.: lvs. long-pointed, glaucous: fl. deep crimson with paler outside, 2 in. across, outer segms. acute. Persia, Afghanistan.

Oculus-solis. Tall, with rather broad acute lvs.: fl. large, bright red with large black yellow-margined bottom, segms. acute. S. Eu.—Early.

Orphanidea. Low, slender, 12 in., the long narrow lvs. equalling or exceeding scape: fl. yellow and tinted, with narrow very acute segms. Greece.—Early.

patens (T. persica). Low, mostly 9 in.. or less, with narrow often curved lvs.: fls. 1-3, whitish or yellowish with yellow bottom, fragrant, segmes, narrow and obtuse or nearly so. Siberia.—Midseason.

pérsica: T. patens.

polychròma. Dwarf, with narrow acute lvs. exceeding the very short scape: fl. vari-colored, yellowish and purplish, segms. very acute. Persia.—Early.

præcox. Leafy, lvs. broad at base and long-pointed, st. 12-18 in.: fl. red or scarlet with purplish bottom, segms. acute or cuspidate. S. Eu. to Asia.—Early.

præstans. Medium, 12-18 in., with broad short-pointed lvs.: fl. light red, segms. nearly or quite obtuse but cuspidate. Bokhara. Var. Tubergènii has sts. of 2-5 fls. each.—

primúlina. Low, 12 in. or less: lvs. very narrow: fl. pale primrose, fragrant, segms. narrow and acute. Algeria.

pulchélla. Very low, 6 in. or less: lvs. narrow, next the ground: fl. mauve-red, yellow in bottom, segms. acute. S. W. Asia.

retrofléxa. Supposed to be a hybrid between T. Gesneriana and T. acuminata: fl. yellow, darker at base.

rùbra máxima: T. Gesneriana form.

saxátilis. Medium, 12-18 in.: lvs. narrow: fls. usually 2, mauve with yellow bottom, fragrant, segms. acute. Crete.

sharonénsis. Stemless, or at, subterranean, to 3 in: lvs. narrowly linear to lanceolate, often overtopping the fl., margins wavy and chilate, circinate at tip: fl. solitary, crimson with black spot at base of each segm., campanulate, segms. cuspidate, to 1 in. long. Coastal plains of Persia to Syria.—Often confused with T. montana from which it differs in its narrower and somewhat cucinate lvs.

Spréngeri. Medium, 8-18 in., with long narrow acute lvs.: fl. orange-scarlet with darker bottom, segms. cuspidate. Armenia.—Very late.

stenopétala: T. acuminata,

stelläta. Medium: lvs. long and narrow: fl. white or yellow without darker bottom, segms. short-acute. Himalaya, Afghanistan.—Midseason.

strangulata. Like T. suaveolens but taller, mostly red-fld. with black blotch but running to yellows. Italy.

suaveolens. Duc Van Thol T. Low, 4-8 in., broad-lvd.: fl. bright yellow, very fragrant, segms. acute. S. Eu.—Very early.

sylvéstris (T. florentma). Medium, 9-18 in.: lvs. narrow: fl. (sometimes 2) bright yellow, fragrant, segms. narrow and acute. Eu.—Midseason to late.

Tubergeniàna. Lvs. long-acuminate fl. large, bright crimson with dark-margined blotch, segms. long-pointed. Bokhara.

turkestánica: T. biflora var.

violàcea. To 1 ft.: fl. bell-shaped, fragrant, 2 m. across, mauve-red or rosy-crimson flushed with purple, with dark blotch at base of segms. Persia. Listed forms are pállida, fl. white tinged pink with dark blue base, and rôsea, fl. pink with blue base.

viridiflora. Tall, to 2 ft., with large broad lys: fl. large, light soft green with yellowish or whitish edges, segms. abruptly acute or cusipidate. Cultigen.—Midseason to late. Var. præcox is an early large pale green kind.

Willmottiæ. Tall. 18 in, or more, with broad long-acute lvs.: fl. large, clear yellow, slightly fragrant. Asia Minor.—Late.

Wilsoniana. To 8 in.: fl. vermilion-scarlet margined with red, with bluish-black blotch at base of segms. Mts., S. W. Asia.

TUMION: Torreya.

TUNA: Opuntia.

TUNG-OIL-TREE: Aleurites Fordii.

TÙNICA. Caryophyllaceæ. Herbaceous wirystemmed annuals and perennials with small narrow lvs. and fl.-heads similar to Dianthus but smaller; native in the Medit. region. Grown as edging plants in the border or rock-garden. Propagated by seed and division.

graminea. Tufted per. to 1 ft.: lvs. setaceous: fis. rose, to 1/3 in. across. Greece.

prolifera: Dianthus prolifer.

Saxifraga (Petrorhagia Saxifraga). Tunic-Flower. Coat-Flower. Hardy per to 10 in., tufted, spreading: lvs. narrow, linear, to ½ in. long: fls. pink or pale purple,

14 in. across, summer. Eu.; adventive in E. U. S. Var. álba has white fis., carnôsa fiesh-colored, rôsea rose-pink, and fibre-plêno double fis. to 14 in. across. Var. nâna is lated. Var. splêndens is an improved form.

velùtina. Perhaps better kept in Dianthus; allied to D. prolifer from which it differs in being pubescent and having 2-parted petals. S. Eu.—Hardly a hort. subject.

TUNIC-FLOWER: Tunica Saxifraga.

TUNKA: Benincasa hispida.

TUPELO: Nussa.

TUPIDÁNTHUS. Araliaceæ. Indian small tree which eventually becomes a tall climber, suitable for cult. in warm climates and sometimes raised under glass for its abundant glossygreen foliage. T. calyptràtus. Lvs. palmately divided into 7–9 entire drooping lfts. to 7 in. long: fls. green, borne in compound umbels.

TURGID: swollen from fullness.
TURKEY-BEARD: Xerophyllum.

TURKS-TURBAN: Clerodendrum Siphonanthus.

TURMERIC: see Curcuma longa.

TURNIP. Underground tubers of Brassica Rapa. Seed is produced from tubers planted out after the winter or that may be left in the ground in very mild climates; the early varieties often run to seed the first year if sown very early and not gathered at the maturity of the tuber. Turnips are hardy cool-season plants, of unknown nativity, but they will not withstand as much frost as rutabagas.

The true turnips are mostly "flat," that is, not bearing a long neck and the tuber broad rather than long although there are exceptions in the shape; most of them grown in this country are white- or light-fleshed; the substance is less firm and durable than in the rutabaga. All the usual turnips are short-season plants; the supply for late autumn and winter use in the northern states is grown from seeds sown in July-"on the twenty-fifth of July sow your turnips wet or dry" is an old saw. The seeds are broadcast or sown in drills that are 10-20 inches apart; it is necessary to thin the plants well if the best tubers are desired. For drill culture, 1 to 2 pounds of seed are required to the acre. For late spring or summer use, seeds are sown, of early varieties, as soon as the ground is fit. The commonest pest of turnips is aphis, which is controlled (as on cabbage) by thorough spraying or dusting with nicotine preparations.

The Seven-top turnip is Brassica septiceps.

TURNIP, INDIAN: Arisæma triphyllum.
TURPENTINE TREE: Syncarpia glomulifera.

TURRÆA. Meliaceæ. Trees or shrubs of Asia and Afr., with alternate simple lvs., white fls. and capsular frs.; grown out-of-doors in S. Calif. and sometimes under glass.

obtusifòlia. Broad attractive shrub to 3 ft. or more: lvs. obovate, to 2 in. long, sometimes 3-lobed near tip: fls. 11/2 in. long, many and giving the bush a pleasing effect; petals very narrow, 1 in. or more long. S. Afr.

TIIRTLE-HEAD: Chelone.

TUSSACIA. Gesneriaceæ. Herbs of trop. Amer. with creeping rhizomes, opposite lvs., and tubular fls. in axillary clusters, the calyx colored; one species intro. in S. Calif.

pulchélla. To 1½ ft.: lvs. to 10 in. long and 4 in. across, toothed, pale beneath: fis. orange-yellow marked with red, ¼ in. across; calyx salmon-colored, ½ in. long. W. Indies.

TUSSILAGO. Compositæ. Stemless per. herb native in Eu., India and Asia and nat. in N. Amer., sometimes grown as a ground-cover and to hold banks. Propagated by root-cuttings. T. Fárfara. Collistoot. Lvs. cordate-orbicular, to 7 in. across, lobed and toothed, white-tomentose beneath: heads solitary, on scaly scapes to 1½ ft. high in very early spring before the lvs., the ray-fls. bright yellow; pappus of white bristles, prominent in the dandelion-like head.

TUTSAN: Hypericum Androsæmum.

TWAYBLADE: Liparis, Listera.

TWEEDIA: Oxupetalum.

TWIN-BERRY: Muchella repens. -Leaf: Jeffersonia diphylla.

TWINFLOWER: Linnxa borealis.

TWINSPUR: Diascia.

TWISTED STALK: Streptopus.

TYDÆA: Isoloma.

TÝPHA. CAT-TAIL. The only genus of *Ty-phaceæ*. Per. herbs in swamps, having creeping rootstocks, tall erect unbranched sts., long, linear, flat, erect, parallel-veined lvs., and unisexual fls. in dense terminal spikes of which the staminate is uppermost; species few, widely distributed in temp. and trop. regions.

Cat-tails are sometimes employed in bog-gardening and on the margins of pools for permanent stately effect. The leaves are used in basketry and for bottoming chairs. Propagated usually by division; sometimes by seeds planted in pots in water.

angustifòlia. To 10 ft.: lvs. to ½ in. across: spikes light brown, the staminate and pistillate parts separated. Amer., Eu., Asia.

latifòlia. To 8 ft.: lvs. to 1 in. across: spikes dark brown to black, the staminate and pistillate parts contiguous. N. Amer., Eu., Asia.

UDO: Aralia cordata.

ULEX. FURZE. GORSE. WHIN. Leguminosæ. Very spiny shrubs with very small spine-tipped lvs. which are often scale-like, yellow papilio-naceous fls., and small ovoid pods; grown for ornament and cover on poor and sandy soils.

Seeds should be sown where the plants are to stand or singly in pots, for they do not bear transplanting well. Propagated also by cuttings or grafting on *U. europæus*. Require winter protection in the North.

europæus. To 4 ft.: fls. fragrant, 34 in. long, in spring in warm climates flowering all the year. Eu. Var. nanus or in warm climates flowering all the year. Eu. is U. nanus. Var. plenus has double fls.

lusitánicus. Shrub with densely pubescent spiny sts.: lvs. triangular-acuminate, spine-tipped: fls. bright yellow: pods broadly obovate, hirsute. Portugal.

nanus. Dwarf, to 2 ft.: fls. about ½ in. long, in autumn. W. Eu.

ÚLLUCUS. Basellacex. Decumbent or climbing per, native in Peru, Bolivia and Chile, grown there for the edible tuberous roots and sometimes planted in our territory for interest. U. tuberdsus. Ulluco. Lvs. alternate, fleshy, ovate: fls. small, golden-yellow, in large axillary racemes.—Propagated by division of tubers.

ULMACEÆ. ELM FAMILY. Trees and shrubs of about 15 genera widely distributed, having alternate simple lys., small bisexual or unisexual fls. without petals, with 3-9-parted calyx and as many or twice as many stamens, superior 1-celled ovary, and fr. a samara, nut or drupe. Several genera are grown for ornament, as Celtis, Hemiptelea, Holoptelea, Planera, Trema, Ulmus and Zelkova.

ULMARIA: Filipendula.

ÚLMUS. Elm. *Ulmacex*. Deciduous trees of the north temp. zone, with alternate toothed short-stalked lvs., inconspicuous fls. in clusters or racemes usually before the lvs., and fr. a flat nutlet surrounded by a wing, making a samara.

Elms are favorite shade and avenue trees and of easy cultivation. Practically all the species here listed are hardy in the North, some of them being among the hardiest lawn and street trees. However, they are attacked by several insects and in such case should be sprayed every year for best results. They will bear transplanting well. Propagated by seeds sown as soon as ripe, by layers in autumn and some species by greenwood cuttings under glass. Varieties may be grafted on common stocks.

alata. Wahoo E. To 50 ft., the branchlets with 2 broad corky wings: lvs. small, to 2½ in. long, oblong: fr. about ½ in. long, with incurved beaks, covered with long white hairs. Va. to Fla. and Tex.

americana. American, White, or Water E. To 120 ft.: lvs. to 6 in. long: fls. on slender drooping stalks: fr. with densely ciliate margins and deeply notched wings. Newf. to Fla. and Rocky Mts.—Very commonly planted. Var. adrea, lvs. yellow. Var. columnaris, of columnar form. Var. pendula, branches long and drooping. The varietal names Littlefordii, molinénsis, pyramidàlis and Urnii are in the trade, representing variations in character of branching.

asplenifòlia: U. glabra var. crispa.

bélgica: U. hollandica var. Berárdii: U. procera var.

betulifòlia: U. procera var. nigrescens.

campéstris: U. procera.

campestris: U. procera.

carpinifòlia (U. foliacea. U. nitens). SMOOTHLEAF E. Pyramidal or upright tree, often with corky branches, commonly suckering; young branches mostly glabrous: lvs. not large, 2-4 in. long, glossy and nearly or quite smooth above and nearly or quite glabrous underneath, obliquely ovate to obovate, double-serrate: fr. obovate, with seed close to upper notch. N. Afr., Eu. and W. Asia. Var. cornubiénsis (var. stricta. U. stricta). CORNISH E. Branches ereet and top narrow: lvs. 2-3 in. long, oval or broadly obovate, more or less tufted-pubescent underneath. Var.

Dampièri. Narrow-topped tree with broad very deeply toothed lvs. crowded on short branches. Var. Koopmannii. Head close, oval: lvs. small, grayish-puberulent beneath and branches often corky. Var péndula. Branches very slender and drooping. Var. propéndens. Branches stiff but drooping: lvs. rather small, and branches corky. Var. sarnifensis (var. Whealleyn. U. campestris var. monumentalis). Guernsber of Jersey E. More stiff and erect than the true Cornish elm, lvs. broader and less tufted underneath. Var. stricta is var. cornubiensis. Var. suberòsa. Small tree, branches corky: lvs. small and roughish above, elliptic to obovate. Var. umbraculifera. Globe E. Head dense and broad: lvs. 2-3 in. long, elliptic to broad-ovate, somewhat rough above. Var. Webbiàna. Head narrow: lvs. 2-3 in. long, ovate to obovate, roughish above, folded lengthwise. Var. Whèatley is var. sarniensis. Var. Weèdei. Narrow-topped with crowded yellowish deeply toothed Narrow-topped with crowded yellowish deeply toothed broad Iva

chinénsis: U. parvifolia.

Clémmeri: U. hollandica var. Klemmeri.

crassifòlia. CEDAR E. Medium-sized tree with stiff corky or scaly branches: Ivs. stiffish, 1 or 2 in long, oblong to ovate-oblong, obtuse or nearly so, closely serrate, rough above and somewhat pubescent underneath. Miss. to Tex. and N. Mex.; sometimes planted in its region. Blooms in

Dampièri: U. carpinifolia var. Dauvéssei: U. hollandica var. Dippeliana: U. hollandica. office. Il Imnie

exoniénsis: U. alabra var.

foliàcea: U. carpinifolia.

fúlva (U. Heyderi. U. rubra). SLIPPERY F. Small or medium-sized open-headed tree with pubescent branchlets: lvs. large, to 6 or 8 in. long, obovate or broadly oblong, acuminate, coarsely serrate, very rough above and pubescent beneath. Canada to Fla.

glabra (U. scabra, U. montana). WYCH E. SCOTCH E. glabra (U. scabra, U. montana). Wych E. Scotch E. Wide-spreading large tree not suckering: 1vs. large, dull green, 4-8 in. long, mostly obovate, coarsely double-serrate, rough above and pubescent beneath: young parts pubescent: fr. large and abundantly produced, with seed in center. Great Britain to Siberia.—Much planted in N. Amer., in several forms. Var. atropurparea. Lvs. purple. Var. Camperdownii. Campendown E. Branches gracefully drooping forming a globose head; grown as a top-worked head on a straight elim stock. Var. cornita (U. tradens and triserrata). Honned E., from the two long projections or lobes on the shoulders or apex of the larger lvs. Var. crispa (U. asplenifolia, incisa and urlicæfolia). Fernleaf E. Lvs. thick and narrow (1-2 in. broad), heavily veined and the margins crispate-serrate; sometimes pendulous; slow-growing tree. Var. exoniensis (var. fastigiata. U. exomensis). Exeter E. Branches erect, forming a narrow-headed tree. Var. fastigiata is var. exoniensis. Var lutéscens. Lvs. yellow. Var. nana. Bush E. Bush-like, 4-6 ft., small-lyd. Var. péndula. Tabletor E. Branches stiffy drooping and more or less elbowed, making a spreading top; worked on erect stocks. Var. pyramidalis is var. exoniensis. Var. variegata. Lvs. variegated. Wide-spreading large tree not suckering: lvs. large, dull

Heyderi: U. fulna.

Heỳderi: U. fulva.

hollándica (U. Dippeliana and U. major). Holland or Dutch E. A group of forms supposed to be hybrid derivatives of U. glabra and U. carpinifolia, with mostly large and rather prominently stalked ovate or broadly elliptic lvs. that are nearly smooth and usually glossy above and little pubescent underneath and with unequal base, the veins 14 pairs or less: young parts glabrous or nearly so: seed near the notch of the fr.: large broad trees, often with drooping branches, suckering from the trunk. Var. bélgica (U. latifolia). Belgian E. Young shoots becoming smooth: lvs. 4-5 or 6 in. long, most y rather narrowly obovate, soft-pubescent beneath and veins 14-18 pairs. Var. Dauvéssei. Tree with broad pyramidal head and hairy branchelets: lvs. soft-pubescent beneath, evry unequal at base, to 4 or 5 in. long; perhaps to be associated with U. glabra. Var. Dümontii. Similar to var. belgica but with narrow head. Var. Klémmeri. Tree with narrow pyramidal head, and young branches more or less short-hairy: lvs. 3-4 in. long, ovate, roughish above and slightly pubescent beneath. Var. péndula. Downton E. Branchlets somewhat pubescent when young, drooping: lvs. about 3-4 in. long, eliptic, rather thick, smooth above and slightly pubescent underneath. Var. Pittebrsii. Strong-growing: lvs. large, to 5 in. long, produly ovate to obovate, more or less rough and pubescent; perhaps nearer to U. glabra. Var. supérba (U. superba). Narrow-pyramidal: lvs. to 5 in. long, very oblique at base, glabrous except axillary tutts beneath. Var. végeta (U. Huntingdonii). Huntingdon E. Vigorous

large tree, with ascending branches: lvs. elliptic, to 5 or 6 in. long, mostly smooth above and pubescent beneath only in the axils, veins 14-18 pairs.

Huntingdonii: U. hollandica var. vegeta.

incisa: U. glabra var. crispa.

japónica. Large broad-topped tree with pubescent young branches which are often somewhat drooping: lvs. 3-5 in. long, obovate or oblong, acuminate, veins 12-16 pairs, roughish above and pubescent underneath: seed near apex of fr. Farther Asia.

Kléhmii, Klémmeri: U. hollandica var. Klemmeri.

lavis (*U. efusa* and *U. pedunculata*). European White E. Tall open-headed tree with branchlets at first pubescent: lvs. to 4 or 5 in. long, oblong or obovate, usually broadest above middle, acuminate, unequal at base, mostly glabrous and smooth above, pubescent underneath. Cent. Eu. and

latifòlia: U. hollandica var. beloica.

Littlefordii: hort, name for habit form of U. americana.

major: U. hollandica. montàna: U. glabra.

nígricans: U. procera var. nigrescens.

nitens: U. carpinifolia.

parvifòlia (U. chinensis). CHINESE E. Open-headed parviolia (U. chinesis). CHINESE E. Open-neaded tree, partially evergreen in mild climates, blooming in late summer or autumn: lvs. small and firm or thick, 1-2 or 3 in. long, elliptic to ovate, shining and mostly smooth above, blog emptice to vace, animing and nesses smooth above, becoming nearly or quite smooth underneath: fr. about ½ in. long: branchlets thinly pubescent. China, Japan; hardy N. Var. sempérvirens is listed and may not be distinct from typical form.

pedunculàta: U. lævis. Pitteursii: U. hollandica var.

Pitteursii: U. hollandica var.

procèra (U. campestris. U. sativa). English E. Very tall tree, to 150 ft. (whence the name procera, very tall), with more or less pubescent young shoots, usually suckering: lvs. 2-4 in. long, mostly relatively small, broadly oval or ovate, oblique at base, acuminate, roughish above and pubescent beneath: seed above the middle in the notched fr. W. and S. Eu.; in Britain supposed to be native only in S. England.—Popular tree in northeastern states; rarely produces seeds and is propagated by suckers. The continental form is var. australis, with thicker firm sharperpointed lvs Var. argénteo-variegàta (var. variegata), lvs. marked white. Var. Berárdii, small bushy tree with small rather narrow lvs. 1-2 in. long, coarsely notched. Var. Dampièri is U. carpiniolia var. Var. monumentàlis is U. carpiniolia var. Sarmensis. Var. nigréscens (U. nigricans, U. betulifolia), lvs. elliptic or ovate, doubly serrate, dark colored. Var. péndula has drooping branches. Var. purpuracens, lvs. dark purple, of ordinary size. Var. supérba is U. hollandica var. Var. umbraculifera is U. carpinifolia var. Var. umbraculifera is U. carpinifolia var. Var. umbraculifera is U. carpinifolia var. Var. wheatley is U. carpinifolia var. Sarmensis.

pùmila. Dwarf E. Small tree, sometimes shrub-like,

pûmila. Dwarf E. Small tree, sometimes shrub-like, ith slender often drooping branches: lvs. 2-3 in. long. with slender often drooping branches: lvs. 2-3 in. long, elliptic to oblong, long- or short-pointed, not deeply serrate, smooth above, mostly glabrous underneath or with axillary tufts: fr. about ½ in long, from early spring fls.: branchlets glabrous or pubescent only when young: foliage not lustrous nor coriaceous. Turkestan to N. China; hardy N. Var. arborea (U. turkestanica). A tall tree with narrowly ovate or ovate-lanceolate lvs. shining above.

racemòsa: U. Thomasii. rubra: U. fulva. sativa: U. procera. scàbra: U. glabra.

sempérvirens: see U. parvifolia.

seroftina. September E. Medium-sized tree with somewhat pendulous often corky branches, blooming in autumn: lvs. small, 2-3 in. long, oblong or somewhat obovate, acuminate, veins about 20 pairs, smooth and shining above, pubescent on veins underneath. Ky. south and west, planted in its region.—Sometimes called Red E., a name also used for *U. fulva*.

sibírica: U. fulva.

stricta: U. carpinifolia var. cornubiensis.

supérba: U. hollandica var.

Thomasii (U. racemosa of cult.). Rock E. Large tree, with very corky branches and pubescent buds: lvs. large, to 4 or 6 in. long, elliptic to oblong-obovate, rather short-pointed, glabrous or nearly so above, pubescent underneath, coarsely serrate: fr. ½ in. or more long, notched, pubescent. Que. to Tenn. and Neb.

tridens: U. glabra var. cornuta. triserràta: U. glabra var. cornuta. turkestánica: U. pumila var. arborea.

urticæfòlia: U. alabra var. crispa.

végeta: U. hollandica var.

vàseyi, the "vase elm," probably a form of U. americana.

viminalis. Willow E. Slender tree with drooping spray and narrow oval or oblanceolate incised lvs., sometimes variegated: fr. not known. Eu, of doubtful origin, probably a form of *U. proceru.*—Plants of another species have been grown in the U. S. under this name.

Webbiana: U. carpinifolia var.

Whèatleyi: U. carpinifolia var. sarniensis.

Wrèdei: U. carpinifolia var.

UMBEL: corymbose or indeterminate cluster with branches or rays arising from a common point and about equal in length, resembling framework of umbrella; umbels are characteristic of the Umbelliferæ.

UMBELLÍFERÆ. PARSLEY OF CARROT FAM-ILY. A large and widely distributed family, mostly in temp. and boreal regions, of about 250 genera, furnishing many plants grown for food, flavoring, medicinal products, and some for orna-Commonly herbs, rarely somewhat shrubby, with alternate mostly compound lvs., small unshowy bisexual fls. in simple or compound umbels or sometimes heads, having 5-lobed calyx, 5 petals and stamens, inferior 2celled ovary, and dry fr. of 2 ribbed carpels mostly bearing oil-tubes and splitting apart. They are mostly plants of strong or pungent odor, many of them with poisonous qualities, some of them yielding spices. The genera chiefly known to cult. are: Aciphylla, Actinotus, Ægopodium, Ammi, Anethum, Angelica, Anisotome, Anthriscus, Apium, Arracacia, Astrantia, Athamanta, Bupleurum, Carum, Chærophyllum, Cicuta, Conium, Coriandrum, Crithmum, Cum-Daucus, Erigenia, Eryngium, Ferula, Fœniculum, Hacquetia, Harbouria, Heracleum, Hydrocotyle, Laserpitium, Leptotænia, Levisticum, Ligusticum, Lomatium, Meum, Molopospermum, Musineon, Myrrhis, Oreoxis, Osmor-Pastinaca, Petroselinum, Peucedanum, Phellopterus, Pimpinella, Pseudocymopteris, Selinum, Sium, Smyrnium, Taenidia, Trachymene, Zizia.

UMBELLULÀRIA. Lauracex. Evergreen tree to 80 ft. high, native in Calif. and Ore. U. califórnica. California-Laurel. Lvs. ovateoblong to lanceolate, to 5 in. long, shining above: fls. yellowish-green, in many-fld. umbels: fr. a greenish or purplish drupe to 1 in. long.—It thrives in fairly moist soils. Propagated by seeds.

UMBÍLICUS. Crassulaceæ. Per. succulents with lvs. alternate, fleshy, peltate or cordate or orbicular, depressed in the center: sts. mostly simple, terminating in a raceme or panicle; fls. 5-parted, yellowish or greenish, with petals fused into a long cylindrical or campanulate tube. About 16 species in the Old World, in N. Afr., S. Eu., W. Asia. Cult. as for Sedum and Sempervivum; see Succulents.

chrysanthus: Sedum chrysanthum.

horizontalis. Basal lvs. peltate, upper lvs. lanceolate to subulate, entire: floral bracts subulate; fls. standing out at right angles from axis of raceme, with cylindrical corolla, to ½ in. long. Medit. region.

pendulinus (Cotyledon Umbilicus). NAVELWORT. PENNY-wort. To 1 ft.: lvs. orbicular, peltate, coarsely toothed; fis. yellowish-green, drooping. W. Eu. to W. Asia and trop. Afr.

pérsicus: species of doubtful status, possibly a var. of Sedum sempervivoides.

Péstalozzæ: possibly to be referred to Sedum semper-

platyphýllus: Sedum sempervivoides, spindsus: Sedum spinosum. Winkleri: Sedum Winkleri.

UMBRELLA-LEAF: Diphylleia cymosa. -Plant: Cyperus allernifolius, Peliiphyllum pellalum. -Tree: Magnolia trippiala. -Tree, Texas: Melia Azedarach var. umbraculiformis. -Wort: Allionia.

UMKOKOLO: Dovyalis caffra.
UNAMIA ALBA: Aster ptarmicoides.

UNGNADIA. Sapindaceæ. Shrub or tree to 30 ft., native from Tex. to Mex. and occasionally planted in the S. U. speciosa. Texan, Mexican or Spanish Buckeye. Lvs. alternate, of 5–9 ovate-lanceolate shining lfts. to 5 in. long, wavytoothed: fls. rose, 1 in. across, in clusters in Apr.—May before the lys.: fr. a leathery 3-valved caps. 2 in. across, with large black seeds. Not hardy in northern states.

UNICORN-PLANT: Proboscidea. UNIFOLIUM: Maianthemum.

UNIOLA. Graminex. N. American per. grasses with prominent flat 2-edged spikelets borne in panicles; one species grown for ornament. See Grasses.

latifolia. To 5 ft.: lvs. to 9 in. long and 1 in. wide, rough on margins. spikelets to 1½ in. long, on slender hanging stalks, the panicles to 10 in. long and drooping. Pa. to Fla. and Tex.

UNISEXUAL: of one sex; staminate only or pistillate only.

UPAS-TREE: Antiaris toxicaria.

URBINIA: Echeveria.
URD: Phaseolus Mungo.

ÙRERA. Urticaceæ. Trop. shrubs or trees often armed with stinging hairs, having alternate simple lvs. and unisexual fls. in panicles; one species sometimes planted in S. Fla. and southward.

caracasana. Shrub to 20 ft.: lvs. ovate, cordate at base, the largest to 1 ft. long and 10 in. wide: fls. in clusters from the branches: fr. vermilion-colored, very small. Trop. Amer.—See Bahmeria Urera.

URGÍNEA. Liliacex. Bulbous herbs with basal lvs. and whitish, yellowish or rose fls. in racemes terminating the scapes, the perianth-segms. distinct; the bulbs are collected in the wild for their medicinal properties; also occasionally grown for ornament but only partially hardy.

marstima (U. Scilla). Sea-Onion. To 3 ft.: lvs. to 1½ ft. long and 4 in. wide: fls. whitish, ½ in. long, on racemes to 1½ ft. long. Canaries to Syria, S. Afr.

Scilla: U. maritima.

UROPÁPPUS. Compositæ. Low ann. herbs of W. N. Amer. with basal lvs. and solitary heads of yellow ligulate fls.; pappus of scales or awns. Sometimes seen in the flower-garden.

linearifolius (Microseris linearifolia). To 1½ ft.: lvs. linear, to 6 in. long, entire, toothed or lobed: heads to 1¾ in. across, with white or brown pappus. Wash. to Calif. and New Mex.

UROSPÉRMUM. Compositæ. A small genus of usually ann. or bien. herbs from the Medit. region, having toothed or lyrately pinnatifid lvs. and long-peduncled yellow heads of both ray- and disk-fls., the former truncately 5-toothed at apex. Propagated by seed and may be grown in the border or for cutting.

Dalechâmpii. Bien. or sometimes per. to 1½ ft.: lower lvs. runcinate, pinnatifid, pubescent, upper ones ovate to lanceolate, often entire: heads solitary, to 2 in. across, sulfur-yellow, involucre obconical, soft-pubescent.

UROSTIGMA: Ficus microphylla.

URSÍNIA. Compositæ. S. African ann. or perherbs or subshrubs, strongly scented, the lvs. alternate and pinnately cut; heads daisy-like, solitary or loosely clustered; pappus of scales and bristles.

The annual flower-garden ursinias are grown from seed planted indoors or directly in the open.

anethoides (Sphenogyne anethoides). Shrubby per, to 2 ft., often webby-pubescent: lvs. pinnatisect, to 1½ in. long, segms. semi-terete: fis. blight golden-yellow, in solitary heads to 1 in. across, on pedunces to 8 in. long.—Confused with U. anthemoides from which it differs in its semi-terete lf.-segms. and uniformly colored ray-fis. Perhaps best treated as an ann.

anthemoides (Sphenogine anthemoides). Ann, to 1 ft.: lvs. pinnate into flat linear acute lobes: heads solitary, on long drooping sts., rays yellow, purplish on the outside.—In the N. the plant does well in the cool greenhouse.

fæniculàcea (Sphenogyne fæniculacea). Ann. to 1 ft.: lvs. bipinnate into linear acute lobes: heads solitary on elongate naked peduncles, rays yellow on each side.

ptilchra (Sphenogyne speciosa). Ann., branching, to 2 ft.: lvs. 2-pinnate into linear lobes: heads yellow or orange, 2 in. across, solitary, rays spotted brown-purple at the base.

URTICA. NETTLE. Urticaceæ. Herbs with stinging hairs, opposite toothed or cut lvs. and very small unisexual fls. in axillary clusters or panicles; one species sometimes grown for medicinal properties and another for ornament. Propagated by seeds and cuttings.

didica. Stinging N. Per. to 4 ft.: lvs. ovate, to 5 in. long and 3 in. wide, pubescent beneath: fls. in clusters in branched panicles. Eu., Asia; nat. in N. Amer.

pilulifera. Roman N. Ann. to 2 ft.: lvs. ovate or heart-shaped, to 3 in. long: stammate fis. in clusters, pistillate in globular heads. S. Eu.—Sometimes grown under glass N. tillie. Roman grand and tillie.

URTICACEÆ. NETTLE FAMILY. More than 40 widely distributed genera of herbs, shrubs or trees with simple lvs., small mostly unisexual fls. having 3-5-parted calyx, 3-5 stamens, superior 1-celled ovary and fr. an achene. Some of the kinds bear sharp stinging hairs. The plants are of minor importance horticulturally. A few genera are grown for ornament, for fiber, or as drug plants, as Bæhmeria, Debregeasia, Gesnouinia, Helxine, Parietaria, Pellionia, Pilea, Urera, Urtica.

UTRICLE: a small bladder; a bladdery 1-seeded fruit.

UTRICULÀRIA. BLADDERWORT, Lentibulariacex. Aquatic herbs or terrestrial epiphytes of wide distribution, of minor importance in hort. although several names persist in the literature. The group has been divided into several smaller genera; under such treatment Utricularia vulgaris, of Eurasia (with a thick blunt spur), remains in the genus, and there are similar North American plants that may be employed in aquaria, as *U. macrorhiza* (or *U. vulgaris* var. americana) with an awl-like spur on the fl., and U. minor a much smaller plant with sts. not free-floating but creeping on the bottom in shallow water. The other species most fre-quently mentioned in hort. literature pass into other genera although for the present purposes of the horticulturist they may well be retained in Utricularia: U. bifida and U. prehensilis are species of Stomoisia under recent treatment; *U. alpina* (*U. montana*), *U. Endresii* which is very much like U. alpina except in the smaller and thinner lvs. and lilac fls. with yellow palate, U. janthina and U. reniformis, are species of

Orchyllium: U. longifolia is Calpidisca. plants have been described as *U. longifolia*; both are species of Calpidisca. The *U. longifolia* of Sander, 1843, is from Brazil; *U. longifolia* of Sander, 1893, is from Mt. Roraima, S. Amer. and *U. Forgetiana* may be the same.

alpina (U. montana of old literature but now Orchyllium alpinum) is a trop. American plant with clusters of hollow tuber-like bladders on the roots at base of st.: lvs. elliptic-lanceolate, to 6 in. long: fls. orchid-like, 1½ in. across, white with yellow palate, 1-4 on a scape.—This plant is apparently in cult.

UVA-URSI: Arctostaphylos.

UVULÀRIA. BELLWORT. Liliacex. Per. herbs from rootstocks, having alternate sessile or perfoliate lys. and yellow bell-shaped drooping fls. mostly solitary at ends of branches.

Bellworts are sometimes grown in the wild-garden. Of easy cultivation in rich soil and shady locations. Propagated by division.

flava: U. perfoliata var.

flàva: U. perfoliata var. grandiflòra. To 1½ ft.: lvs. oblong to ovate, to 5 in. long, perfoliate, pubescent beneath: fis. lemon-yellow, to 1½ in. long. Que. to Ga. and Kans. perfoliata. To 1½ ft.: lvs. oblong to ovate, to 5 in. long, glabrous, perfoliate: fis. pale yellow, 1½ in. long. Que. to Fla. and Miss. Var. flàva has deeper yellow fis. pubérula (Oakesia and Oakesiella puberula). Differs from U. sessul/olia in its stiffer lvs. whose margins are rougher, and ovary and caps. not stipitate. N. B. to Ga. west to Minn. and Ark.

sessilifolia (Oakesta and Oakestella sessilifolia). To 1 ft.: lvs. oblong-lanceolate, to 3 in. long, sessile: fis. greenish-yellow, 1½ in. long. N. B. to Ga. and Ark.

VACCARIA: Sanonaria Vaccaria.

VACCÍNIUM. BLUEBERRY. CRANBERRY. Ericacex; by some authors placed in Vacciniacex. Shrubs with alternate deciduous or evergreen simple lvs. which often turn brilliant colors in autumn, cylindrical to wheel-shaped fls., and fr. a berry capped by the persistent calvx; native in the northern hemisphere and mts. of tropics. Some authors divide the group into several

Some of the vacciniums are grown for ornament in borders or colonized in wild areas. Others are grown for the edible fruits. Most of them require peaty or sandy soils and do not thrive in limy lands. For culture see Blueberry and Cranberry.

angustifolium (V. pensylvanicum var. angustifolium). Deciduous, to 1 ft.: lvs. lanceolate, to ¾ in. long, serrulate, with bristle-tupped teeth, glabrous or nearly so: fis. greenish-white, to ¼ in. long, in small clusters, Apr.-May: fr. bluish-black, bloomy, rarely white or reddish, to ½ in. across. Arctic Amer. south to mts. of N. II. and N. Y. Var. lævifolium (V. pensylvanicum). Lownush B. To 2 ft.: lvs. narrowly elliptic to oblong-lanceolate, to ½ in. long. Newf. to Wis, and Va.—Grown for its fr. and now mostly interested with permed bort year available. greatly improved with named hort, vars, available.

arboreum (Batodendron arboreum). FARKLEBERRY. SPARKLEBERRY. To 30 ft., evergreen in the S. but deciduous northward: Ivs. to 2 in. long, shining above: fls. white, 1/4 in. long, in racemes to 2/4 in. long, July-Aug.: fr. black, 1/4 in. across. Va. to Fla. and Tex.; not hardy N.

atrocóccum: V. corymbosum var.

buxifolium. Erect shrub 11/4 ft. high, glabrous: lvs. oblong, to % in. long, obtuse, black dotted beneath, very thick and leathery: fls. white, about 1/8 in. long, in dense racemes. Borneo.

cespitosum. Dwarf Bilberry. Tufted deciduous shrub to 1 ft.: lvs. to 1 ½ in. long, obovate, crenate-serrulate, shining above: fls. white or pink, ½ in. long, solitary, May: fr. black, bloomy, ¼ in. across. N. Amer.

canadense. Deciduous, twiggy, 1-2 ft., making colonies: lvs. narrow, 1 in. or more long, soft-pubescent both sides: fls. greenish-white to reddish, about ¼ in. long: fr. blue, more or less glaucous. Lab. to Man. and Va.

more or less glaucous. Lab. to Man. and Va. corymbosum. Hudhbush or Swamp B. or Whortleberry. Deciduous, to 15 ft.: lvs. to 3 in. long, ovatelanceolate, glabrous to pubescent: fis. white or pinkish, to ½ in. long, in clusters in May; fr. blue-black, bloomy, ½ in. across. Me. to Fla. and La. Var. atrocóccum (V. atrococcum), lvs. and twigs densely pubescent. Integranding forms between this and the type are known. Var. glabrum (var. pallidum), lvs. pale beneath.

crassifolium (Herpothamnus crassifolius), Sts. trailing to 3 ft.: lvs. persistent, broadly ovate to ovate-elliptic, to ½ in. long, minutely and distantly serrulate. fls. pink, ½ in. long, in small axillary clusters, in spring: fr. black, ½ in. across. N. C. to Ga.

Dunalianum. Large shrub: lvs. to 4 in. long, leathery: Himalayas.

erythrocarpum (Oxycoccus erythrocarpus). Deciduous, to 6 ft.: lvs. to 3 in. long: fls. pink, 14 in. long, 4-parted, solitary, nodding, May: fr. red turning purplish, 14 in. across. Va. to Ga.

hirsûtum. HAIRY HUCKLEBERRY. Deciduous, to 3 ft.: lvs. to 2 ½ in. long, pubescent: fls. white or pinkish, to ½ in. across, in short dense racemes, May-June: fr. purplishblack, ¼ in. across. N. C. to Ga.

hýbridum: listed name.

japonicum. To 3½ ft., twigs glabrous: lvs. ovate to oblong, to 2½ in. long, acute, base rounded, bright green above, glaucescent beneath, glabrous, margins bristly-serrulate: fls. pink, 40 ½ in. long: fr. scarlet, pendulous.

macrocárpon (Oxycoccus macrocarpus). LARGE or AMERICAN C. Evergreen, sts. creeping, to 3 ft. long: lys. to ¾ in. long, whitsh beneath: fls. pink, 4-parted, ⅓ in. long, in lateral clusters, June-Aug.: fr. red, to ¾ in. across. Newf. to N. C. and Minn.

membranaceum. To 4½ ft.: lvs. ovate to ovate-oblong, to 3 in. long, thin, glabrous, serrulate: fls. solitary on drooping pedicels to ½ in. long, becoming erect: fr. black. Mich. to B. C. and Ore.

microphyllum: V. scoparium.

Myrsinites (V. nitidum. Cyanococcus Myrsinites).

Evergreen, to 2 ft.: lvs. to ¾ in. long, with bristly teeth, minutely hispid beneath: fls. white or pink, ¼ in. long, in umbel-like clusters: fr. black or glaucous, to ⅓ in. across. N. C. to Fla. and La.

Myrtflus. Whortleberry. Deciduous, to 2 ft.: lvs. to 1½ in. long; fls. pinkish, ½ in. long, solitary, May: fr. black, bloomy, ½ in. across. Eu., N. Asia.

nítidum: V. Myrsintes.

ovatum. To 12 ft., evergreen: lvs. to 1½ in. long, sharply and finely serrate, glaucous, hispid beneath: fls. white or pink, ¼ in. long, in short racemes, July-Aug.: fr. black, ¾ in. across. B. C. to Calif.—Sold for winter green.

Oxycóccus. SMALL or EUROPEAN C. Evergreen, sts. creeping, to 1 ft. long: lvs. to ½ in. long, ovate, acute, glaucous beneath: fis. pink, 4-parted, ¼ in. long, 1-4 in terminal clusters, May-July: fr. red, ½ in. across. N. Eu., N. Asia, E. N. Amer. Var. intermèdium has lvs. to ¾ in. long, longer rachis with 2-10 fis., slightly larger fr.

pállidum (V. vacillans). DRYLAND B. Deciduous shrub pallidum (V. varillans). Dryland B. Decidious shrub to 3 ft., with green white-speckled and glabrous branchlets: lvs. oval to obovate, to 2 in. long, glaucous underneath: fls. white or tinged red, ¼ in. or more long, in dense clusters: fr. blue and glaucous. Me. to Ga. and Mo.

parvifòlium. Deciduous, to 10 ft., branchlets and twigs parvironum. Deciduous, to 10 lt., oranchies and twigs with decurrent ridges: lvs. to ½ in. long: fls. pinkish-white: fr. red, ¼ in. across. Alaska to Calif.

pensylvánicum: V. angustifolium var. lævifolium.

scoparium (V. microphyllum). Shrub to 8 in.: lvs. ovate to elliptic-ovate, to nearly ½ in. long, serulate: fls. white, to ½ in. long, urn-shaped: fr. red, about ¼ in. diam. Alta. to B. C. south to Colo. and Calif.

stamfneum (Polycodium stamneum). Deerserry, Deciduous, to 3 ft., branchlets hairy and not white-speckled: lvs. to 4 in. long, glaucous beneath: fls. white or purplish, ½ in. long, in racemes to 2½ in. long, May-June; stamens exserted: fr. greenish, ½ in. across. Mass. to Fla. and La.

uligindsum. Bog Bilberry. Erect deciduous shiub to nearly 2 ft. with branchlets shredding lvs. oval to obovate, to 1 in. long, glaucous, bright green and remotely pubescent beneath, margins entire: fis. pink or white: fr. blue-black and glaucous. N. Eu., N. Asia, N. Amer.

vacillans: V. pallidum.

virgatum. RABBITEYE B. Deciduous, to 12 ft.: lvs. to 2 in. long, pale beneath: fls. white or pink, ½ in. long, in short racemes, Apr.-May: fr. black, ¼ in. across. Va. to Fla and La.

Vitis-Idæa. Cowberry. To 8 in, creeping, evergreen: lvs. to 1½ in. long, obovate, minutely hispid beneath, margins entire, shining above: fls. white or pink, ½ in. long, in short nodding racemes, May-June. Eu., N. Asia. Var. mājus has larger lvs. and fr. Var. mīnus. Mountain C. Dwarf forming mats: lvs. to ¾ in. long: fls. pink or red. Alaska to Mass.

VACHELLIA. Acacia Farmesiana

VAGNERA: Smilacina.

VALERIAN: Valeriana. African: Fedia Cornucon Greek: Polemonium curuleum. Red: Centranthus ruber. Cornucopiæ.

VALERIÀNA. VALERIAN. Valerianaceæ. Per. herbs or shrubs of various habit in the north temp. zone, with strong-smelling roots, simple or pinnate lvs., small white or rose fls. in cymes or spikes, stamens mostly 3, calyx pappus-like, and fr. a flattened achene.

Valerians are of easy culture in the flower-garden or border. Propagated by seeds or division.

acutiloba. To 1½ ft., dioccious: basal lvs. obovate, entire; st.-lvs. pinnately divided into lanceolate to linear entire segms. Wyo. to New Mex.

álba: sometimes means Centranthus ruber var. alba.

alliariifòlia. Tall: lvs. cordate-ovate, toothed or wavy: fis. pink. E. Eu., W. Asia.

arizônica. To 6 in., with creeping rootstocks: basal lvs. ovate, entire; st.-lvs. 3-5-parted: fis. bisexual, whitish or pinkish, ½ in. long. Ariz.

coccinea: Centranthus ruber.

columbiana. To 10 in.: basal lvs. ovate, entire; st.-lvs. 3-parted, the terminal segm. 3-lobed: fis. whitish, ½ in. long. Wash.

didica (V. palustris. V. sylvatica). To 1 ft., usually diceious: lvs. broad-ovate, lower st.-lvs. lyrate-pinnatifid, upper divided into linear lfts. Eu.

echinata: Valerianella echinata.

edulis. To 4 ft., with edible thick roots: basal lvs. thick, oblanceolate; st.-lvs. divided into linear segms.: fis. diœcious, yellowish-white. N. Amer.

excélsa. Bearing runners ending in rosettes: lvs. pinnately divided into 3-5 pairs of toothed lfts.: fls. bisexual, reddish or white. Eu.

micrantha. To 3 ft., with creeping rootstocks: basal lvs. entire or with 1-2 pairs of lfts.; st.-lvs. 5-7-parted: fls. unisexual, white, ½ in. long. Mts., Mont. to Utah.

montana. To 1 ft., diœcious: lvs. ovate or the upper linear-lanceolate, entire or toothed: fls. bright rose. Eu., W Asia

officinalis. Common V. Garden-Heliotrope. To 5 ft.: lvs. pinnately divided into 7-10 pairs of ovate-oblong to lanceolate segms, entire or toothed: fls. bisexual, whitish, pinkish or lavender, very fragrant. Eu. N. Asia; nat. in N. Amer. Var. alba has white fls. and rubra red.

palústris: V. dioica.

Phù. To 3 ft.: basal lvs. ovate-oblong, entire or toothed at base; st.-lvs. pinnately divided into 3-4 pairs of oblong entire segms.: fls. bisexual, whitish or pinkish. Caucasus. Var. aûrea, young shoots golden-yellow.

pyrenàica. To 4 ft.: basal lvs. cordate-ovate, coarsely toothed; st.-ivs. 3-parted into toothed segms., the terminal largest: fls. bisexual, pale rose. Pyrenees.

rosea: Centranthus ruber var.

ribra: Centranthus ruber.

sitchénsis. To 2 ft.: basal lvs. ovate or oblong, entire or lobed; st.-lvs. 3-5-parted: fls. bisexual, white, fragrant, 1/2 in. long. Alaska to Ida.

supina. To 6 in.: lvs. obovate or the upper lanceolate, entire or slightly toothed, ciliate on edges: fls. pink. Austria. sylvática: V. dioca.

uliginòsa. To 2½ ft.: basal lvs. oblong, nearly entire: st.-lvs. pinnately divided into 3-15 lfts.: fls. pink to white. Que, to N. Y. and Mich.

VALERIANACEÆ. VALERIAN FAMILY. Widely distributed herbs or shrubs of about 9 genera: lvs. opposite, simple or pinnate: fls. small, bisexual or unisexual, with gamopetalous 5-lobed corolla, usually 1-3 stamens, and inferior 1-3-celled ovary: fr. an achene. Centranthus, Fedia, Patrinia, Plectritis, Valeriana and Valerianella are grown as flower- or vegetable-garden subjects.

VALERIANELLA. Valerianaceæ. Small ann. herbs mostly native in the Medit. region, with entire basal lvs., entire or toothed st.-lvs., small whitish, bluish or rose fls. in cymes, stamens usually 3, ovary 3-carpelled, and fr. with 2 empty cells and 1 fertile cell; two are grown as pot-herb or salad plants and others for ornament or interest.

Corn-salad is of easy cultivation in spring and fall. Successioned sowings may be made and it takes six to eight weeks for maturity. Plants should be thinned or transplanted to stand about 6 inches apart in the row.

congésta: Plectritis congesta.

echinata (Valeriana echinata). To 1 ft.: st.-lvs. wavy-toothed or cut: fls. pink: fr. linear, 3-angled, with 3 reflexed teeth. S. Eu.

eriocárpa. Italian Corn-Salad. Very similar to V. oldora but with lvs. to 5 in. long, and flattened frs. surmounted by truncate calyx-limb. S. Eu.

olitòria (V. Locusta var. olitoria). Corn-Salad. To 1 ft.: st.-lvs. spatulate or oblong, to 3 in. long, toothed or entire: fls. light blue: fr. nearly spherical with 2-pointed beak. Eu.

VALERIANOIDES: Stachytarpheta.

VALLÀRIS. Apocynaceæ. Woody twining or clambering vines with milky juice, opposite lvs., and salver-shaped fls. in axillary clusters; trop. Asia and Malaya, one grown in S. Fla. as a tall veranda and arbor cover.

dich otoma: V. Heynei.

Hèynei (V. dichotoma). Tall climbing: lvs. oval to linearoblong, to 4 in. long, strongly pinnately veined: fis. creamywhite or greenish-white, fragrant, 3/4 in. across, the tube shorter than lobes. Dec.-Apr. India. VALLISNÈRIA. EEL-GRASS. TAPE-GRASS. Hydrocharitaceæ. Submerged grass-like aquatic perherbs with linear lvs., staminate fls. on a short stalk or practically sessile near base of plant and pistillate on long spirally coiled scapes and coming to surface; occasionally grown in aquaria. Propagated by cuttings.

americans. Formerly included in V. spiralis and differing chiefly in the longer and more slender scape of the staminate fl. and the smaller spathe. Me. to Fla. and Miss.

spiralis. Lvs. from 6 in. to 6 ft. long and h-1/8 in. wide: staminate fls. on short club-shaped scapes; pistillate fls. white. S. Eu., W. Asia.—The plant known to the trade as "Italian type" is probably V. spiralis, and is said to grow all winter while V. americana does not: the former is not hardy.

VALLÒTA. Amaryllidaceæ. S. African bulb grown in the greenhouse. V. speciòsa (V. and Amaryllis purpurea). SCARBOROUGH-LILY. L.vs. to 2 ft. long and 1 in. wide, with fls.: fls. scarlet, funnelform, to 3 in. across, in umbels terminating a hollow scape to 3 ft. high; summer and autumn. Var. álba has white fls.—The bulbs should be kept somewhat moist even during the resting period. The roots should be interfered with as little as possible and plants may be kept in the same pots several years if liquid manure is applied. Repotting should be done after flowering is over.

VALVE: a separable part of a pod; the units or pieces into which a capsule splits or divides in dehiscing.

VANCOUVÈRIA. Berberidaceæ. Per. herbs of W. N. Amer., having creeping rootstocks, ternately compound lvs. and small drooping fls. in panicles on leafless scapes; grown in the border in rich soil.

chrysantha. To 1 ft., evergreen: lfts. slightly 3-lobed, rather thick: fis. golden-yellow, larger than in V. hexandra.

hexándra. To 1½ ft.: lfts. ovate, to 1½ in. long, thin: fls. white, ½ in. long. Wash. to Calif., in forests.

parviflora. Inside out Flower. To 20 in., evergreen: Its. oval, slightly 3-lobed, to 1½ in. long, with cartilaginous margins: fls. white or lavender, ½ in. long, in panicles to 7 in. long. Ore., Calif.

VÁNDA. Orchidaceæ. Old World epiphytic orchids with leafy sts. and fls. in axillary racemes or panicles, the sepals and petals similar and spreading, the lip 3-lobed, spurred or saccate, united with foot of column. See Orchids for cult.

Amesiana. Sts. short: lvs. linear or almost cylindrical, to 12 in. long: infl. usually racemose, exceeding lvs., to about 20-fid.: fis. 1½ in. across; sepals and petals white; lip amethyst-purple and white. Dec.-Apr. Burma, Indo-China.

Bâtemanii: Vandopsis lissochiloides.

Bóschii. Hybrid between $V.\ tricolor$ and $V.\ luzonica.$

Bóxallii: V. lamellata var.

carillea. To about 3 ft. high: lvs. to 8 in, long and 1 in, wide: racemes longer than lvs., loosely about 3-11-fld.; fls. to 4 in, across; sepals light blue reticulated with azure; lip dark blue. July-Jan. Himalayas, Burma.

ceruléscens. Sts. to 2 ft. long: lvs. to 8 in. long: infl. about 14 in. long, racemose, 9- many-fld.: fls. to 1½ in. across; sepals and petals similar, pale lilac-blue; lip dark blue. Mar.-July. Burma.

cristata. Lvs. to 7 in. long and ¾ in. wide: infl. short, few-fid.; sepals and petals yellow-green; lip yellow streaked with dark purple and purple side lobes. Mar.-July. Himalayas, Burma.

Denisoniana. Lvs. to 12 in. long and ¾ in. wide: infl. to 5 in. long, 5-6-fld.: fls. to 2½ in. across, white or creamywhite with orange spot at base of lip. Apr.-July. Burma.

densiflora: Anota densiflora.

Faùstii. Hybrid between V. Phallax and Gil Triboulet. gigantèa: Vandopsis gigantea.

Kimballiàna. Sts. short, to 6 in. long: lvs. subcylindric, to 12 in. long: infl. to about 15 in. long, racemose, 4-12-fld..

fls. about $2\frac{1}{4}$ in. across; sepals and petals white; lip with side lobes yellow spotted with red and mid-lobe violet-purple. Aug.-Nov. Burma, China.

lamellata. Sts. stout, to over 1 ft. high: lvs. ligulate, imbricating, to 16 in. long, conduplicate: infl. longer than lvs., 4-many-fid.; fis. to 2 in. across; sepals and petals yellow blotched with chestnut-brown; lip lilac with white keels. Aug.-Apr. Philippines. Var. Bóxallii (V. Boxallii) has longer lvs. and racemes and more brightly colored fis.

Lòwii: Arachnis Lowii

luzónica. Fls. with white sepals and petals marked with purple, rose-purple lip and white spur. Philippines.

Párishii (Vandopsis Parishii). Sts. 7-9 in. long: lvs. to 10 in. long and 4 in. wide infl. to about 15 in. long, racemose, up to 12-fid.: fls. about 2 in. across; sepals and petals greenish-yellow spotted with brown; lip violet-mauve edged with white. Spring and summer. Burma, Indo-China. Var. Marriottiana has fewer-fid. racemes, sepals and petals togs tread with brown. and petals rose tinged with brown.

Róxburghii: V. tesselata.

Sanderiana (Esmeralda and Euanthe Sanderiana). Sts. relatively short, thickly covered with distichous lysto about 19 in. long and 1 m. wide racemes 5-10-fld., generally shorter than lyst; fls. 3-4 m. across; dorsal sepal and petals pale rose or hlac; lateral sepals larger, greenish or brownish-yellow with purple-red veining; lip with basal concave half tawny-yellow and anterior half reddish-brown. July -Dec., May. Philippines.

spathulata. Sts. to 2 ft. high: lvs. to 4 in. long, shortly 2-lobed. peduncle to 1½ ft. tall, raceme few-fid.: fis. golden-yellow, 1¼ in. across. India, Ceylon.

suavis: V. tricolor var.

tères. Sts. several ft. long: lvs. to 8 in. long: infl. racemose, few-fld., to 12 in. long: fls. to 4 in. across; sepals and petals pale rose-puiple; lip with tawny-yellow side lobes with bands of red spots and mid-lobe yellow below and rose-puiple near apex. May-Aug. Hunalayas, Burma. Var. Andersonii has larger brighter colored fis.

tesselàta (V. Roxburghu). Sts. to 2 ft. high: lvs. conduplicate, to 8 in. long. infl. to 8 in. long, to 10-fld.: fls. 2 in. brown; ip with white side lobes and volet-purple mid-lobe. Nov.-Aug. India, Ceylon, Burma, China.

tricolor. Sts. to 3 ft. long: lvs. to about 18 in. long and 1½ in. wide, inbricating below infl. racemose, shorter than lvs., 7 many-fid.: fls. fleshy, very fragiant, to 3 in. across; sepals and petals white to yellow spotted with brown; lip with whitsh side lohes and magenta mid-lobe. Feb.—duly. Java. Var Pātersonii has cream-white fls. densely spotted with chocolate-brown and lip bright magenta. Var. planilābris has larger brighter colored fls. with citron-yellow sepals and petals spotted with brown and rose lip margined with purple. Var. sudvis has longer racemes, sepals and petals white with fewer red-purple spots. tricolor. Sts. to 3 ft. long: lvs. to about 18 in. long and

violàcea: Anota violacea.

VANDÓPSIS. Orchidacex. Orchids allied to Vanda and with similar habit but differing in the lip being without a spur and laterally compressed in front.

gigantèa (Vanda 'yiyantea). Sts. stout, 20 in. high or more: lvs. to 28 in. long and 3 in. wide: infl. laxly racemose, to 14-fid.: fls. fleshy, to almost 3 in. across; sepals and petals yellow with brown ocellate spots inside and purplish outside; lip white and yellowish. Feb.-Apr. Burma, China.

lissochiloides (Vanda Batemanu). Sts. stout, to 6 ft, high: lvs. to 24 in. long and 2½ in. wide. infl. laxly racemose, much exceeding lvs., to 26-fld. fls. fleshy, 2-3 in. across; sepals and petals inside golden-yellow spotted with crimson, outside violet-rose; lip with small yellowish side lobes and purplish mid-lobe. Apr.—Oct. Philippines, Malaya.

Lòwii: Arachnis Lowii. Párishii: Vanda Parishii.

VANGUERIA. Rubiaceæ. Trop. and subtrop. trees or shrubs with usually opposite lvs., small white or greenish fls. in axillary clusters, and drupaceous fr. said to be edible; one species is planted in S. Fla.

infausta. Shrub to 10 ft. or small tree, rusty-tomentose: lvs. ovate or nearly orbicular, 2-9 in. long fls. greenish, ¼ in. long: fr. globose, to 1 in. across, glabrous. Trop. Afr.

VANHEÉRDIA. Aizoaceæ. Dwarf succulents of the Mesembryanthemum group, with keeled lvs. united ½ or more their length, edges finely toothed, and 1-3 stalked orange or yellow fls.; stigmas 10. S. Afr.

Roddise (Rimaria Roodise). Plant-body ovoid, to 1½ in. across, producing second pair of lvs. in fissure. fls. 1½ in.

VANIERIA: Cudrania.

VANÍLLA. Orchidacex. Leafy or leafless climbing orchids of both hemispheres, with commonly large fls. in short axillary racemes or spikes: sepals and petals similar; lip with lower part more or less united to column. Grown for ornament and chiefly for the elongated seed-pods which, in some species, yield the vanilla extract of commerce.

Vanilla vines are grown commercially in semi-tropical regions where temperature and humidity are high, the soil rich in organic matter and with constant shade. The vines are supported on poles or trunks of the shade trees. Increased primarily by root-cuttings, but propagation by seed in nutrient culture has been developed recently. See

aromática: a name of uncertain botanical application, probably referable to V. fragrans.

fragrans (V. planifolia). Common Vanilla in. long and 3 in. wide: fls greenish to yellowish, to about 2½ in. long, in short many-fld. racemes, Dec.—June pods 3-angled, 6-9 in. long. Trop. Amer.; intro. elsewhere. Var. variegata (V. planifolia var. variegata) has lvs. variegated with white

planifòlia: V. fragrans.

VANILLA, CAROLINA: Trilisa odoratissima.

VARIETY. A group or class of plants subordinate to a species. Thus, *Lycopersicon esculentum*, tomato, is a species in nature; a race or form is described as var. (variety) cerasiforme. It is essential to clearness in speaking or writing about plants to keep these categories distinct, yet they are commonly not carefully recognized and here arises one of the causes of confusion in nomenclature. To speak of all kinds of plants as different varieties, which is a prevailing popular practice, is failure to understand the subject.

There are two classes or ranges of varieties those displaying rather marked differences in nature, and those presenting only small more or less temporary or artificial differences useful to the gardener. The former class is entitled to Latin botanical names, as Rosa carolina var. glandulosa, whereas the horticultural varieties of roses mostly (and properly) receive vernacular names. What constitutes a variety is a question of personal opinion or judgment; but to name such a variation as if it were a species (as Salvia compacta rather than S. splendens var. compacta) is to introduce confusion in the identities of plants; and clear identification is an essential to the best horticulture.

VARNERIA AUGUSTA: Gardenia jasminoides. VARNISH-TREE: Aleurites moluccana, Rhus vernici-Aua.

VEGETABLE-GARDENING is that branch or department of horticulture that is concerned with the growing of oleraceous or esculent herbs, or of the class of cultivated plants known by custom and tradition as "vegetables." Its formal or Latin equivalent is the term olericulture. The terms are impossible of close definition because the plants that fall within their scope are so various. The best definition is an enumeration of the plants. These plants are prevailingly annual, the marked exceptions being asparagus and rhubarb and also some of the sweet herbs. There are several kinds of vegetable-gardening, as home- or kitchen-gardening, market-gardening, truck-gardening. See Market-Gardening.

VEGETABLE MARROW: a form of Cucurbita Pepo; see Pumpkin. -Oyster: Tragopogon porrifolius. -Sponge: see Luffa.

VEITCHIA. Palmaceæ. Monoccious unarmed feather-palms from Fiji and the New Hebrides, one of which is sometimes grown under glass and may be possible in S. Fla.: trunk closely ringed: spadices at apex of trunk or base of long lf.-column, short and branched, the lower fls. pistillate; stamens 6: fr. large, ellipsoid or ovoid, with terminal stigmatic point, the exterior fibrous. For cult. see Palm.

Joánnis (Kentia Joannis). Tall tree with single trunk and crown suggesting Dictyosperma: Ivs. arching, several ft. long; pinnæ 80-100, close together and drooping, 2¼ in. or less broad, strongly many-nerved, oblique or truncate and somewhat toothed at apex: fr. long-cartridge-shaped and narrowed at apex, 2 in. long. Fiji.

VELTHEÌMIA. Liliaceæ. S. African bulbous herbs with basal lvs. and tubular drooping fls. in dense terminal racemes; rarely grown but of easy cult.; spring and summer.

glauca. Lvs. to 1 ft. long and 1½ in. across, oblanceolate, acute, glaucous: fis. various, white dotted red or reddishpurple dotted yellow.

viridifòlia. Lvs. to 1 ft. long and 3 in. wide: fls. yellow or tinged with red, 1½ in. long, in racemes to 6 in. long on stalks 1½ ft. high.

VELVET-PLANT: Gynura aurantiaca.

VENATION: veining; arrangement or disposition of

VENÍDIUM. Compositæ. Herbaceous annuals or perennials of S. Afr. with solitary heads of ray- and disk-fls.; pappus none or of scales.

Venidiums are usually treated as annuals, but sometimes grown as perennials under glass. Propagated by seeds sown under glass and transplanted.

calendulaceum: V. decurrens.

decurrens (V. calenduluceum). Spreading tomentose per with sts. to 2 ft. long: lvs. mostly lyrate, the terminal lobe to $1\frac{1}{2}$ in. long: heads golden-yellow with dark center, to $2\frac{1}{2}$ in. across.

fastuosum. Ann. to 1½ ft. or more, cobwebby when young. lvs. irregularly lobed or nearly lyrate, to 3½ in. long: fls. bright orange with dark purple-brown base, to 4 in. across.

VENTRAL: front; relating to the anterior or inner face or part of an organ; opposite the back or dorsal part.

VENUS FLY-TRAP: Dionæa muscipula. -Hair: Adiantum Capillus-Veneris. Looking-Glass: Specularia Speculum-Veneris.

VÈPRIS. Rutaceæ. Trees or shrubs native in Mauritius, Bourbon and S. Afr., with alternate lvs. of 3 lfts., small unisexual fls. in terminal panicles, and drupaceous fr.; grown out-of-doors in warm regions and under glass in the N. Propagated by cuttings over heat, and by seeds when available.

lanceolàta (Toddalia lanceolata. Boscia undulata). Shrub or small tree: lfts. oblong-lanceolate, to $2\frac{1}{2}$ in. long and narrow, wavy margined: fls. white: fr. size of pea.

VERATRUM. FALSE HELLEBORE. Liliaceæ. Stout per. herbs with thick rootstocks, broad clasping lvs. and polygamous whitish, greenish or purplish fls. in terminal panicles; sometimes planted in the border or wild-garden. Of easy cult. and hardy. Propagated by division and seeds. The species yield poisonous principles.

Album. EUROPEAN WHITE H. To 4 ft.: lvs. to 1 ft. long and 6 in. wide: fls. greenish outside, whitish inside, wavy-toothed, in panieles to 2 ft. long. Eu., N. Asia.

califórnicum. To 6 ft.: lvs. to 20 in. long and 8 in. wide, narrower toward top of plant: fls. white marked with green, to 3/4 in. long, in panicles to 11/2 ft. long. Wash. to Lower Calif.

nigrum. To 4 ft.: lvs. to 1 ft. long and 8 in. wide: fls. blackish-purple, in narrow panioles. Eu., Asia.

speciòsum. To 6 ft.: lvs. to 1 ft. long and 8 in. wide, soft-pubescent beneath: fis. yellowish-white, 1/2 in. long. Wash. to Mont. and Calif.

tenuipétalum. To 9 ft.: lvs. to 1 ft. long and 8 in. wide: fis. yellowish-white. Colo.

viride. American White H. To 8 ft.: lvs to 1 ft. long and 6 in. wide, narrower toward top: fls. yellowish-green, to 1 in. across, in panicles 2 ft. long. N. B. to Minn., south to Ga.

VERBÁSCUM. MULLEIN. Scrophulariaceæ. Commonly tall and erect hardy mostly bien. herbs, with alternate simple but sometimes pinnatifid lvs., yellow, tawny, red or purple, rarely white fls. in terminal racemes or spikes; native in Eu. and Asia, several nat. or escaped in N. Amer.

Several kinds are grown in the border where their columnar habit and gray-green foliage give a pleasing contrast. There are named garden kinds, said to be hybrids. Verbascum also hybridizes with Celsia. The species listed here are bienmal, or so treated. Mulleng grow well in any soil except a cold wet one. Propagated by cuttings, division or by seed; they often self-sow freely, blooming the following year.

abietinum (V. vernale). Differs from V. nigrum in sts. sparsely Ivd., paneulately branched with branches suberect or ascending. Balkan region.

Báldaccii. Bien. to 7 ft. or more, green and sticky-glandular throughout: lvs. of basal rosette obovate to oblong-elliptic, st.-lvs. ovate-oblong to ovate, sessile, base truncate to cordate, margins toothed: fls. yellow, 1½-2 in. across, petals tomentose outside. Greece, Yugoslavia.—A parent of both wild and hort. hybrids.

Blattària. More M. To 6 ft., glabrous: lvs. to 2½ in. long, toothed or cut: fls. yellow with lilac throat, 1 in. across, the stamens hlac-pubescent, on solitary pedicels. Eu., Asia; nat. in N. Amer. Var. albiflòrum (var. album) has white fls.

Boerhavii. Bien. to 3 ft., robust, densely white-tomentose: lvs oval to elliptical, margins wavy or toothed: fls. yellow with violet throat, to 1¼ in. across, nearly sessile. Medit. region.

Châixii. To 3 ft., white-tomentose: lvs to 6 in. long, coarsely toothed: fls. yellow with purple-woolly stamens, pedicelled, the racemes panicled. S. Eu. Var. álbum has white fls.

crassifòlium: V. lusitanicum. densiflòrum: V. thapsiforme.

floccosum: V. pulverulentum. gigantèum: V. simplex.

hybridum: botanically a hybrid between V. pulverulentum and V. sinuatum, but material in trade may not be of this parentage.

lanatum. Bien, to 4 ft. lvs. broadly ovate to elliptical, densely white-woolly beneath and less so above. fls. dull yellow, to ¾ m. across, stamens purple-woolly. Cent. Eu.

leianthum. To 14 ft., densely white-tomentose basal lvs. to 4 ft. long and 2 ft. across, st.-lvs. smaller, coarsely toothed: fls. bright yellow, 1/2 in. across, clustered in panicled racemes to 7 ft. long, the stamens woolly. Asia Minor.

libani: a hort. form to 5 ft. high, with large yellow fls. longifòlium. To 4 ft., white- or yellowish-tomentose: lower lvs. to 2 ft. long, wavy: fls. golden-yellow, 1 in. across, pedicelled, in densely fld. racemes 1 ft. long, longer stamens glabrous. S. Eu. Var. pannòsum (V. pannosum) is more woolly and the fls. usually larger.

lusitanicum (V. crassifolium). To 4 ft., yellow-tomentose: lvs. to 8 in. long, toothed: fls. yellow, the stamens glabrous, in clusters in the raceme. Portugal.

Lychnitis. Bien. to 3 ft.: lvs. ovate to lanceolate, margins entire, pubescent: fis. bright yellow, about ½ m. across, stamens white-woolly. Cent. and W. Eu.

macedónicum. Bien. to 5 ft., densely white-tomentose to white-woolly throughout. lvs. broadly elliptic- to obovate-oblong and suborbicular at top of st., to 10 in. long, st.-lvs. strongly decurrent: fls. yellow, to 1 in. across, densely pellucid-punctate and corolla white-hairy on outside, stamens versatile. Yugoslavia.

nlgrum. To 3 ft., sts. erect, unbranched, very leafy: lvs. green above, tomentose beneath: fls. small, yellow with purple throat, clustered in the raceme, the stamens violetwoolly. Eu., Asia. Var. álbum has white fls.—Sometimes confused with V. abietinum which see.

olfmpicum. To 5 ft., densely white-tomentose: lvs. entire, to 6 in. long: fls. 1 in. across, bright yellow, clustered

in very long many-fid. racemes, stamens white-woolly.

nannosum: V. longifolium var.

pheniceum. Purple M. To 5 ft.: lvs. glabrous above, pubescent beneath, toothed. fls. purple or red, in a simple slender raceme, nearly glabrous, stamens purple-woolly. S. E. Eu., Asia.

plicatum: V. undulatum.

pulveruléntum (V. floccosum). To 9 ft., loosely white-tomentose: lvs. mostly entire: fis. yellow, small, in clusters in panicled racemes, stamens white-woolly. Eu.

pyramidale. Hybrid between V. speciosum and V. Chauru: to 4 ft., white-pilose: lvs. wrinkled, coarsely toothed: fis. small, yellow, in clusters, stamens white- or purple-woolly. Austria.

simplex (V. giganteum). A species of S. W. Eu. allied to V. Thapsus and V. lusuanuum, but differing in the much slenderer style whose stigma is small and depressedhemispherical, not large and reniform-hemispherical.

sinuatum. To 3 ft., yellow- or gray-tomentose: lower lvs. deeply cut, upper lvs. entire: fis. yellow or rarely white, small, in nearly sessile clusters in panicled racemes, the stamens purple-woolly. Medit. region.

thapsiforme (V. densiforum). To 5 ft., densely yellow-ish-tomentose: lvs. toothed: fls. yellow, in sessile clusters in a long spike. Eu.

Thépsus. Common M. To 6 ft., yellowish-tomentose: lvs. to 1 ft. long, toothed, soft: fls. yellow, 1 in. across, in sessile clusters in dense erect spikes, 2 lower stamens glabrous, all basifixed. Eu., Asia; extensively nat. in N. Amer. in old dry fields.

undulatum (V. plicatum). Plant white- or yellow-to-mentose: lvs. wavy-plicate, pinnatifid into round lobes: fls. sessile, in clusters on long interrupted racemes, stamens yellow-pubescent. Greece.

vernale: V. abietinum.

virgatum. To 4 ft.: lvs. to 3 in. long or the lower to 1 ft., toothed or lobed, pubescent and green: fis. yellow or white, 1 in. across, in short-stalked clusters, the stamens purplewoolly. Eu.; nat. in W. N. Amer.

Wiedemannianum. To 3 ft., woolly: lvs. to 5 in. long, toothed: fls. blue or purplish-lilac, to 1½ in. across, the pedicels solitary, stamens purple-woolly. Caucasus.

Willmottiæ: hort. name. Wilsonii: listed name.

VERBÈNA. Verbenacex. Mostly per, herbs. some of them prized in the flower-garden for their profuse continuous bloom, and other species somewhat shrubby and some ann., not in cult., most of them native in Amer. The lvs. in the garden kinds are opposite, toothed, lobed or divided: fls. pink, red, lilac, white, in mostly rather broad corymb-like clusters that soon elongate into spikes, corolla tubular and salver-

The plants of garden verbenas are treated as annuals in the North, the seeds being started under glass in the window and planted out to I foot or so apart; or they may be propagated by cuttings from over-wintered plants. The garden kinds are hardy in the open in the southernmost states and give early and brilliant bloom in spring. Verbenas need open sunny exposure. The named verbenas of Teas are reputed hybrids between the common garden verbena (V. teucrioides) and the moss verbena (V. pulchella). There are wild native verbenas in many parts of the United States and Canada but they are rarely known as cultivated subjects, except forms of V. canadensis. Many of them are erect weedy plants with small not showy flowers in close mostly long spikes. They are known as vervains, alpina of hort, is V. nulchella var. Magnettii.

alpina of hort. is V. pulchella var. Maonettii.

Aublètia: V. canadensis.

bipinnatifida. More or less prostrate per. with ascending sts.: Ivs. divided into narrow or linear parts: fis. lilac-purple, ½ in. or less across, in head-like clusters that soon elongate, the bracts as long as ealyx. S. D. to Mex. and Ariz.—A showy plant, sometimes transplanted.

bonariénsis. One of the S. American ann. or per. vervains that is sometimes known as a cult. plant and has also run wild in the S.: to 4 ft., erect, branched, st. square: lvs. long and narrow, toothed: fls. lilac, in dense spikes 1½ in. or less long in clusters.

bracteata (V. bracteosa). Per., prostrate or ascending, hairy: lvs. irregularly cut-toothed or pinnatifid: fis. small, purplish, obscured by large bracts in terminal spikes. Cent. and S. U. S.

bractedsa: V. bracteata.

canadénsis (V. Aubletia. V. Drummondii. V. montana). CLUMP V. Ascending and branching per. to 18 in.: Ivs. 1-4 in. long, ovate-oblong, truncate or broadly cuneate at base, toothed and cut: fis. reddish-purple, lilac, rose, white, to 3% in. across, in an elongating head or spike, bracts shorter than calyx. Va. south and west. Var. compacta is offered as of more dense and lower habit.—Somewhat grown in gardens, in the N. as an ann.

candidissima: garden name for white-fid. form.

chamædryfðlia: V. peruviana

ciliàta. Per. or ann., depressed or low, to 10 in., pubescent: Ivs. about 1 in. long, cut-lobed and cleft, petiole margined: fis. purple or bluish, ½ in. or less across, in lengthening clusters. W. Tex. to Colo. and Ariz., Mex.

citriodora: Linna citriodora.

coccinea: garden name for hort. form.

colóssea: garden name.

compácta: V. canadensis var.

compacta: V. canadensis var. corymbosa. Per. to 3 ft., spreading by subterranean rhizomes: lvs. ovate, to 1½ in. long, coarsely serrate or sometimes pinnately lobed, hispidulous on both surfaces: fis. reddish-purple to lavender, about ½ in. across, in dense imbricate spikes to ¾ in. long collected into a terminal corymbose panicle. Chile.—Distinguished from V. rigida by its larger size and by the lvs. having 2 small toothed or entire lobes toward the base. Does best in moist sunny location.

dissécta: see V. pulchella.

Drummondii: V. canadensis.

erécta compácta: garden name.

erinoldes: V. laciniata: see also V. pulchella.

gigantèa: garden name.

grandiflòra: hort, name.

hastata. Erect vervain, per., st. 4-sided, to 4-5 ft. or more: lvs. lanceolate or oblong-lanceolate, serrate or dentate, to 6 in. long: fls. small, blue, in narrow spikes. Weedy plant, N. S. across the continent and to Fla.

hispida. Per, vervain with erect or ascending rigid hispid st.: lvs. oblong or lanceolate, acuminate, sessile, sharp-serrate, sometimes 3-lobed or cut: fls. small, in long dense terminal spikes. Peru, Bolivia, Chile.

horténsis (V. hybrida). Garden V. Soft decumbent plant, more or less rooting, per. but mostly grown as ann.: lvs. soft to the hand, oblong to ovate-oblong, 2-4 in. long, lys, sort to the hand, onlong to ovate-onlong, 2-4 in. long, broadened and truncate or truncate-cuneate at base, obtusely dentate, with short margined petiole: fls. in a broad corymb that lengthens in fr. to 2 or 3 in., pink, red, yellowish, white. Cultigen; commonly pronounced a multiple hybrid but this origin is undetermined; nearly allied to V. teuerioides.

hýbrida: V. hortensis.

incisa. Erect, to 3 ft., pubescent, but weak: lvs. oblong with rather broad base, deeply lobed and cut with rather broad sinuses and lobes nearly obtuse: head or corymb remaining short, or not elongated, rose-crimson and mostly with an eye. S. Brazil, Paraguay, Argentina.—Perhaps sometimes cult.

laciniata (V. erinoides). Grown as an ann. but per. in mild climates, the branches decumbent and rooting, more or less harry: lvs. ovate in general outline, deeply 3-parted and the divisions pinnatifid into narrow somewhat revolute lobes: fis. lilac, in short close often somewhat clover-like heads, the corolla bearded inside. Argentina, Chile.—See V. pulchella.

luminòsa: garden name.

Mahonéttii, Maonéttii: a form of V. pulchella.

montàna: V. canadensis.

officinalis. Erect per. vervain, to 2 ft., rather stiff, wiry-branched above: lvs. oblong, pinnatifid or 3-parted or sometimes only coarsely toothed: fls. small, illac, in a slender elongating spike. Eu., Asia, escaped in this country and weedy.—Sometimes cult. and once an object of super-

peruviàna (V. chamædryfolia). Grown as an ann., more or less prostrate and rooting: lvs. 1-2 in. long, oblong or lance-oblong and pointed, rather sharply serrate or dentate and tapering at base, very scabrous: spike remaining rather short, on slender peduncle, fis. scarlet or crimson. S. Brazil, Uruguay, Peru.—Sometimes seen in botanic gardens.

phlogiflora. Prostrate, with ascending ends: lvs. short, ovate-lanceolate, notched and toothed: fls. rosy or purple, in dense umbel-like clusters that do not elongate. S. Brazil, Uruguay.—Probably not in cult. with us.

pulchélla. Per., somewhat woody at base, but grown often as ann. from seed, decumbent, rooting, somewhat hairy to nearly smooth, sts. to 20 in. long: lvs. dissected into linear acute lobes: fls. blue or lilac, in terminal rather dense heads that elongate in fr. S. S. Amer., and now widely nat.—This is apparently the plant commonly known as V. erinoides and sometimes as V. dissecta and V. tenera. Var. Maonéttii, fis. rose-pink to carmine with white-margined corolla-lobes. Italy.

radicans. Sts. procumbent, rooting at nodes: lvs. divided, segms. almost filiform, glabrous: fis. lilac, in compressed head-like spikes, fragrant. Andes Mts., S. Amer.

nead-like spikes, iragrant. Andes Mts., S. Amer.
rigida (V. venosa. V. bonariensis var. rigida). Erect
stiff per. vervain, 1-2 ft., simple or branched, st. 4-angled,
making rhizomes: lvs. narrow-oblong and pointed, 2-3 in.
long, sharply toothed, base wedge-shaped: fls. purplish,
in dense spikes 1-3 in. long. S. Brazil, Argentina, sometimes
spontaneous in warm regions. Var. 4lba, fls. white. Var.
lilácina, fls. lilac.—Blooms first year from seed.

ròses stellàts: garden name.

stricta. Per. soft-pubescent vervain, strict and leafy, to 30 in. high: lvs. ovate to oblong, to 4 in. long, nearly sessile, sharp-serrate or cut: fls. purple, in long close spikes. Ont. to New Mex.

ténera. Somewhat shrubby at base and cespitose, sts. decumbent and rooting: lvs. laciniate-pinnatifid, more or less hairy: fis. purplish, in an elongating spike. S. Brazil and south.—Doubtfully in cult. with us; see V. pulchella.

and south.—Doubtfully in cult. with us; see V. puccheus. teucrioides. Per., rooting at base but sts. ascending, hairy: lvs. ovate to oblong with triangular base, nearly or quite sessile, obtusely serrate, margins more or less revolute, glandular-pubescent above: fis. yellowish-white or pinkish, in elongating terminal spikes, fragrant. S. Brazil and southward, Peru, Chile.—Probably chief source of the common garden verbenas.

venòsa: V. rigida.

violacea stellata: garden name.

VERBENACEÆ. VERVAIN FAMILY. About 70 genera of herbs, shrubs or trees in the tropics, subtropics and temperate zones, characterized by irregular bisexual fls. having 4-5-lobed calyx and corolla, 4 (rarely 2 or 5) stamens, superior 2-8-celled ovary, and fr. a drupe or berry or nutlets. The family furnishes many showy garden and greenhouse subjects, and Tectona yields the teak-wood of commerce: Amasonia, Baillonia, Callicarpa, Caryopteris, Citharexylum, Clerodendrum, Congea, Duranta, Gmelina, Holmskioldia, Lantana, Lippia, Oxera, Petrea, Premna, Rhaphithamnus, Stachytarpheta, Tectona, Verbena, Vitex.

VERBENA, LEMON-: Lippia citriodora. Sand-: Abronia.

VERBESINA. Compositæ. American herbs and shrubs with opposite or alternate lvs. and yellow, orange or white solitary or panicled heads, with or without ray-fls.; pappus of awns. Sometimes grown for ornament.

crocata. Shrub to 15 ft., the sts. 4-winged: lvs. opposite, ovate, to 9 in. long, the lower deeply pinnatifid: heads orange-red, about 1 in. across, without lays. Mex.

encelioides (Ximenesia encelioides). Ann to 3 ft.: lvs. alternate, triangular-ovate, to 4 in. long, toothed, pale beneath: heads to 2 in. across, with golden-yellow rays.

virgínica (Phæthusa virginica). Per. to 6 ft., sts. densely puberulent: lvs. alternate, elliptic-lanceolate to oyate, to 10 in. long, usually distantly serrate, petiole winged: heads about 1 in. across, in corymbose panicles, ray-fis. white, usually 3-5. Va. to Fla. west to Ill. and Tex.

VERNONIA. IRONWEED. Compositæ. Herbaceous perennials or in the tropics shrubs and trees, with alternate lvs. and showy purple, pink or white heads of disk-fls. usually borne in terminal clusters in late summer and autumn; pappus of scales and bristles.

Vernonias are sometimes grown in the border or wild-garden. They are easily cultivated in any good rich soil. Increased usually by division; also by seeds and cuttings.

altissima (V. maxima). To 10 ft.: lvs. lanceolate, to 1 ft. long, finely toothed: heads purple, ½ in. across. N. Y. to Fla. and La.

arkansana: V. crinita.

Báldwinii. To 7 ft., tomentose: lvs. oblong to ovate-lanceolate, to 8 in. long, toothed: heads purple, ½ in. across. Mo. to Tex.

crinita (V. arkansana). To 12 ft.: lvs. linear-lanceolate, to 1 ft. long, finely toothed: heads purple, 1 in. across, pappus purplish. Mo. to Tex.

fasciculata. To 6 ft.: lvs. linear to lanceolate, to 6 in. long, toothed: heads crowded, purple, about 1/4 in. across. Ohio to Tex.

intèrior. To 8 in.: lvs. elliptic or elliptic-lanceolate, to 8 in. long, toothed, tomentose beneath: heads purple. Ia. to Tex.

marginata. To 2½ ft.: lvs. linear or linear-lanceolate, to 6 in. long, entire or slightly toothed, punctate: heads purple. Neb. to Tex.

máxima: V. altissima.

noveboracénsis. To 9 ft.: lvs. oblong or lanceolate, to 10 in. long, finely toothed: heads deep purple, ½ in. across, pappus purplish. Mass. to N. C. and Miss.

VERÓNICA. Speedwell. Scrophulariacex. Many ann. and per. herbs of wide distribution, with at least lower lvs. opposite or seldom whorled, small white or blue fls. in axillary or terminal racemes or sometimes solitary, and capsular frs. The New Zeal. shrubby evergreen kinds, much planted on the Pacific coast, are now referred to the genus Hebe and they should not be called Veronicas.

Speedwells are grown in the flower-garden and border and the low or dwarf kinds in the rock-garden. They are of easy culture in good soil. Propagated by seeds and division.

álbicans: Hebe albicans.

Allionii (V. pyrenaica). Per, with prostrate sts. lvs. oblong, fine-toothed: fis, violet, in spike-like racemes. S. Eu.

alpéstris: V. serpyllifolia.

alpina. Per. to 6 in.: lvs. oblong, to 1 in. long, entire or toothed: fis. blue or violet, in dense racemes. Eu., Asia, N. N. Amer.

amáhilis: Hebe amahilis.

amethýstina: V. spuria.

amplexicaulis: Hebe amplexicaulis.

Andersonii: Hebe Andersonii.

angustifòlia: Hebe angustifolia.

anitida: listed name.

anómala: Hebe anomala.

aphfila. Per. to 4 in.: lvs. obovate to suborbicular, in loose rosette, to ½ in. long, denticulate to entire fis. blue or pink, usually 2-5 in terminal cluster, small. Cent. Eu.

argita. Per. with creeping rootstocks: lvs. ovate to ovate-lanceolate, to ¾ in. long, toothed: fis. small, in few-fid. racemes. Australia.

armèna. Per. to 4 in., tufted: lvs. pinnate into linear segms. 1/4 in. long: fis. deep blue, in few-fid. racemes. Armenia.

austràlis: V. spicata.

austriaca (V. prenja). Per. to 2 ft.: lvs. pinnately cut into oblong or linear segms.: fls. blue, large, in long racemes. S. E. Eu., Asia Minor.

Bachofènii. White-pubescent per. to 2 ft.: lvs. oblong, to 2 in. long, cordate at base, coarsely toothed: fls. blue, in long racemes. Hungary.

Baileyana: listed as a shrubby plant with large blue fis.

Balfouriana: Hebe Balfouriana.

Bárkeri: Hebe Barkeri.

Beccabúnga. European Brooklime. Per. with prostrate sts.: Ivs. oval, toothed: fis. deep blue, rarely pink, small. Eu., N. Afr.

bellidioides (V. Townsendii). Hairy per. to 6 in.: lvs. obovate, slightly toothed: fis. bluish, in short few-fid. racemes. S. Eu.

Bidwiliii. Per. to 9 in., with prostrate rooting sts.: lvs. leathery, oblong or ovate, ¼ in. long, entire or with few notches: fls. white, ½ in. across. New Zeal.

Bóllonsii: Hebe Bollonsii.

Bonarota. Per. to 6 in.: lvs. orbicular, to 1 in. long, or upper ones lanceolate, toothed or cut: fis. blue, 1/2 in. across, in spikes to 2 in. long. S. Eu.

Buchánanii: Hebe Buchananii.

buxifolia: Hebe buxifolia.

cæspitòsa. Tufted per. to 3 in.: lvs. linear-spatulate, 1/3 in. long, entire, margins revolute: fis. rose, in few-fid. racemes. Greece, Asia Minor.

cándida: V. incana.

canéscens. Per. with creeping matted sts. to 4 in. long:

lvs. to $\frac{1}{10}$ in. long, entire: fls. solitary, pale blue, $\frac{1}{10}$ in. across. New Zeal.

cárnea: Hebe carnea.

carnósula: Hebe carnosula.

catarractee. Per. to 2 ft. or sometimes prostrate: lvs. lanceolate to 4 in. long, coarsely toothed; fis. white or pink, in racemes to 9 in. long. New Zeal.

caucásica. Per. to 6 in., pubescent: lvs. 1-2-pinnately cut into oblong or linear segms.: fis. white veined with violet, in loose racemes. Causasus.

Chamèdrys (V. pulchella). GERMANDER S. Per. to 1½ ft. lvs. broad-ovate, to 1½ m. long, toothed: fis. blue, ½ in. across, in racemes to 6 in. long. Eu., Asia; nat. in N. Amer.

chathámica: Hebe chathamica.

cinèrea. Tufted per. to 4 in., gray-pubescent, with prostrate rooting sts.: lvs. oblong or oblong-linear, toothed: fls. pink, in axillary racemes. Asia Minor.

circeoldes: confused name. coeléstis: listed name. Colensoi: Hebe Colensoi. corvmbòsa: V. spicata var. crassifòlia: V. spicata.

crixifòlia: hort, name for Hebe buxifolia.

cupressoldes: Hebe cupressoides.

Casickii. Per. to 9 in.: lvs. nearly orbicular to oblong, to 3/2 in. long, entire: fis. blue or violet, 3/2 in. across, in few-fid. racemes. Ore., Calif.

Darwiniana: Hebe Darwiniana. decúmbens: Hebe decumbens. decussàta: Hebe elliptica. Dieffenbáchii: Hebe Dieffenbachii. diosmæfòlia: Hebe diosmæfolia. Dorrien-Smithii: Hebe Dorrien-Smithii.

elàtior: V. latifolia. élegans: V. spuria var.

elegantissima: hort, name of uncertain application.

ellíptica: Hebe elliptica. epacrídea: Hebe epacridea. Erica: V. spicata var.

exaltata. Per. to 4 ft.: lvs. toothed: fls. blue, in long

spikes. Siberia. excélsa: V. maritima.

fasciculàta: listed name.

filicaulis: catalogue name for V. filiformis.

filifòlia. Per. to 1 ft., pubescent: lvs. 2-pinnate into nearly filiform segms.: fls. white veined with blue. Caucasus.

filiformis. Ann. or per., with prostrate rooting sts.: lvs. ovate, small: fls. blue, on thread-like stalks. Asia Minor.

flexuòsa nàna: listed name. formòsa: Hebe formosa.

fruticans (V. saratilis). Shrubby per. to 6 in., much branched: lys. oblong, to ½ in. long, nearly entire: fis. blue, in short racemes. Eu.

fruticulòsa. Differs from V. fruticosa in larger crenulate lvs. and pink fls. S. Eu. Vars. álba and ròsea are listed.

gentianoides (V. glabra). Per. to 2 ft.: lvs. oblonggenuanouses (v. giaora). Fer. to 2 It.: Ivs. oblong-lanceolate, to 3 in. and more long, entire or slightly toothed: fis. pale blue veined with darker, in long loose racemes. S. E. Eu. Vars. angustifolia and stenophylla have narrower Ivs. Var. pállida (V. pallida), fis. pale porcelain-blue. Var. variegāta is listed.

Gibbsii: Hebe Gibbsii. gigantèa: Hebe gigantea. glàbra: V. gentianoides.

gladca. Nearly erect ann.: lvs. broadly ovate, to $\frac{1}{2}$ in. long, wavy-toothed, pubescent: fls. bright blue with white throat, to $\frac{1}{2}$ in. across. Greece.—Plants under this name may also be glaucous-foliaged forms of V. incana or V. latifolia, or even of $Hebe\ glaucophylla$.

glaucophýlla: Hebe glaucophylla.

glomerata: hort, name for Hebe buxifolia,

Gòldenii: listed name. gracillima: Hebe gracillima.

grándis (V. Koenitzeri). Per. to 2 ft. or more, pubescent: by obling included to obling, to 3 in. long, petioled, subcordate, incised-dentate to serrate, with lower lys. sometimes pinnatifid: fls. white, in terminal racemes to 6 in. long. Siberia.

Grièvei: a form of V. fruticans usually known to the trade as V. saxatilis Grievei.

Guthrieana. Garden hybrid to 9 in. with blue fis.

Héctori: Hebe Hectori.

himalénsis. Per. to 2 ft.: lvs. ovate, to 2 in. long, coarsely toothed: fis. blue, to 1 in. across, in racemes to 5 in. long. Asia.

Hookeriana (V. nivalis). Prostrate per. with sts. to 10 in. long: lvs. ovate, to ½ in. long, coarsely toothed, leathery and stiff: fis. purplish or white, in corymbose racemes. New Zeal.

Hulkeana: Hebe Hulkeana.

hýbrida: V. spicata.

imperialis: a garden name for Hebe speciosa.

incana (V. candida). White-pubescent per. to 2 ft.: lvs. oblong or lanceolate, to 3 in. long, toothed: fls. blue, in racemes to 6 in. long. N. Asia, Russia. Var. glauca, foliage glaucous-blue, fls. purple. Var. nana is listed. Var. rosea is listed with rose-pink fls.

Koenitzeri: V. grandis.

lavis: Hebe lams.

latifòlia (V. elatror. V. Teucrium). Per. to 2 ft.: lvs. ovate, cordate at base, toothed: fls. blue or reddish, in panicled racemes. Eu. Listed vars. include dùbia, prostràta, ròsea.

latisépala: Hebe macrocarpa var. latisepala.

leiophýlla: Hebe lerophylla.

Lèwisii: Hebe Lewisir.

linifòlia. Procumbent per., sts. to 9 in. long, ascending at tips, glabrous: lvs. linear, to 1 in. long, obtuse, entire, petiole ciliate. fls. white to pale rose, to ½ in. across, in racemes. New Zeal.

lobelioides: advertised as a low small-lvd. plant with small spikes of bright blue fis.; probably a Hebe.

Lòbicæ ròsea: listed name. loganioides: Hebe loganioides.

longifòlia: V. maritima.

Lyallii. Per. with prostrate rooting sts. to 1½ ft. long: lvs. broad-ovate, to ½ in. long, coarsely toothed: fis. white veined with pink, ½ in. across, in racemes to 6 in. long. New Zeal.

macrántha: Hebe macrantha.

macrocárpa: Hebe macrocarpa.

macrostachya (V. polifolia). Tufted per. to 4 in.: lvs. oblong to linear-spatulate, small, obtusely pectinate-crenate, revolute: fls. pink, in short dense racemes: caps. minute and woolly. Syria.

macroùra: Hebe macroura.

martima (V. longifolia, V. excelsa). Per, to 2 ft.: lvs. lanceolate or oblong, to 4 in. long, toothed: fls. lilac, in dense racemes. Eu., Asia, nat. in E. N. Amer. Var. fiba, fls. white. Var. Héndersonii nana is semi-dwarf with dark blue fls. Var. rosea, fls. pink. Var. subséssilis (V. subsessilas) has larger deep blue fls. and nearly-sessile lvs.

Michauxii. Per. to 5 ft., pubescent: lvs. ovate, toothed: fls. pale blue, in dense racemes. Persia.

multifida. Per. with decumbent sts.: lvs. pinnately cut into linear segms.: fls. pale pink or blue. Asia.

nivalis: V. Hookeriana.

Nummulària. Per. with creeping sts.: lvs. ovate-orbicular, in. long, entire, rather thick, the lowest scale-like: fis. blue or pink. Pyrenees.

obovata: a name of uncertain application, perhaps a hybrid; properly belonging to genus Hebe.

obtusata: Hebe obtusata.

officinalis. Per. with prostrate or ascending sts. to 1½ ft. long: lvs. oblong, to 2 in. long, toothed: fls. pale blue, to ½ in. across, in racemes much longer than lvs. Eu., Asia, N. Amer.

Olsenii. Prostrate per.: lvs. ovate or orbicular, to 1/2 in. long, coarsely toothed, thick and leathery: fls. white veined with pink, in many-fld. racemes. New Zeal.

orchidea. Per. to 114 ft.: lvs. ovate or oblong, toothed, shining above: fis. pale blue or pinkish. S. E. Eu.—Probably only a variant of V. spicata, differing in the lvs. glabrescent above and corolla revolute in bud.

orientalis. Per. with decumbent or prostrate sts.: lvs. cuneate-oblong or lanceolate, toothed: fls. pink or pale blue, in one-sided racemes. Asia Minor. Var. tenuitolia (V. taurica), lvs. narrowly linear, margins often revolute and sometimes remotely toothed. S. Armenia and Persia.

pállida: V. gentianoides var. paniculàta: V. spuria.

parviflora: Hebe parviflora. pectinata. White-pubescent prostrate per.: lvs. obovate, 1/2 in. long, toothed or sometimes cut: fis. deep blue with white center, in many-fid. racemes. Asia Minor. Var. alba, fis. white. Var. rosea, fis. rose. pedunculàris. Per. with prostrate or ascending sts.: lvs. ovate or oblong, coarsely toothed or cut: fis. white veined with pink. Asia Minor.

pérsica: V. Tournefortii. pimeleoides: Hebe pimeleoides.

pinguifdlia: Hebe pinguifolia.

pinnata. Per. to 3 ft.: lvs. pinnate, shining. rather thick: fls. blue, in many-fld. racemes. Russia.

polifòlia: V. macrostachya.

polita. Ann. with weak sts. to 10 m. long: lvs. oval, deeply toothed: fls. blue, 1/2 in. across, solitary. Eu., N. Afr.; nat. in N. Amer.

prénia: V. austriaca.

procumbens: a name without botanical standing.

prostràta: V. latifolia var.

pulchélla: V. Chamadrus.

pùmila. Low ann., sticky-pubescent: lvs. ov. rhomboid, deeply lobed: fls. ½ in. across. S. E. Eu. ovate or

pyrenàica: V. Allionii.

Ouateriàna: listed as a fine blue-fld. form.

rakaiénsis: Hebe rakaiensis.

Reèvesii: advertised as having lavender-pink fls.

rèpens. Creeping moss-like per.: lys. ovate, to 1/2 in. long, shining: fis. rose or bluish, in few-fid. racemes. Corsica. Var. álba, fis. white. Var. ròsea, fis. rose.

rotundata: Hebe rotundata

rubra: listed name, possibly a var. of Hebe speciosa or of V. spicata.

rupéstris: hort, name, probably for a dwarf variant of V. latifolia which is usually densely tufted and has lys. narrowly lanceolate, entire or remotely toothed.

runicola. Hebe runicola salicifòlia: Hebe salıcıfolia.

saturejoides. Creeping per. to 3 in.: lvs. oblong, ½ in. long, fls. blue, in short dense racemes. Dalmatia.

saxátilis: V. fruticans.

scutellàta. Prostrate glabrous per., st. tips ascending: lvs. linear-lanceolate, remotely denticulate or entire: fis. white, bluish or pinkish, in lax racemes. S. Balkan region.

senanénsis. Suffrutescent, pilose at base lvs. ovate to lanceolate, to 1 m. long, petioled, base wedge-shaped, sharply toothed: fls. lilac, to ¾ m. diam., calyx pilose, segms. oblong and acute caps. narrow, obcordate. Japan.

serpyllifòlia (V. alpestris). Per. to 1 ft.: lvs. ovate or oblong, to ½ in. long, toothed or entire: fls. pale blue with darker strips. ½ in. across, in few-fld. racemes. Eu., Asia, N. and S. Amer.

speciòsa: Hebe speciosa.

spiciosa: Nece speciosa.

spicata (V. australis. V. crassifolia. V. hybrida). To
1½ ft.. lvs. lanceolate, to 2 in. long, toothed. fis. blue or
pink, in long dense racemes. N. Eu., Asia. Var. álba, fis.
white. Var. corymbosa, to 1 ft., fis. pale blue. Var. Erica,
heather-like, fis. pink. Var. nana, to 9 in., fis. blue. Var.
rosea, fis. purplish-pink. Var. rubra, fis. purplish-red.

spûria (V. amethystina. V. paniculata). Per. to 2 ft., densely pubescent. Ivs. linear, 1 in. long, toothed above: fls. blue, in panicled racemes. S. E. Eu., S. Asia. Var. élegans (V. elegans) is more branched and pubescent.

stenophýlla: V. gentianoides var.

subséssilis: V. maritima var.

surculòsa. Per., sts. mostly prostrate or somewhat ascending, sticky-hairy: lvs. oblong to oblong-lanceolate, to ½ in. long, usually with 2-3 rounded teeth: fis. pale blue, in terminal and axillary racemes, peduncles densely glandular-hispid. E. Eu.

taùrica: V. orientalis var. tenuifolia.

tenuifòlia: V. orientalis var. Teucrium: V. latifolia.

Tournefórtii (V. persica). Prostrate ann.: lvs. ovate, in long, coarsely toothed: fls. blue, in axillary racemes. Eu., Asia; nat. in N. Amer.

Townsendii: V. bellidioides. Townsonii: Hebe Townsonii. Traversii: Hebe Traversii.

Trèhanii: one of the many forms of the plant passing as V. rupestris.

triphfilos. Ann., often prostrate, pubescent: lvs. palmately cut into 3-5 oblong segms.: fis. blue, in loose racemes. S. Eu., N. Afr.

vernicòsa: Hebe vernicosa.

versícolor: a listed name, perhaps a hybrid.

virginica: Veronicastrum virginicum.

Wáldsteinii: hort, form with blue fis. in verv late aummer

wardiénsis: listed as an evergreen shrub to 1 ft. with gray-green lvs. and blue fis.

Wormskjòldii. Per. to 1 ft.: lvs. ovate or elliptic, to 1 in. long, entire or slightly toothed: fls. dark blue, ¼ in. across, in terminal racemes. Mts., N. Amer.

VERONICÁSTRUM. Scrophulariaceæ. able per, herb native from Vt. to Tex. V. virginicum (Veronica virginica. Leptandra virginica). Culvers-Root. To 7 ft.: lvs. mostly whorled, lanceolate, to 6 in. long and 1 in. across, toothed: fls. white or pale blue, 1/6 in. long, in racemes to 9 in. long. Var. album is listed.—Sometimes transplanted from the wild.

VERRUCIFERA: Titanopsis.

VERSCHAFFÉLTIA. Palmacex. One monœcious more or less armed tree with brace roots at base of trunk and large pinnate-ribbed lvs. not parted to rachis, native in the Sevehelles in the Indian Ocean: spadix among lower lvs., drooping, spathes 3; fls. in 3's, spirally disposed on slender side branches, the middle one pistillate; stamens 6, on very short filaments: fr. globular, with hard shell, nearly or quite 1 in. diam.; seed grooved; albumen strongly ruminate.

splendida. To 80 ft., slender, when young the st., lf.spiendida. 10 80 ft., siender, when young the st., fr-sheaths and petioles spiny but losing the spines with age: lvs. oval or obovate, cuncate at base, blade several ft. long, deeply bifid at apex and the sides cut deeply or nearly to midrib at base, strongly ribbed. Sometimes seen under glass and in test in the open far S.

VERTICILLATE: whorled; arranged in a circle about the stem, as leaves, bracts, flowers.

VERTICÓRDIA. Myrtacex. Australian usually heath-like shrubs with mostly small opposite entire lys. and fls. in corymbs, spikes or racemes, the calyx-lobes plumose and radiating; one species intro. in Calif.

densifiòra. To 3 ft.: lvs. linear, to ½ in. long, cylindrical or 3-angled: fls. white or pınk, to ½ in. long, petals fringed, in dense terminal corymbs.

VERVAIN: Verbena.

VESICÀRIA. BLADDER-POD. Cruciferæ. Per. herbs of Cent. Eu. and Medit. region, V. utriculata grown for the large inflated pods or silicles as well as for the yellow fls. Distinguished from Lunaria and Alyssum by the fr. inflated and sac-like, not flattened and compressed; the fls. differ from the latter genus in their larger size and in having unequal sepals with the lateral ones saccate at the base.

græca. Differs from V. utriculata in basal lvs. stellatehairy, st.-lvs. glabrescent and entire, petals more orbiculate and orange-yellow, longer fr.-pediccis and narrower seeds. E. Italy and Greece.

sinuata: Alyssum sinuatum.

utriculata. To 1½ ft. high, somewhat woody at base: lvs. many and entire, the lowest oboyate and crowded, upper lanceolate: pods subglobose, to about ½ in. diam., the thin disseptment persistent.

VETCH: Vicia. Crown: Coronilla varia. Kidney: Anthyllis Vulneraria. Ladys-Finger: Anthyllis Webbiana. Milk: Astragalus.

VETCHLING: Lathyrus.

VETIVERIA. Gramineæ. Per. grasses with aromatic roots from which perfumery and medicines are made, narrow lvs. and spikelets borne in narrow terminal panicles. See Grasses.

zizanioides (Anatherum zizanioides). VETIVER. KHUS-KHUS. To 8 ft.: lvs. to 3 ft. long and ½ in. wide, rough on edges: panicles to 1 ft. long, the branches ascending. Asia, E. Indies; escaped in La.—Sometimes planted far S. along divisions between areas.

VIBÚRNUM. Caprifoliaceæ. Manv shrubs and small trees with opposite simple deciduous or persistent lvs., small white or pinkish fls. in showy terminal panicles or umbel-like cymes, and fr. a 1-seeded drupe which often persists into winter; native in Amer., Eu., and Asia. Some of the viburnums are known as haws.

Viburnums are amongst the most popular ornamental shrubs, and many of them assume attractive autumn colors; they make good bird refuges because of their autumn and winter fruits. They are deciduous unless otherwise stated. winter fruits. They are deciduous unless otherwise stated. Most of the deciduous species are hardy as far north as New England. They are not particular as to soil. Propagated by stratified seeds, by hardwood cuttings or cuttings of green wood under glass, by layers and grafting. A few of the snowballs are forced in the greenhouse for early bloom.

acerifòlium. Dockmackie. To 6 ft.: Ivs. 3-lobed, maple-like, coarsely toothed, to 5 in. long: fls. white, in long-stalked cymes to 3 in. across, May-June: fr. purple-black. N. B. to N. C. and Minn.

affine: V. Rafinesouranum var.

aline: V. Rajnesquianum var.

alnifòlium (V. lantanoides). Hobble-Bush. American
Wayfaring-Tree. To 10 ft.: lvs. nearly orbicular, to 8 in.
long. cordate at base, irregularly toothed: fis. white, in
sessile cymes 5 in. across, the marginal fis. sterile and 1 in.
across, May-June: fr. red, becoming purple-black. N. B.
to N. C. and Mich. Var. præcox flowers earlier.

americanum: V. trilobum.

betulifðlium. To 12 ft.: lvs. ovate, to 3 in. long, toothed: fls. in short-stalked cymes 4 in. across, June-July: fr. red.

bitchiuense. Similar to V. Carlesii but more straggling, with smaller lys. and cymes. Japan.

bracteatum. To 10 ft.: lvs. orbicular, to 5 in. long, wavy-toothed, cordate at base: fis. in cymes to 3 in. across, conspicuously bracted: fr. bluish-black. Ga.

buddleifòlium. To 6 ft.: lvs. oblong-lanceolate, to 6 in. long, slightly toothed, gray-tomentose beneath: fis. in dense cymes 3 in. across: fr. black. China.

burejaéticum. To 15 ft.: lvs. ovate or oval, to 4 in. long, wavy-toothed: fls. white, in dense cymes 2 in. across, May: fr. bluish-black. Manchuria, China.

Bürkwoodii. Hybrid between V. Carlesii and V. utile: partially evergreen: lvs. shining: fls. white, fragrant.

Cánbyi: V. pubescens var.

Cárlesii. To 5 ft.: lvs. ovate or oval, to 4 in. long, toothed, pubescent on both sides: fis. white, fragrant, in dense cymes to 3 in. across, Apr.-May: fr. blue-black. Korea.

cassinoides. Withe-Rod. To 12 ft.: lvs. ovate or oval, to 4 in. long, finely toothed: fls. white, in short-stalked cymes to 5 in. across, June-July: fr. blue-black. Newf. to N. C. and Minn.

cinnamomifòlium. To 20 ft., evergreen: lvs. elliptic-oblong, to 5 in. long, nearly entire: cymes to 7 in. across: fr. blue-black. China.

corylifòlium. Similar to V. dilatatum but distinguished by the long pubescence of petioles, infl. and young branchlets. China.

cylindricum. To 40 ft., evergreen: lvs. elliptic or oblong, to 7 in. long, entire or slightly toothed, waxy above: fis. white, in stalked cymes to 4½ in. across, July-Sept.: fr. black. China, Himalayas.

Davidii. To 3 ft., evergreen: lvs. elliptic, to 5½ in. long, slightly toothed, pale beneath: fls. white, in dense stalked cymes to 3 in. across, June: fr. blue. China.

dentātum. Arrow-Wood. To 15 ft.: lvs. orbicular or ovate, to 3 in. long, coarsely toothed: fls. white, in long-stalked cymes 3 in. across, May-June: fr. blue-black. N. B. to Ga. and Minn.

dilatatum. To 10 ft.: lvs. orbicular or ovate, to 5 in. long, coarsely toothed, hairy on both sides: fls. white, in stalked cymes to 5 in. across, May-June: fr. scarlet. Japan.

ellipticum. To 8 ft.: lvs. oval, to 3 in. long, coarsely toothed above middle: fis. in long-stalked cymes 2 in. across: fr. black. Wash. to Calif.

eròsum. To 6 ft.: lvs. ovate, to 3 in. long, sharply toothed: fis. in loose cymes to 3 in. across, May-June: fr. red. Japan.

fetidum. To 10 ft., semi-evergreen: lvs. obovate or oval, to 2½ in. long, toothed above middle: fis. in cymes to 3 in. across, June: fr. scarlet. Himalayas, China. Var. rectangulum (V. rectangulum) is taller with branches often drooping.

fragrans. To 10 ft.: lvs. oval, to 3 in. long, toothed, slightly pubescent: fis. white or punkish, fragrant, in panicles 2 in. long, Apr.-May: fr. black or purple. China.

Very similar to V. alnifolium but of more upright habit: lvs. narrower, finely serrate. Japan.

grandiflorum. To 6 ft.: lvs. oval-oblong, to 4 in. long: fls. in short dense panicles: fr. blue-black or purple. Himalayas.

Harryanum. To 10 ft., evergreen: lvs. orbicular-ovate or obovate, to 1 in. long, nearly entire: cymes to 1½ in. across: fr. black. China.

Hénryi. To 10 ft., evergreen: lvs. oblong, to 5 in. long, toothed, shining above: fls. in broad panicles to 4 in. long, Aug.: fr. red turning black. China.

hupehense. To 6 ft.: lvs. ovate, to 3 in. long, coarsely toothed, pubescent on both sides: fls. in cymes 2 in. across, June: fr. red. China.

ichangénse. To 6 ft.: lvs. ovate to ovate-lanceolate, to 2½ in. long, pubescent beneath: fis. in cymes to 1½ in. across: fr. red. Cent. and W. China.—Similar to V. erosum.

japónicum (V. macrophyllum). To 6 ft., evergreen: lvs. ovate, to 6 in. long, slightly toothed above middle, shining above: fls. white, fragrant, in short-stalked cymes to 4 in. across, June: fr. red. Japan.

Keteleèri: V. macrocephalum var.

lævigatum: V. obovatum.

Lantana. WAYFARING-TREE. To 15 ft.: lvs. ovate. to in long, finely toothed, pubescent on both sides: fls. white, in cymes to 4 in. across, May-June: fr. red tuning black. Eu., W. Asia. Var. rugosum has more wrinkled lvs.

lantanoides: V. alnifolium. latifòlium: V. rıgidum.

Lentago. Sheep-Berry Nanny-Berry. To 30 ft.: lvs. ovate, to 4 in. long, finely toothed: fis. white, in sessile cymes to 5 in. across, May-June: fr. blue-black, pruinose. Hudson Bay to Ga. and Miss.

lobophyllum. To 15 ft.: lvs. broad-ovate or obovate, to 4½ in. long, toothed, pubescent only on veins: fls. in long-stalked cymes to 4 in. across, June-July: fr. bright red. China.

lùcidum: V. Tinus var.

macroeéphalum. To 12 ft., semi-evergreen: lvs. ovate or oval, to 4 in. long, finely toothed, pubescent on both sides: fis. white, in stalked cymes to 5 in. across, the marginal ones sterile and 1 m. across. May-June. China. Var. Keteleèri, the wild form, having only the marginal fis. sterile and enlarged. Var. stérile, Chinxes Snowball, has all fis. sterile, forming a globose ball to 8 in. across.

macrophyllum: V. japonicum.

mölle. To 12 ft.: lvs. nearly orbicular, to 5 in. long, cordate at base, coarsely toothed, pale and pubescent beneath: fts. white, in long-stalked cymes to 3 in. across, June: fr. blue-black. Ia. to Ky. and Mo.

mongólicum. To 7 ft., twigs stellate-pubescent: lvs. broadly ovate to elliptic, to 2½ in. long, usually obtuse, somewhat hairy, subdentate, base rounded: fls. in flat umbel-like cymes: fr. black. N. E. Asia.

nitidum: V. nudum var. angustifolium.

nddum. Smooth Wither-Rod. To 15 ft.: lvs. ovate to oval-lanceolate, to 5 in. long, nearly entire, pubescent beneath: fis. white or yellowish, in long-stalked cymes to 5 in. across, June-July: fr. blue-black. L. I. to Fla. and La. Var. angustifolium (V. nitidum), vs. smaller and more glossy, usually narrower.

obovatum (V. lævigatum). To 8 ft., semi-evergreen: lvs. obovate, to 1½ in. long, nearly entire, shining and leathery: fls. white, in sessile cymes 2 in. across, Apr.-June: fr. black. Va. to Fla.

odoratissimum. To 10 ft., evergreen: lvs. oval, to 6 in. long, nearly entire, shning above: fls. white, fragrant, in panicles 4 in. high, May-June: fr. red turning black. India to Japan. Var. nanum, a dwarf form, and var. variegatum with variegated foliage, are listed.

Opulus. European Cranberry-Bush. To 12 ft.: lvs. Opulus. EUROPEAN CRANBERRY-BUSH. To 12 ft.: lvs. 3-5-lobed, maple-like, to 4 in. long, pubescent beneath: fis. white, in stalked cymes to 4 in. across, the marginal fis. sterile and ¾ in. across, May-June: fr. scarlet. Eu., N. Afr., N. Asia. Var. nānum is a very dwarf form with small lvs. Var. rošeum (var. sterile), SNowBall., GUELDER-Ross, has all fis. sterile and forming a round rose-like head. Var. xanthocārpum has yellow fr.—See V. trilobum.

ovatifòlium. Shrub lvs. ovate or oblong-ovate, to 3 in. long, toothed: fis. in cymes 3 in. across. China.

Oxycóccus: V. trilobum.

pauciflorum. To 5 ft.: lvs. nearly orbicular, to 3 in. long, 3-lobed at apex, toothed: fls. in heads 1 in. across, May: fr. red. N. N. Amer., N. E. Asia.

plicatum: V. tomentosum var. sterile.

propinguum. Evergreen, with shining red-brown branch-lets: Ivs. elliptic to ovate-lanceolate, to 3½ in. long, slightly toothed, shining above: fis. greenish-white, in stalked cymes to 2½ in. across: fr. black. China.

prunifòlium. BLACK-HAW. To 15 ft.: lvs. ovate or broad-oval, to 3 in. long, finely toothed: fls. white, in sessile cymes to 4 in. across, Apr.-May: fr. blue-black, pruinose. Conn. to Fla. and Tex.

pubescens (V. venosum). To 10 ft.: lvs. ovate to nearly orbicular, to 4 in. long, coarsely toothed, pubescent beneath: orbicular, to 4 in. long, coarsely toothed, pubescent beneath: fis. white, in long-stalked cymes to 4 in. across, June-July: fr. blue-black. Mass. to Va. Var. Cánbyi has larger wider lvs. Var. longifòlium (V. dentatum var. longifòlium) has longer narrower lvs.—Recent studies indicate that V. pubescens and its variants represent forms of V. dentatum differing primarily in degree of hairiness.

Rafinesquianum (V. affine var. hypomalacum). To 6 ft.: lvs. to 3 in. long, coarsely toothed, densely pubescent beneath: fis. white, in dense short-stalked cymes to 3 in. across, May-June; fr. bluish-black. Mo. Var. affine (V. affine) has lvs. glabrous beneath or nearly so. Que. to Ga. and Ill.

rectángulum: V. fætidum var.

rhytidophfilum. To 10 ft., evergreen: lvs. ovate-oblong, to 7 in. long, nearly entire, shining and deeply wrinkled above, gray- or yellow-tomentose beneath: fts. yellowish-white, in cymes to 8 in. across, May-June: fr. red turning black. China.

rigidum (V. latifolium). To 6 ft.: lvs. ovate or ovate-oblong, to 6 in. long, wrinkled above, pubescent beneath: fls. white, in cymes 4 in. across, May-July: fr. bluish-black. Canary Isls.

robfistum: listed name.

rotundifòlium; confused name; the material so listed may be V. tomentosum var.

ruffdulum (V. rufotomentosum). Southern Black-Haw. Turdulum (V. rajoumenosum). Southern Black-law. To 30 ft.: lvs. oval, to 4 in. long, finely toothed, shining above, rusty-tomentose beneath: fis. white, in cymes 5 in. across, May-June: fr. dark blue, pruinose. Va. to Fla. and Tex.

rufotomentòsum: V. rufidulum.

Sárgentii. To 12 ft.: lvs. 3-lobed or sometimes oblong-lanceolate and unlobed, 4 in. or more long: fls. in long-stalked cymes to 4 in. across, the marginal fls. sterile and 1 in. across, May-June: fr. scarlet. N. E. Asia. Var. flàvum, lvs. hairy on veins beneath, anthers and fr. yellow. Var. xanthocárpum is listed with yellow fr. and may not be distinct from preceding form.

scabréllum. To 6 ft.: lvs. ovate to oblong, to 4 in. long, smooth above, hairy on veins beneath, remotely or shallowly toothed: fls. in stellate-pubescent cymes to 3 in. across: fr. blue-black. S. E. U. S.

setfgerum (V. theiferum). To 12 ft.: lvs. ovate-oblong, to 5 in. long, slightly toothed, dark green above: fis. in stalked cymes 2 in. across, May-June: fr. red. China.

Sièboldii. To 10 ft.: lvs. oval or obovate, to 6 in. long, coarsely toothed, shining above, paler and pubescent beneath: fs. creamy-white, in panicles 4 in. long, May-June: fr. pink turning blue-black. Japan.

suspensum. To 6 ft., evergreen: lvs. oval, to 4 in. long, toothed toward apex, shining above, paler beneath: fls. pinkish, in dense panicles 1½ in. across, June-July: fr. red. Liu-Kiu Isl.

thefferum: V. setigerum.

Thus. Laurestinus. To 10 ft., evergreen: lvs. ovate-oblong or oblong, to 3 in. long, entire, dark green above: fls. white or pinkish, in cymes 3 in. across, in summer, often flowered in greenhouse: fr. black. Medit. region. A few of the hort. vars. are hiftum with lvs. pubescent beneath, læddum (V. lucidum) with larger lvs., strictum of more upright habit, and variegatum with variegated lvs.

tomentòsum. To 10 ft.: lvs. ovate, to 4 in. long, toothed, pubescent beneath: fis. white, in long-stalked cymes to 4 in. across, the marginal fis. sterile and 1 in. or more across, May-June: fr. red turning blue-black. Japan, China. Var. lanceatum has narrower lvs., var. Mariesii larger sterile fis. and cymes, var. parvifòlium lvs. to 2 in. long, and var. rotundifòlium broader lvs. and blooms earlier. Var. stérile (var. plenum, var. plicatum), Japanese Snowball, has all sterile fis. in round heads.

trilobum (V. americanum. V. Oxycoccus). Cranberry-Bush. To 12 ft.: lvs. broad-ovate, to 5 in. long, 3-lobed and coarsely toothed: fis. white, in short-stalked cymes to 4 in. across, the marginal fis. sterile, May-June: fr. scarlet. N. N. Amer.—The American representative of V. Opulus, and formerly not distinguished from it.

urceolatum. Rather straggling shrub to 3 ft., sts. procumbent and rooting: lvs. ovate to ovate-lanceolate, to 5 in. long, acuminate, glabrous above, veins scurfy beneath, crenate-serrate: fts. in flat umbel-like cymes to 2½ in. across: fr. black. Japan.

ûtile. To 6 ft., evergreen: lvs. ovate to oblong, to 3 in. long, entire, shining above, whitish-tomentose beneath: fls. white, in dense cymes to 3 in. across, May: fr. bluish-black. China.

Veitchii. To 6 ft.: lvs. ovate, to 5 in. long, slightly toothed, densely pubescent beneath: fis. white, in dense cymes to 5 in. across, May-June: fr. red turning black. China.

vendsum: V. pubescens.

ventricosum: listed as a loose spreading shrub to 8 ft. with glossy dark lvs. and white fis. in small clusters.

Wrightii. To 10 ft.: lvs. broad-ovate, to 6 in. long, coarsely toothed: fis. white, in short-stalked cymes 4 in. across, May-June: fr. red. Japan.

VÍCIA. VETCH. Leguminosæ. Mostly tendril-climbing herbaceous vines with pinnate lvs., papilionaceous fls., and flat pods; several species are grown for food, forage and green-manure crops and a few for ornament.

Seeds of vetches used for cover-crops (as V. sativa and V. villosa) are sown broadcast; those of V. Faba in drills 21 to 35 inches apart. Vetches are not particular as to soil.

americana. Per., with trailing or climbing sts. to 3 ft. long: Ifts. elliptic or oblong: fts. purplish, in few-fid. racemes: pods to 1½ in. long. N. Amer.

angustifòlia. Ann. or bien.: lfts. linear-oblong: fis. purplish, usually 2 in the axils: pods black, to 3 in. long. Eu. atropurpurea. Purple V. Ann., white-hairy: Ifts. linear-oblong: fis. purple, white at base, in racemes: pods to 134 in. long, pubescent. S. Eu.

calcarata. Ann.: Ifts. linear-lanceolate: fis. purplish, solitary: pods 1½ in. long. Medit. region.

Crácca, Cow V. Per.: Ifts. linear to oblong: fls. purplish, varying to white, in one-sided many-fid. racemes: pods to 1 in. long. Eu., Asia, N. Amer. Var. Gerárdii is more pubescent, has more lfts. and violet fis.

Ervilia. Ervil. Bitter V. Ann., erect, 2 ft. or more, without tendrils: lfts. linear: fls. rose-colored, 2-4 in the axils: pods to 1 in. long. S. Eu.

Fåba. Broad Bean. Horse Bean. Ann., erect, to 6 ft., without tendrils: Ifts. oval to oblong: fls. white with purple blotch, solitary or several in the axils: pods sometimes to 1 ft. long. N. Afr., S. W. Asia.—Grown for forage, also for human food; bean of history.

Gerárdii: V. Cracca var.

gigantèa. Per., climbing to several ft.: Ifts. narrow-oblong: fls. reddish-purple, in racemes: pods 1½ in. long. Calif. to Alaska.

hirsuta. Ann., sts. to 3 ft., hairy: lfts. ovate to lanceolate: fls. white or pale blue, in 1-6-fld. clusters: pods 1/4 in. long. Eu., N. Afr., Asia.

hybrida. Ann.: Ifts. obovate: fls. pale yellow striped with violet, solitary. Medit. region.—Probably some of the material cult. under this name belongs to other species.

narbonénsis. NARBONNE V. Ann.: lfts. oval to oblong: fls. purplish, solitary or few in the axils: pods to 2 in. long. S. Eu.

onobrychioides. Ann.: Ifts. linear: fis. purplish turning to rellow, several in loose clusters: pods 1 in. or more long. S. Eu.

oroboldes (Orobus lathyroides). Per. to 2 ft., without tendrils: Ifts. ovate to oblong: fls. whitish or yellow, 3-7 in the axils: pods to 1½ in. long. S. Eu.

Pseudo-cracca. Ann.: fis. purplish with yellowish wings in short racemes: pods to 11/4 in. long. S. Eu.

pyrenàica. Prostrate or ascending per., sts. to 1 ft. long, angular: lfts. 2-12: fts. purple-violet, solitary, large: pods glabrous. S. W. France.

rdsea: probably Lathyrus roseus.

sativa. Common or Spring V. Tare. Ann. or bien.: Its. oblong: fis. purplish. usually 2 in the axils: pods to 3 in. long. Eu.; nat. in N. Amer. Var. álba has white fis., var. fúigens scarlet fis. and var. macrocárpa large fis. and seeds.

semicincta. Per., sts. to 4 ft.: litts. linear: fls. blue-purple, in dense racemes: pods ¾ in. long. Calif., S. Ore.

vérna: probably Lathyrus vernus.

villoss. HAIRY or WINTER V. Ann. or bien.: Ifts. linear-oblong: fis. violet-blue, in long one-sided racemes: pods to 1 in. long. Eu., Asia.

VICTÒRIA. Nymphæaceæ. Very large per. aquatics with erect rhizomes, prickly: lvs. large circular, with great bars and cross ribs filled with air spaces, the margins turned up straight 3-8 in.: fis. fragrant, floating, 6-18 in. across when spread, opening late in the afternoon and remaining till the second day, changing from white to pink and even red: fr. a large more or

less berry-like body: probably 3 species in S. Amer., sometimes grown in large aquaria

Under cultivation in temperate regions victorias are treated as annuals, and require the same treatment as tender nympheas. They are raised from seeds, those of V. regia requiring a water temperature of 85-90° for germination, and V. Cruziana 65-70°. They are sown in February or March in pots or seed-pans that are set in shallow water. The young seedlings are transferred to small pots and kept growing continuously until transferred to their permanent quarters in tanks. If grown outside in the summer, steam pipes through the water keep this at the correct temperature till the season is warm enough.

Cruziàna (V. Trickeri). Santa Cruz Water-Lily. Lvs. densely soft-hairy beneath, the upturned margins green, 6-8 in. high: fls. turning deep red-pink second day; sepals prickly only at base. Paraguay.—This is the species usually grown in this country.

règia. ROYAL WATER-LILY. Lvs. 3-6 ft. across, in the larger forms turned up 2-4 in. at the edges, reddish beneath: fls. turning dull crimson second day; sepals prickly. British Guiana and Amazon. Var. Rándii, the usual form in cult., has lf.-rim 5-6 in. and under side deeper red, fls. turning deep crimson.

Trickeri: V. Cruziana.

VÍGNA. Leguminosæ. Vine-like herbs with 3foliolate lvs., yellowish-white or purplish papilionaceous fls. usually in pairs at the ends of long peduncles, and long slender cylindrical pods.

Several species are grown for food, forage and as green-manure and cover-crops, V. sinensis being one of the staple crops of the South. Adapted only to mild climates, as southern United States and susceptible to frost. Grown as annuals from seed planted as soon as land is warm in spring.

Cátjang. Cattang. Pods short, 3-5 in. long, erect or spreading. Probably Asia.

lùtea: V. marina.

marina (V. lutea). Pods 2 in. long, reflexed. Trop.

sesquipedàlis (Dolichos sesquipedalis). Asparagus Bean. Yard-long Bean. Pods 1-3 ft. long, hanging, flabby or somewhat inflated when green. Probably Asia.

sinénsis. Cowpea. Pods 8-12 in. long, hanging. Probably Asia.—Grown for forage, green-manure, the beans also for human food.

VILLÀDIA (Altamiranoa). Crassulaceæ. Per. herbs resembling Sedum but with petals united below into a tube; native in Mex., Cent. and S.

elongàta. Pubescent, branches becoming prostrate, rooting at joints. lvs. closely set, linear-ovate, ¼ in. long, acute: fls. white or pinkish, ½ in. long, in panicles. Mex.—Plants listed as Lenophyllum elongatum probably are to be referred here.

VILLARÈSIA. Icacinacex. Evergreen trees and shrubs native in the southern hemisphere, having alternate lvs., white fls. in small headlike cymes, and fr. a drupe; one species is cult. in Calif. Propagated by cuttings.

mucronata. Tree to 40 ft. or more: Ivs. ovate to oblong, to 3 in. long, entire, shining above, pale beneath: fls. yellowish-white, ¼ in. long, in cymes to 2 in. long: fr. about ¾ in. long. Ch'le.

VILLARSIA: Fauria.

VILLOUS: provided with long and soft, not matted, hairs; soft-shaggy.

VINCA. Periwinkle. Apocynaceæ. Herbs erect or trailing, sometimes shrubby and evergreen, with opposite firm lvs., solitary axillary salverform fls., and fr. of 2 spreading follicles; native in the Old World, several planted for ornament and ground-cover; useful for vases and baskets.

The common periwinkle thrives in moist shady locations. It and $V.\ major$ are propagated by division and cuttings. $V.\ rosea$ is grown from seeds as an annual, or propagated by cuttings from carried-over plants.

alpina: form of V. minor; rose or purplish, often double. delicata: a form of V. rosea.

Hárrisonii: a listed name for a plant of the V. major kind

herbacea. Trailing: lvs. elliptic or lanceolate: fls. purplish-blue. I in. across. E. Eu., Asia Minor.

madagascariénsis: listed name for V. rosea.

major. Trailing, evergreen: lvs. ovate, truncate or heart-shaped at base: fis. blue, 1-2 in. across. Eu. Var. variegata has lvs. variegated.

minor. Common P. Running-Myrtle. Trailing, evergreen: Ivs. oblong to ovate, narrowed at base: fis. hlac-blue, varying to white and purple as indicated by the names alba, atropurpurea, cærdlea, purplerea, rôsea, rûbra, to ¾ in. across. Eu.; run wild in E. U. S. There are variegated (var. variegāta and aûreo-variegāta) and double-fid. forms (vars. múltiplex, plêna in cifferent colors.) Var. Bówlesii has darker blue fis. and said to be more floriferous.

toses (Ammocallis and Lochnera rosea). MADAGASCAR rosea (Ammocaus and Locanera rosea). MADAGASCAR P. Per. but commonly grown as an ann. in the N., to 2 ft., erect: lvs. oblong. fis. rosy-purple or white (var. álba), to 1½ in. across, showy, everblooming. Tropics.—Useful as a flower-garden ann. in the N.

VINCETÓXICUM. Asclepiadacex. Herbaceous American twining vines with opposite heart-shaped lvs., small wheel-shaped deeply-parted fls. in axillary clusters, the crown joined to corolla, and thick milkweed-like smooth or warty frs.; rarely transplanted from the wild. The plants referred to Vincetoxicum in the Old World are regarded as better treated under Cynanchum, which differs from the above in having a scale or ligule on the inside of each of the 5 parts of the crown.

acuminatum: Cynanchum acuminatifolium.

fuscatum: Cunanchum fuscatum.

hirsùtum. Hairy or downy: lvs. ovate-acuminate, to 7 in. long and 5 in. broad: fis. crimson-purple, about ½ in. long: fr. warty. Md. to Fla.

japónicum: Cynanchum acuminatifolium.

nigrum: Cynanchum nigrum.

officinale: Cynanchum Vincetoxicum.

suberosum. Plant glabrous or pubescent: lvs. oval or ovate and acute or abruptly pointed, to 5 in. long and 3 in. wide: fis. brown-purple, 1/4 in. long, May-July: fr. not warty. Va. to Fla.

VINE: Vitis.

VIOLA. VIOLET. Violacex. Many attractive herbaceous perennials, rarely subshrubs, stemless or with leafy sts., a very few ann.: stipules persistent and often leafy: fls., in many species, of two kinds, those in early spring showy and non-fertile, those in summer cleistogamous, apetalous and producing numerous seeds; showy fis. nodding, the lower petal spurred while the other 4 are in two unlike pairs: caps. dehiseing into 3 boat-shaped and keeled valves: native in north and south temp. zones, many species suitable for the rock- and wild-garden and as edging plants in semi-shady positions in the border.

Nearly all violas thrive best in partial shade and fairly rich soil. They require plenty of moisture and a winter covering of leaves or evergreen boughs. The violets may be grown from seeds sown in autumn in boxes and exposed to freezing, germination then taking place in spring. A quicker method of propagation is by division or by runners when such are produced. The florists' violet is usually increased by offsets in late winter or early spring, rooting these in sand. Sometimes the old plants are divided when they are lifted in spring but care must be exercised not to save hard or weak material.

or weak material.

Pansy is a viola. In this country the pansy is usually propagated by seed which should be sown from the middle propagated by seed which should be sown from the middle of July to the middle of August for the next spring bloom. The plants may be wintered over in coldframes or in milder sections they may be planted in permanent quarters if covered with a mulch preferably of leaves; the crowns should not be covered too thickly or the plants smother. If desired, the seed may be sown indoors in late winter. In the case of named varieties or special colors cuttings should be used or layers, as the seed is too hybrid in character. Pansies are normally perennial but some races are essentially annual as to horticultural treatment or at least biennial inasmuch as they are supposed to give their best bloom when relatively young; they are sonetimes classed with biennials, although the plants may persist and with good care bloom for a number of years. It is well to have a new stock coming on each year from seed; and if one wants choice flowers careful attenton must be given to the se-curing of well-bred strains and the seeds of such kinds are necessarily expensive. Pansies thrive in a cool rather moist soil, and although they may benefit by some protection from the noonday sun they should not be planted in shade. As the ground becomes warm a mulch of leafmold or other light material may be spread over the bed to retain moisture light material may be spread over the bed to retain moisture and exclude heat. Spring and fall give the best bloom, but with attention to these details and to watering and not allowing seeds to form or long weak growths to choke the bed, good pansies may be had all summer; by pruning and otherwise the plants should be kept stocky and compact; do not grow too thickly,—say 8 inches apart each way. Seeds sown in boxes in January or February make blooming plants by April, taking the place of those blooming earlier from over-wintered stock.

adúnca (V. canina var. adunca). Sts. to 4 in. long: lvs. round-ovate, slightly toothed: fis. violet turning redpurple. Alaska to Calif.

ætólica. To 8 in. or less, sts. numerous, elongate, decumbent: lvs. ovate-oblong, obtuse, broadly and obtusely crenate: fls. yellow, petals nearly twice as long and spur 1½ times as long as calyx. Greece.

affinis. Lvs. cordate-ovate, wavy-toothed, long-petioled: fis. violet with white base. Vt. to Ga. and Ala.

álba (V. violacea). To 5 in.: lvs. cordate-acuminate to ovate, blade to 4 in. long, entire, chiate, pubescent beneath, lying close to ground: fls. white with violet center and veins o violet, to 1 in. across, on erect peduncles. Cent. Eu. and Medit. region.

alpéstris: V. saxatılis.

alpina. To 2 in.: lvs. round, wavy-toothed, long-petioled: fis. bright violet, rarely white. Eu.

altaica. Differs from V. calcarata in its smaller broader lys, and much shorter spur. Asia Minor, Siberia.

amábile: hort, name of no botanical standing; listed as with lavender fls.

arenāria. To 3 in.: lvs. ovate, small, puberulent on both sides: fls. pale violet or white. Que. to Mass. west to Alaska, Eu. Var. rôsea is listed.—Most European authors consider this a pubescent var. of V. rupestris.

Arkwrightii: hort. name of a form of V. cornuta.

atropurpurea: an unidentified name for a purple-fid. violet.

Battandièri. Per. to 6 in.: fls. cream-wh'te to lilac and blue-gray, to 1 in. across. N. Afr.—Perhaps only a variant of V. Munbyana.

Béckwithii. To 4 in.: lvs. palmately 3 times 3-parted into linear segms.: fls. with 2 upper petals purple and 3 lower pale violet. Ore. to Calif. and Nev.

bellidifòlia. Dwarf, matted: lvs. broad-ovate, obtuse, glabrous: fls. violet or purple. Mont. to Ida.

Bertolònii: V. corsica.

betonicifòlia. Stemless per. to 9 in.: lvs. ovate to oblong-lanceolate, to 2 in. long, with large stipules attached to petiole: fls. purple or violet with white tips, spur short, petals about ½ in. long, the lateral ones bearded within. Australia to Himalayas.

biflòra. Lvs. reniform, toothed, glabrous: fls. small, yellow, lip streaked with blackish-purple, spur very short. Eu., Siberia.

blánda. Sweet White V. Lvs. ovate, acute, somewhat hairy on the upper surface: fis. white with narrow strongly reflexed petals. Que. to Ga. and La.

bosniaca: V. elegantula.

Brittoniana. To 8 in.: lvs. reniform, each of the 3 lobes of 2-4 somewhat linear segms. remotely serrulate, middle lobe widest, glabrous beneath: fis. dark violet with white throat, large. Me. to Va.

Brodksii (V. lobata var. integrifolia). To 8 in., minutely pubescent, sts. usually naked at base and few-lvd. above: lvs. deltoid to rhombic-ovate, sometimes acuminate crenate-serrate, to 3 in. wide: fls. yellow, to ½ in. long. crenate-serrate, to S. W. Ore. to Calif.

calcaràta. To 4 in., with creeping rootstocks: lvs. ovate to lanceolate, wavy-toothed: fis. violet, the spur as long as

canadénsis. To 1 ft. or more: lvs. broad-ovate, cordate, acute, toothed: fls. white inside with yellow base, outside often tinged violet. N. B. to Ala. and Ariz.

canina. Dog V. Lvs. ovate-cordate, toothed: fis. bluishpurple with yellow spur. Eu.

cárnea: hort. name for pale lavender form.

censia. Lvs. ovate, entire: fls. violet. Alps of Eu.

cherophylloides: a confused name; perhaps a form of V. pinnata.

chinénsis: V. Patrinii.

chrysantha: V. Douglasii.

confederata: V. Priceana.

conspérsa. To 6 in.: lower lvs. cordate-orbicular, toothed: fis. many, pale violet varying to white, spur short. Que. to Minn. and Ga. Var. sylvéstris is listed.

cordata: name of uncertain application.

cordàta: name of uncertain application.
cornùta. HORNED V. Per. more or less tufted: lvs. ovate,
wavy-toothed, stipules large, triangular, coarsely toothed:
fls. violet, spur slender, as long as calyx. Spain and Pyrenees.—The Tufted or Bedding pansies are probably an
offshoot of this species, with shorter spurs. Garden vars.
are admirâbilis, possibly a hybrid form; âlba, fls. white;
atropurpurea, dark purple with small yellow center; airea,
fls. golden-yellow; grandiifora, a garden form; litea spléndens, fls. golden-yellow; Papilio, fls. very large, violet with
purple center; Picârdii is listed; purpurea, fls. purple.

corsica (V. Bertolona). Glabrous per., sts. leafy, ascending: basal lvs. ovate-orbicular, st.-lvs. oblong to lanceolate, entire or nearly so, stipules entire, the lower ones with 2 linear lateral lobes: fls. violet-blue, acute, spur twice as long as the lanceolate sepals. Corsica, Sardinia.

cucullata. Lvs. broad-ovate, acute, wavy-toothed. fls. violet with darker throat, sometimes white. Que. to Ga. Var. álba has fls. white. Var. bicolor has white fls. with small violet center and veins. Var. variegata is listed.

cuneata. Sts. to 7 in. long: lvs. ovate, toothed: fls. with 2 upper petals purple, lower violet or whitish veined or spotted with purple, spur yellowish. Ore., Calif.

cuspidata: listed name of no known botanical standing.

dactyloides. Lvs. palmately 5-lobed, segms. oblong-cuneate, somewhat serrate-incised, villous beneath: fis. violet, sepals oblong, obtuse, spur short. Siberia.

declinata. Similar to V. lutea, differing in spur and petals twice as long as calvx. Balkans.

declivis: listed name.

delphinifòlia: V. pedatifida.

Douglasii (V. chrysantha), To 5 in.: lvs. bipinnate into linear or oblong segms. fis. orange-yellow veined with purple, the 2 upper brownish-purple outside. Calif.

Dubyana: listed name.

eizanénse is listed as with large white fragrant fls. and originating from Japan; the name is not known botanically.

elatior. Strong erect per to 20 in.: lvs. not in basal rosette, blade lanceolate to lanceolate-ovate, to 3 in. long glabrous: fls. bright blue with darker veins. Cent. and E. Eu.

elegántula (V. bosniaca). Per. but better treated as bien., to 6 in., becoming straggling: lvs. ovate, wavy-toothed. fls. rose-purple with yellow striped spot at base of lower petal, long-spurred. S. W. Eu.

emarginata. Plant glabrous, to 6 in.: Ivs. ovate to triangular, to 4 in. long, petiole much longer than blade, glabrous, margins usually coarsely toothed along middle: fis. violet-blue, peduncles shorter than Ivs., erect. N. Y. to Ga., west to Okla.

eriocárpa (V. scabriuscula). To 4 in.: basal lvs. ovate to remform, st.-lvs. on upper part of st.: fis. yellow: caps. woolly. N. S. to Man., Ga. and Tex. Var. leiocárpa has glabrous caps.—The typical form with woolly fis. is more rare in the wild and in cult. than is the var. leiocarpa.

esculenta. Plant glabrous, with usually branched ascending rootstocks, to 6 in.: lvs. 3-5-lobed, to 6 in. long: fls. pale violet to white, on long peduncles. Wet land along coastal plann, S. C. to Fla.

flicatilis. Sts. creeping, slender: lvs. ovate-orbicular, to 3 in. across, cordate, obtusely crenate, supules broad and laciniate: fls. to 3 in. across, pedicels to 4 in. long, spur short. New Zeal

fimbriátula. To 4 in.: lvs. ovate to oblong-ovate, pubescent beneath, serrulate: fls. violet-purple. N. S. to Wis. south to N. Ga.

Fléttii. To 6 in., glabrous: lvs. reniform, toothed: fls. violet with yellow base. Mts., Wash.

florariénsis. Recorded as a hybrid with V. rothomagensis and V. cornuta: fls. purple, the lower petal yellow at base striped purple, short-spurred.

floridana. To 4 in.: lvs. cordate, serrulate, ciliate, often puberulent above: fls. pale violet to nearly white, on peduncles longer than lvs. Fla.

glabélla. To 1 ft.: lvs. cordate: fls. bright yellow veined with purple, short-spurred. Alaska to Calif.

grácilis. To 1 ft., hairy: lvs. oblong to broad-ovate, somewhat toothed, stipules pinnately parted: fls. violet, spur longer than sepals. Macedonia to Asia Minor. Var. álba, fls. white. Var. lùtea, fls. yellow.

grandiflora: a confused name used in the trade for hort.

grynocèras: V. aulnestria.

Viola

Háliii. To 4 in.: lvs. palmately 2-parted into narrow segms.: fis. with 2 upper petals dark violet and 3 lower yellow or white. Ore., Calif.

hastata. To 10 in.: lvs. halberd-shaped, toothed: fis. yellow tinged violet outside. Pa. to Fla.

hederacea (Erpetion reniforme). Australian V. Tufted, cieeping by stolons: Ivs. reniform to spatulate, entire or toothed: fis. blue varying to white, scarcely spurred. Australia.

heterophylla: name of uncertain application.

hirsdula. Southern Wood V. To 3 in.: Ivs. orbicular-reniform, to 2 in. across, usually flat on ground or nearly so, silvery-pubescent and purple-veined above, purplish-green and glabrous beneath. fls. reddish-purple, spur very blunt and about ¼ in. long. S. N. Y. to Ala. and Ga.

hirta. Similar to V. odorata, hairy, 6 in.: lvs. narrower and more triangular: fis. inodorous or faintly scented, spur long and hooked. Eu.

Howellii. To 1 ft., erect or spreading: lys. ovate-cordate or round-reniform, toothed and cliate: fis. pale blue or violet, large, spur straight, about half length of sepals. Ore.

hybrida. Botanically the name is a synonym of V. uluinosa, a plant not known to be in cult.; it is used in the trade for various hort. forms of uncertain lineage.

incógnita. White V. To 3 in.: lvs. orbicular- reniform, pubescent beneath and on petioles, glabrous above, apex very abruptly acuminate, margins serrulate: fls. white. Que. to Wis. south to Mass. and Tenn. Var. Fórbesii has lvs. pubescent above but glabrous beneath and on petioles; in cult. it is not usually distinguished from the typical form.

inominata: listed name of unknown botanical standing.

Jobi. Per. to 3½ in., rootstock slender: lvs. ovate to oblong, to 1½ in. wide, base subtruncate to cordate, crenulate, glabrous: fis. pinkish-violet, to ½ in. across, lateral petals bearded below, sepals oblong-lanceolate. S. E. Eu.—Sometimes distributed as V. missouriensis.

Kitaibeliàna. Ann. to 8 in., glabrous: lvs. nearly orbicular to obovate, upper ones spatulate to linear-oblong, to 1 in. long, toothed: fls. cream-colored. Iberian Peninsula. Var. Rafinésquil (V. Rafinesqui) differ in its ciliate sepals, lvs. often entire or only slightly toothed, fls. lilae or lavender-tinged and larger. Probably S. Eu.; nat. N. Y. to Ga.

labradorica. To 3 in., with few short slender ascending sts.: lvs. orbicular, to % in. across, glabrous: fls. deep violet. Greenland and Lab. south to mts. of N. H., Me. and N. Y.

lanceolata. To 4 in.: lvs. lanceolate, tapering into margined petioles, slightly toothed: fis. white. Moist soil, N. S. to Fla. and Tex.

Lángloisii. To 4 in.: lvs. cordate-ovate, glabrous: fls. violet, to 1 in. across, on peduncles longer than lvs. Moist shade, N. C. to Fla. and Tex.

Lángsdorffii. To 8 in.: lvs. ovate-cordate, wavy-toothed: fis. blue or violet varying to white, spur broad. N. W. Amer., Siberia.

laticacula. To 6 in., lvs. reaching 1 ft. after flowering: lvs. triangular-cordate, immature blades tinged purple beneath, serrate: fls. deep violet, large. Vt. to N. J. and N. W. Pa.

linearifòlia: Ionidium linearifolium.

lobata. To 1 ft.: lvs. palmately 3-7-parted into nearly entire lobes: fls. yellow veined at base, purple outside. Ore., Calif.

Lovelliana. To 6 in.: lvs. ovate-cordate, blades to 2 in. long, remotely pubescent, often 3-lobed with lobes 2-3-cleft: fls. violet-purple, the 3 lower petals bearded and with darker lines. N. C. to Fla. west to Okla.

lûtea. To 10 in., with creeping underground sts.: lvs. ovate to lanceolate, wavy-toothed, stipules pinnatifid: fls. yellow, sometimes upper petals or fls. purple, spur as long as calyx. Eu. Vars. grandiflora and spléndens are in the

macedónica. To 10 in., sts. numerous and decumbent: lower lvs. ovate-subcordate, others oblong-lanceolate, acute, all crenulate: fis. bluish-violet, spur rounded, twice as long as calyx. Greece.

Macióakeyi. To 6 in. or less: lvs. cordate to orbicular, remotely crenulate, in tufts at ends of leafy stolons: fis. white. Alta., B. C. to Calif.

macrocèras. To 6 in. or more, glabrous, sts. not leafy, rootstock stout: lvs. oblong-cordate, obtuse, crenate-serate, petiole to 4 in. long: fis. violet, fragrant, throat bearded, spur incurved and about as long as petals or longer, stigma somewhat hooked, sepals ovate, obtuse. Russia.

mirábilis. To 1 ft.: lvs. oval, cordate, wavy-toothed: fis. pale blue, fragrant. Eu.

missouriénsis. Tufted, to 6 in.: lvs. ovate-cordate, toothed: fis. pale violet marked with purple, white center. Mo. to Tex.—See V. Jon.

Munbyana. To 1 ft.: lvs. cordate-ovate, toothed, glabrous, stipules pinnately cut: fis. large, 1-3 from the lower axils, violet or yellow, spur straight, about twice length of sepals. Algeria.

nana: listed name.

762

nephrophylla. Lvs. cordate-ovate or reniform, wavy-toothed; fis. deep violet, large. Cold bogs, N. N. Amer.

nigra: advertised as having black velvety fis.

nippónica: V. phalacrocarpoides.

nummularifòlia. Tufted alpine: lvs. broad-ovate, entire: fls. blue with darker lines, short-spurred. S. Eu.

Núttallii. To 10 in.: lvs. lanceolate, tapering into marwavy-toothed. B. C. and Wash.

obtusoságitta. Stemless: lvs. sagittate to oblong-ovate, auriculate at base, to 2 in. long, glabrous, petiole to 3½ in. long: fls. pale violet, hairy within, spur saccate and almost as long as lanceolate sepals. Japan.

occidentalis. To 6 in., glabrous, rootstock not creeping but producing long fillform runners: lvs. ovate to spatulateoblong, obscurely crenate, longer than scapes: fis. white, the lower petals veined purple. Marshes, Ore. and Calif.

ocellata. To 1 ft.: lvs. cordate-ovate. wavv-toothed: fls. with 2 upper petals white, violet on outside, the 3 lower white or yellow spotted or vened with purple. Ore., Calif.

odorata. Sweet, Garden or Florists V. Tufted, stemless, making long runners: lvs. cordate-ovate to reniform, toothed: fis. deep violet, rarely rose or white, fragrant, spur short, nearly straight. Eu., Afr., Asia.—Many forms varying in stature, size and color of fis., also vars. with double fis. Named forms are álba, nana, rosina, semperdouble fis. Named forms at florens, spléndens, sulfùrea.

orbiculata. Stolons to 4 in. long: lvs. orbicular, wavy-toothed: fls. yellow. B. C. to Wash. and Ida.

pállens. Lvs. cordate-ovate or cordate-orbicular, glabrous, toothed: fis. white, slightly fragrant. Lab. to S. C. and west to N. D.

palmata. Lvs. palmately 5-11-lobed or -parted, middle Minn. and Fla.

palústris. Lvs. cordate-ovate or reniform, wavy-toothed: fis. pale lilae with darker veins, varying to nearly white, short-spurred. Moist soil, N. N. Amer., Eu., Asia.

Papílio: V. cornuta var.

papilionacea. Robust, to 6 in.: lvs. deltoid-ovate to cordate-ovate, toothed: fis. normally deep violet with whitish or greenish-yellow center; cleistogamous fis. usually underground. Mass. to Ga. and Okla. Var. alba has white fls.

Patrinii (V. chinensis). Stemless and non-stoloniferous per. to 5 in.: lvs. triangular-ovate to linear, to 4 in. long, base hastate, heart-shaped to wedge-shaped, margins crenate or serrate: fls. lilac, to ½ in. across, stigma 3-lobed. Cent. Russia east to Japan.

parvifiòra: confused name, material so listed may be referable to V. trucolor.

pedata (V. pedata var. bicolor). BIRDS-FOOT V. Stemless: lvs. 3-5-divided, segms. 2-4-cleft or toothed near apex: fls. with 2 upper petals dark violet, 3 lower pale lilac. Mass, and Minn. to Fla. Var. fibh ahs white fls. Var. grandiflòra is listed. Var. linearsloba has all petals lilac-purple.

pedatifida (V. delphinifolia). Lvs. palmately many-parted, the ultimate segms. linear: fis. violet, on scapes longer than lvs. Ohio to Ariz.

pedunculàta. Sts. ascending, often 2 ft. long: lvs. round-ovate, coarsely toothed: fls. orange-yellow veined purple on the inside. Calif.

phalacrocarpoides (V. nipponica). Stemless, rhizome short, thick and erect: lvs. ovate, \(\frac{1}{2} \) in. wide, obtuse, crenate, glabrous, usually erect: fis. violet-purple, to \(\frac{1}{2} \) in. across, on peduncles often exceeding lvs., lateral petals white-bearded, spur to \(\frac{1}{2} \) in. long: caps. glabrous. Japan.—
Thought to be a hybrid between \(V. \) japonica and \(V. \) phalacrocarpa.

pinnata. Stemless, to 3 in.: lvs. palmately many-parted: fis. violet, paler at base. Eu.

præmórsa: V. Nuttallii var.

Priceana (V. confederala). CONFEDERATE V. Lvs. cordate-ovate, glabrous: fis. whitish heavily veined with violet-blue. Ky. to Ga. and Ark.—This plant has been considered by some authors as an albino form of V. papil-

ionacea, but no seedling reversions to forms resembling V. papilionacea are known.

primulifòlia. To 10 in.: lvs. oblong to ovate, somewhat toothed: fis. white with purplish veins. N. B. to Fla. and La.

pubéscens. To 1 ft., soft-pubescent: lvs. broad-ovate to reniform, toothed, stipules large: fis. bright yellow, spurs short. N. S. to Va. and Mo.

Rafinésquii: V. Kitaibeliana var.

renifolia. To 4 in.: lvs. reniform, pubescent, remotely crenate-serrate, apex rarely acute: fis. white, lower 3 petals with brown veins, all glabrous. Swamps of Newf. south to Pa., Mich. and Minn., also in Rocky Mts. to Colo.

retusa. To 4 in.: lvs. cordate-acuminate to ovate, glabrous crenate-serrate: fis. violet. Kans. to Colo.

Riviniana. To 6 in.: lvs. cordate-ovate, stipules lanceolate: fis. pale blue with short yellowish-white spur. Eu.

Rôbertii. Hort. hybrid of which one parent is said to be V. affins.

rostrata. To 8 in.: lvs. cordate-ovate or orbicular, toothed: fis. lilac with darker spots, spur to ½ in. long. Que. to Mich. and Ga.

rothomagensis: a form of V. tricolor.

rotundifòlia. To 4 in.: lvs. oval, obtuse, thick and prostrate, round-toothed: fis. bright yellow, with brown lines on 3 lower petals. Mts., Me. to Ga.

rugulòsa. To 2 ft., with branching stolons: lvs. cordatereniform, hairy below: fls. white inside with yellow base, often tinged violet. Alaska to Ia.

rupéstris. To 4 in.: lvs. cordate to orbicular, blade to 1½ in. long, pale green above and often purplish beneath, rather thick: fls. blue-violet. Eu.

sagittàta. Lvs. lanceolate or oblong-lanceolate, sagittately toothed at base: fls. violet-purple. Mass. to Ga. and L.

Sarea: hort. name for pure white-fid. form.

sarmentòsa: V. sempervirens.

saxátilis (V. alpestris). Ann. to 6 in.; sts. slender, prostrate or sometimes creeping: lvs. ovate, crenate, stipules broad: fis. yellow, or the upper petals violet or the corolla entirely violet, about ¼ in. across. Cent. Eu.

scabriúscula: V. eriocarpa.

sempérvirens (V. sarmentosa). Sts. decumbent: lvs. round-cordate, toothed, dark-spotted: fis. yellow, short-spurred. B. C. to Calif.

septentrionalis. To 5 in.: lvs. ovate to reniform, toothed and ciliate: fis. large, violet-purple, rarely white. Newf. to B. C.

Shéltonii. To 6 in.: lvs. palmately 3-parted into cut lobes: fls. pale yellow. Wash. to Calif.

Sièboldii. Similar to V. Selkirkii, from which it differs in its obtuse lvs., small white fis. and in the jointed rhizome. Japan.

silvática: V. sylvestris.

soròria. To 6 in.: lvs. ovate, orbicular or reniform, usualty pubescent beneath and on petioles, crenate-serrate: fis. violet to lavender, rarely white, peduncles often pubescent. Que. to Minn. south to N. C. and Okla.—It is sometimes not possible to distinguish this from forms of V. papilionacea.

spléndida. Per. to 20 in., ascending: lvs. ovate, to 6 in. long, obtuse, crenate, petiole narrowly winged: fls. yellow, solitary, to 1½ in. across, spur long as petals or longer, ovary glabrous, sepals broadly lanceolate, subpilose, margins denticulate. Italy.

striata. Tufted, to 2 ft.: lvs. ovate to orbicular, wavy-toothed: fls. white or cream. N. Y. to Ga. and Mo.

supérba: hort. name given to forms of several species.

sylvéstris (V. silvatica. V. grypoceras). Sts. reclining and ascending, to 8 in. lvs. deeply cordate or nearly reniform, stipules narrow, fringed-toothed: fls. bluish-purple or lilac, spur short. Eu. Var. rôsea is listed.

or liac, spur snort. Ed. var. rosea is listed.

tricolor var. horténsis. Pansy. Heartsease. Ann. or short-lived per., sts. becoming long and much branched: basal lvs. round-cordate, st.-lvs. ovate-oblong or lanceolate, toothed, large stipules pinnately parted near base: fis. large, usually in 3 colors, blue, whitish and yellow, spur short. The garden pansy is considered an offshoot of V. tricolor, probably with other species involved in its parentage; it varies greatly in size, shape and coloring of fis. See cult. at head of this article.

trineryata. Lvs. dissected into thick lanceolate or ovatelanceolate strongly 3-nerved segms.: fis. with upper petals dark blue and lower pale blue or white with yellow base. Wash.

vaginata. Related to V. cucullata but differs in If. petioles somewhat sheathing the more slender st., stipules whitish, and short-spurred paler fis. Japan.

valificala. Plants stemmed: lvs. ovate to lanceolate, obtuse, nearly entire, basal ones narrowly ovate: fis. yellow,

upper 2 petals tinged purple. Moist rich soil, Sask. to B. C. south to Colo. and Wash.

Varenària: catalogue name.

vendsa. To 5 in.: basal lvs. round, 5-7-lobed or toothed: fis. yellow. Mont. to Calif

vikrum. To 5 in.: lvs. simple or 3-7-lobed, glabrous, incised or serrate: fls. deep violet. Mo. to Kans.

villòsa. Lvs. ovate to orbicular, slightly toothed, long-petioled: fis. violet. Va. to Fla. and Tex.

Vilmoriniana: hort. name.

violacea: V. alba.

vittata. To 1 ft. lvs. glabrous, usually 6 in. high at time of flowering, becoming larger with age, blade lanceolate becoming linear, to ½ in. wide, villous beneath: fis. white. N. C. to Fla., west to Tex.

Walteri. Lvs. orbicular or ovate, mottled with dark green: fis. violet-blue. S. C. to Fla. and Tex.

Wellsiana: listed name.

Wóckei: hort. name of hort. or hybrid form.

VIOLACEÆ. VIOLET FAMILY. Widely distributed temp. and trop. herbs or shrubs, and sometimes trees, of 15 genera, having simple or deeply cut lvs., mostly bisexual irregular or regular fls. with 5 sepals and petals, the lower petal often spurred or saccate, 5 stamens, superior 1-celled ovary, and fr. a caps. or berry. Known to cult. with us in the genera Hymenanthera, Ionidium, Melicytus and Viola.

VIOLET: Viola. African: Saintpaulia ionantha. Dames: Hesperis matronalis. Dogs-tooth: Erythronium dens-canis. Usambara: Saintpaulia ionantha.

VIORNA: Clematis.

VIRGÍLIA. Leguminosæ. S. African tree, intro. in S. Calif. V. capénsis. Lvs. with 6-10 pairs of linear-oblong leathery lfts. to 1 in. long, pale and tomentose beneath: fls. papilionaceous, rosypurple, ½ in. long, in terminal racemes: pods linear, flattened, leathery. For V. lutea see Chadrastis.

VIRGINIA CREEPER: Parthenocissus quinquefolia.

VIRGINS-BOWER: Clematis.

VISCARIA: Lychnis.

VISCUM: see Loranthaceæ.

VITACEÆ. Grape or Vine Family. Mostly woody vines climbing by tendrils, of 10 or more widely distributed genera, having alternate simple or compound lvs., small bisexual or unisexual fls. with 4–5 sepals, petals and stamens, superior 2–6-celled ovary, and fr. a berry. Several genera are grown for ornament and screens and covering arbors and walls, as Ampelopsis, Cissus, Leea, Parthenocissus, Tetrastigma, Vitis; and Vitis is grown also for the edible fr. The plants are of easy cult., and many of them are hardy in the northern states.

VITEX. Verbenacex. Trees and shrubs with opposite digitately compound lvs. and white, blue, yellowish or red fls. in terminal spikes or panicles in late summer and autumn.

Vitex does well in any good soil. Propagated by seeds in spring, layers and greenwood cuttings under glass. V. Negundo is usually root-hardy in some of the northern parts of the country, but V. Apnus-casius is more tender; when the roots survive, the young shoots produce flowers.

Agnus-cástus. Chaste-Tree. Hemp-Tree. Monks
Pepper-Tree. To 10 ft.: Ivs. of 5-7 lanceolate nearly
entire lfts. to 4 in. long, grayish-tomentose beneath and
very dark green above: fts. lilac or lavender (varying to
whitish), ½ in. long, in rather dense spikes to 7 in. long.
S. Eu. Var. álba has white fts. Var. latifòlia (V. latifòlia)
has shorter broader lvs. Var. variegàta has variegated

divaricata. To 60 ft.: lvs. of 1 or 3 elliptic to ovate entire lfts. to 6 in. long: fts. violet or blue, to 1/4 in. across, in panicles: fr. black, 1/4 in. long. W. Indies, Guiana.

incisa: V. Negundo var.

laciniàta: V. Negundo var. incisa.

latifolia: V. Appus-castus var. laticolia: V. Appus-castus var. laticons. To 60 (t.: lvs. of 3-5 obovate lfts. to 5 in. long, glabrous and shining: fls. dark red, 1 in. long, in panicles: fr. bright red, ¾ in. across. New Zeal.

macrocéphala: listed name of unknown botanical standing

macrophylla of hort. may be a broad-lvd. form of V. Agnus-castus, or V. Negundo var.

Negúndo. To 15 ft.: lvs. of 3-5 ovate to lanceolate toothed or entire lfts. to 4 in. long, grayish-tomentose beneath and dark green above: fls. lilac or lavender, 1/4 in. beneath and dark green above. Its. may of lavelidet, 24 in. long, on slender branches of loose panicles to 8 in. long. China, India. Var. incisa (V. lacimata) has deeply toothed or cut lvs. Var. macrophylla is a broad-lvd. form.

quinata. Lvs. usually 5-foliolate, nearly glabrous, lfts. elliptic-oblong, acuminate, entire: fis. yellowish, to ¼ in. across, in densely-fid. cymes. S. China to Indo-China.

VITIS. THE VINE. GRAPE. Vitacex. Tendrilclimbing woody deciduous vines of the northern hemisphere (sometimes nearly erect shrubs in arid regions), grown for the fr. and also for screen cover, trellises and ornament: fls. (often unisexual) with a disk separate from the ovary; petals 5, coherent at the apex and falling to-gether: fr. a more or less globular berry with seeds contained in the soft pulp. Most of the cult. species are hardy in the middle or northern states; propagated readily by means of seeds, also by cuttings of ripe dormant wood, and rare kinds by soft cuttings in frames. See Grape.

ácida: Cissus acida.

ESITIALIS. SUMMER G. Very tall vigorous climber: lvs. rusty-tomentose or cobwebby on under side of the large soft lobed lvs.; fr. ½ in. or less diam., glaucous-black. New England to Fla. and Kans.—Norton Virginia grape is supposed to be a derivative.

amurénsis. Strong vine with the look of *V. cordifolia* but lvs. more or less 3-lobed and the basal sinus very broad and shallow: fr. about ½ in. across, black. Manchuria.—Grown for ornament, the lvs. highly colored in autumn.

antárctica: Cissus antarctica.

argentifolia (V. bicolor of many authors, V. Leconteana). BLUE G. Much like V. æstıvalıs, differing particularly in lvs. more or less glaucous underneath and glabrous and absence of rusty wool on young growths, and frs. not usually as large. New England to Ont. and Mich. and south.

arizónica. Canyon G. Low, scarcely climbing, the tenanzonica. Canyon G. Low, scarcely climbing, the tendrils mostly perishing if not attached to support, the internodes short: lvs. rather small, broad-ovate with wide open sinus, usually only indistinctly lobed if at all, cobwebby when young: fr. about 1/3 in. across, black. W. Tex. to Calif. and Mex.

austrina: V. Simpsonii.

Baileyana. Possum G. Slender high climber, densely foliaged: lvs. broad-ovate and cordate, mostly 3-lobed near apex, dull, at maturity pubescent on veins underneath: fr. 1/2 in. or less diam., shining black. W. Va. to Ga.

Baudiniana is Cissus antarctica.

Berlandièri. Spanish G. Stocky, moderately climbing: lvs. cordate, often as broad as long, angled or 3-lobed to-ward apex, shining above and at maturity pubescent on veins underneath: fr. ½ in. or less diam., purple. S. W. Tex. and Mex.

betulifòlia. Birch G. Good climber: lvs. mostly rather small, ovate, shallow-cordate to almost truncate at base, mostly not lobed or only angled, pubescent underneath: fr. small, blue-black. China.

bícolor: inapplicable name; see V. argentifolia.

bipinnata: Ampelopsis arborea.

Bourquinia (V. æstivalis var. Bourquiniana V. Bourquiniana). Southern Summer G. Young growth only moderately rusty as well as under surface of Iva., the covering mostly gray: fr. to ½ in. across and in large clusters. Cultigen; Herbemont, Lenoir and other vineyard vars. belong here.

califórnica. Tall climber: lvs. roundish or reniform, cordate, pubescent or floccose underneath, some of them 3-5-lobed but commonly not so: fls. very fragrant: fr. about 1/2 in. diam., purple and very glaucous. Calif.

cándicans. Musrang G. High strong climber, the young parts white-tomentose and lvs. (which are broad-ovate and lobed only on verdurous shoots) remaining so underneath and dull above: fr. to 1/4 in. across, purplish, pungent in flavor. Ark., Okla., Tex.

capénsis: Cissus capensis.

caribæa. Strong high vine: lvs. orbicular-ovate, cordate

or truncate at base, apex short, not lobed, becoming dull shove. ristv-tomentose underneath: fr. very small. Trop. above, rusty-tomentose underneath: fr. very small. Amer., doubtfully in U. S.

Chámpinii. Robust climber: lvs. reniform to very broad-ovate, cobwebby or pubescent when young but becoming dark glossy green above, lower surface pale and at first tomentose: fr. about ½ in. diam., black. Tex.

cinèrea. Sweet Winter G. Very high climber: lvs. large, broad-ovate, more or less 3-angled or -lobed, dull and dark green above at maturity, under surface cobwebby-pubescent: fr. ½ in. or less diam., black or purple without appreciable bloom. N. Fla. to Tex., north to Ill. and Kans.

Ciotat: see V. vinifera.

Coignétize (V. Kaempferi of some). Very strong heavy-foliaged vine, brightly coloring in autumn: lvs. large (sometimes 1 ft. across), cordate-orbicular, sinus narrow, often shouldered or shallowly lobed, dull above and gray- or rusty-tomentose underneath: fr. about ½ in. diam., black with bloom. Japan.

cordifòlia: V. vulpina.

coriàcea: V. Shuttleworthii.

Davidii (Spinoulis Davidii). Vigorous prickly climber: lvs. large and rugose, broad-ovate, more or less angled or obscurely lobed toward apex, dull green above and glaucous underneath: fr. about ½ in. across, black. China.

Doaniana. Vigorous climber: lvs. medium size, very broad-ovate and cordate, sometimes shouldered, floccose above but becoming glabrous, tomentose underneath: fr. ½ in. or more diam., black with bloom. Okla. to N. Mex.—Promising as parent of vineyard vars.; hardy in northern

flexuosa. Slender graceful climber: lvs. rather small, broad-ovate with broad sinus or nearly truncate, shouldered or 3-lobed, shining above and pubescent on veins under neath. fr. about ½ in. across, black. Japan, China.—An Ampelopsis is sometimes grown under this name.

Girdiana. High climber: differs from V. californica in having young parts densely white-tomentose, lvs. cordate-ovate and pointed and more tomentose or arachnoid underneath, large forked fl.-cluster, fr. smaller and scarcely, if at all, glaucous. S. Calif., often near the sea.

gongylddes: Cissus gongylodes.

heterophélla: Ampelopsis brevipedunculata var. Maxi-

himalayana: Parthenocissus himalayana. humulifòlia: Ampelopsis humulifolia.

hypoglauca: Cissus hypoglauca.

incìsa: Cissus incisa.

indivisa: Ampelopsis cordata. Kaémpferi: V. Coignetiæ.

Labrúsca. Fox G. Strong climber with intermittent tendrils: lvs. large and thick, broadly cordate-ovate and often obscurely 3-lobed toward apex, upper surface dull, under surface dull whitish or rusty-tomentose: frs. few in a cluster, % in. or less diam., purple-black with strong foxy flavor. New England and N. Y. to Ga.; also in botanic gardens.

Labruscana. LABRUSCAN GRAPES. Vineyard vars. (as Concord) showing strong Labrusca likeness and derivatives or hybrids from it: lvs. mostly thinner, less rusty-tomentose: frs. in heavy pointed or shouldered clusters, larger and ameliorated in flavor. Cultigen.

lacinidsa: V. vinifera var. apiifolia.

Leconteàna: V. argentifolia.

Lincecumii. Post-Oak G. Much like V. astivalis but a more stocky grower, lvs. larger and densely tomentose underneath and frequently not rusty: fr. larger, sometimes 1 in. diam., black or dark purple and with thin bloom. S. W. Mo. to La. and Tex.—Promising as parent of vineyard grapes.

Lóngii (V. Solonis). Bush G. Stocky, more or less bushy and erect, young parts floccose: lvs. broad-cordate to nearly orbicular, very coarsely dentate, becoming glossy above at maturity, under surface pale and pubescent on nerves: fr. ½ in. or less diam., black and glaucous. Okla., N. Tex. and N. Mex., S. Colo.

megalophýlla: Ampelopsis megalophylla.

micans: Ampelopsis Bodinieri.

monticola. Sweet Mountain G. Slender climber: lvs. rather small, nearly orbicular or reniform, the sinus open or shallow, sometimes somewhat 3-lobed, shining light green above and below: fr. 1/2 in. or less diam., black with little or no bloom. Tex.

Munsoniàna. Bird G. A muscadine grape, differing from V. rotundifolia in being a more slender grower, continuously flowering or fruiting, lvs. less pointed, fr. smaller with thinner skin and tender pulp and lacking the strong flavor. S. Fla.; likely to be planted or utilized in its region.

novæ-ángliæ. Strong vine native Me. to Vt. and

Conn., probably not cult. outside botanical collections but which is to be distinguished from V. riparia: lvs. round or reniform-ovate, only obscurely or shallowly lobed, the teeth less prolonged, more pubescent underneath: fr. nearly in or less diam., black-purple and glaucous.

oblónga: Cissus oblonga.

orientalis: Ampelopsis orientalis.

Pagnúccii: V. Prasezkii var.

paimata (V. rubra). RED or Catbird G. Tall glabrous climber, the branchlets and petiole red: lvs. rather small, ovate and long-pointed, 3-lobed: fr. about 1/3 in. across, black. Ill. to Tex.; hardy N.

pentagona. Climber, with young branches tomentose: lvs. ovate, nearly or quite truncate at base, obscurely angled, gray- or reddish-tomentose underneath: fr. about 1/2 in diam., in a long cluster. China; hardy in S. New England.

Piasézkii. Climber with young sts. sometimes glandular: Pasezkii. Climber with young six sometimes giandmar: lvs. tomentose underneath, mostly deeply lobed or palmately compound with 3-5 narrow or lance-ovate lits. with the lateral ones smaller: fr. about ½ in. diam., black with bloom. Var. Pagnúccii (V. Pagnuccii) has young branches and under surfaces of lvs. glabrous or nearly so. China; hardy in northern states.

pteróphora: Cissus gongylodes.

pulchra. Strong handsome climber with reddish someputcars. Strong nanosome climber with redusin somewhat flocose young growth: lvs. large, becoming bronzy and glabrous above and purplish tomentose underneath to green, scarcely if at all lobed. Origin unknown; perhaps a hybrid. Hardy in S. New England.

quadrangulàris: Cissus quadrangularis.

reticulata: V. Wilsoniæ.

rhombifdlia: Cissus rhombifolia.

riparia (V. vulpina of some). RIVERBANK G. Vigorous climber, fragrant in bloom, glabrous except perhaps on veins on under surface of the broad-ovate rather thin large-toothed commonly 3-lobed pointed lys.: fr. ½ in. or less diam., black and glaucous. N.S. to Man. and Tenn. and Tex.

Romanétii. Stout climber with shoots pubescent and glandular-harry: lvs. large and thick, orbicular-ovate and indistinctly 3-lobed or shouldered, glabrous or nearly so above, tomentose underneath; fr. about 1/4 in. across, black. China; hardy in northern states.

rotundifolia (Muscadina rotundifolia). Muscadines Bullace G. Very strong climber with bark not shredding and tendrils simple: lvs. nearly orbicular to very broadovate, short-pointed, shining above, glabrous or essentially so underneath. fr. in small clusters, early deciduous, 1 in. or less diam., dull purple, skin thick and pulp strong-flavored. Del. to Fla., Kans. and Mex.—There are a number of vineyard vais., the Scuppernong having amber-green fr. rùbra: V. palmata.

rufotomentòsa. Redshank G. Allied to V. æstivalis: outline of representative mature lvs. very broad or even

circular with triangular apex short, red-woolly or floccose underneath and on stout petioles, margins coarsely toothed or notched: fr. black, less than 1/2 in. diam. Fla., probably Ga.

rupéstris. Sand G. Bushy, sometimes somewhat climbing, glabrous, tendrils often absent: lvs. rather small, nearly or quite reniform, conduplicate, only slightly, if at all, lobed: fr. ½ in. or less diam., purple-black and lightly glaucous. S. Pa. and Mo. to Tenn. and Tex., and hardy when planted farther N.

sempérvirens: see Cissus striata.

Shuttleworthii (V. coriacea Amer. auth.). Calloosa G. Vigorous vine with rusty young growth: lvs. nearly reniform to broad-ovate, stoutly stalked, coarsely toothed and perhaps shallowly lobed, upper surface shining and lower surface densely felted: fr. few, about ½ in. thick, pleasantly flavored. S. Fla.

Simpsonii (V. cinerea var. floridana. V. austrina). Currant G. Allied to V. astivalis but lvs. grav-webby and pubescent rather than rusty, with only shoulder-points rather than lobes, teeth very small: fr. currant-like, in long loose clusters. Fla., Ga.

Smalliana. Figleaf G. The grape commonly but erroneously known as V. Simpsoni: mature lvs. mostly deeply 3-5-lobed and with rounded sinuses: fr. large, usually more than ½ in. diam., in dense mostly broad clusters. Fla.

sola. Curtiss G. The Fla. plant heretofore known as V. caribæa: lvs. cordate, margins sinuate with point terminating each vein: fr. black, about 1/3 in. diam.

Soldnis: V. Longii.

Thomsonii: Parthenocissus Thomsonii.

titànea: recent name in U.S., perhaps an Ampelopsis.

Thúnbergii. Slender climber, young parts and under surface of lvs. rusty-tomentose: lvs. cordate-ovate, deeply 3-5-lobed mostly with rounded sinuses: fr. 1/3 in. or so diam., black and glaucous. China; hardy N.

vinifera. Wine G. The cult. grape of Eu. and of history and also of Calif., in many forms, moderately climbing: lvs.

broadly cordate-ovate or nearly orbicular, rather thin, with deep narrow sinus, coarsely toothed, 3-5-lobed with narrow obtuse sinuses, glabrous both surfaces or sometimes tomentose underneath: fr. variable in size, form and color, the skin adhering to the pulp. Probably of the Caucasian region. Var. apiifòlia (V. laciniosa) is a cut-lyd. form.—V. Ciotat is a cut-lyd. or compound-lyd. sport of the vineyard variety Chasselas Doré (of V. vinifera), but it has been confused apparently with Ampelopsis acontifolia.

Voinieriana. Somewhat fleshy very strong vine with tree-like stock and young shoots and under leaf surfaces rusty and usually tomentose: lvs. digitate with 3 or 5 large toothed stalked lfts.: tendrils very long, simple: fls. in cymes: fr. large, acid. E. Asia.—Planted for ornament in S. Fla. and S. Calif.

vulpina (V. condiolia). FROST G. Very large high climber: lvs. broad-ovate, the cordate sinus narrow, mostly Very large high not lobed, shining above, paler underneath but becoming glabrous except perhaps on veins: fr. 1/2 in. or less diam., dull black. Pa. to Fla., Kans. and Tex.—See also V.

Wisonise (V. reticulata). High climber with young parts tomentose: lvs. broad-ovate, at first reddish, not lobed, becoming glabrous above, cobwebby on veins underneath and reticulate: fr. about ½ in. across, glaucous. China.

VITTADÍNIA. Compositæ. Herbaceous perennials with thick rootstocks, alternate lvs., and heads in corymbs or solitary, of blue or white ray-fis. and yellow disk-fis.; pappus of bristles; distributed in Australia, New Zeal., S. Amer. and Hawaiian Isls. Closely related to Erigeron, differing in the slender-pointed rather than blunt or broad style-branches.

australis (V. triloba). Per. to 1 ft., woody at base, decumbent or nearly erect, not trailing, mostly pubescent: lvs. to 1/5 in. long or longer if very narrow, spatulate or linear, lobed or toothed at tip: heads solitary and terminal, with white rays. Australia, New Zeal.—Probably not in cult., the plant grown under this name being Erigeron Karvinskianus.

triloba: V. australis.

VOLADOR: Triplaris americana. VOLKAMERIA: Clerodendrum. VOLUTARELLA: Amberboa. VOLUTARIA: Amberboa.

VOUACAPOUA AMERICANA: Andira inermis.

Bromeliace x.Mostly epiphytic herbs native in trop. Amer., having stiff lvs. in dense rosettes and yellow, green, white or rose fls. covered with conspicuous bracts and borne in flattened spikes; grown also for the foliage which is often barred or variegated. For cult. see Bromeliacex.

bromelioides: listed name of unknown botanical standing. Cáppei. Hybrid of uncertain parentage.

Duchártrei. Hybrid, parentage unknown.

Duvaliana (Tillandsia Duvaliana). To 1 ft.: lvs. tinged with red beneath: fls. yellow tipped with green, with scarlet and green bracts. Brazil.

erécta. Hybrid between V. Poelmanii and V. Rex.

fenestralis. To 1½ ft.: lvs. to 2 ft. long, dark-veined and tipped with brown: fls. pale yellow, bracts spotted green.

hieroglýphica. Lvs. banded and irregularly marked with dark green above and brown-purple beneath: fis. yellowish. Brazil.

Magnisiana. Hybrid between V. Barilletii and V. fenestralis, having green lvs. with dark zigzag lines, to 16 in. long and 4 in. wide: fls. yellow, the bracts nerved with red, the infl. to 2½ ft. high.

nigréscens: perhaps the same as Tillandsia nigrescens. picta: V. speciosa

Poelmanii. Hybrid of uncertain origin.

Réx. Hybrid between V. Morreni-Barilletii and V. cardinalis, with carmine-red bracts.

Saundersii (Encholirion Saundersii). To 1½ ft.: lvs. linear, grayish above dotted with white, spotted with redbrown beneath: fls. yellow. Brazil.

speciosa (V. splendens. V. zebrina. V. picta). To 3 ft.:
lvs. to 1 ft. long and 3 in. wide, banded transversely with
dark brown: fis. yellowish-white, the bracts bright red.
Guiana. Var. måjor is a robust form.

spléndens: V. speciosa. zebrina: V. speciosa.

WACHENDÓRFIA. Hæmodoraceæ. S. African herbs with tuberous roots, plicate lvs., and funnel-shaped usually bright vellow fls. in panicles: related to Lachnanthes.

thyrsifiòra. To 2 ft.: lvs. to 3 ft. long and 3 in. wide: fis. % in, long, in dense cylindrical panicles 1 ft. long.

WAHLENBÉRGIA. Campanulaceæ. Many ann. and per. herbs, largely in Eu. and Afr., Campanulaceæ. Many differing from Edraianthus (which see) in the loculicidal caps, as well as in more open upright habit and solitary rather than aggregate fis., although some of them, as W. hederacea, are slender trailers: lvs. simple, cauline or in basal rosettes, linear to oblanceolate or spatulate, often crenate, or in trailing species much broader: fls. bell-shaped or tubular, often nodding, violet or blue. The small per, species are useful in the rock-garden; propagated by seeds; cult. as for Campanula. The species are much confused. Many species have been described in recent time from Afr.

álbo-marginàta. Low per. 3-8 in. high making a clump of basal resulate lvs. above which are slender sts. each bearing an erect bell-shaped blue or white fl. 1 in, more or less across: lvs. lanceolate to elliptic and spatulate, nearly or quite obtuse, to 1 in. long, often marginate. New Zeal.

annularis. Per. with fleshy roots, a few in. high: lvs. mostly basal and crowded, linear-lanceolate, denticulate, pubescent, st.-lvs. bract-like: fl.-sts. often forked: fls. pale blue, bell-shaped, about 1½ in. across. S. W. Afr.—Has been grown as W. robusta.

Berterdi: the plant so listed is a Campanula.

bosniaca: probably an Edraianthus.

capénsis. Ann., 1-2 ft.: lvs. ovate-lanceolate, sessile, 1 in. long more or less, dentate: peduncles long and naked, single-fld.: fls. short and nearly rotate, large, dark blue. S. Afr. caudata: Edravanthus dalmaticus.

congésta. Per with creeping sts.: lvs. orbicular or oblong, to 1 in. long, toothed: fls. pale blue, 1/2 in. across. New Zeal.

dalmática: Edraianthus dalmaticus.

dinárica: Edravanthus dinaricus.

grácilis. Ann., 10-18 in., very leafy on lower half, glabrous above: lvs. sessule, linear-lanceolate to lanceolate, to 114 in. long, with scattered hairs, margins undulate and thickened: fig. 2-4 in a raceme, corolla very small and little exceeding calyx, color not recorded. Australia, New Zeal., New Caledonia.—Apparently not in cult., probably all the material under this name being W. vincafora, a per. species.

graminifòlia: Edraianthus graminifolius.

grandiflora: Platucodon grandiflorum.

Grúmphii: listed name.

hederacea. Creeping very slender glabrous ann. with much the look of Cymbalaria muralis: lvs. round-cordate, angled and shallowly lobed, thin: fls. small, pale lilac, narrowly bell-shaped, about 1/3 in. long. Eu.

Kitaibèlii: Edraianthus Kitaibelii. lobelioides: W. pendula.

paniculata. Variable ann., 3-12 in. high, branched at base: Ivs. linear-lanceolate or lance-acuminate, margins thickened, entire or nearly so: fls. funnelform, violet or blue, corolla twice longer than calyx. S. Afr.

péndula (W. lobelioides). Ann.: lvs. obovate to linear-lanceolate, toothed: fls. rosy-blue, small, scarcely exceeding the calyx, solitary on long stalks. Madeira, Canary Isls.

Pumílio: Edraianthus Pumilio.

robústa: see under W. annularis.

saxícola. Small per., 1-4 in. high: lvs. all basal, lanceolate to oblanceolate or narrow-obovate, 1 in. or less long and ¼ in. or less broad, nearly entire to slightly toothed: peduncle single in each separate rosette: fls. bell-shaped, less than ½ in. broad, bright light blue. Tasmania.

serpyllifdlia: Edraianthus serpyllifolius.

tasmánica: perhaps W. saxicola. tenuifòlia: Edraianthus tenuifolius.

vincæfiðra. Per. to 1½ ft., leafy on lower half: lvs. reaching 2½ in. long but mostly less, linear to oblong or spatulate, glabrous, often undulate: fls. bell-shaped, 1 in. or

more across, blue or white. Australia, New Zeal.-See W. gracilis.

WAHOO: Eugnumus atromurmureus.

WALDSTEÌNIA. Rosacex. Per. strawberry like creeping herbs of north temp. zone with mostly basal long-stalked 3-5-lobed or -divided lys. and yellow fis. in corymbs borne on bracted scapes; sometimes planted in the rock-garden and of easy cult.

fragarioides. Barren-Strawberry. Lvs. of 3 wedge-shaped lfts. to 2 in. long, coarsely toothed at tips: fls. about ½ in. wide. Woods, N. B. to Ga. and Minn. sibfrica (W. trifolata). Lvs. with 3 entire lfts.: scapes axillary, 3-5-fld., white. Siberia.

trifoliàta: W. sibirica.

WALLFLOWER: Cheiranthus Cheiri, which see for tt. Beach: Erysimum suffrutescens. Coast: Erysimum Beach: Erysimum suffrutescens. capitatum.

WALLICHIA. Palmacex. Feather-palms, mostly soboliferous, unarmed, monœcious or polygamous, the pinnæ short and cuneate and variously toothed at the oblique or irregular apex; species about 4 in the Indo-Malayan region; they thrive in protected situations in S. Fla.: stemless or with short trunk; spadices among the lvs., much branched; stamens 6, borne on the corolla tube: fr. ovoid-oblong, 1-3-seeded, ½-1 in. long, red or purple. Monocarpic (dying after fruiting). See *Palm*.

caryotoides. Clustered palm, with sts. short or not evident. lvs. to 8 or 9 ft., curved or arching; pinnæ a dozen or more, oblong or narrow-oblong, white underneath, irregularly cut and toothed; petiole long and nearly cylindrical: fr. about 1 in. long. Bengal, Burma.

disticha. Trunk solitary or very few, 10-15 ft., coarsely ringed, the lvs. distichous (on two opposite sides) and 8-10 ft. long; pinnæ 1-2 ft. long and 2-3 in. broad, stiff and ribbed, somewhat glaucous underneath, narrow at base and runcate, obtuse or irregular at apex and toothed, with a jagged tooth or little lobe on either side about the middle; petiole short, obscurely angled: fr. oblong. Himalayas.

WALNUT (species of Juglans). The native black walnut of the eastern United States and Canada is J. nigra, often gathered from fields and roadsides for home use and market and to some extent planted for the nuts, as is also the butternut, J. cinerea.

Nearly one hundred horticultural varieties of black walnut have been selected from the wild and named and some of these have been propagated for the nursery trade. Among these the Thomas is of outstanding merit. The Snyder, Wiard, Tasterite and Kettler are superior cracking varieties of northern origin. The Stambaugh, Ohio, Stabler and Rohwer are adapted to the latitude of Pennsylvania and southward.

Farther west and in California are other native species of Juglans. Good edible nuts are produced by East Asian species. The walnut of history (the English or Persian walnut) is Juglans regia, in several marked forms, and this species is under discussion in the remainder of this article.

Various races of cultivated walnut thrive over a wide territory in North America. They have been grown somewhat in western New York but in most localities have been severely damaged or killed outright by occasional cold winters with temperatures ranging down to -20° to -30° F. A recently introduced strain from the Carpathian Mountains has withstood temperatures as low

as -40° F. and is promising for trial in the eastern United States. The commercial acreage, however, is in southern California, where adaptable varieties have been produced. Commercial production is also found in parts of Oregon and Washington.

Fertile, deep and well-drained loams are desired, with dependable irrigation water. Trees may be set as close as 40 by 50 feet, but this is too near together for trees at maturity, 60 or 65 feet being preferable. Clean tillage is given from the first, with good cover-crop for winter or following fruiting; this crop is plowed under in spring. The trees are strong free growers on good land. The young tree may be pruned to the desired height for a trunk, but thereafter little regular pruning is undertaken except to thin out the poor, weak and crowding branches.

The crop may run as high as one ton of nuts to the acre, but much less than this quantity is the usual yield. The nuts are shaken off by means of long poles with hooks, but many of them fall naturally. They are washed, dried and sacked, and then taken to the central packing house to be bleached and graded for market. They are now marketed in small cartons for retail trade, under label or trade-mark, and each

nut may also be stamped.

Formerly trees were grown directly from seed, but with the coming of improved named varieties grafting must be employed. The desired variety may be worked on common seedling stocks, or on seedlings of the wild California walnut or of the black walnut. The year-old seedling is grafted at the crown in the nursery in spring, the whip-graft method being usual, the parts being covered with wax. At one year from the graft the tree should be 6 feet or more tall, if the soil is good and it has been staked to prevent injury. This one-year-old tree (twoyear root) is set in the orchard or grove. tree is cut back to 5 or 6 feet, to form the head; or if it is not strong or shapely enough it may be headed back to within a foot or two of the ground and a new sprout (which should be staked) is developed for the future bole. The walnut tree is long lived.

Insects and diseases are usually not particularly damaging; but the grower should be informed by the latest bulletins and reports.

WALTHÈRIA. Sterculiaceæ. Herbs, shrubs or trees native mostly in trop. Amer., with alternate toothed lvs. and small fls. in axillary clusters or cymes; one species sometimes grown in Fla.

americana. To 4 ft.: lvs. ovate to oblong, to 2 in. long: fls. yellow, about 1/4 in. long, in dense clusters. Fla., W. Indies, S. Amer.

WAMPI: Clausena punctata.

WANDERING JEW: Tradescantia fluminensis, Zebrina

WAND-FLOWER: Sparaxis.

WARATAH: Telopea speciosissima.

WARNERIA AUGUSTA: Gardenia jasminoides.

WARSCEWICZÉLLA. Orchidacex. Epiphytes of trop. Amer. without pseudobulbs, clustered distictions lys. and large solitary fls.; sepals and petals similar; lip 2- or more-lobed, movably joined to the column-foot. Grown in a warm greenhouse; see Orchids.

aromática. Fls. fragrant, 3-4 in. across, white with an azure lip. Panama, Costa Rica.

discolor. Lvs. to 17 in. long: scapes much shorter than

lvs.; fis. about 2 in. across; sepals and petals white, greenish or yellowish, the latter sometimes tinged with purple; lip purple shading to white on margins, with a yellow or whitish plicate crest at base. Feb.-July, Sept.-Oct. Cent. Amer., Cuba.

Wéndlandii. Lvs. to 13½ in. long: peduncles to 4 in. long; fis. large, to over 4 in. across; sepals and petals white to yellow-green; lip violet through the center with white margins. July-Sept. Costa Rica.

WARSZEWÍCZIA. Rubiaceæ. Trop. American trees or shrubs with large opposite lvs. and small fls. in cymes borne in terminal panicles; one species intro. in S. Calif.

coccinea. To 20 ft.: lvs. obovate, to 2 ft. or more long and 1 ft. across: fls. yellow or orange, 1/4 in. long, the infl. 1 ft. and more long. Trinidad, Cent. Amer. to Brazil.

WASHINGTÒNIA (Neowashingtonia). Palmacex. Two species of massive hermaphrodite fan-palms, native in Sonora and Lower Calif., Mex., and in the interior of S. Calif., and in S. W. Ariz., unarmed except for the spiny margins of petioles, the chaffy fls. solitary and nearly sessile on the branchlets of long and slender axillary spadices that exceed the foliage, the clusters of sprays looking not unlike corn-tassels: lvs. large and heavy: stamens 6, with narrow filaments: fr. a little 1-seeded thin-fleshed ellipsoid or globose drupe about 1/3 in. long. The Washingtonias are extensively planted in Cent. and S. Calif., and are common along the Gulf Coast, in Fla., as well as in other parts of the world. They are still sometimes listed as Brahea, a practice that should now be discontinued. For cult. see *Palm*.

filamentòsa: W. filifera.

filifera (Brahea filifera and filamentosa. W. filamentosa). Ponderous tree to more than 80 ft. with gray-green foliage, blade lacking a tawny patch underneath about the hastula; trunk clothed in nature with a dense evenly thatched "petticost" or shag of hanging old lvs. that usually tapers inward somewhat at the base when the lower trunk is bare and does not show any outstanding old fl.-stalks; lower lvs. hanging prone, displaying the long flat mostly green (except at base) spined petioles: lvs. very long-stalked and standing well separated so that the crown is open and very broad, the long limp narrowly-attenuate segms. of the very fliferous blades gracefully hanging. Native about streams and springs on borders of Colorado Desert, Calif. and in S. W. Auz.—Not so well adapted as the next species for planting near the coast.

gracilis: W. robusta.

grácilis: W. robusta.

grācilis: W. robusta.

robūsta (W. graculis. W. Sonoræ). A taller and more slender tree than W. filifera, or more rapid-growing, with brilliant green foliage and a large tawny patch about hastula on under side of blade, clothed in nature with a long cylindrical uneven or ragged shag, and the old fi-stalks standing out squarely through it, the rich brown and heavily spined petioles not prominent: crown relatively narrow: lvs. stiffer and mostly less deeply cut and less slender-pointed, bearing few or no fibers except on very young trees; segms. very variable as to their drooping habit and the number of filaments. Mex.—The shag or thatch sometimes falls from the upper part of the trule of tall sometimes falls from the upper part of the trunk of tall trees, leaving the st. bare.

Sondræ: W. robusta.

WASHINGTON PLANT: Cabomba caroliniana.

WATER-FEATHER: Myriophyllum proserpinacoides.
-Hawthorn: Aponogeton distachyus. -Hemlock: Cicuta.
-Hyacinth: Eichhornia crassipes. -Leaf: Hydrophyllum.
-Lily: Nympheaa, Victoria. -Lettuce: Pistia Stratiotes.
-Milfoil: Myriophyllum. -Plantain: Alisma. -Poppy: Hydrocleys nymphoides. -Shield: Brasenia, Cabomba. -Snow-flake: Nymphoides indicum. -Soldier: Stratiotes. -Weed:
Anacharis canadensis. -Weed, Yellow: Jussiwa californica.
-Willow: Decodon verticillatus.

WATERMELON (Citrullus vulgaris). watermelon is of simple requirements, yet good commercial results are obtained only on quickly fertile land that has not raised the crop for three or four years or more. In the home gardens long rotation cannot often be practiced, but extra

attention to fertility and to combatting of pests may overcome the deficiency. Good early varieties of excellent quality are available for home planting, and they should be more largely grown even in the northern states; these varieties are commonly less long-running than the commercial field varieties, and 8 feet apart each way is sufficient space to allow.

For general field culture the vine should have a running space of 10 feet between the hills. The crop requires a long warm season. Drainage should be good. Land is often plowed in autumn, to expose it to the comminuting action of frost. Well-rotted manure may be worked into the hill and soft earth placed on top in which the seeds are planted. Two or three plants may be left to the hill or stand. Horse cultivation should cease when the plants begin to run, so that the vines will not be disturbed. About twelve tons of merchantable melons to the acre is a good crop. Watermelon wilt is one of the troublesome diseases, for which rotation and care not to use contaminated manure, and planting resistant varieties are preventives.

When a watermelon is ripe it gives a flat dead sound when thumped; the white under side turns yellowish and becomes rather hard and rough or pimply; the fruit has a yielding or "givey" feeling when pressed by the palm of the hand as it lies on the ground, but this test is likely to injure the melon for shipping.

The hard white-fleshed citron-melon, used for preserving, is grown the same as other forms of watermelon. See Citrullus.

WATERMELON, CHINESE: Benincasa hispida.

WATSÒNIA (Meriana). Iridacex. Summerblooming bulbs from S. Afr., the sts. bearing sword-shaped lvs. and red or white fls. in terminal or lateral racemes, with curved perianthtube and equal segms. Cult. as for Gladiolus, to which they are related but differ, among other things, in the character of the style. Popular in Calif. for summer bloom.

álba: W. iridifolia var. O'Brienii.

angústa. To 4 ft.: fis. scarlet, the segms. to 1 in. long and acuminate.

Árdernei: W. iridifolia var. O'Brienii.

Beátricis. St. to 3 ft.: lvs. few, linear: fls. rich apricot-red, corolla 2 in. or more long, limb wide open.

brevifolia. To 1½ ft.: fls. bright rose-red, the curved tube 1 in. long and segms. ½ in. long.

bulbiliffera. Similar to W. Meriana but taller and more robust, lvs. broader, infl. looser, and upper lvs. and bracts bearing bulbels.

coccinea. To 1 ft.: fis. scarlet, the tube to 2 in. long and exceeding the spreading segms.

densifiòra. To 3 ft.: fls. bright rose-red, the curved tube 1½ in. long, twice length of segms., in dense spikes 1 ft. long. iridifòlia. To 4 ft.: fls. pink, to 3 in. long, the tube much longer than segms. Var. O'Brienii (W. Ardernei, W. O'Brienii, W. alba) has pure white fls.

longifòlia. To 5 ft. or more: fis. from white or pale pink to deep rose, the curved tube to 2 in. long, twice length of segms., densely distuchous, in many-fid. spikes.

marginata. To 5 ft.; fls. rose-red, fragrant, differing from W. rosea in the funnel-shaped upper part of the tube being very small.

Meriana. To 4 ft.: fls. bright rose, the curved tube to 2 in. long, segms. ¾ in. long, in 12-20-fld. spikes.

O'Brienii: W. iridifolia var.

Pfilansii. To 6 ft.: fis. brick-red, the tube 2 in. long, segms. 1 in. long, in dense simple spikes to 1 ft. long.

ròsea. To 6 ft.: fis. rose-red, the tube broadened under segms. and of same length.

Vérsfeldii. Similar to W. rosea but with much larger fis. having longer, narrower segms.

Wflmaniæ. To 5 ft.: basal lvs. narrowly sword-shaped, to 20 in. long, midrib green, margins pale yellow: fls. purplish-rose, to 1½ in. long, horizontal, tube sharply curved, segms. oblong.

Wordsworthians. To 5 ft.: basal lvs. glaucous, to 2 ft. long: fs. purplish-lulac, about 3 ½ in. long, ascending, segms. half as long as tube, obovate, spreading.

WATTLE: see Acacia.

WAXBERRY: Symphoricarpos albus, Gaultheria hispida.
WAX-PLANT: Hoya carnosa. -Tree: Rhus succedanca.
-Weed: Cuphea petrolata.

WAXWORK: Celastrus scandens.

WAYFARING-TREE: Viburnum alnifolium and Lantana.

WEATHER-GLASS, GOLDEN: Hypoxis hygrometrica.

WEBEROCÈREUS. Cactaceæ. A small genus of Cent. American epiphytic cacti allied to Selenicereus, having slender trailing sts., nocturnal fls., ovary warty, and bristly and scaly on upper half, the fr. spineless but somewhat pubescent on the arcoles.

Biblieyi (Cereus Biolleyi). Sts. long, to ½ in. diam., irregularly 3-5-angled or cylindrical, areoles 1-3-spined or spineless: fls. pale pink within, darker outside, to 2 in. long. Costa Rica.

panaménsis. Sts. 3-angled or flat, margins acute, areoles 1-3-spined or spineless: fls. white within, yellowish-green outside, to 3 in. long. Panama.

WEDÈLIA. Compositæ. Ann. and per. herbs in the warm parts of the world, erect to creeping, sometimes more or less woody: lvs. opposite, entire to lobed: heads mostly yellow-rayed and solitary or few together; pappus a crown.

trilobata (Stemmodontia trilobata). Trailing and rooting: lvs. elluptic, 2-4 in. long, more or less notched and shallowly lobed: heads yellow, erect on solitary pedicels. S. Fla. and trop. Amer.—Sometimes employed as ground-cover.

WEED: a plant not wanted and therefore to be destroyed. A plant desired under one circumstance, as horse-radish or vegetable-garden dandelion, may be a weed under other circumstances. Datura back of the barn is jimson-weed; in the drug-garden it is stramonium. Some plants are naturally weedy, by which it is meant that they invade habitable and cultivated grounds and make trouble: they are not wanted. Plants that do not make trouble excite no opposition and are not weeds even though they may have no "uses" in cookery, commerce, ornament or medicine.

The primary remedy for weeds is to grow the plants that one wants: the better they are grown the less will be the opportunity for invaders; and if naturally weedy places are kept clean, most of the breeding grounds will be eliminated; and clean seed may be sown. Aside from this, special practices may be necessary to circumvent and control some kinds of weeds under given conditions. The gardener and farmer will find these means by consulting current books and bulletins and by inquiring of well-informed persons.

WEIGÈLA. Caprifoliaceæ. Popular brilliantly-flowered upright shrubs, in white, pink and red in spring and early summer, the plants not stoloniferous or colonizing: lvs. opposite: fls. about 1½ in. long, borne on short leafy shoots of the season often in more or less compound clusters: fr. long and narrow, woody, dehiscing by 2 valves from the top. Species about 10, in E. Asia. Formerly included in the American genus Diervilla, but really distinct. The kinds are much confused by variation, probably by

hybridization, so that some of the hort, names cannot be referred exactly to botanical species.

The weigelas are hardy bushes adapted to any good garden land if it is not droughty, although they profit by winter protection of the ground. They require no special attention. The bloom arises from twigs of preceding year and therefore should not be trimmed before flowering. Propagated by greenwood cuttings in frames in summer.

amábilis: W. florida, sometimes W. corgensis.

arbòrea: sometimes means W. coræensis, and sometimes a form of W. florida.

argénteo-marginàta: hort. name.

bifórmis: W. florida associate.

cándida: white-fld. W. florida (as var. alba).

candidíssima: hort. name.

coræénsis. Large stout shrub to 15 ft., distinguished by coreensis. Large stout shrub to 10 ft., distinguished by its glabrous branches and lvs. except that latter may be somewhat pubescent on veins underneath, broad lvs., narrow calyx-lobes separate to base, pale rose to carmine corolla (whitish in var. Alba) that is suddenly narrowed below the middle. Japan.

decora. Related to W. japonica but lvs. somewhat villous underneath and fis. very short-stalked, changeable in color. Japan.

Désboisii: hort. name, supposed to be hybrid between W. hortensis and W. floribunda.

floribunda. To 10 ft.: known by the narrowly funnel-form dark crimson fis. crowded on short lateral branchlets and the projecting style and sometimes short-exserted anthers; corolla pubescent outside; calyx-lobes narrow, separate to base: Ivs. somewhat pubescent above, more so underneath. Japan. Var. grandiflora, fis. large, brownish.

underneath. Japan. Var. grandiflöra, fis. large, brownish. flôrida (W. rosea). Diffuse nearly glabrous shrub to 8 and 10 ft., with elliptic or obovate short-petioled acuminate lvs. to 4 in. long that are pubescent on veins underneath: fis broadly funnelform, rose-colored (a white var., álba), with blunt spreading lobes; calyx-lobes broad and united at or toward base. N. China, Korea. Var. variegāta, lvs. margined with yellowish-white.—The commonest weigela in old yards and in many forms of which some depart considerably from the type; some of the named kinds more or less associated with W. florida are Biformis, Intermedia, Glorieux, Gustave Mallet, Madame Tellier, Vanhouttei, Venosa, Verschaffeltu, and some of the plants known as Verschaffeltu, and some of the plants known as Verscolor. Versicolor.

grandiflora: W. floribunda var. or W. corwensis.

gratissima: hort. name, perhaps hybrid between W. hortensis and W. florida.

Groenewégenii: W. florida or hybrid from it.

Héndersonii: hort. name, thought to be hybrid between W. floribunda and W. florida.

horténsis (W. japonica var. hortensis). To 10 ft.: young branches hairy and under surface of ovate or oblong acuminate lvs. densely tomentose, upper surface pulescent when young, length 3-4 in.: fls. 3 together on slender peduncle, narrow bell-shaped, carmine (varying to white in var. nivea), style sometimes slightly exserted; calyx-lobes narrow and separate to bottom. Japan.

hýbrida: indefinite name for hort. vars. of uncertain origin.

japónica. To 10 ft., branchlets glabrous or nearly so: Japonica. To 10 It., branchiets glabrous or nearly so: llys. elliptic to long-obovate, to 4 in. long, acuminate, densely pubescent underneath particularly on veins: fis. mostly in 3's on short shoots, rather narrowly bell-shaped, whitish changing to carmine; calyx-lobes very narrow and distinct. Japan. Var. sinica from China has lvs. soft-pubescent underneath, pale rose-colored corolla abruptly narrowed toward base toward base

Kosteriàna variegàta: hort. name.

lùtea: hort, name.

nana variegata: hort. name.

præcox. To 6 ft.: of the W. florida relationship, separated as the earliest flowering: lvs. soft-pubescent underneath: fls. on very short lateral branchlets, calyx-lobes broad and joined below, corolla narrowly bell-shaped and much narrowed below the middle, pubescent outside, rose-colored or pink with yellow in throat. Korea.—Vars. of this species, or to be associated with it, are Avalanche, Bouquet Rose, Conquérant, Daubenton, Espérance, Floreal, Girondin, Gracieux, LePrintemps, Seduction, Vestale.

purpurata, purpurea: trade names.

ròsea: W. florida.

sessilifòlia: probably Diervilla sessilifolia.

Sièboldii: hort. name.

Stéltzneri: probably hybrid between W. hortensis and W. florida.

styriaca: probably hybrid between W. floribunda and W. cormensis.

Vanhoùttei: probably hybrid between W. hortensis and W. florida.

Vanicekii: hort, name.

vendsa: supposed to be hybrid between W. corxensis and W. florids.

venústa (W. florida var. venusta). Handsome, hardy and graceful species, to 5 or 6 ft., with glabrous branchlets and nearly or quite glabrous rather small lvs., distinguished particularly from W. florida by its rich rose-purple corolla which is gradually contracted into a slender tube and has short lobes, calyx small and 2-lipped. Korea.

Verschafféltii: see W. florida.

versicolor: probably W. floribunda; sometimes applied to an associate of W. florida.

WEINMÁNNIA. Cunoniacex. Shrubs or trees mostly of the southern hemisphere, two intro. into Calif.: lvs. opposite, simple or pinnate: fls. in terminal or axillary racemes: fr. a leathery

racemòsa. Tree to 80 ft.: lvs. oblong-lanceolate to ovate, to 4 in. long, pinnately 3-5-parted when young, very leathery, coarsely toothed: fls. white or pink, small, in racemes to 4 in. long. New Zeal.

sylvicola. To 50 ft.: lvs. of 3 lfts, or pinnate in young trees, lfts. oblong to lanceolate, to 2 in. long, leathery, coarsely toothed: fis. white or pink, small, in racemes to 4 in. long. New Zeal.

WELLINGTONIA: Sequoiadendron giganteum.

WÉRCKLEA. Malvacex. One tree native in Costa Rica and planted in S. Calif. W. insígnis. To 30 ft.: lvs. alternate, orbicular or kidneyshaped, to 16 in. across, bright green, palmately veined: fls. rose-lilac with yellow base, 5 in. across, solitary, on stalks to 6 in. long: fr. a bristly caps. 2 in. long.

WESTRÍNGIA. Labiatæ. Australian shrubs with entire lys. in whorls and 2-lipped fls. axillary or in terminal leafy heads; one species sometimes grown in S. Calif.

rosmarinifórmis. To 3 ft. or more: lvs. oblong-lanceolate to linear, to 1 in. long, shining above, silvery-pubescent beneath: fls. white, ½ in. or less long, axillary.

WHEAT: Triticum æstivum. -India: Fagopyrum tataricum.

WHIN: Ulex.

WHÍPPLEA. Saxifragacex. Deciduous shrub from Calif., of little ornamental value but adapted to rock-gardens. W. modésta. Branches trailing or arching, 1½ ft. long: lvs. opposite, ovate or elliptic, to 1½ in. long: fls. white, small, in dense cymes ¾ in. across: fr. a leathery caps. 1 in. across. Related to Jamesia and Carpenteria.

WHISPERING BELLS: Emmenanthe penduliflora.

WHITE-CUP: Nierembergia rivularis.

WHITEWEED: Chrysanthemum Leucanthemum. WHITEWOOD: see Liriodendron Tulipifera,

WHITFIELDIA. Acanthaceæ. Trop. African shrubs differing from Strobilanthes in the brightly colored broadly lanceolate calyx-segms. and campanulate corolla, all subtended by rather large greenish bracts. Grown in greenhouses or out-of-doors in extreme S.; propagated by cuttings or seed.

lateritia. Low shrub: Ivs. oblong-ovate, to 2½ in. long, opposite, entire, persistent: fis. orange- to brick-red, to 1½ in long, 2-lipped, in terminal racemes.

WHITLAVIA: Phacelia Whitlavia.

WHITLOW-GRASS: Draba verna.

WHITLOW-WORT: Paronychia.

WHORL: three or more leaves or flowers at one node, in a circle. -Flower: Morina longifolia.

WHORTLEBERRY: Vaccinium.

WIDDRINGTÒNIA. Cupressacex. Evergreen trees with scale-like or linear lys, and cones composed of 4 scales: native in Afr. and Madagascar, suitable for warm countries. Allied to Callitris with which some authorities unite it. For cult. see Conifers.

cupressoides. Shrub or small tree to 12 ft.: lvs. scale-like, imbricated: cones ¾ in. or less across, about 3 together. S. Afr.

juniperoides (Callitris arborea). Tree to 60 ft.: lvs. scale-like. imbricated: cones 3/4 in. across, solitary or several together. S. Afr.

Schwarzii. Similar to W. juniperoides but with smaller thicker lys, and smaller cones. S. Afr.

Whytei (Callitris Whytei). Tree to 140 ft.: lvs. imbricated, scale-like on young plants linear: cones ¾ in. across, 4-6 together. E. Afr.

WIGÁNDIA. Hydrophyllacex. Large stout per. herbs, subshrubs or tree-like, with large simple toothed lvs. covered with glistening stinging hairs, and bell-shaped fls. in terminal scorpioid cymes; several species in trop. Amer.

Wigandias are grown as foliage plants in subtropical bedding. Propagated by seeds sown under glass in winter or by cuttings of the roots in spring.

caracasàna. To 10 ft. or more, sometimes making a large very woody shrub or small tree: lvs. to 1½ ft. long, heart-shaped at base: fls. blue or violet with white tube; filaments hairy below. S. Mex. to Venezuela and Colombia. Var. macrophýlla has larger lvs.—Cult in S. Calif. in several

imperiàlis: a robust form, probably a var. of W. caracasana.

macrophélla: W. caracasana var.

ùrens. To 12 ft.: lvs. to 1 ft. long, heart-shaped at base: fls. violet. Peru.

Vigièri: of silvery appearance, perhaps a var. of W.

WILCÓXIA. Cactaceæ. Low spiny cacti with dahlia-like roots, 5 species in Tex. and Mex.: branched, often as slender as a lead-pencil, ribs few and low: fls. diurnal, short-tubed, 1 from an areole. See Cacti.

austràlis: listed name.

Poséigeri (Cereus and Echinocereus Poseigeri and tuberosus). Sts. to 2 ft. high and less than ½ in. thick; ribs 8-10 and inconspicuous and almost hidden by appressed spines; radials 9-12; central 1: fls. purple or pink, 2 in. long. S. Tex., Mex.

Schmöllii (W. senilis). Tubers to 10 in. long and ¾ in. diam.; sts. cylindrical, to 3 in. tall and ¾ in. diam. with 9-12 low tubercled ribs; spines about 35, soft and hair-like, blackish: fis. rose-purple, to 1¾ in. long. Mex.

senilis: W. Schmollii.

striata (Cereus striatus). Prostrate, to 3 ft. long and about ½ in. diam., blue-green when young; ribs 8-9, very low, straight; spines 9-10, short, black to brown: fis. purplish-red, to 4 in. long. Lower Calif.

tamaulipénsis. Much branched, joints cylindrical, 4-10 in. long; ribs about 10, low; radial spines usually 15-20, spreading, to ½ in. long, whitish, straight; central 1, shorter: fls. pale rose, to 2 in. long, tube short, segms. linear-lance-

viperina. Sts. branching, velvety-pubescent, less than ½ in. diam., becoming spineless; ribs about 8 and inconspicuous; spines 8 and short: fls. red, 1 in. long. Mex.

WILLEMETIA: Noltea africana.

WILLOW: Salix. Desert -: Chilopsis linearis. Flowering -: Chilopsis linearis. -Herb: Epilobium. Primrose -: Jussiwa. Virginia -: Itea virginica. Water -: Decodon verti-

WILMATTEA. Cactaceæ. A climbing monotypic genus of Honduras and Guatemala, differing from Hylocereus in much smaller fls. whose perianth-tube is scarcely discernible and st.-axils woolly and bristly. W. minutiflora. Slender high-climbing vine with dark green acutely 3-angled joints; areoles about 1½ in. apart; spines 1-3. brownish: fls. white within, to $1\frac{1}{2}$ in. long. Young plants often have st.-angles with thin wings to ½ in. wide or terminal shoots may be subterete.

WINDFLOWER: Anemone.

WINDOW-GARDENING: see House Plants.

WINEBERRY: Rubus phænicolasius. New Zealand: Aristotelia racemosa

WINE-PLANT: Rheum Rhaponticum.

WING: a thin, dry or membranaceous expansion or flat extension or appendage of an organ; also the lateral petals of a papilionaceous flower. -Nut: Pterocarya.

WINTERBERRY: Ilex glabra, lævigata, verticillata.

WINTER FAT: Eurotia lanata. -Savory: Satureja montana. -Sweet: Acokanthera spectabilis.

WINTERGREEN: Gaultheria, Purola, Flowering: Polygala paucifolia.

WIRE-PLANTS: Muehlenbeckia. -Vine: Muehlenbeckia complexa.

WISTÈRIA (Kraunhia). Leguminosæ. Woody twining vines with pinnate lys., showy papilionaceous fls. in drooping terminal racemes in spring, and elongated pods contracted at intervals; popular ornamental subjects. W. floribunda and W. sinensis are the commonly planted species and are hardy N.

Wisterias thrive in deep rich soil. They do not transplant readily. Propagated by seeds, division, layering, cuttings of ripened wood under glass, root-cuttings over bottom heat, and horticultural forms by grafting.

brach&botrys: W. floribunda.

chinénsis: W. sinensis.

floribunda (Glycine floribunda. W. brachybotrys). Japanese W. Lfts. 15-19, ovate-elliptic: fls. violet or violetblue, to ¼ in. long, in racemes to 1½ ft. long: pods velvety. Japan. Vars. are. álba, fls. white; cárnea, fls. flesh-colored; longíssima, racemes to 4 ft. long, may not be distinct from var. macrobotrys; macrobotrys (W. macrobotrys, W. multivai. macroodys, matroodys (v. macroodys, v. matrijuga), racemes to 3 ft. long; præcox, early-fld; ròsea, rose-colored or pale pink fls.; rübra, deep pink to reddish fls.; variegāta, lvs. variegāta; violāceo-plēna, double fls.

frutéscens (W. speciosa). I.fts. 9-15, ovate to ovate-lanceolate. fls. llac-purple, ½ in. long, in racemes to 4 in. long: pods glabrous. Va. to Fla. and Tex.; hardy N. Var. nívea(var. alba), fls. white. Var. magnifica is W. macrostachya.

japônica (Millettia japonica). Lfts. 9-13, ovate-lanceolate: fls. white, ½ in. long, in racemes to 1 ft. long: pods glabrous. Japan, Korea; not reliable N.

macróbotrys: W. floribunda var.

macrostachya (W. frutescens var. magnifica). Lfts. usually 9, ovate: fis. lilac-purple or light blue, in racemes to 12 in. long: pods glabrous. Swamps, Ill. to Ark.; nearly or quite hardy N.

magnifica: W. macrostachya.

megaspérma (Millettia megasperma). EVERGREEN W. Lfts. 7-13, obovate, evergreen: fis. purple, in racemes to 6 in. long. pods velvety. Australia; to be grown in Calif.

multijuga: W. floribunda var. macrobotrys.

reticulata: Millettia reticulata.

sinénsis (W. chinensis. Glycine sinensis). CHINESE W. Lfts. usually 11, ovate to ovate-lanceolate: fls. bluishviolet, 1 in. long, in racemes to 1 ft. long; pods velvety. China. Var. álba has white fls. Var. cærûlea is listed. Var. purpûrea is said to have purplish-violet fls.

speciòsa: W. frutescens.

venústa. SILKY W. Líts. 9-13, oblong-lanceolate or broader, velvety-pubescent on both sides: fis. white, 1 in. long, in racemes to 6 in. long: pods velvety. China; hardy N. Var. álba is listed, but may not differ from type.

WITCH-HAZEL: Hamamelis.

WITCHS-TEETH: Lotus formosissimus.

WITHANIA ORIGANIFOLIA: see Salpichroa rhom-

WITHE-ROD: Viburnum cassinoides and nudum.

WITLOOF: see Chicory.

WOAD: Isatis.

WOLFBERRY: Symphoricarpos occidentalis.

WOLFSBANE: Aconitum lycoctonum.

WOMANS-TONGUE-TREE: Albizzia Lebbek.

WONDERBERRY: Solanum nigrum.

WONGA-WONGA VINE: Pandorea pandorana.

WOODBINE: Lonicera Periclymenum, Parthenocissus quinquefolia.

WOOD-GOSSIP: Casalpinia Crista. -Oil-Tree: Aleurites.

WOODLAND STAR: Lithofragma affinis.

WOODRUFF: Asperula.

WOÓDSIA. Polypodiaceæ. Small rock-loving ferns with tufted rootstocks and pinnately divided fronds; sori on veins beneath the indusia, splitting into star-like lobes; native in temp. and cold countries. They are sometimes planted in rock-gardens and similar places. See Ferns.

alpina. Fronds to 5 in. long, narrowly oblong-lanceolate, smooth above, sparingly hirsute beneath; pinnæ ovate, obtuse, pinnately lobed. Eu., Asia, N. N. Amer.

Cathcartiana. Fronds to 1 ft. long and 2 in. wide, lanceolate, bipinnatifid; pinnæ oblong, with the segms, separated by wide sinuses, oblong and denticulate. W. N. Y. and N. Mich. to N. Minn.

glabélla. Fronds to 6 in. long, pinnate into triangular or ovate crenately lobed pinna, the straw-colored stipes articulate near base. N. N. Amer., Eu.

ilvénsis. Rusty W. Fronds to 10 in. long and 1½ in. wide, 2-pinnathfid into oblong wavy-toothed pinna clothed underneath with rusty chaff. Eu., Asia, N. N. Amer.

mexicana. Fronds to 1 ft. long, glandular-pubescent, 2-pinnatifid into finely toothed segms. with semi-transparent tips. Tex. to Mex.

obtusa. Blunt-lobed W. Common W. Fronds to 15 in. long and 4 in. wide, 2-pinnate into toothed or cut segms. N. Amer.

oregâna. Fronds narrowly lance-oblong, to 8 in. long and 1 in. wide, bright green, glabrous, bipinnatifid; pinne oblong-ovate, crenate-serrulate. Que. to B. C., south to N. Mex. and Lower Calif.

scopulina. Rocky Mr. W. Fronds to 10 in. long and 2 in. wide, 1-2-pinnate into toothed segms, under surface covered with fine white hairs. Mts. of N. Amer.

WOODWARDIA. CHAIN-FERN. Polypodiaceæ. Large ferns with pinnately divided fronds and sori in rows parallel to the midrib; native Eu., Asia, N. Amer. Strong plants for outdoor cult. requiring mostly moist places, and a few of them under glass. They present no particular difficulties. See Ferns.

angustifòlia: W. areolata.

areolata (W. angustifolia. Lorinseria areolata). Fronds of two forms, to 15 in. long, 1-pinnate, sterile pinnæ lanceolate and toothed, fertile linear and entire. Me. to Fla. and La.

Chamissòi (W. radicans var. americana). Fronds to 9 ft. long and 1½ ft. wide, 2-pinnate into toothed or lobed segms. B. C. to Calif.

radicans. Differs from the American species in having large buds on the main rachis which root to form new plants. Eu., Asia.

spinulòsa. Differs from W. Chamissoi in the lower surface having fibrillose scales and the glands stalked. Mex., Guatemala.

virginica (Anchistea virginica). Rootstock long and creeping, fronds to 2 ft. long and 9 in. wide, 2-pinnatifid into oblong or ovate fine-toothed segms. N. S. to Fla. and La., Bermuda.

WOOLLY: provided with long, soft and more or less matted hairs; like wool; lanate.

WOOLLYBUTT: Eucalyptus longifolia.

WORMS: Scorpiurus.

WORMSEED, AMERICAN: Chenopodium ambresioides.

WORMWOOD: Artemisia. Roman: Corydalis sempervirens.

WOUNDWORT: Anthyllis Vulneraria, Stachys.

WULFÈNIA. Scrophulariaceæ. Hardy low herbaceous perennials suitable for the rockgarden or the border, with mostly basal toothed lvs. and raceme-like clusters of blue tubular 4-lobed fls.; native Eu. and Asia. Wulfenias need rich moist soil but protection from excessive moisture in winter, as they easily decay. Propagated by seeds or division.

carinthiaca. Lvs. oblong, to 8 in. long: fls. about 1/3 in. long, in dense racemes on scapes to 2 ft. high. Mts. of Carinthiaca.

WYÈTHIA. Compositæ. Per. herbs of W. N. Amer. with alternate mostly entire and elongated lvs. and solitary or few heads of yellow ray- and disk-fls.; pappus a crown. Sometimes transferred to the garden.

amplexicaulis. To 2 ft., glabrous: lvs. oblong to lanceolate, to 1 ft. long, glossy, the upper sessile or clasping: heads bright yellow, the rays 1½ in. long. B. C. to Colo.

angustifòlia. To 2 ft., hairy: lvs. lanceolate to oblongovate, to 1 ft. or more long, the upper sessile or shortpetioled: rays to 2 in. long. Calif. **XANTHISMA.** Compositæ. Ann. or bien. herbs native in Tex., with alternate entire lvs. and solitary heads of yellow ray-fls. blooming in summer; pappus of bristles. Of easy cult. in the border

texanum (Centauridium Drummondii). To 4 ft.: lvs. lanceolate to linear, to 2½ in. long, the lower toothed: heads 2 in. across.

XANTHÓCERAS. Sapindaceæ. Deciduous shrub from China, planted for ornament. X. sorbifòlia. To 15 ft.: lvs. of 9-17 narrow sharply toothed lfts. to 2 in. long, dark green above and paler beneath: fls. polygamous, white with yellow or red blotch at base of petals, nearly 1 in. across, in racemes in May: fr. green, hard and thick-walled, to 2½ in. long, something like a horse-chestnut.—It thrives in any good soil and is hardy N. Propagated by seeds stratified and sown in spring or by root-cuttings over heat.

XANTHORHÌZA (Zanthorhiza). Ranunculaceæ. One deciduous shrub to 2 ft. with bitter yellow roots, native in E. N. Amer. X. simplicissima (Z. apiifolia). Shrub Yellow-Root. Lvs. 1–2-pinnate, with usually 5 toothed or lobed lfts.: fts. brownish-purple, polygamous, about ½ in. across, in drooping racemes to 4 in. long, with 5 petal-like sepals and 5 small petals. The name simplicissima was bestowed by Marshall, 1785, because the sts. are "generally simple or without branches." The generic name Xanthorhiza originated with Marshall, who spelled it as here printed; the spelling Zanthorhiza and the name apiifolia date from L'Héritier 1788.—It thrives in shady damp positions, and is a little bush of much interest. Propagated by division of roots and by seeds.

XANTHORRHŒA. Liliaceæ. Australian perennials with thick woody often palm-like sts., linear lvs. in a tuft at top of trunk, and fls. in dense spikes at end of terminal scape, the perianth-segms. distinct; suited to dry climates; propagated by offsets.

Preissii. To 15 ft.: lvs. to 4 ft. long and ½ in. wide, stiff: spikes 1 in. diam., on scapes to 6 ft. long; stamens to ½ in. long.

XANTHOSOMA. MALANGA. TANIER. YAUTIA. Araceæ. Large herbs of trop. Amer., with thick often tuberous rhizomes, thick arrow-shaped lvs. or sometimes pedately parted, with long petioles, and unisexual fls. borne on densely-fld. spadices which are shorter than the spathes. Grown in the tropics for the edible roots and sometimes also as greenhouse foliage plants.

atrôvirens. Lvs. to 3 ft. long and 2 ft. wide, dark green above and gray-green below, glaucous, the petioles to 2 ft. long: spathes about 1 ft. long. S. Amer.

bataviénse: a name of no botanical standing, applied to a plant with purple sts. and dark green lvs.

Lindenii (Phyllotanium Lindenii). Lvs. to 1 ft. long, bright green with white veins and midrib, the petioles to 1 ft. long; spathes white, about 5½ in. long. Colombia. Var. magnificum is an improved form.

Márshallii is a trade name for a form with green lvs. and dark petioles but is not known botanically.

sagittæfölium. St. to 3 ft. and more high: lvs. to 3 ft. long and nearly as wide, green, the petioles to 3 ft. long: spathes to 9 in. long, greenish-white. W. Indies, S. Amer. trilobum: hort. name.

violaceum. Lvs. to 2 ft. long and $1\frac{1}{2}$ ft. wide, green with usually purplish nerves, paler beneath, glaucous, the

purplish petioles to 23% ft. long: spathes to 1 ft. long, yellowish-white. W. Indies, S. Amer.

XANTHOXALIS: Oralia

XANTHOXYLUM: variant but not original spelling of Zanthoxylum.

XERÁNTHEMUM. Compositæ. Annuals of the Medit. region, with entire lvs. and solitary long-stalked heads of disk-fls., the involucral bracts papery and petal-like, in lilac, rose and purple. One of the oldest and most satisfactory of the immortelles or "everlastings." Propagated by seeds.

ánnuum. Common Immortelle. To 3 ft., white-tomentose: lvs. oblong or oblong-lanceolate, to 2 in. long: heads to 1½ in. across, white, purple, violet, rose. Var. ligulõsum (X. imperiale) is double or semi-double. Var. perligulõsum (X. superbissimum) is very double.

cylindraceum. Gray-pubescent: heads oblong-cylindrical, 12-15-fid.

imperiàle: X. annuum var. ligulosum.

superbissimum: X. annuum var. perliquiosum.

XEROPHÝLLUM. TURKEY-BEARD. *Liliaceæ*. Per. with woody rootstocks, linear mostly basal lvs. and white fls. in dense terminal racemes, the perianth-segms. distinct; sometimes transplanted to the wild-garden.

asphodeloides. To 5 ft.: lvs. to 1½ ft. long and $\frac{1}{12}$ in. wide: racemes to 6 in. long. N. J. to Fla. and Tenn.

tenax. To 5 ft.: lvs. to 2 ft. long and 1/6 in. wide: racemes to 2 ft. long. B. C. to Calif.

XIMENESIA: Verbesina encelioides.

XIMÈNIA. Olacaceæ. A few species of unarmed shrubs and trees of the western hemisphere and Afr.: lvs. alternate or fascicled, simple and entire: fls. small, white or yellowish, hermaphrodite, mostly in short-peduncled axillary cymes but less frequently solitary, sepals and petals 4 or 5, corolla bearded inside; stamens 8–10; ovary 4-celled at base but fr. a small 1-celled drupe with a single seed.

americana. Tallow-Wood. Tree to 30 ft. but sometimes only a shrub on sterile lands lvs. oblong or elliptic, 2-3 in. long and about 1 in broad, obtuse, shining above: fr. ovoid to nearly globose, $\frac{1}{2}$ -3 in. long, yellow. Fla. and tropics.—Sometimes planted in Fla. for the edible fr.

XOLISMA: Lyonia.

XYLÒBIUM. Orchidaceæ. Epiphytic orchids native in trop. Amer., having 1-2-lvd. pseudobulbs, plicate lvs., and fis. in lateral racemes; sepals and petals nearly similar; lip commonly 3-lobed. For cult. see Orchids.

Cólleyi (Maxillaria Colleys). Pseudobulbs ovoid, to 1½ in. long, commonly 2-lvd.: lvs. elliptic-lanceolate, to 28 in. long and 6 in. wide, leathery, strongly 3-nerved: infl. a short 3-5-fld. raceme; sepals and petals reddish-brown covered with small purplish spots; lip fleshy, dark purple, paler on margin. W. Indies, British Guiana.

hyacinthinum (Maxillaria hyacinthina). Pseudobulbs oblong-cylindric, 2-lvd.: lvs. oblong: raceme to 20-fld.; fls. white to yellow with a rosy lp, with odor of hyacinths. Venezuela.

leontoglossum. Pseudobulbs with 1 lf. to about 1 ft. long and 3 in. wide: fls. yellow spotted with red, in manyfid. racemes to 1 ft. high. Mar.-Apr. Peru, Colombia, Ecuador.

squalens. Pseudobulbs ovoid or ovoid-oblong, to nearly 3 in. tall, 2-lvd.: lvs. elliptic-lanceolate, to 26 in. long: infl. to 8 in. high, densely many-fld.; sepals and petals about 34 in. long, yellowish-white suffused with flesh color; lip with dark brownish-purple in front. May-June, Sept.-Dec. Costa Rica, Venezuela, Brazil, Peru.

XYLOCOCCUS: Arctostaphylos bicolor. XYLOPHACOS: Astragalus.

XYLOPHÝLLA. Euphorbiaceæ. Trop. American shrubs with flattened leaf-like branches, the monœcious apetalous fls. borne in clusters on the edges of the branches, and capsular frs. Often grown as specimen plants under glass for the odd appearance. Propagated by greenwood cuttings.

angustifolia (Phyllanthus angustifolius). Shrub to 10 ft.: branches or phyllodia to 4 in. long and 1/2 in. wide; ffs. reddish. Jamaica.

speciòsa (*Phyllanthus speciosus*. *P. latifolius*). Shrub or tree to 20 ft.: branches or phyllodia to 3 in. long and 1 in. wide: fis. whitish. Jamaica.

XYLÓSMA. Flacourtiaceæ. Evergreen trees or shrubs of trop. and semitrop. regions of the world, except Afr., having alternate simple lvs., small apetalous usually unisexual fls. in axillary racemes, the 4–5 sepals mostly fused at base and the many stamens surrounded by a disk. The name Xylosma has been conserved by botanists over the older name Myroxylon, the latter being the legitimate name of a small genus of leguminous plants.

senticòsa (Myroxylon senticosum). Low shrub, twiga brown-tomentose, axillary spines slender and sharp: lvs. ovate, to ¾ in. long, acute, revolute and obtusely glandular-serrate: fis. unisexual, in racemes of 5-7, sepals ciliate. S. E. China.

XYLOSTEON: Lonicera cærulea and utahensis.

XYRIDACEÆ. Rush-like or grass-like herbs of 2 genera and perhaps 50 species in the western hemisphere and Australia, of which only Xyris is listed. They have inconspicuous fls. in close terminal heads. Of small hort. interest except in wild-gardening.

XYRIS. Yellow-eyed-Grass. Xyridacex. Tufted herbs with narrow basal lvs. and yellow fls. borne in axils of leathery imbricated scales, forming heads at tips of leafless scapes.

Congdonii. To 2½ ft., without bulbous base: lvs. to 15 in. long, concave: heads ovate, to ¾ in. long, not plumose. Mass. to N. J.—Of less ornamental value than the following species.

flexuosa. To 1½ ft., with bulbous base: lvs. to 6 in. long: heads globose, ½ in. high, fis. ½ in. across, July-Sept. Me. to Ga. and Tex.

YAM: Dioscorea: less correctly, forms of sweet potato. Cockscomb: Rajania pleioneura.

YAMPEE: Dioscorea trifida. YANGTAO: Actinidia chinensis.

YARROW: Achillea. Golden: Eriophyllum confertiforum

YATE, FLAT-TOPPED: Eucaluptus occidentalis. -Tree: Eucalyptus cornuta.

YAUPON: Ilex vomitoria.

YAUTIA: Xanthosoma.

YELLOW-BELLS: Emmenanthe penduliflora, bium stans. -Root, Shrub: Xanthorhiza simp-Tuft: Alyssum argenteum. -Wood: Cladrastis. simplicissima.

YERBA BUENA: Micromeria Chamissonis. Man Anemonsis californica. Santa: Eriodictyon californicum.

YEW: Taxus. Plum -: Cephalotaxus.

YLANG-YLANG: Cananga odorata. Climbing: Artabotrue odoratiesimus

YOUTH-AND-OLD-AGE: Zinnia elegans.

YÚCCA. Liliacex. Bold plants of the western hemisphere, stemless (caudex not above ground) or with woody trunks, having stiff sword-shaped lvs. and white or violet cup- or saucer-shaped drooping fls. borne in mostly erect panicles, opening and fragrant at night, the perianthsegms distinct or slightly united.

Yuccas are suitable for bold effects in the garden, or the tender kinds under glass in the North; sometimes grown as tub specimens and massed for summer effects. Yuccas require good drainage and prefer sandy loam soil and open exposure. Propagated by seeds, offsets, stem- or root-cuttings. Y. filamentosa is the species commonly planted North; Y. glauca is also very hardy.

agrifòlia: listed name.

aloifòlia. Spanish Bayonet. To 25 ft., trunk simple or branched: lvs. to 21/5 ft. long and 21/5 in. wide, very sharp-pointed: fls. white, often tinged with purple, to 4 in. across, in panicles to 2 ft. long. S. U. S., W. Indies, Mex.—A form in pancies to 2 It. long. S. U. S., W. Indies, Mex.—A form with Ivs. yellow or white in center is known as tricolor and Ivs. yellow margined as marginata. Var. draconis has trunk branched above, Ivs. to 2 in across which are more flexible, recurred and not rigid. Var. quadricolor is probably not distinct from var. tricolor and var. variegata is listed.

angustifòlia: Y. glauca.

angustissima. To 6 ft., stemless: lvs. to 16 in. long and 1/5 in. wide, margined with white and with many threads. Utah, Nev., Ariz.

arboréscens: Y. brevifolia.

arkansana. Similar to Y. tenuistyla but with racemose rather than paniculate infl. Ark. to Tex.

austrâlis. Large tree: lvs to 18 in. long and 2 in. across, thick and stiff, spreading rigidly, sharp-pointed, coarsely filterous: fis. creamy-white, small, style constricted and short, infl. a narrow pendent panicle: fr. indehiscent, pendent, light colored. Mex.

baccata. To 3 ft., nearly stemless: lvs. 2 ft. long and 2 in. wide, with coarse threads on margins: fis. to 3 in. long. Colo. to Tex.

breviôlia (Y. arborescens). JOSHUA-TREE. To 30 ft., with trunk to 15 ft.: lvs. to 9 in. long, toothed: fis. greenishwhite, to 2 in. long, in heavy panieles 1 ft. or more long. Calif. to Utah.—A striking grotesque tree in many shapes.

Colòma: Y. neomexicana.

concàva: Y. filamentosa var.

constricta. To 6 ft., st. to 18 in. crowned with rosette of lvs. to 15 in. long and ½ in. wide: scape many-fld., fls. white, long-peduncled: caps. to 2½ in. long, constricted in middle. W. Tex.

dracònis: Y. alorfolia var.

elàta (Y. radiosa). To 20 ft., with simple or branched trunk: lvs. to ½ in. wide, white-margined: fls. white. W. Tex., Ariz., Mex.

elephántipes (Y. guatemalensis. Y. gigantea). To 30 ft., branched above: lvs. to 4 ft. long and 3 in. wide, rough on margins: fls. white or creamy-white. Mex.

filamentòsa. Adams-Needle. To 12 ft., nearly stemless: filamentosa. Adams-Needle. To 12 ft., nearly stemless: lvs. to 2½ ft. long and 1 in. wide, with long curly threads on margins: fis. nearly white, to 2 in. long. N. C. to Fla. and Miss. Var. bractèola (var. maxima), very large with leafy bracts on scape. Var. concâva, lvs. not recurved, very broadly spatulate, to 4 in. wide. Md. to S. C. Var. rôsea, fis. tinged pink outside. Var. variegâta has variegated lvs.

fláccida. Often grown as Y. filamentosa but differing in the less rigid habit and the marginal threads being straight. N. C. to Ala.

gigantèa: Y. elephantipes.

gigantea: Y. elephannipes.

glauca (Y. angustifolia). To 6 ft., the short trunk prostrate: lvs. to 3 ft. long and ½ in. wide, margined with white and with fine threads: fis. greenish-white, 2 in. long. S. D. to New Mex. Var. rosea, fis. tinted rose outside.

gloridsa. Spanish Dagger. To 8 ft., with short trunk: lvs. to 2½ ft. long and 2 in. across, with stiff point: fis. greenish-white to reddish, 4 in. across. N. C. to Fla.

grandiflòra: listed name, probably of hort. form.

guatemalénsis: Y. elephantipes.

Hárrimaniæ. To 2 ft., stemless: lvs. linear to spatulate, to 1½ in. wide, with narrow brown margins and white fibers: fls. greenish. Utah to New Mex.

hýstrix: Agave stricta.

latifòlia: listed name.

louisianénsis. Stemless or nearly so: lvs. to 1½ ft. long, rarely more, and to ¾ in. wide, flexuous and grass-like, white-margined fls. greenish-white, style green and swollen, in a paniculate infi.: fr. dehiscent, erect. La. to Tex. and

macrocárpa. To 20 ft.: lvs. stiff, rough, yellowish-green with white inside, threads grayish: fr. to 4 in. long. W. Tex. to Arız.

neomexicana (Y. Coloma). To 3 ft., stemless, cospitose: lvs. to 1 ft. long and about $\frac{1}{2}$ in. wide, with white threads on margins. fis. white, $1\frac{1}{2}$ in. long. New Mex.

nóbilis: a glaucous form of Y. gloriosa.

péndula: Y. recurvifolia.

periculosa. To 20 ft., with few branches: lvs. to 1½ ft. long and 1½ in. wide, with many brown threads: fis. creamy-white, in tomentose panicles 3 ft. long. Mex.

radiòsa: Y. elata.

recurvifòlia (Y. pendula). To 6 ft., the trunk branching: lys. 2 in. wide, recurving. Ga. to Miss. Var. variegata has a central yellow band down lvs.

rupicola. Stemless: lvs. to 1½ ft. long and 1½ in. wide, glaucous, with yellow or brown margin: fls. white or greenish. Tex.

tenuistyla. To 3 ft., stemless: lvs. to 20 in. long and ½ in. wide, with white margin, mostly recurved. Tex.

Treculeana. To 25 ft., the trunk simple or branched: lvs. to 3 ft. long and 2 in. wide, concave, brown margined: fls. white, to 2½ in. long. S. Tex., Mex.

Whipplei: Hesperoyucca Whipplei.

YUCCA, DATE: Samuela.

ZALUZIÁNSKYA (Nucterinia), Scrophulariacex. Ann. or per. herbs or subshrubs in S. Afr., with the lower lys, opposite and the upper alternate: fls. long-tubular, the limb 5-lobed, in terminal spikes, especially fragrant toward eve-

Zaluzianskyas are grown for ornament and fragrance, usually from seed sown indoors in early spring or in the autumn and the plants wintered in a coldframe. Those in cultivation are known as flower-garden annuals.

capénsis. Night-Phlox. Ann. to 11/2 ft.: lvs. linear, to 2 in, long: fls. white inside, purple-black outside and pubescent, to 1% in. long.

selaginoides: Z. millosa.

villòsa (Z. selaginordes). Ann. to 1 ft., pubescent: lvs. obovate, to 1 in. long: fis. white or lilac inside, purple outside and nearly glabrous, to 1 in. long.

ZAMAN: Samanea Saman.

ZÀMIA. Cucadacex. Somewhat palm-like mostly low plants with short or underground tuberlike trunks, pinnate evergreen lvs. and fls. borne in cones and heads, about 40 species in trop. and subtrop. Amer., sometimes planted in the open in warm countries. The width and size of pinnæ (which are without midrib) varies with age and growing conditions, and specific lines are not well understood. For cult. see Cycas.

Altensteinii: Encephalartos Altensteinii.

floridana. Coontie. Trunk low or underground, tuber-like. Ifts. revolute at edges, to 6 in. long and 1/2 in. wide. S. Fla.

glauca: Encephalartos Lehmannii.

integrifòlia. Trunk to 1½ ft. high: lfts. entire or only slightly toothed toward tip. W. Indies.

Lèhmannii: Encephalartos Lehmannii.

Lóddigesii (Z. terrestris). Lits. finely spiny-toothed from middle to tip. Mex., Guatemala.

pùmila: see Z. umbrosa.

Skinneri: Encephalartos Lehmannii.

terréstris: Z. Loddigesii.

umbrosa. Similar to Z. floridana but lits. to 4 in. long and ½ in. broad. Fla.—The plant cult. as Z. pumila belongs here.

villòsa: Encephalartos villosus.

ZANTEDÉSCHIA (Calla of gardeners. Richardia). Calla. Araceæ. S. African herbs with thick rhizomes, simple basal lvs. with long petioles, and unisexual fls. borne on spadices which are shorter than the white, yellow or pink showy spathes; popular greenhouse plants and also grown out-of-doors in warm regions. The true calla is a small herb of northern regions (Calla palustris) sometimes grown in the wildgarden.

For indoor growing, callas do best if they are rested throughout the summer. Bulbs should be planted in rich fibrous soil in 6-inch pots and kept fairly cool until the roots have formed. They may then be given heat, light and plenty of water. After the flowers appear applications of liquid manure may be beneficial. Propagated by offsets from the bulbs. The golden calla may also be propagated by seeds.

æthiòpica (Richardia æthiopica and africana). C. To 2 1/4 ft.: lvs. heart- on ---ethiopica (Richardia Ethiopica and africana). Common C. To $2\frac{1}{2}$ ft.: lvs. heart- or arrow-shaped, to $1\frac{1}{2}$ ft. long and 10 in. wide, shining green: spathes to 10 in. long, white, the limb flaring outward. Var. devoniénsis is a dwarf form. Var. Godefreyana is listed as being smaller and a more profuse bloomer than the type. Var. minor grows to $1\frac{1}{2}$ ft. tall and has spathes to 4 in. long.

álbo-maculàta. Spotted C. Lvs. arrow-shaped, to 1½ ft. long, spotted with white: spathes to 5 in. long, creamywhite, purplish in throat, trumpet-shaped.

devoniénsis: Z. æthiopica var.

Elliottiàna. Golden C. Lvs. ovate-cordate, to 10 in. long and 6 in. wide, bright green with white or translucent spots: spathes to 6 in. long, rich yellow.

melanoleùca. Black-throated C. Lvs. triangular or arrow-shaped, to 1 ft. long and 6 in. across, spotted with white: spathes to 3 in. long, pale or greenish-yellow with black-purple spot at base inside, the limb flaring. Natal.

Réhmannii. Red or Pink C. Dwarf: lvs. long-lance-late, to 1 ft. long and 1½ in. wide, bright green with white or translucent spots: spathes to 5 in. long, rose or red or sometimes nearly white with a rose margin.—For another plant sometimes known as red calla, see Sauromatum,

ZANTHORHIZA: Xanthorhiza.

ZANTHÓXYLUM (Xanthoxylum). Rutaceæ. Prickly shrubs or trees, often aromatic, with alternate pinnate lys., small diocious or polygamous fis. in cymes or panicles, and fr. of 1-5 carpels; sometimes planted for ornament, some of them bearing the small fls. in advance of the

The first species (Z. americanum) is very hardy and most of the others should thrive in the middle latitudes. Several species have medicinal properties. Propagated by seeds. suckers, and root-cuttings.

americanum. PRICKLY-ASH. Prickly shrub or tree to 25 ft.: lvs. of 5-11 ovate lits. to 2½ in. long: fls. greenish, in axillary cymes, before the lvs. Que. to Va. and Neb.

Búngei: Z. simulans.

Clava-Herculis (Pagara Clava-Herculis). HERCULES-CLUB. Тоотньсны-Твек. Tree to 30 or even 50 ft., with prickly trunk and branches, sometimes bush-like: Ifts. 3-9 pairs, closely serrate, petiole and rachis often prickly: fls. in terminal panicles; seeds black and shining. S. Va. to S. Fla., to Tex.

oxyphýllum. Shrub: lvs. of 7-21 ovate-lanceolate or oblong lfts. to 4 in. long: fls. ½ in. across, in many-fld. cymes. Himalayas; to be grown far S.

Piasézkii. Shrub to 10 ft. lvs. of 7-15 ovate or oblong lfts. to 1 in. long: fls. in small cymes. China.

piperitum. Shrub or tree to 20 ft.: lvs. of 7-11 ovate lfts. to 2 in. long: fls. in cymes 2 in. across. China.

schinifolium (Fagara schinifolia). Shrub or small tree: lvs. of 13-21 lanceolate lits. to 1½ in. long: fis. greenish, in cymes 4 in. across. Japan, Korea.

simulans (Z. Bungei). Prickly shrub or tree to 25 ft.: lvs. shining, of 7-11 ovate lfts. to 2 in. long: fls. in cymes $2\frac{1}{2}$ in. across. China.

stenophyllum (Fagara stenophylla). Shrub climbing to 10 ft. lvs. of 7-13 ovate to lanceolate lfts. to 3 m. long: fis. in cymes 3½ m. across. China.

ZAUSCHNERIA. Onagracex. Per. herbs with alternate lvs. or the lower lvs. opposite, scarlet fuchsia-like fls. in racemes, and capsular frs.; useful as a wall cover, in rockeries or the flower-garden. Propagated by division, cuttings or

arizónica. To 2 ft, vi'lous, sts. decumbent, branching from the base: lvs. mostly ovate-oblong, sessile, to 1 1/4 in. long, shallowly and coarsely dentate: fis. scallet, to 1 1/4 in.

californica. California Fucusia. Decumbent or nearly erect, to 2½ ft.: lvs. lanceolate to oblong, to 1½ in. long, hairy, glandular: fis. to 2 in. long. Calif. Var. microphylla is Z. cana.

cana (Z. californica var. microphylla. Z. microphylla). Differs from Z. californica in its much fascicled linear lys. which are less glandular and tomentose-canescent. Calif.

latifòlia. To 2 ft.: lvs. elliptical to ovate-lanceolate, to 1¾ in. long, villous, denticulate, lateral vens more conspicuous than in Z. californica: fls. to 2 in. long. Calif. Var. Étteri, foliage silvery-white.

macrophylla: listed name, perhaps intended for Z. microphylla.

microphýlla: Z. cana.

ZEA. Graminex. One large ann. grass comprising many races or strains, supposedly trop. American but of undetermined origin, widely grown for forage, grain and human food. See Corn. Z. Mays. MAIZE. INDIAN CORN. To 12 ft. or more, suckering at base: lvs. to 3 ft. long and 4 in. wide, curving: staminate spikelets in terminal panicles; pistillate in several rows on a thick rachis or cob, inclosed in large leafy bracts or husks, with long styles or "silk": grains flattened, white, yellow or black. Var. Curágua is a robust green-lvd. form grown for ornament. Var. evérta, Pop Corn, has small ears with mostly pointed grains that explode when heated. Var. gracfillima is dwarf with narrow lvs. Var. indentata, Dent Corn, is tall with yellow or white grains indented at top. Var. indurata, Flint or Yankee Corn, is of medium size with brown-yellow hard smooth grains. Var. japônica has foliage longitudinally striped with yellow, white or pink and planted for ornament. Var. quadrícolor is a form of japonica. Var. rugôsa (var. saccharata), Sweet or Sugar Corn, is rather small with wrinkled sweet grains. Var. tunicata, Pop Corn, has each kernel inclosed in a husk. Var. variegata is a form of japonica.

ZEBRA PLANT: Calathea zebrina.

ZEBRINA. Commelinacex. Small genus of trailing plants differing from Tradescantia in technical characters. Z. péndula (Tradescantia zebrina). Wandering Jew. Decumbent perrooting at joints: lvs. ovate-oblong, striped with white above, purple beneath: fls. red-purple, in clusters between 2 boat-shaped bracts of unequal size. Mex. Var. quadricolor (Tradescantia quadricolor and multicolor) has metallic-green lvs. striped with green, red and white. Z. Purpusii is a trade name, without adequate description.—Propagated by cuttings of the st. It creeps and propagates itself and is useful under benches and as a basket plant.

ZEHNTNERÉLLA. Cactaceæ. A monotypic Brazilian genus similar to Cleistocactus from which it differs in its very short perianth-tube and stamens not exserted. Z. squamulòsa. Shrub or tree-like to 25 ft. tall, branches usually arising at or near the base, about 2½ in. diam., spine-covered; ribs 17–20, compact and low; spines 10–15, to 1¼ in. long, brown, needle-like: fts. white, to 1¼ in. long: fr. about ¾ in. diam.

ZELKÒVA. Ulmacex. Deciduous elm-like trees or shrubs in Asia, with alternate toothed lvs., unisexual or bisexual fls., and fr. an oblique drupe. Hardy as far north as New England and of easy cult. Propagated by seeds, layers and grafting on the elms.

acuminata: Z. serrata.

califórnica: material under this name appears to be Z. carpinifolia.

carpinifolia (Z. and Planera crenata. Z. ulmoides. Planera Richardii). To 80 ft.: lvs. elliptic to oblong, to 2 in. long, acute, wavy-toothed, pubescent on veins beneath. Caucasus.

crenata: Z. carpinifolia.

cuspidata: Z. serrata.

Dàvidii: Hemiptelea Davidii.

Kèakii: Z. serrata.

serràta (Z. acuminala. Z. cuspidata, Z. Keakii. Planera japonica). To 100 ft.: lvs. ovate or oblong-ovate, 2-5 in. long, acuminate, sharply toothed, glabrous beneath. Japan.

sinica. To 60 ft.: lvs. ovate-oblong, to 2 in long, wavy-toothed. China.

ulmoldes: Z. carpinifolia.

ZENÒBIA. Ericaceæ. Deciduous or semievergreen shrub to 6 ft., native from N. C. to Fla. Z. pulverulénta (Z. speciosa. Andromeda pulverulenta and A. speciosa). Lvs. alternate, oval to oblong, to 3 in. long, covered with glaucous bloom: fls. white, bell-shaped, to ½ in. across, in clusters forming terminal racemes, May-June: fr. a caps. ¼ in. across. Var. nida (Z. and Andromeda cassinifolia) has lvs. without bloom and smaller fls.—It does best in sandy or peaty soil and is also adapted for forcing in the greenhouse. Propagated by seeds, by layers, by cuttings of half-ripened wood or of green wood from forced plants.

ZEPHYRÁNTHES (Atamosco). ZEPHYR-LILY. Amaryllidaceæ. Small bulbous herbs with grasslike basal lvs. and funnelform white, yellow, pink or red fls. solitary at end of hollow scape, the perianth-segms. united into short or long tube; stigma in ours mostly 3-branched. Fairly hardy out-of-doors with winter protection, but in regions of heavy frosts the bulbs should be stored in winter.

Ajax. Hort. hybrid: lvs. linear, to 8 in. long: scape 6-8 in.; fls. 1½ in. diam., light yellow.

álba: uncertain name, possibly Z. candida.

Andersonii: Habranthus Andersonii

Atamásco (Amaryllis Atamasco). Atamásco-Lily. To 1 ft.: lvs. narrowly linear, to 1 ft. long: fls. white sometimes tinged with purple, to 3 in. long, in spring. S. E. Va. to Fla. and Ala.

aurea: Pyrolirion aureum.

bifòlia. Lvs. linear, broader than in most species: scape 6–8 in.; fls. large, declinate, cardinal. Haiti, Santo Domingo.

cándida. Lvs. linear, thick with obtuse edges, stiff, to 1 ft. long: fls. white sometimes tinged with rose outside, 2 in. long, in summer and autumn; stigmas not markedly cleft. La Plata region, S. Amer.—Sometimes planted as Atamasco.

carinàta: Z. grandiflora.

citrina. To 10 in.: lvs. to 1 ft. long and ½ in. wide, channelled: fis. bright yellow, 2 in. long, the tube very short or wanting. S. Amer.

grandiflora (Z. carinata). Lvs. linear, to 1 ft. long, flat: fls. rose or pink, to 4 in diam., in spring and summer. S. Mex. to Guatemala.—Widely known in cult.

insularum. I.vs. linear, subcrect to 10 in.; scapes 8-10 in.; fls. white faintly pink tinted outside, sepals and petals unequal, early summer. Described from cult. plants in Fla. and Cuba.

longifòlia. To 6 in.: lvs. narrowly linear, to 9 in. long: fis. bright yellow, coppery outside, to 1 in. long, tube short. W. Tex. to Mex.

mesochlòa. Lvs. linear, to 10 in. long: scapes 6-8 in.; fis. erect, 1¾ in., not opening widely, white above, green in lower portion, red tinted. Argentina.

pulchélla. Lvs. linear, at first erect, twisted, later declinate, to 10 in. long: fis. 1 in. diam., buttercup-yellow. S. E. Tex.

robústa: Habranthus robustus.

ròsea. Lvs. flat, spreading, very obtuse at apex: fls. rose-red, about 1 in. long, in autumn. Cuba.—Plants grown under this name are likely to be Z. grandiflora.

Simpsonii. Differs from Z. Atamasco in narrower perianth-tube with erect or ascending rather than spreading lobes. Fla.

texàna: Habranthus texanus.

Treatise. Distinguished from Z. Atamasco by lvs. nearly cylindrical with rounded margins and mostly obtuse. Fla., S. E. Ga.

tubispatha. Lvs. narrow-linear, exceeding slender scapes: fis. white, 2 in. or less long, spring and summer, the spathe sheathing. W. Indies.

verectinda. To 8 in.: lvs. narrow-linear, to 1 ft. long, becoming recurved-spreading: fis. white tinged pink outside, 2-3 in. long, the tube to 1/2 in. long. Mex.

ZEXMÈNIA. Compositæ. Per. herbs with mostly opposite lvs. and solitary yellow heads of ray- and disk-fls.; pappus of awns or scales; allied to Verbesina.

hispida. To 2 ft., rough-hairy: lvs. lanceolate, irregularly toothed, sometimes lobed near base: rays orange-yellow, ½ in. long. Tex.

ZIGÁDENUS (Zygadenus is a later spelling). Liliaceæ. Per. herbs with or without bulbs, having linear lys. and greenish-white fls. in terminal panicles or racemes, the perianth-segms. often united at base. Occasionally grown in the wildgarden. Propagated by division or seeds.

angustifolius (Amianthium angustifolium. Tracyanthus angustifolius). To 3 ft.: lvs. to 1½ ft. long: racemes to 4 in. long. N. C. to Fla.

bracteatus: Z. elegans.

chloránthus: Z. glaucus.

élegans (Z. bracteatus. Anticlea elegans). To 3 ft.: lvs. to 1 ft. long, glaucous, sharp-pointed: fis. white to straw-colored, bracts of infl. scarious, infl. a raceme to 1 ft. long: caps. twice as long as perianth. Alaska to N. Mex. east to Minn. and Mo.

Frèmontii. To 3 ft.: lvs. to 1 1/4 ft. long and 3/4 in. across: racemes simple or compound, to 1 ft. long. Calif. Var. minor is smaller with few-fid. raceme.

glabérrimus. To 4 ft., sts. from creeping rootstocks: lvs. linear-acummate: fls. greenish-white, sepals ovate with short claw: caps. shorter than perianth. Va. to Ala.

glaucus (Z. chloranthus. Anticlea chlorantha). To 3 ft.: lvs. to 1 ft. long, usually blunt: fls. greenish, suffused on back with purple, bracts of infl. herbaceous, infl. a panicle to 1 ft. long: caps. as long as perianth. Minn. to Ind. east to N. B. and N. Y.

gramineus (Toxicoscordion gramineum). To 14 in.: lvs. to 8 in. long: fls. in short racemes. Sask. to Colo.

intermèdius: listed name of unknown botanical standing.

leimanthoides (Oceanorus leimanthoides). To 4 ft.: lvs. to 1 ft. long: panicles to 1 ft. long. N. Y. to Ga. and Tenn. muscætóxicus: Amianthium muscætoxicum.

Núttallii (Toxicoscordion Nuttallii). To 2 ft.: lvs. to 1½ ft. long and ½ in. across: fls. ½ in. across, in simple or branched racemes. Tenn. to Tex.

paniculatus (Toxicoscordion paniculatum). To 2 ft.: lvs. to 16 in. long and ½ in. across, striate: fis. yellow, in panicles. Mont. to New Mex. and Calif.

venenosus (Toxicoscordion venenosum). To 2 ft.: lys, to 1 ft. long and $\frac{1}{4}$ in. across, striate: racemes simple, to 10 in. long. Mont. to Calif.

ZÍNGIBER. GINGER. Zingiberacex. Trop. herbs bearing tuberous aromatic rootstocks which are the source of commercial ginger, leafy sts. and fls. borne under bracts in terminal or lateral spikes, having 1 petal-like staminode or lip.

Ginger should have fertile soil and partial shade and requires tropical temperatures. Of easy cultivation in the greenhouse but should be rested in winter. Propagated by division of the roots in spring. See Zingiberacez.

Darceyi. To 3 ft.: lvs. to 8 in. long and 2½ in. wide, bright green with creamy-white or pink margins and oblique stripes: fls. deep red. Of hort. origin.

officinale. COMMON G. To 3 ft.: lvs. to 1 ft. long and in. wide: fis. yellow-green, the lip purple spotted with yellow, in dense spikes to 3 in. long. Pacific Isls.

Zerúmbet. To 1½ ft.: lvs. to 6 in. long and 3 in. wide: fis. white, the lip pale yellow tinted with orange, in dense spikes to 3½ in. long. India, Malaya.

ZINGIBERÀCEÆ. GINGER FAMILY. Trop. per. rhizomatous herbs of about 40 genera, characterized by erect cane-like sts. in clumps with elongated entire lvs. and commonly sheathing petioles, irregular bisexual fls. borne under bracts in spikes, heads or panicles, with tubular 3-lobed calyx and corolla, 1 fertile stamen and 1 or more petal-like staminodia, inferior 1-celled ovary, and capsular fr. Species of several genera are grown for the ornamental foliage and others furnish dyes, perfumes, spices, condiments, and medicinal products. Those herein treated are Alpinia, Amomum, Costus, Curcuma, Elettaria, Hedychium, Roscoea, Zingiber.

The culture is simple in the open in tropical and semi-tropical regions; they commonly thrive on lowish ground. Under glass they are mostly planted in the ground or grown in tubs or very large pots. Propagation is by division of the thick rootstocks or subterranean tubers.

ZÍNNIA (Crassina). Compositæ. Herbs or subshrubs with opposite and usually sessile lvs. and showy solitary terminal heads, the rays bright colored, the disk in cult. forms nearly or wholly lacking; native in N. and S. Amer., chiefly Mex. Z. elegans is a common large garden annual.

Zinnias are popular in the flower-garden and as cutflowers. The usual garden soil is satisfactory and full sun or even a semi-shady situation. Propagated by seed sown indoors or outdoors in the spring when the ground is warm enough.

angustifòlia (Z. mexicana). Differs from Z. elegans in the smaller stature, oblong to ovate-lanceolate sessile lvs. and orange heads 1½ in. across. Mex.

élegans. Youth-and-Old-Age. Ann., erect, to 3 ft., hairy: lvs. ovate or oval, clasping: heads to 4½ in. across, rays broad and showy, originally purple or lilac but now of nearly every color except blue and green; disk yellow or orange when present. Mex.

gracillima: hort. name.

grandiflora. Per. to 8 in., hairy: lvs. linear, 1 in. long: heads with yellow rays turning white and brick-red disks. Colo. to Tex. and Ariz.—The grandiflora of hort. may be only a form of Z. elegans.

Haageana: a broad-lvd. form of Z. angustifolia.

linearis. Ann. to 1 ft., branching: lvs. linear-lanceolate: heads clear golden-yellow, to 2 in. across, each ray-fl. margined with bright orange. Mex.

mexicana: Z. angustifolia.

multiflora (Z. tenuiflora). Ann., erect: lvs. ovate or ovate-oblong: heads 1 m. across, rays red or purple, linear. Mex., S. Amer.

pauciflora. Ann., erect: lvs. lanceolate or oblong-ovate: heads 1 in. across, yellow, sometimes with purple or yellow rays in cult. Mex., S. Amer.

pumila: hort. name for a dwarf form of Z. elegans.

 $tenuiflora:\ Z.\ multiflora.$

verticillata. Robust form of Z. multiflora with verticillate lys. and double series of rays.

ZIT-KWA: Benincasa hispida.

ZIZÀNIA. WILD RICE. Graminex. Tall ann. and per. grasses inhabiting marshes in N. Amer. and Asia, monœcious, the pistillate spikelets borne in upper part of panicle, the staminate in lower; one species planted along borders of ponds and in pools. See Grasses.

aquática. Ann. to 10 ft.: lvs. to 1 ft. or more long and 2 in. wide: panicles to 2 ft. long, awns to 3 in. long; pistillate lemmas thin and papery. Me. to Fla. and La. Var. angustifolia (Z. palustris) has lvs. to ½ in. across and tough pistillate lemmas. N. B. to N. Y. and Ind.

palústris: Z. aquatica var. angustifolia.

ZIZIA. Umbelliferæ. Per. herbs with ternate lvs. and small yellow fls. in compound umbels; sometimes transplanted into gardens.

aurea. To 2½ ft.: lvs. ternate, lower ones 2-3-compound into ovate or ovate-lanceolate toothed segms. to 2 in. long: fls. Apr.-June. N. B. to Fla. and Tex.

ZĪZYPHUS. Rhamnaceæ. Shrubs and trees, deciduous or evergreen, mostly with stipular spines, alternate simple lvs. strongly mostly 3-nerved from the base, some 40 species in warm and trop. regions of eastern and western hemispheres, a few of them in the Tex.-Mex.-Calif. region: fls. small, greenish, whitish or yellow, in axillary clusters: fr. a fleshy drupe, sometimes edible.

The species are known in horticulture mostly from the fleshy fruits of the jujube, which are preserved, dried, sweetpickled, stewed, and employed in confections, represented in Z. Jujuba and Z. maurituana. The former (as now defined) is a deciduous small tree or large bush with small green serrate leaves, standing as far north as western New York in protected places, and the principal source of jujubes; the latter, from India, is a small tree with nearly or quite entire broad thick more or less persistent leaves that are white- or

rusty-felted underneath, hardy only in Florida, southern California and similar climates. There is unfortunate confusion in the names of these two species. The former was known to Linneus (1753) as Rhamnus Zizyphus. Philip Miller in 1768 established the genus, spelling it Zuziphus, and named the plant Z. Jujuba. In 1789 Lamarck applied the name Z. Jujuba to the other or tomentose evergreen species, the one for which the name Z. maurituana is now held, calling the green-leaved Millerian species Z. nulgaris; it is the Jujuba plant of Lamarck that has become current in literature, but the Jujuba of Miller (representing the Chinese jujube) is an older designation and must stand although it has been generally recognized only recently.

The cultivation of these plants applies primarily to the green-leaved or common Chinese jujube. This tree thrives in hot and dry regions and in lands strong in alkali. It blooms late and thereby usually escapes late spring frosts. It promises well as a fruit-tree in the southwestern United States. Irrigation contributes to the production of abun-

It promises well as a fruit-tree in the southwestern United States. Irrigation contributes to the production of abundant large fruits. In orchard plantations trees may be set 20 to 25 feet apart either way. Thus far the jujube is very free in this country from diseases and insects. Propagation is simple by means of cleaned and stratified seeds, but the seedlings are utilized only as stocks if the best fruit is desired. The jujube may also be propagated by means of root-cuttings. Improved varieties are whip-grafted on seedlings, determent given being usually explored. dormant cions being usually employed.

Jujuba (2. vulgaris. 2. salva). Common or Chinese Jujuba. Deciduous tree to 40 ft., sometimes a large bush: 1vs. green both sides, ovate to oblong-oval or nearly lanceolate, 1-2 in. long, obtusely serrate; spines usually 2, slender, one of them mostly recurved: fr. oblong to ovoid to subglobose, 1/2 in. or less long. S. E. Eu. to China.—There are many pomological vars., particularly in the Orient.

mauritiana (Z. Jujuba of Lamarck). Indian or Cottony Jujuba. Shrub or small tree, commonly evergreen: lvs. broad-oval, rounded, to 2½ in. long, the under surface and twigs white- or rusty-tomentose; spines stout: fr. globose or short-oblong, I in. or less diam., acid. India; now widely spread in warm countries.—Less developed pomologically than the preceding.

Mistol. To 30 ft., spiny: lvs. oval, 1 in. long, minutely toothed: fr. black, ½ in. across. Argentina.

obtusifòlia. Much branched spiny stiff shrub: lvs. ovate or rarely oblong, to 1 ¼ in. long, entire or slightly toothed, glabrous: fr. black, ¼ in. long. Tex. to Ariz.

sativa: Z. Jujuba. vulgăris: Z. Jumba.

ZÓMBIA. ZOMBI PALM. Palmacex. One soboliferous or cespitose fan-palm in Haiti, somewhat intro. into S. Fla., unarmed except that fibers of the cylindrical lf.-sheath are produced into long stiff spreading or reflexed prongs: fls. hermaphrodite, in short axillary spadices: fr. drupe-like.

antillarum (Chamerops antillarum. Coccothrinax anomala). Trunks 8-10 ft. tall from a clump of bamboo-like shoots: lvs. soon shedding and the trunks breaking over as the basal shoots grow, silvery underneath, cut nearly to base into narrow segms.: fr. white, about ¾ in. diam.

ZOYSIA (Osterdamia). Graminex. Per. creeping grasses with fine close foliage useful for lawns and golf-courses in the S.: lvs. subulate: spikelets borne in spikes. See Grasses.

japónica. Korean Lawn-Grass. Differs from Z. Matrella in being coarser and lvs. 1/8 in. wide. Japan, China.

Matrélla (Z. pungens). Manilla-Grass. Flowering sts. to 1½ ft. high: lvs. to 3 in. long and $\frac{1}{12}$ in. wide, sharppointed: spikes to 2 in. long. S. Asia, E. Indies.

púngens: Z. Matrella.

tenuifòlia. MASCARENE-GRASS. Similar to Z. Matrella but with finer thread-like lvs. Mascarene Isls.

ZYGADENUS: Zigadenus. ZYGIA: Ebenopsis flexicaulis.

ZYGOCÁCTUS. Cactaceæ. One epiphytic species in S. Brazil, much cult, as a window and conservatory plant under the name Epiphullum truncatum, known by its regularly forking growth and irregular fls. For other binomials see Epiphyllum and Nopalxochia.

truncatus. CRAB and CHRISTMAS CACTUS. Bushv. much flat and sharp-serrate and 2 teeth at apex: fls. horizontal from ends of joints, red.—Much grown under various names from ends of joints, red.—Much grown under various names and in many colors and forms, most of which are hybrids with other cacti. Among the trade names which belong here as varieties or hybrids are bfcolor, delicatus, Hárrisonii, magnificus, ròseus, salmòneus, spectábilis and violaceus. They propagate readily from cuttings and bloom freely in winter. Standards and bizarre forms are produced by grafting on species of Acanthocereus, Pereskia, Harrisia, Hylocereus, Selenicereus and on Opuntia Ficus-indica.

ZYGOCÒLAX. Orchidacex. Bigeneric hybrids between Zygopetalum and Colax, intermediate between the two in habit and floral characters. Cult. as for Zygopetalum.

Chárlesworthii (Z. Perrenoudii × C. jugosus).

ZYGOPÉTALUM. Orchidaceæ. Epiphytes of trop. Amer. with 2-3-lvd. pseudobulbs or without pseudobulbs, and rather large fls. which are solitary or in lax racemes; sepals and petals similar; lip simple or 3-lobed with broad spreading mid-lobe. Grown in a warm greenhouse; for cult, see Orchids.

Barkei. Pseudobulbs with 2-3 lvs. to 1 ft. long: infl. to 16 in. high, racemose, about 3-5-fld.; fls. 2½ in. across; sepals and petals green with chocolate stripes; lip white with a callus of violet radiating stripes. Sept.-Jan. British Guiana, Venezuela.

Bürtii: Huntleya Burtii.

caléste (Bollea calestis). Without pseudobulbs: lvs. to 21½ in. long and 2 in. wide: fis. solitary, to 4 in. across, blue-violet with large yellow semicircular callus on hp. May-July. Colombia.

crinitum: Z. Mackayi var.

Garrianum. Without pseudobulbs: fis. solitary, large; sepals and petals deep violet shading to blackish-purple above; lip purplish-mauve bearing a 15-17-ndged callus which is sometimes orange with purple ridges. Ecuador.

Gautièri: Z. maxillare var.

intermedium. Pseudobulbs with 3-5 lvs. to 20 in. long: infl. to 5-fid., racemes longer than lvs.; fls. to 2¾ in. across; sepals and petals green spotted with reddish or purplish; lip white covered with radiating purple lines. Brazil.

Lalindei (Bollea Lalindei). Without pseudobulbs: lvs. to about 12 in. long and 1½ in. wide: fls. solitary, to 3 in. across; sepals and petals rose, darker above; lip and ridged callus yellow to orange. Aug. Colombia.

Callus yellow to orange. Aug. Colombia.

Máckayi. Pseudobulbs with 2-3 lvs. to 20 in. long: infl. to 30 in. long, loose to 7-fld.; fls. to about 3 in. across; sepals and petals yellow-green spotted with brown-purple; lip white striped with rays of purple, large, spreading, Nov.-June. Brazil. Var. crinitum (Z. crinitum) differs in having petals equally long with the dorsal sepal and the lip densely velvety or long-hairy. Var. mājus is listed.

maxillare. Pseudobulbs with 2-3 lvs. to 16 in. long: scapes to 1 ft. long, loose, to 8-fld.; fls. to almost 2 in. across; sepals and petals green barred with brown; lip violet-blue with paler margins and purple crest. Brazil. Var. Gautièri (Z. Gautièri) is more robust with larger fls.

ZYGOPHYLLÀCEÆ. CALTROP FAMILY. Over 20 genera of trees, shrubs and herbs, with mostly pinnate lvs., bisexual fls. with 4-5 sepals and petals, 8-10 stamens, 2-5-celled ovary and united style, and fr. a caps., often winged. Of little hort. importance in this country, but Guaiacum furnishes the lignum-vitæ of commerce and the trees are interesting and ornamental, and Larrea and Tribulus may be planted.
